EPA requested and received comments on the proposed hydraulic conductivity requirement. Commenters opposed the 1 cm/sec requirement for several reasons. Several commenters stated that the requirement would force them to use rounded gravels or other granular materials meeting the hydraulic conductivity value. These commenters maintained that such materials were either not available or only available at significantly higher costs in many areas of the country. One commenter suggested that EPA should provide a variance to owners or operators in areas where suitable granular drainage materials having the proposed hydraulic conductivity are unavailable. Another commenter stated that the Agency should continue to require granular materials to have minimum hydraulic conductivities of 1×10^{-2} cm/sec as currently specified in EPA guidance. This commenter asserted that sand, which is the most common granular material used in leak detection systems, generally has a hydraulic conductivity of 1×10^{-2} cm/sec. Other commenters argued that using granular materials with hydraulic conductivities on the order of 1 cm/sec would significantly increase the susceptibility of geomembranes (above and below the drainage layer) to puncture, because it would be difficult to remove angular materials from the materials used to

response to the commenters concerns, the final rule (§§ 264.221(c)(2)(ii), 264.251(c)(3)(ii), 264.301(c)(3)(ii), 265.221(a), 265.254(a), and 265.301(a)) requires that granular materials used in leak detection systems at waste pile and landfill units subject to today's rule have a minimum hydraulic conductivity of 1×10^{-2} cm/sec consistent with current Agency guidance. However, the final rule specifies that granular materials used in leak detection systems at surface impoundments subject to today's rule must have a minimum hydraulic conductivity of 1×10^{-1} cm/sec.

The Agency has determined that granular materials used in leak detection systems at surface impoundments must have a higher hydraulic conductivity (one order of magnitude greater than what is currently specified by Agency guidance) to account for the potentially greater hydraulic heads imposed on the top liner in surface impoundments. Surface impoundments are typically used to manage liquids, therefore the hydraulic heads on the liner systems of these units are often much higher than those in waste piles and landfills, which are not allowed to manage wastes containing free liquids and must have a leachate collection system above the top liner. Consequently, if a leak occurs in the top liner of a surface impoundment, and is not rapidly drained to the detection sump, areas of the bottom-liner system will potentially be subjected to hydraulic heads in excess of one foot, increasing the probability of migration of hazardous constituents out of the unit. A greater permeability in the leak detection system will drain any leak more rapidly and thus reduce the head on the bottom liner system. Although granular materials having hydraulic conductivities of 1×10^{-1} cm/sec will typically be coarser sands and fine gravels, the Agency feels that two common construction techniques can be

used in combination to prevent any damage to geomembranes adjacent to the drainage materials. First, facilities may select rounded drainage materials; these materials are less likely to puncture or otherwise damage geomembranes. Second, owners or operators may use additional layers of synthetic materials (e.g., a needle-punched nonwoven geotextile) next to the liner to provide a cushion for the drainage materials and reduce the probability of puncturing. In addition, today's construction quality assurance requirements help to assure against such punctures.

The Agency's recent evaluation of current industrial practices (see "Compilation of Current Practices at Land Disposal Facilities", January 1992) revealed that many facilities are selecting synthetic drainage materials, such as geonets, for their leak detection systems. Synthetic drainage materials are often selected instead of granular materials because they typically require less space and are easier to install than granular materials. Also, as discussed below, virtually all synthetic drainage materials have permeabilities greater than 10^{-3} cm/sec.

Transmissivity of synthetic drainage materials. EPA proposed a minimum transmissivity value of 5×10^{-4} m^2/sec for synthetic drainage materials that are used in lieu of granular drainage materials. This value was selected because it provides equivalent drainage capacity to that of a granular drainage layer meeting the requirements of the proposed rule; that is, 12 inches of a granular drainage layer with a hydraulic conductivity of 1 cm/sec. The minimum value of 5×10^{-4} m^2/s for hydraulic transmissivity was based on numerical simulations of typical leak detection systems. In these simulations, EPA considered a range of synthetic drainage materials, including nets, mats, and waffles. From the results of these simulations ("Liner and Leak Detection Rule Background Document", 1987), EPA concluded that a hydraulic transmissivity value of 5×10^{-4} m^2/sec would enable the leak detection system to collect and remove relatively large amounts of leakage while maintaining gravity flow conditions. This specification was to ensure that the liquids in the leak detection system would be rapidly collected while the hydraulic head on the bottom liner would be minimized.

One commenter objected to the transmissivity standard, claiming that a value of 5×10^{-4} m^2/sec is not achievable with a single layer of currently available netting, and that performance may be worse when creep, loading, and rib layover come into effect. EPA disagrees. The Agency has data (Liner and Leak Detection Rule Background Document, 1987) showing transmissivities of single layers of synthetic drainage materials produced by four major manufacturers under the conditions of ASTM Test Method D 4716-87 (that is, a pressure of 100 kilopascals (kPa) and a hydraulic gradient between 0.1 and 0.25). At the time of the proposal, these transmissivities ranged from approximately 2×10^{-4} m^2/sec to 4×10^{-4} m^2/sec. Improvements in geonets since then have resulted in typical transmissivities of 2×10^{-3} to 4×10^{-3} m^2/sec using the same ASTM test method. The Agency maintains that the conditions at which ASTM D 4716-87 is conducted are representative of the pressures and hydraulic gradients in many land disposal units, and as a result, a transmissivity value of 5×10^{-4} m^2/sec can be obtained with typical commercially available synthetic drainage materials. However, the Agency recognizes that the requirements for synthetic drainage materials should be consistent with the requirements for granular drainage systems in leak detection systems. Thus, the Agency has revised the transmissivity requirements in today's rule (§§ 264.221(c)(2)(ii), 264.251(c)(3)(ii), 264.301(c)(3)(ii), 265.221(a), 265.254(a), and 265.301(a)) to require that synthetic drainage materials achieve equivalent flow rates to drainage layers utilizing granular materials.

Other performance requirements. Today's final rule also includes several general performance standard requirements for leak detection systems that are simply restatements of what is already required in existing regulations for leachate collection and removal systems at surface impoundments, waste piles, and landfills subject to today's final rule. Under today's rule, leak detection systems for affected units must be constructed of materials that are chemically resistant to wastes and leachate in the unit, and be of sufficient strength to resist pressure gradients generated within the unit (§§ 264.221(c)(2)(iii), 264.251(c)(3)(iii), 264.301(c)(3)(iii), 265.221(a), 265.254(a), and 265.301(a)). These requirements are designed to ensure that leak detection systems are not damaged from chemical and physical stresses associated with the unit. Also, these requirements are simply an extension of the performance standards for liners.

Leak detection systems for units regulated under today's rule must also be designed and operated to minimize clogging during the active life and post-closure period (§§ 264.221(c)(2)(iv), 264.251(c)(3)(iv), 264.301(c)(3)(iv), 265.221(a), 265.254(a), and 265.301(a)). This requirement is to ensure that drainage in leak detection systems is not impeded over time. EPA is concerned about the potential for drainage layers to become clogged as a result of physical, chemical, or biological mechanisms. EPA data indicate that the potential for clogging increases as the hydraulic conductivity of drainage material decreases. Examples of techniques to minimize clogging include: Using properly graded granular filter materials, filter fabrics (geotextiles), or other filter materials to reduce fines; using poorly graded (i.e., uniform) granular drainage material; increasing collection pipe slot numbers or size; reducing liquid residence time by increasing slope, decreasing pipe spacing, or increasing the size of granular drainage material; and cleaning collection system pipes and drainage media using hydraulic jetting, steam, or acidic solutions.

In addition, today's rule requires that leachate collection and removal systems immediately above the top liner (for landfill and waste pile units) be capable of ensuring that the leachate depth over the top liner does not exceed 1 foot (30 cm) as proposed in the March 28, 1986 proposed rule. EPA received no comments on these requirements and is therefore finalizing them as proposed.

EPA is today also promulgating several requirements for sumps that are part of a leak detection system. Owners or operators of new and replacement landfills, surface impoundments, waste piles, and lateral expansions of such units must use sumps of sufficient size to collect and remove liquids efficiently and prevent these liquids from accumulating on the drainage layer. In addition, the design of the sump and removal system must provide a method for measuring and recording the volume of liquids present in the sump and of liquids removed. EPA received no comments on these requirements and is therefore finalizing them as proposed (§§ 264.221(c)(2)(v), 264.251(c)(3)(v), 264.301(c)(3)(v), 265.221(a), 265.254(a), and 265.301(a)).

EPA is today promulgating a requirement for owners or operators of units affected by today's rule to collect and remove pumpable liquids in leak detection sumps to minimize the head on the bottom liner (§§ 264.221(c)(3), 264.251(c)(4), 264.301(c)(4), 265.221(a), 265.254(a), and 265.301(a)). The Agency had proposed, in the May 29, 1987

Federal Register, that the head in the sump for the leak detection sump be minimized; in the preamble, the Agency suggested that the average liquid levels in the sump should be below 12 inches. One commenter on the proposed rule stated that the 12-inch maximum was unachievable in many instances because of the size and geometry of most sumps and the pumps used to empty them. The commenter also mentioned that automated level control systems and minimum submergence requirements make the 12-inch maximum level an impossible performance standard. EPA agrees that the geometry of sumps may vary and that minimum pumping levels may be greater than 1 foot. Thus, the Agency is not setting a maximum level of liquids in the sump, but specifying only that the head on the bottom liner must be minimized by requiring owners and operators to remove pumpable liquids from the sump. "Pumpable liquids" means any amount of liquids that can be reasonably pumped out of the sump, based on sump dimensions, pump operating levels for automated pump systems, and the goals of minimizing head in the sump and backup of liquids (from the sump and drainage tile or pipes) into the drainage layer.

Today's rule also modifies the definition of the term "sump" in § 260.10 to redefine sumps used as part of leak detection systems for waste piles, surface impoundments, and landfills. The purpose of this modification is to make clear that the regulations for hazardous waste tanks that are otherwise applicable to certain sumps do not apply to those sumps used at land disposal units that function as part of the leak detection system. These sumps serve fundamentally different purposes than many other types of sumps. Sumps used at land disposal units are usually surrounded by one or more liners; therefore, many requirements, especially secondary containment, are not practicable for these units. The Agency maintains that subjecting these units to the requirements for hazardous waste tanks will not provide a substantial environmental benefit and has therefore modified the definition of the term sump to redefine sumps used as part of leachate collection and removal or leak detection systems for surface impoundments, waste piles, and landfills.

Finally, today's rule includes a requirement applicable only to those leak detection systems installed at new, replacement, or lateral expansions of landfills, surface impoundments, and waste piles that are not located above the seasonal high water table. EPA received no comments on this requirement and is finalizing it as proposed. The Agency is therefore requiring in today's rule that owners or operators of leak detection systems not located completely above the seasonal high water table demonstrate that the operation of the leak detection system will not be adversely affected by the presence of ground water (§§ 264.221(c)(4), 264.251(c)(5), 264.301(c)(5), 265.221(a), 265.254(a), and 265.301(a)).

3. Alternative Systems

Alternative designs. The existing rules (§§ 264.221(d), 264.251(b), 264.301(d), 265.221(c), and 265.301(c)) already provide for alternative designs to the liners and leachate collection and removal systems if an owner or operator can demonstrate that an alternative design will prevent the migration of any hazardous constituent into the ground water or surface water at least as effectively as the requirements in §§ 264.221(c), 264.251(a), and 264.301(c), as appropriate. Today's rule adds §§ 264.221(d), 264.251(d), 264.301(d), 265.221(a), 265.254(a), 261.301(a) to allow alternative designs for leak detection systems that are capable of detecting leaks of hazardous constituents at least as effectively as the new leak detection system requirements in §§ 264.221(c)(2), 264.251(c)(3), 264.301(c)(3), 265.221(a), 265.254(a), and 265.301(a). EPA feels that variance procedures allow owners or operators flexibility in designing their leak detection systems without discouraging the use of new leak detection systems.

In order to be granted a variance from the leak detection requirements of today's final rule, an owner or operator must demonstrate to the Regional Administrator that the proposed design detects leaks through the top liner at least as effectively as a leak detection system designed to meet today's minimum design standards. In deciding whether to allow a variance for an alternative leak detection system or technology, the Regional Administrator will consider: (1) The ability of the proposed system or technology to operate as effectively through the active life and post-closure period of the unit as a unit designed using the minimum design specifications; (2) the nature and quantity of the wastes to be managed in the unit; and (3) the ability of the system to detect leaks, and in combination with response actions to be taken upon discovery of leakage, prevent migration of hazardous constituents out of the unit during the active life and post-closure care period. For example, an alternative leak detection system that did not provide information about leakage until after the leakage migrated through the bottom liner would be deemed unacceptable, because such a system would trigger an owner or operator response after hazardous constituents migrated into the environment.

Owners or operators may apply for a variance if they wish to propose a leak detection system design that deviates from today's design parameters. For example, if an owner or operator specified that the drainage layer of a surface impoundment would utilize granular materials having a hydraulic conductivity of 1×10^{-2} cm/sec (instead of the minimum required value of 1×10^{-1} cm/sec), the owner or operator would have to describe how other components of the system (e.g., depth of impoundment, bottom slope, flow path to a collection pipe or sump or pipe spacing) or the action leakage rate or response action plan would detect leaks at the earliest practicable time, minimize head on the bottom liner, and prevent migration of potentially hazardous constituents out of the unit as effectively as the design required in today's rule.

Temporary units. In the May 29, 1987 proposal EPA invited comment about whether double liners and leachate collection systems are necessary for all waste piles, or if alternative systems might provide adequate environmental protection at some units. In response to the Agency's request, a commenter questioned whether double liner and leachate collection systems are necessary for short-term waste piles created during corrective action. The same commenter also suggested that EPA should propose an overall policy in its upcoming corrective action rule as to what technological requirements will apply to units used for corrective action.

The Agency agrees with these comments. There are circumstances where the Agency believes it should allow temporary units constructed as a part of corrective action pursuant to a permit or 3008(h) enforcement order, or an approved closure plan, to be constructed without a double liner and a leachate collection system. Due to the limited time these units are in operation, in concert with alternative design, location and operating practices, there are situations which are equally effective as double lined units in preventing migration of constituents to ground water or surface water. Many waste piles (as well as some temporary storage surface impoundments) may thus qualify for the double liner waiver

found in §§ 264.221(d), 264.251(d), 265.221(a), and 265.254(a).

These provisions provide for a generic waiver of the double liner system, but do not specifically address temporary units. In response to the special needs posed by corrective action and facility closure (e.g., rapid cleanup and short-term operation) the Agency has published a proposed "Subpart S" rule (55 FR 30798) that, among other things, specifically addresses standards for temporary units. That proposal outlines Agency guidance on what factors to consider in determining what constitutes a temporary unit.

4. Applicability to Waste Piles

EPA is requiring that new and replacement waste piles, and lateral expansions of waste piles, install, operate, and maintain double liner and leak detection systems (§§ 264.251 and 265.254). The Agency is extending the double liner and leachate collection and removal system requirements to waste piles, as discussed in the preamble to the May 29, 1987 proposal (52 FR 20250), because the Agency maintains, for several reasons, that these units pose threats similar to or greater than landfills concerning leakage through the top liner and releases of hazardous constituents. First, waste piles are often exposed to precipitation for longer periods of time than landfills. Many owners or operators of landfills provide an intermediate cover to minimize leachate generation; this practice is not as common for waste piles. Second, waste piles have a higher potential for equipment-related damage than do landfills, because equipment is frequently used to add and remove waste from piles during these units' active lives. This increased equipment activity at waste piles increases the risk of damage to the primary liner and merits use of a secondary liner for these units. Finally, waste piles typically have much longer active lives than landfills: Waste piles are typically used for 20 years or more, whereas landfill units are more common used for periods of 6 months to 5 years before being closed.

Today's rule provides a waiver from the double liner and leachate collection and removal system requirements for certain waste piles that are monofills. In the May 29, 1987 proposal rule, EPA proposed a variance for monofills when (1) the monofill contains only hazardous wastes from foundry furnace emission controls or metal casting molding sand, (2) such waste do not contain constituents which would render the wastes hazardous for reasons other than EP toxicity characteristic, (3) the monofill has at least one liner for which there is no evidence that such liner is leaking, (4) the monofill is located more than a quarter mile from an underground source of drinking water, and (5) the monofill is in compliance with generally applicable ground-water monitoring requirements for facilities with permits. The Agency proposed this waiver to codify the language in section 3004(o)(3) of RCRA and to be consistent with regulations for landfills and surface impoundments. Because EPA received no comments on this proposed waiver, it is being finalized as proposed in today's rule (§§ 264.251(e)(1) and 265.254(a)).

Today's rules do not affect the existing exemption in § 264.250(c) and now in § 265.254 for certain indoor waste piles. These units continue to be excluded from today's double-liner and leak detection requirements because they contain no free liquids and are protected from precipitation and surface water run-on and are therefore unlikely to have any leakage.

5. Applicability to Land Treatment Units

EPA proposed a number of leak detection requirements for land treatment units in the May 29, 1987 proposed rule. These requirements included (1) a 95-percent confidence level for detecting hazardous constituents in the treatment zone, (2) monitoring conducted above the seasonal high water table, (3) response action plans, and (4) inspection of unsaturated zone monitoring equipment. Today's rule does not include additional leak detection requirements for land treatment units. EPA has concluded that the current regulatory requirements for unsaturated zone monitoring at land treatment units are sufficient to ensure that leakage of hazardous constituents will be detected at the earliest practicable time. Therefore, EPA finds that additional regulations for such units are not needed to meet the statutory requirements of section 3004(o)(4) of RCRA for these units.

In the preamble to the 1987 proposal, EPA noted that unsaturated zone monitoring systems serve as effective leak detection systems for land treatment units. The Agency received no comments challenging this position or suggesting more effective alternatives. The existing regulations, however, already require unsaturated zone monitoring—i.e., leak detection systems—at all land treatment units, both new and existing. Specifically, §§ 264.278 and 265.278 contain detailed technical standards for soil and soil-pore liquid monitoring in the unsaturated zone below the land treatment unit to ensure detection of any hazardous constituents migrating out of the treatment zone. Furthermore, when releases are detected, the owner or operator of a permitted facility is required to modify operating procedures at the land treatment unit to prevent further release. EPA has implemented these requirements through two guidance documents: "Permit Guidance Manual on Hazardous Waste Land Treatment Demonstrations" and "Guidance Manual on Unsaturated Zone Monitoring for Hazardous Waste Land Treatment Units." After reviewing public comments and its experience in permitting land treatment units since the proposal, EPA concluded that the current regulatory requirements, coupled with existing guidance, are sufficient to ensure that leak detection systems in new land treatment units are capable of detecting releases at the earliest practicable time.

In the May, 1987 proposal, EPA did not propose to change the basic regulatory requirements for unsaturated zone monitoring, but added several relatively minor amendments. For example, the proposal would have added a requirement that constituents migrating out of the treatment zone be detected at a 95% confidence level and that the unsaturated zone monitoring take place above the seasonal high water table as well as below the treatment zone (as the current standards specify). EPA has concluded that these minor changes are unnecessary, either to meet the statutory standard or to protect human health and the environment. Available guidance documents already specify a 95% level of confidence for monitoring, and EPA and the States have successfully incorporated this standard into permits. Therefore, it is unnecessary to impose this requirement as a matter of regulation. Similarly, monitoring below the seasonal high water table is already prohibited by the existing regulations, because monitoring below the water table would not qualify as unsaturated zone monitoring. Therefore, the regulatory requirement that the monitoring be above the seasonal high water table is also unnecessary.

Today's final rule also does not finalize requirements for a response action plan describing remedial action if releases are detected in the unsaturated zone. EPA has concluded that a response action plan for permitted land treatment units is superfluous, because the current regulations (§ 264.278(g)) already require facility owners or operators to take specific responses in the case of hazardous constituents detected in the unsaturated zone monitoring system. EPA also notes that

migration found in the unsaturated zone monitoring system would constitute migration from the unit, and therefore could be addressed by the Agency, if necessary, under RCRA corrective action requirements. Finally, EPA notes that, because of the RCRA land disposal restrictions, most if not all hazardous waste land treatment units in the future will be able to operate only if wastes placed in them meet applicable treatment standards before placement in the unit or if they are granted a no-migration variance. A unit granted a no-migration variance that then releases hazardous constituents from the unit would have to cease receipt of prohibited wastes (§ 268.6(f)). In this case, a unit found to be releasing hazardous constituents to the unsaturated zone would be required to cease operating. For these reasons, EPA has concluded that a response action plan is not necessary for land treatment units.

A December 6, 1991 decision of the United States Court of Appeals, District of Columbia addressed the soil-pore water monitoring requirements for interim status land treatment facilities (*Shell Oil Company v. EPA*, No. 80-1532). As of the date of this rule, the Court's mandate was not yet issued and the regulation remains in place. The Agency is still considering what response to take to the Court's decision.

C. Response to Leaks

1. Action Leakage Rate

The final rule requires owners or operators to establish one action leakage rate (ALR) for each unit affected by today's rule (§§ 264.222, 264.252, 264.302, 265.222, 265.225, and 265.302). The action leakage rate is a leakage rate that requires implementation of a response action to prevent hazardous constituent migration out of the unit. The Agency has determined, the public comments support, the need for an ALR and response actions that the ALR triggers. EPA believes that the ultimate goal of the liner and leak detection system requirements is to prevent the release of hazardous constituents from the unit, thereby protecting the ground water and surface water. A system in place to detect leaks at the earliest practical time should be complemented by early follow-up actions to effectively minimize the chance for migration of hazardous constituents from the unit. Furthermore, it is often more effective to address leaks within the liners than to later address ground-water contamination through corrective action.

Today's final rule requires owners or operators to monitor the rate of leakage into the leak detection sump and to determine whether the measured rate of leakage over a specified period of time exceeds the action leakage rate (see Section IV.D. of the preamble for further discussion of today's monitoring requirements). If the owner or operator determines that the measured rate of leakage exceeds the ALR, the owner or operator must notify EPA and implement procedures contained in a response action plan that owners or operators must prepare for units affected by today's rule.

The proposed rule allowed the owner or operator a choice in establishing an action leakage rate. EPA proposed to specify an action leakage rate between 5–20 gallons/acre/day (gpad). Alternatively, the owner or operator could propose a site-specific action leakage rate for EPA approval. The proposed rule required owners and operators to develop and submit a plan for responding to the action leakage rate.

The proposed rule also required owners and operators to establish a value and a response action plan for a rapid and large leakage rate (RLL). The RLL was defined as the maximum design leakage rate (plus a safety factor) that the leak detection system can remove under gravity flow conditions (i.e., without the fluid head on the bottom liner exceeding one foot in granular leak detection systems and without the fluid head exceeding the thickness of synthetic lead detection systems). EPA also considered in the proposal the possibility of owners or operators developing responses to leakage rates between the action leakage rate and rapid and extremely large leakage rate (referred to as an intermediate leakage rate). In addition, the Agency considered requiring owners or operators to develop responses to "significant changes" in the flow rate (EPA suggested a 100 gpad or 25–50 percent increase, whichever was larger), leakage that exceeded health-based concentrations of hazardous constituents, and a leakage rate exceeding 50 gpad for any one-day period. In summary, EPA discussed six leakage rates in the proposal that could trigger various response actions by owners or operators.

Although no commenters objected to the establishment of an action leakage rate, EPA received many comments on the proposed action leakage rate value. Several commenters favored EPA setting an action leakage rate within the proposed range of 5–20 gpad. Some suggested that EPA should not finalize a specific value within the proposed range, but keep the range of 5–20 gpad and allow the permit writer to select a specific value within the range to apply to the unit. Some commenters suggested an action leakage rate of 50 or 100 gpad. Another commenter suggested that EPA set an action leakage rate at 75 percent of the proposed rapid and extremely large leakage rate. One commenter stated that the action leakage rate should be decreased over the life of the unit according to a formula, thus allowing a higher action leakage rate during initial operation of the unit to account for presence of liquids in the sump from sources other than leaks (e.g., construction water).

In general, most commenters stated that EPA had little or no field data to set an action leakage rate within the proposed range, and argued that the Agency should allow site-specific action leakage rates to be set by the permit writer, especially to account for other potential sources of liquids in the leak detection sump (e.g., soil liner construction water, precipitation during construction, and ground-water infiltration). Although the proposed rule would allow site-specific variances to the proposed action leakage rate, commenters expressed concern that EPA would not allow many site-specific action leakage rates. These commenters claimed that site-specific action leakage rates based on the design and operation of the unit should be common.

EPA also received many comments on other leakage rates that would require owners or operators to develop response actions. Commenters opposed using "significant changes" in the flow rate or health-based concentrations of hazardous constituents in liquids entering the detection sump to trigger a response by the owner or operator. Commenters felt that the proposed "significant change" concept was unclear and difficult to define. Commenters felt using leachate quality analysis at flow rates below the rapid and extremely large leakage rate to trigger a response was costly, time-consuming, and provided no additional environmental benefit. These commenters generally felt that liquid flow rates into the detection sump should be the sole trigger of an owner or operator's response. Many of these commenters also disagreed with the use of health-based levels (e.g., maximum contaminant levels) in the leachate to trigger a response. They argued that EPA's assumptions in proposing such levels were overly conservative and unrealistic because such liquid was still contained in the leak detection system and migration to the environment was

controlled by the bottom-liner and drainage system.

Many commenters maintained that EPA was proposing too many leakage rates without a clear distinction between them as to the differences in response associated with the leakage. These commenters claimed that some of the responses actions discussed by EPA in the preamble seemed to be redundant for different leakage rates, and that EPA's requirements were confusing, burdensome, and provided no additional benefit. As an example, the commenters cited that flow rates above the proposed action leakage rate (5–20 gpad) would trigger many of the same responses that exceedance of other leakage rates, such as the rapid and extremely large leakage rate (an example in the preamble showed a RLL of 3000 gpad) or significant change in leakage rate, would mandate. Some of these commenters stated that leakage rates less than the rapid and extremely large rate did not necessarily indicate a failure of the top liner, and that leakage would still be contained within the unit by the bottom liner. Therefore, they felt that the Agency should not stipulate excessive and redundant responses on the part of owners or operator for leakage rates that do not pose environmental concerns.

EPA requested and received field data on actual leakage rates from commenters on the proposed rule, and obtained additional data from more recent studies of leakage rates through top liners at land disposal units. However, these data are limited and furthermore, indicate that a portion of units (>25%) with CQA could exceed 20 gpad, the highest end of the proposed range for action leakage rates. Therefore, the Agency agrees with commenters that existing field data do not support establishment of an action leakage rate within the proposed range of 5–20 gpad for all units.

In response to EPA's request for comments on the appropriateness of the proposed range for surface impoundments, commenters argued that it was inappropriate for the Agency to set the same action leakage rate for landfills and surface impoundments and that the Agency should take into account the type, size, and operation of the unit when establishing an action leakage rate. EPA agrees with the commenters that the size, type, and operation of the unit should be accounted for in establishing a leakage rate that will trigger a response by the owner or operator, and that a standard leakage rate value for all units is not appropriate at this time.

In addition, EPA acknowledges commenters' concerns about the proposed number of leakage rates triggering a response by the owner or operator, and the lack of distinction among them for purposes of implementation. To simplify the final rule, EPA has chosen to establish one leakage rate that will trigger a response by the owner or operator, account for the site-specific design of the unit, and indicate significant evidence that there is problematic leakage through the top liner that mandates a response. EPA is requiring owners or operators to propose an action leakage rate for each unit subject to today's rule based on an approach that is similar to the proposed definition of the rapid and extremely large leakage rate. That is, owners or operators must calculate an action leakage rate based on the maximum design leakage rate that the leak detection system can remove without the fluid head on the bottom liner exceeding one foot. This leakage rate must account for an adequate margin of safety for uncertainties in design, construction, and operation of the leak detection system. The action leakage rate must not be greater than the flow capacity of the drainage layer in order to assure detection of leaks (e.g., if the ALR is 500 gpad and the flow capacity is 400 gpad then the ALR would never be exceeded no matter how large the leak). The action leakage rate should always be less than or equal to the pumping capacity of the leak detection sump since the pumping capacity is required to be greater than the maximum leak detection system flow rate under which gravity flow conditions prevail (i.e., to prevent liquids from backing up into the drainage layer). If the owner or operator determines that the action leakage rate is exceeded, the owner or operator must implement the procedures contained in the response action plan.

EPA believes that flow rates in excess of the action leakage rate indicate a major localized or general failure of the top liner, thus increasing the potential for a buildup of head on the bottom liner and increasing the potential for migration of hazardous constituents into the bottom liner. For this reason, it is necessary to maintain leak detection flow rates below the action leakage rate and for the owner or operator to take response actions for leaks greater than the action leakage rate.

Under today's rule, as in the May 29, 1987 proposal, the owner or operator must propose an action leakage rate based on calculations of the maximum flow capacity of the leak detection system design so as not to exceed one foot head on the bottom liner (called rapid and extremely large leak in the proposal). The proposal background document "Liner and Leak Detection Rule Background Document", (EPA/530–SW–87–015, May 1987) presented a number of mathematical models for making such a determination. All of these models are based on Darcy's Law for non-turbulent flow through saturated media. Of these models, the Agency finds that the following formula for flow originating through a hole in the liner is the most likely leak scenario for a geomembrane liner:

$$Q = k.h.\tan\alpha.B$$

where

Q = flow rate in the leak detection system (drainage layer),
h = head on the bottom liner,
k = hydraulic conductivity of the drainage medium,
α = slope of the leak detection system,
B = width of the flow in the leak detection system, perpendicular to the flow.

Using this formula, the Agency calculated the maximum flow rates using the minimum specifications in today's rule: 1% slope, and 1×10^{-1} cm/sec hydraulic conductivity for surface impoundments and 1×10^{-2} cm/sec hydraulic conductivity for landfills and waste piles. Assuming that the head is 1 foot and the width of flow (B) is 100 feet, the results show maximum flow rates of 2,100 gpad for surface impoundments and 210 gpad for landfills and waste piles. Using a safety factor of two, as suggested in the proposed rule preamble, yields about 1,000 gpad for surface impoundments and 100 gpad for landfills and waste piles as the Agency recommended action leakage rates. Because this calculation used the minimum technical requirements and other design assumptions to maximize potential head on the bottom liner, the Agency believes that the units meeting the minimum technical requirements would not require action leakage rates below 100 gpad for landfills and waste piles and 1000 gpad for surface impoundments. The final background document on action leakage rates ("Action Leakage Rates for Leak Detection Systems," January 1992) provides further discussion and background on these recommended action leakage rates. As discussed earlier in the preamble, this document is available from the docket for this rule or from NTIS, U.S. Department of Commerce.

While EPA recommends the above action leakage rates for the minimum design specifications, the Agency recognizes that a number of site-specific

factors affect the maximum flow capacity of a leak detection system, and owners or operators may want to propose alternative action leakage rates. For example, the leak detection system design may be different than the minimums specified in today's rule. As indicated above and in the background document, hydraulic conductivity is a factor that significantly affects the flow capacity of the system. The Agency believes that leak detection systems with greater hydraulic conductivities would have higher action leakage rates. In additional, owners or operators may have information to justify a different width of flow in the above calculation. Owners or operators also may justify a higher action leakage rate by using a different formula or model. While the Agency recommends the use of the above model for defining the maximum flow capacity of the leak detection system and action leakage rate, EPA recognizes that there may be alternative models available now or in the future that may more accurately predict system flow capacity to justify higher action leakage rates. Therefore, owners or operators may propose to use an alternative model that they believe more accurately predicts the maximum flow capacity of the leak detection system. Further, owners or operators may want to do a flow (pump) test on the leak detection system to show actual flow capacity, which may justify a higher action leakage rate. Finally, the owner or operator may have flow rate data on similarly designed units to use to justify a different level. As more and more units are built, the Agency as well as owners or operators will develop a better data base that may be used to establish appropriate action leakage rates.

For facilities seeking a permit, the action leakage rate will be set after the Regional Administrator reviews the rate proposed by the owner or operator in either the facility's part B permit application or permit modification. for interim status facilities, the owner or operator must submit a proposed action leakage rate for the affected unit to the Regional Administrator 60 days prior to the receipt of waste in the unit. The Regional Administrator will either approve, modify, or deny the proposed leakage rate. The Regional Administrator may extend the review period to evaluate the owner or operator's proposed action leakage rate for up to 30 more days. If none of these actions occur within 60 days (or if the review period is extended, within 90 days), the proposed rate can be considered approved.

Owners and operators of units affected by today's rule must monitor the leak detection sump and use the monitoring information to determine if the action leakage rate has been exceeded. The final rule sets forth the procedures owners or operators must use in determining whether the action leakage rate has been exceeded §§ 264.222(b), 264.252(b), 264.302(b), 265.222(c), 265.255(c), and 265.302(c)). To calculate the flow rate into the leak detection sump, owners, or operators must convert flow rate data into an average daily flow rate per acre (i.e., gpad) for each leak detection sump. This calculation must be performed weekly during the active life and closure period of the unit, unless the Regional Administrator approves otherwise. Upon closure (installation of the final cover for the unit), owners or operators will monitor the leak detection sump monthly, or in some cases quarterly or semi-annually (see Section IV.D. for further discussion). While on a monthly monitoring schedule, owners or operators will have to convert the monitoring data to an average daily flow rate to determine if the action leakage rate has been exceeded. If an owner or operator is monitoring quarterly or semi-annually no calculations are needed unless liquids are detected in the sump above the pump operating level, in which case the owner or operator must resume monitoring the sump on a monthly basis. Such an owner or operator would then have to convert monitoring data to an average daily flow rate per acre for the purpose of determining if the action leakage rate has been exceeded.

2. Response Action Plan

The final rule requires owners or operators of affected units to develop a response action plan for leaks exceeding the action leakage rate §§ 264.223, 264.253, 264.304, 265.223, 265.259, and 265.303). The response action plan is a site-specific plan that the owner or operator develops to address leakage through the top liner to assure that it does not migrate out of the unit. It is based on an assessment of the capability of the total design, construction, and operation of the unit rather than of individual components of the unit.

The majority of commenters on the proposed response action plan requirements stated that there were too many potential triggers (i.e.,leakage rates) that the response action plan must potentially address in the proposed rule. These commenters argued that these trigger levels lacked distinction as to the responses they would necessitate. Other commenters felt that the response action plan requirements were confusing and inconsistent in certain cases. The commenters noted that many of the response actions for leaks above the proposed rapid and extremely large leakage rate were similar to actions for leaks above the proposed action leakage rate. In response to these comments, EPA has simplified and clarified the response action requirements in today's final rule.

The final rule specifies minimum response actions that the owner or operator must take when the owner or operator determines that the action leakage rate has been exceeded. The minimum response actions are included in the response action plan that the owner or operator must prepare. Although minimum response actions are required to be in the response action plan, the content of a response action plan is determined by site-specific factors. The minimum responses required under today's rule are typical of response action plans EPA has identified at operating facilities and incorporate comments EPA received on the proposed response action plan requirements. Although today's rule only requires the owner or operator to initiate response actions upon exceedance of the action leakage rate, owners or operators may want to implement some types of response actions for leakage rates less than the action leakage rate, because these actions will lower the probability that leakage will exceed the action leakage rate and trigger today's final response action requirements.

An owner or operator's response action plan must include notifying EPA within 7 days that the action leakage rate has been exceeded. EPA received no comments on the proposed notification requirement and thus, is finalizing this requirement. The Agency is also requiring that the owner or operator submit a preliminary written assessment to the Regional Administrator within 14 days of the determination as to amount and source of the liquids in the detection sump, information on possible size, location, and cause of the leak, and any immediate and short term actions the owner or operator will take (e.g., additional pumping and removal of the leachate, changes in operating practices to reduce the leakage). As stated above, the Agency believes that exceedance of the action leakage rate is significant and indicates a major localized or general failure of the top liner, thus increasing the potential for a buildup of head on the bottom liner and increasing the potential for migration of hazardous

constituents into the bottom liner and out of the unit. For this reason, the Agency must be notified and given a preliminary assessment of the actions taken by the owner or operator.

The focus of the response action requirements for flow rates above the action leakage rate is the degree and schedule of what remediation, if any, is needed to reduce the leakage to the action leakage rate. The final rule requires that owners or operators identify the location, size, and cause of the leakage, and sample and analyze the leachate present in the detection sump. EPA believes that analyzing the leachate is necessary as part of determining the response needed to reduce the leakage to below the action leakage rate. For example, such information may be useful in locating a leak at sites where different wastes are disposed of in different cells. The owner or operators's's response action plan must discuss whether wastes should be removed to locate and repair the leak, whether repairs or controls will be used to minimize the leakage, and if so, whether operational changes, such as reduction or cessation of waste receipt, or partial or final closure of the unit, will be implemented, and if so, what types.

Today's rule clarifies when the owner or operator must submit a report documenting the response actions taken concerning leakage above the action leakage rate. The final rule requires that the owner or operator submit a report to the Regional Administrator describing how effective the response actions have been in reducing the leakage below the action leakage rate and preventing migration of hazardous constituents out of the unit within 90 days of exceeding the action leakage rate. The final rule also requires that the owner or operator continue to submit these reports monthly as long as the action leakage rate is exceeded.

EPA received several comments on the proposed response action submission and approval process. Several commenters expressed concern over possible delays associated with requiring a response action plan before receipt of waste. EPA received comments both supporting and objecting to submittal of the response action plan as part of the permit application process. One commenter suggested that the response action plan for both leakage rates above the rapid and extremely large leakage rate and leakage rates above the proposed action leakage rate but below the rapid and extremely large leakage rate should be submitted as part of the permit application. Another commenter argued against submittal as part of the permit application. The commenter stated that the bottom liner system can contain leakage rates in excess of the rapid and extremely large leakage rate until the response action plan is approved, and that such liquid would not migrate very far into the bottom liner before the response action plan was approved.

Unlike the proposed rule, the final rule requires owners or operators to submit only one response action plan for leakages exceeding the action leakage rate. Although EPA acknowledges that the bottom liner will provide initial containment of any leakage into the leak detection system, EPA still feels that leakage above the action leakage rate is an indication of a significant problem with the unit. The Agency believes that a response action plan is necessary before receipt of the waste into a unit to assure that there is both a commitment and an instrument in place to initiate responses upon exceedance of the action leakage rate, before leaks can potentially migrate out of the unit.

The final rule requires that new hazardous waste management facilities submit their response action plans and have them approved as part of the permit application process. Permitted facilities must submit the plan as part of a permit modification according to the procedures in § 270.42. Consistent with the minimum technology notification requirements of RCRA section 3015 for surface impoundments and landfills, owners and operators of units at interim status facilities subject to today's leak detection system rules are required to submit a response action plant in conjunction with the proposed action leakage rate 60 days prior to receiving waste into the unit.

D. Monitoring and Inspection Requirements

In today's final rule, EPA is promulgating several minor amendments to monitoring and inspection requirements for new and replacement landfills, surface impoundments, and waste piles, and lateral expansions of these units. These amendments add inspection requirements for leak detection systems (§§ 264.226, 264.254, 264.303, 265.226, 265.260, and 265.304). Specifically, today's rule requires facility owners and operators to monitor the sumps in leak detection systems for the presence of liquids in the sumps and record the amount of liquid removed from the sumps. Under §§ 264.222(b), 264.252(b), 264.302(b), 265.222(c), 265.255(c), and 265.302(c), owners or operators must calculate the average daily flow rate in gpad for each leak detection system sump on a weekly basis during the active life and monthly during the post-closure period, when monthly monitoring is required, to determine if the action leakage rate has been exceeded.

In the May 29, 1987, proposal, EPA proposed to require daily monitoring of the leak detection system sump during the active life of the units, and weekly monitoring during the post-closure period. EPA received several comments on the issue of the frequency of leak detection system sump monitoring requirements. Among those who commented, several objected to the requirement for leak detection system sump measurement on a daily basis during the active life because (1) not all facilities are operational on weekends and holidays, and (2) the payment of overtime rates to personnel for monitoring activities on weekends and holidays would be a significant financial burden. Other commenters stated that it would be difficult to monitor many sumps on a daily basis, especially large sumps or facilities with small leakage rates. One commenter suggested monthly monitoring of the leak detection sump. Most of these commenters suggested that monitoring the sump weekly during the active life was sufficient to determine exceedance of an action leakage rate.

EPA maintains that precipitation or other events may lead to large heads on the bottom liner over a period of a week, and that monthly monitoring of the sump during the active life is insufficient for observing changes in liquid levels in the sump that may necessitate action on the part of the owner or operator. However, EPA agrees with commenters that daily monitoring of the sumps is excessive given that the Agency has redefined the action leakage rate that triggers a response action. Thus, EPA has changed the requirement from daily monitoring of the leak detection system sump to require weekly monitoring during the active life and closure period. As discussed earlier, EPA has also changed the requirement from daily removal of accumulated liquids in the sump to a requirement to remove liquids from the sump as necessary to minimize head on the bottom liner (§§ 264.221(c)(3), 264.251(c)(4), 254.301(c)(4), 265.221(a), 265.254(a), and 265.301(a)).

Two commenters also objected to the requirement to monitor the leak detection system sump weekly during post-closure. These commenters stated that monthly monitoring would be sufficient because the elimination of liquids from incident precipitation and the reduction of drainage from wastes will result in insignificant leachate

generation in the years following closure. These commenters stated that monitoring should be conducted monthly or quarterly and more often only if the volumes of liquid in the sump increased.

EPA acknowledges that leachate generation should decrease in the years following closure of the unit, due to the effectiveness of the final cover. In response to comments received on this issue, EPA is allowing owners or operators to conduct monthly monitoring of the sump after the final cover is installed on the unit (§§ 264.228(d), 264.303(c), 265.228(c), and 265.304(a)). The Agency has also decided in the final rule to allow owners or operators to conduct quarterly monitoring of the sumps during post-closure, if the liquid levels in the sump stay below the pump operating level for two consecutive months, and/or semi-annual monitoring of the sumps if the liquid level in the sump stays below the pump operating level for two consecutive quarterly inspections. However, if pumping is required to remove liquids from the leak detection sump (i.e., liquids above the operating level of the sump) at any time during quarterly or semi-annual inspections, owners or operators must increase their monitoring to a monthly or quarterly basis, respectively. However, the Agency acknowledges that in some cases the levels may vary at facilities depending on the design and geometry of the sump and the type of pump used.

The "pump operating level" is a level proposed by the owner or operator and approved by the Regional Administrator based on sump dimensions, pump activation levels, and a level that avoids backup of liquids (from the sump and drainage tile or pipes) into the drainage layer.

Today's rule requires the owner or operator to monitor for and record the presence and level of liquids present in each leak detection sump, as well as the amount of liquids removed from the sump, to determine the leakage rate through the top liner. The leachate volume in the sump typically will be determined by measuring the liquid level in the sump. The leachate volume removed from the sump can be determined by collecting (in containers, tanks, etc.) and measuring the quantity of liquid pumped out of the sump or, alternatively, by installing flow-metering equipment to record the volumes. A third option is to install a device to measure inflow into the sump, for those units where the sump is located outside the unit; this may be a weir or pump at the sump inflow pipe. The leakage rate is to be calculated as the volume of liquid entering the sump over a period of time divided by the time and then also divided by the unit area served by the sump.

EPA is today requiring, as proposed, that the measured leakage rate in each sump in the leak detection system be used for determining whether the action leakage rate for the unit has been exceeded. EPA received several comments on this requirement. These commenters maintained that a variance from the action leakage rate should be available when it can be demonstrated that liquid in the leak detection system is from a source other than leakage through the top liner. EPA acknowledges that the actual leakage rate through the top liner may be different (larger or smaller) than the measured leakage rate at the sump depending on: (1) The collection efficiency of the system and (2) the presence of water in the leak detection system from construction, ground-water infiltration, consolidation of compacted soil liners, or additional sources of liquid other than leakage. However, owners and operators may consider these other sources of liquid when determining an action leakage rate that is appropriate for their unit and in developing their response action plan.

Today's final rule makes several technical amendments to the general inspection requirements and operating record requirements for units affected by today's rule. EPA today is amending § 264.15 by correcting an earlier oversight by adding requirements to inspect hazardous waste tanks as required by §§ 264.193 and 264.195 (today's amendments also remove two erroneous cross-references—§§ 264.194 and 264.253—from § 264.15). Section 265.15 is being amended by adding today's inspection requirements for units at interim status facilities under §§ 265.260, 265.278, and 265.304. EPA is also today making technical changes to the operating record requirements for units affected by today's rule at permitted and interim status facilities in §§ 264.73 and 265.73. These sections have been modified to reference recordkeeping requirements for permitted tank facilities (in §§ 264.191, 264.193, and 264.195) and interim status tank facilities (in §§ 265.191, 265.193, and 265.195).

E. Construction Quality Assurance

EPA today is promulgating construction quality assurance requirements (CQA) for all new landfills, surface impoundments, and waste piles, and replacements and lateral expansions of such units to the extent they are affected by the double-liner system and leak detection system requirements in today's rule. Today's CQA requirements also apply, to the extent they are relevant to units built under variances granted under §§ 264.221, 264.251, 264.301, 265.221, 265.254, and 265.301. The Agency has concluded that CQA is integral to ensure the proper construction, operation, and design of double-liner and leak detection systems and the closure of land disposal units. The CQA requirements being issued incorporate standard engineering practices and common hazardous waste management industry practices that have already been proven to ensure that the design and performance standards of today's final rule are met.

EPA is today promulgating CQA requirements applicable to foundations, dikes, low-permeability soil liners, geomembranes, leachate collection and removal systems, leak detection systems, and final covers.

The Agency has conducted a number of studies that outline the need for CQA. In 1983, EPA conducted a study assessing existing technology for liner installation at hazardous waste land disposal facilities ("Liner and Leak Detection Rule Background Document", 1987). The data base used in the study consisted of information from the literature supplemented by data collected through 40 interviews with technical experts in industry, State regulatory agencies, trade and professional associations, research organizations, and waste management companies. This study's conclusions were: (1) Construction-related problems during liner system installation constituted one of the major causes of liner system failure and (2) a rigorous CQA program could have identified and corrected many of the problems that contributed to such failure. The study also concluded that construction techniques that were available at that time could be used to install geomembrane and clay liner systems that met the Agency's performance standards for liner systems. However, the study noted that a comprehensive monitoring and audit program during construction would be needed to attain the Agency's performance standards for liner systems.

In 1985, EPA conducted another study to supplement existing information on liner performance ("Liner and Leak Detection Rule Background Document", 1987). This study was designed to evaluate the factors that contributed to successes and failures at 27 landfills and surface impoundments selected for case studies. The results of this study showed

that there were two main elements related to successful liner installation. The first element was a proper conceptual approach applied to all stages of unit construction, use, and closure, including design, material selection, contractor selection, liner system installation, facility operation, and final cover design and installation. The second element was the extensive use of formal CQA programs to ensure that the components of the unit were constructed properly in all stages of a unit's construction. The report stated that a CQA program resulted in a better constructed liner system.

EPA data show the performance of double liner systems and leachate collection and removal/leak detection systems is greatly enhanced when CQA procedures are implemented. The implementation of CQA procedures results in increased leachate collection efficiency and reduces leakage through both synthetic and compacted soil liners. For example, information compiled in a recent report ("Action Leakage Rates for Leak Detection Systems", January, 1992) showed that from a group of landfills with geomembrane only top liners, 8 of 11 landfill cells showed leakage rates below 20 gpad when good CQA was implemented, as opposed to only 1 of 5 landfill cells where CQA was not implemented.

With the improved, consistent, performance of the double liner and leachate collection and removal system come significant environmental and practical benefits. The resultant reduction in leakage rates through the top and bottom liners reduces the threat of migration of hazardous constituents to ground water, as is called for by section 3004(o) of RCRA. The use of CQA also may result in fewer costly repairs to land disposal units after waste has been received, fewer occasions when an action leakage rate is exceeded and implementation of response action plans is necessary, and a diminished long-term need for corrective action.

Today's requirements for CQA add a framework for requirements already established in the regulations for CQA for permitted landfill, surface impoundment, and waste pile construction. Current requlations for these units (§§ 264.226, 264.254, and 264.303) already specify that synthetic and soil liners be inspected for uniformity, damage, and imperfections during and immediately after installation. The CQA requirements being promulgated primarily add procedures to ensure that the existing general performance standards for CQA are met. Because the requirements of today's rule also apply to new units and lateral expansions and replacements of existing units at interim status facilities, today's CQA requirements also apply to these units. The requirements being promulgated in §§ 264.19 and 265.19 are in contrast to those in the May 29, 1987 proposal, which would have put in place a substantial CQA program. EPA has concluded that the proposal was, in fact, redundant with existing guidance manuals and also unduly prescriptive and detailed with respect to methods, approaches, and documentation to the Regional Administrator.

The Agency is today continuing to rely on available Agency guidance documents (instead of additional regulations) to implement the performance standards for construction quality assurance of today's final rule because EPA believes that newer technologies may be discouraged by detailed regulations. Agency guidance includes guidelines for selecting specific test methodologies and the number of tests that should be conducted during installation, both of which will vary significantly for different types of units, construction materials, and unit locations. A final guidance document, entitled "Construction Quality Assurance for Hazardous Waste Land Disposal Facilities" (EPA 530-SW-86-031, October 1986), includes detailed guidance on the components of the CQA requirements of today's final rule. Additional guidance is also available in the May 24, 1985 draft "Minimum Technology Guidance on Double Liner Systems for Landfills and Surface Impoundments—Design, Construction, and Operation." Guidance for the construction of clay liners is available in the November, 1988 document entitled "Design, Construction, and Evaluation of Clay Liners for Waste Management Facilities" (EPA 530-SW-86-007F).

In today's final rule, EPA is requiring a site-specific construction quality assurance plan to be prepared by the owner or operator of new landfills, surface impoundments, and waste piles, and replacements and lateral expansions of such units (§§ 264.19(b) and 265.19(b)). This requirement is the same as was proposed in the May 29, 1987 proposed rule. EPA has concluded that this plan is needed to ensure that a hazardous waste management unit is designed, constructed, operated, and closed in accordance with the CQA program for the unit. Owners or operators are required to prepare a CQA plan before constructing all new units, replacement units, and lateral expansions of existing units at both permitted and interim status facilities.

The Agency received several comments objecting to two requirements for interim status facilities to submit documentation under the CQA program. These commenters objected to the proposed requirement that the owner or operator submit, prior to construction, a CQA plan describing actions to be taken to implement the CQA program. The commenters also objected to an associated requirement to submit, prior to placing wastes in the unit, a CQA report documenting compliance with the CQA plan. Many of these commenters felt that these approval processes could result in unnecessary delays in construction of new units at interim status facilities. EPA agrees with the commenters and is eliminating the requirement for interim status facilities to submit a CQA plan for approval. EPA is instead requiring that interim status facilities prepare a CQA plan and maintain it onsite. By contrast, permitted facilities must submit a CQA plan as part of the Part B permit application; any changes to an approved plan at a permitted facility would require a permit modification. In addition, the Agency is dropping the requirement for these interim status facilities to submit a CQA report and has replaced this requirement with one to submit a CQA certification (§ 265.19(d)). EPA is, however, reserving the right to request supporting documentation for the certification. This certification will ensure that CQA procedures have been followed at the facility. The certification must be signed by a registered professional engineer serving as a CQA officer, and must state that the unit has been constructed in accordance with the CQA plan and meets the design specifications. For units at permitted facilities, this certification must be submitted by the owner or operator to the Regional Administrator and either approved or have approval waived by the Regional Administrator under § 270.30(l)(2)(ii) prior to the receipt of waste. For units at interim status facilities, the owner or operator must submit this certification at least 30 days prior to the receipt of waste; this will allow the Regional Administrator time to review the certification, and if necessary, request additional information from the owner or operator. The owner or operator may receive wastes in the unit after 30 days, unless (1) the Regional Administrator notifies the owner or operator in writing that the construction is unacceptable, (2) the Regional Administrator extends the review period (by a maximum of 30

days), or (3) the Regional Administrator requests additional information within the 30-day period from submission of the CQA certification. The certification of CQA activities for the final cover is already addressed in the overall certification required for closure activities under parts 264 and 265.

EPA is also specifically requiring the use of a test fill for compacted soil liners as proposed in the May 29, 1987, proposed rule. The test fill is an area developed using the actual materials of construction for the compacted soil component of the bottom composite liner to ensure that the liner is constructed to meet design requirements for field permeability (§§ 264.19(c)(2) and 265.19(c)(2)). The test fill will allow owners and operators, in many cases, to avoid the costs of failures of the full-scale unit by identifying problems during the test fill analysis.

EPA received several comments on the requirement for a test fill. Some commenters argued that a test fill was not necessary, claiming that it is expensive and does not provide any better data than laboratory tests. One commenter contended that field permeability tests may be less precise than laboratory tests, because the field testing is subjected to more uncontrolled variables (e.g., weather conditions) than laboratory tests, and therefore a test fill often cannot be made to precisely replicate the larger unit.

EPA disagrees, and is confident that, when functionally equivalent materials and equipment are used, a test fill can be constructed to provide more accurate indication of full-scale unit performance. Recent data compiled from permit applicants shows that laboratory studies have often not accurately predicted field permeability of the installed liner. The Agency has found that constructed soil liners will often test well in the laboratory because specimen preparation activities (e.g., root removal, visual selection of a uniform sample, additional compaction) have been conducted on the laboratory sample. These preparation activities are often not achieved to the same degree in a large, field-scale operation. EPA has found that test fill testing using large-scale field tests (e.g., sealed double ring infiltrometer) consistently provide a more accurate indicator of the performance of a full scale unit than do laboratory tests. For these reasons, EPA concludes that the information gained from field testing of test fills is a more reliable indicator of actual field conditions than laboratory tests, and so is stipulating the use of field testing for test fills in today's rule. However, to provide flexibility, today's final rule contains a provision allowing for an alternative demonstration where available data are sufficient to clearly show that a constructed soil liner will meet design specifications (e.g., test fill data from a soil liner constructed using functionally equivalent materials and methods of construction). The Agency believes that as more test fills are constructed, this variance will become more achievable because more data will be available. For units at permitted facilities, this variance must be obtained as part of the permitting process; for interim status units, this variance is self-implementing. EPA is, however, reserving the right to review during inspections documentation associated with variances claimed by owners or operators of units at interim status facilities.

F. Implementation of Permitting and Interim Status Requirements

Today's final rule amends the existing part B permit application requirements in §§ 270.17, 270.18 and 270.21 for surface impoundments, waste piles, and landfills at facilities seeking a RCRA permit. These new provisions require owners or operators of such units to provide information on how the liner and leak detection system will be designed, constructed, operated, and maintained to meet the requirements of part 264. Today's rule also requires owners or operators who propose alternative designs for double liner, leachate collection and removal systems, or leak detection systems to submit the appropriate detailed plans, and engineering and hydrogeologic reports describing the alternative designs and operating practices, including pertinent location aspects. In addition, today's rule requires the owner or operator to submit the proposed action leakage rate, the response action plan and the CQA plan for review in the permitting process. Sections 270.17, 270.18, and 270.21 also require owners or operators to provide a description of how the leak detection system will be inspected to meet the requirements in part 264. The unit design, action leakage rate, response action plan, CQA plan, monitoring provisions, and inspection schedule will become permit conditions that must be complied with over the life of the permit. The monitoring and inspection items become part of the inspection schedule under § 264.15(b).

Currently permitted facilities that are affected by today's rule must submit permit modifications to EPA under the procedures of § 270.42. Since the March 28, 1988 and May 29, 1987 proposals, EPA has promulgated amendments to the procedures for permit modifications for treatment, storage, and disposal facilities (53 FR 37912, September 28, 1988). EPA will implement the new double-liner and leak detection system requirements using the new permit modification procedures, consistent with EPA policy (53 FR 37912, September 28, 1988). Therefore, today's rule contains amendments to § 270.42 that categorize the amended part 264 requirements of today's rule as various classes of permit modifications.

Today's rule subjects owners and operators of interim status facilities to the same design and operating requirements as permitted facilities. However, procedural requirements for documentation or reporting have been structured to be more self-implementing for interim status facilities since these facilities have not yet been subjected to the site-specific tailored standards of a permit. In today's rule, owners or operators of interim status facilities that are subject to today's requirements will follow the same notification and approval procedures existing for interim status surface impoundments and landfills subjected to the minimum technological requirements in section 3015 of RCRA (§§ 265.221(b) and 265.301(b)).

Existing regulations require interim status facilities to submit a notice to the Regional Administrator at least 60 days prior to receiving hazardous waste in units affected by today's requirements. In today's rule, EPA is requiring that owners or operators submit their proposed action leakage rate and response action plan to the Regional Administrator at least 60 days prior to receiving hazardous waste in units affected by today's requirements. If no objection or extension of the review time is made by the Regional Administrator, the proposed action leakage rate and response action plan are effective. In addition, EPA is requiring owners or operators to submit a certification that the unit has been constructed in accordance with the CQA plan at least 30 days prior to receiving hazardous waste in units affected by today's standards. If no objection or extension to the review time is made by the Regional Administrator by the end of the 30-day period, the owner or operator may receive wastes in the unit.

Interim status facilities are required to prepare, but are not required to submit, their design and operating plans, monitoring plans, or CQA plans prior to receiving wastes. These documents must be retained on-site and be available for review by the Regional Administrator. EPA is not requiring submission and

advance approval of this information because such activities would be inconsistent with the goal of interim status to minimize review and approval by the Regional Administrator.

V. State Authority

A. Applicability of Rule in Authorized States

Under section 3006 of RCRA, EPA may authorize qualified States to administer and enforce the RCRA program within the State. Following authorization, EPA retains enforcement authority under section 3008, 3013, and 7003 of RCRA, although authorized States have primary enforcement responsibility. The standards and requirements for authorization are found in 40 CFR part 271.

Prior to the Hazardous Solid Waste Amendments of 1984 (HSWA), a State with final authorization administered its hazardous waste program in lieu of EPA's administering the Federal program in that State. The Federal requirements no longer applied in the authorized State, and EPA could not issue permits for any facilities that the State was authorized to permit. When new, more stringent Federal requirements were promulgated or enacted, the State was obliged to enact equivalent authority within specified time frames. New Federal requirements did not take effect in an authorized State until the State adopted the requirements as State law and was authorized for the requirements.

In contrast, under RCRA section 3006(g), new requirements and prohibitions imposed by HSWA take effect in authorized States at the same time that they take effect in non-authorized States. EPA is directed to carry out these requirements and prohibitions in authorized States, including the issuance of permits, until the State is granted authorization to do so. While States must still adopt HSWA-related provisions as State law to retain final authorization, HSWA-based requirements apply in authorized States in the interim.

B. Effect on State Authorizations

Most of today's final rule for liners and leak detection systems is finalized pursuant to RCRA sections 3004(o) and 3015 which were added by HSWA. The HSWA-based requirements are being added to Table 1 in 40 CFR 271.1(j), which identifies the Federal program requirements that are promulgated pursuant to HSWA and take effect in all States, regardless of their authorization status. As noted above, EPA will implement those HSWA-based sections of today's rule in authorized States until their programs are modified to adopt these rules and the modification is approved by EPA. Because these requirements are finalized pursuant to HSWA, a State submitting a program modification may apply to receive either interim or final authorization under RCRA section 3006(g)(2) or 3006(b), respectivaly, on the basis of state requirements that are equivalent or substantially equivalent to EPA's. The procedures and schedule for State program modifications for either interim or final authorization are described in 40 CFR 271.21. The deadline by which the States must modify their programs to adopt today's rule is July 1, 1993. It should be noted that HSWA interim authorization will expire on January 1, 1993 (see 40 CFR 271.24(c)).

Portions of today's rule at the time they were proposed on May 29, 1987 (52 FR 20220), were proposed to be adopted pursuant to RCRA. As non-HSWA rules, therefore, they would not be effective in authorized States until those States revised their programs to adopt equivalent requirements under State law. EPA has reconsidered this issue and now interprets the statute to allow more of the rule, including the CQA, with the exception of its application to final cover requirements, to be promulgated pursuant to HSWA.

EPA views today's CQA requirements to be vital for liner and leak detection systems to perform as intended by HSWA, in section 3004(o), by effectively preventing the migration of hazardous constituents into and through liners and for detecting leaks of hazardous constituents at the earliest practicable time. The Agency has determined that CQA at land disposal facilities improves the performance of liners and leak detection systems. Specifically, test fills have proven to be necessary for ensuring that compacted soil liners satisfy the permeability requirements set by the statute. The response action plans, based on detected leakage from land disposal units are also considered to be integral parts of the process established by section 3004(o) for early detection of liner breakthrough and prevention of migration of hazardous constituents into the ground and surface water. Consequently, the Agency views the CQA program and the response action plan (including the action leakage rate and monitoring to determine if the flow rate exceeds the action leakage rate) to be promulgated pursuant to HSWA for those units where the liner and leak detection standards are promulgated pursuant to HSWA.

New and replacement surface impoundments and landfill units, and lateral expansions of such units at facilities for which a permit application was received before November 8, 1984, are not explicitly addressed by section 3004(o)(1)(A); however, these units are covered by existing liner requirements which today are being revised by the Agency to take into account improvements in control technology. Thus these revisions are HSWA rules pursuant to section 3004(o)(1). Although section 3004(o)(1)(A) does not require waste piles to meet the double liner and leachate collection system standards, existing regulations already contain liner standards for waste piles and, therefore, pursuant to section 3004(o)(1), the Agency is revising the existing waste pile regulations to take into account improvements in control technology. As a result, the Agency is also promulgating these double liner and leachate collection system standards for waste piles as HSWA requirements. In addition, the Agency views the liner requirements for new waste piles as mandated by the form of leak detection chosen for these regulations; and therefore the liners standards from this point of view are also HSWA requirements. Leak detection for replacement units and lateral expansions of existing units (landfills, surface impoundments, and waste piles) at permitted facilities and at interim status waste piles are also being issued as improvements in control and measurement technologies under section 3004(o)(1) of RCRA.

CQA requirements for final covers at both permitted and interim status facilities are promulgated pursuant to section 3004(a) of RCRA, since final covers is not a HSWA requirement. The CQA requirements for final covers, therefore, will not be effective in authorized states. They will be applicable only in those states that do not have authorization. In authorized states, the CQA requirements for final covers at permitted and interim status facilities will not be effective until the state revises its program to adopt equivalent requirements under state law and receives authorization by EPA for them.

Section 40 CFR 271.21(e)(2) requires States that have final authorization to modify their programs to reflect Federal program changes and to submit the modification to EPA for approval. The deadline by which the State must modify its program to adopt this regulation is determined by the promulgation date in accordance with 40 CFR 271.21(e). These deadlines can be extended in certain cases (40 CFR 271.21(e)(3)). Once EPA approves the

modification, the State requirements become subtitle C RCRA requirements.

Authorized States are only required to modify their programs when EPA promulgates Federal regulations that are more stringent or broader in scope than the existing Federal regulations. For those Federal program changes that are less stringent or reduce the scope of the Federal program, States are not required to modify their programs. This is a result of section 3009 of RCRA, which allows States to impose regulations in addition to those in the Federal program. EPA has determined that the liner and leak detection systems rule is more stringent than the existing Federal regulations. Therefore, authorized States are required to modify their programs to adopt regulations that are equivalent or substantially equivalent.

States with authorized RCRA programs may already have requirements similar to those in today's rule. These State regulations have not been assessed against the Federal regulations being finalized today to determine whether they meet the tests for authorization. Thus, a State is not authorized to implement these requirements in lieu of EPA until the State program modification is approved. Of course, States with existing standards may continue to administer and enforce their standards as a matter of State law. In implementing the Federal program, EPA will work with States under agreements to minimize duplication of efforts. In many cases, EPA will be able to defer to the States in their efforts to implement their programs rather than take separate actions under Federal authority.

States that submit official applications for final authorization less than 12 months after the effective date of these regulations are not required to include standards equivalent to these regulations in their application. States that submit official applications for final authorization 12 months after the effective date of these regulations must include standards equivalent to these regulations in their application. The requirements a State must meet when submitting its final authorization application are set forth in 40 CFR 271.3.

VI. Regulatory Requirements

A. Economic Impact Analysis

Executive Order No. 12291 requires that regulatory agencies determine whether a new regulation constitutes a major rulemaking and, if so, it requires that the agency conduct a Regulatory Impact Analysis (RIA). An RIA consists of the quantification of the potential benefits, costs, and economic impacts of a major rule. A major rule is defined in Executive Order No. 12291 as a regulation likely to result in:

- An annual effect on the economy of $100 million or more; or
- A major increase in costs or prices for consumers, individuals, industries, Federal, State, and local government agencies, or geographic regions; or
- Significant adverse effects on competition, employment, investment, productivity, innovation, or on the ability of United States based enterprises to compete with foreign based enterprises in domestic or export markets.

EPA estimated the effects of this rule to determine if it is a major regulation as defined by Executive Order. The Agency's results indicate that the rule has an annual cost below $100 million. Furthermore, the Agency does not believe the rule will significantly increase costs for consumers, individuals, industries, Federal, State and local government agencies, or geographic regions, or have significant adverse effects on competition employment, investment, innovation, or international trade. Therefore, the Agency determines that the rule is not a major rule.

Because the rule is not a major rule, EPA has performed an Economic Impact Analysis (EIA), focusing its analyses on the costs and economic impacts of the rule only. The Agency's cost analysis indicates the annual incremental costs of the rule will be approximately $23 million per year (all costs are in 1990 dollars).

1. Estimated Cost of the Rule

a. *General approach.* EPA estimated incremental costs for provisions of the final rule which require new compliance activities. The incremental cost of each provision was estimated by computing the difference between the cost of complying with the provision and the cost of complying with current regulations (the baseline for measurement). The baseline created by current regulations includes requirements imposed on hazardous waste landfills, surface impoundments, and waste piles by the July 26, 1982 permitting requirements for land disposal facilities (47 FR 32274) and the July 15, 1985 Hazardous Waste Management System Final Codification Rule (50 FR 28702). These rules, taken together, create baseline landfills having synthetic membrane top liners over a clay bottom liner with leachate collection systems between the liners and on top of the membrane liner. Baseline surface impoundments are constructed similarly, but lack the leachate collection system over the top liner. Baseline waste piles are assumed to be built with a single clay liner beneath a leachate collection system.

In projecting the costs of today's provisions EPA developed estimates of affected populations, unit costs of compliance, and aggregate costs of compliance. Estimates of affected populations were based on the permitted land disposal universe as reported in the EPA Hazardous Waste Data Management System (HWDMS) and RCRIS National Oversight Data Base (October, 1991). Use of the permitted universe was based on the fact that by November 8, 1988, the Agency was required to permit all land disposal facilities that had submitted permit applications by November 8, 1984 (HSWA section 3005(c)(2)). This mandate has resulted in the permitting of nearly all of the land disposal universe. The data base does not, however, identify a very small future population that may be affected by the regulations being promulgated today (i.e., newly-regulated interim status facilities brought into the land disposal universe via new rulemakings). These new interim status facilities, however, are expected to be offset by facilities dropping out of the RCRA Subtitle C land disposal universe as a result of regulatory programs.

Unit costs of compliance, based on capital costs and operating and maintenance costs were developed using EPA's Liner Location and Cost Analysis Model. Both direct and indirect costs were included. Aggregate costs were then obtained by multiplying unit costs by the number of units in the affected population.

In the final rule, costs from the 1987 proposal have been adjusted for inflation and are expressed in terms of 1990 dollars. Also, cost estimates from the 1987 proposal have been adjusted to account for differences between the proposal and the final rule. Therefore, all costs related to permitted land treatment units have been removed. Costs associated with the implementation of response action plans have been incorporated in the final rule, although EPA expects that few facilities will exceed the action leakage rate which triggers response action. In addition, leak detection system unit costs for surface impoundments have been adjusted upward to account for the higher costs of higher-permeability (1×10^{-1} cm/sec) drainage material (this cost was not included in the cost analysis for the May 29, 1987 proposed rule). The CQA costs developed for the 1987 proposal have been incorporated in this final rule analysis with a few

modifications. First, costs used to calculate certain CQA activities for test fills were adjusted upward to reflect new cost information (See Section c. below). Second, an incremental cost of $400 per unit has been added to cover the cost of a professional engineer certifying that each unit was constructed according to the CQA plan. Finally, CQA costs related to closure have been deleted from the analysis. EPA believes owners and operators are routinely performing closure activities when complying with existing rules, which require certification of closure by a registered, professional engineer. Consequently, we do not believe these CQA requirements represent incremental costs attributable to this rulemaking.

EPA used discounted cash flow analysis to convert streams of costs over time to equivalent annual costs over the life of the facility. First, EPA converted cost streams to present values as follows:

$$PV = \sum_{i=0}^{n} \frac{(costs)}{(1+r)^n} \quad n$$

where the real rate of return (r) equals 3 percent and n is the number of periods in which costs are incurred. The cash flows do not include inflation, taxes, or depreciation. As such, the present value costs report the full pre-tax compliance costs in real terms assuming that an owner or operator can access capital at a real interest rate of 3 percent.

Second, in order to spread the costs evenly over the life of the facility, EPA annualized the present value costs by multiplying them by a capital recovery factor (CRF):

$$CRF = \frac{r(r+1)^{OL}}{(r+1)^{OL}-1}$$

where OL is the operating life of the facility. EPA assumed a 20-year operating life and a 3 percent real rate of return, which leads to a CRF of 0.0672. The annualized value represents the annual revenue required to cover the costs imposed by the provision. This value provides a consistent basis for presenting and comparing costs of different provisions. However, it implicitly assumes that facilities can predict future costs and access capital at a steady rate over the life of the facility.

b. *Double liner and leak detection system.* The final rule extends the requirements for double liners to waste piles. The rule also requires the bottom liners of landfills, surface impoundments, and waste piles to be a composite liner and a leak detection system to be installed above the bottom composite liner. The owner or operator is also required to propose an action leakage rate to serve as a trigger for response action and prepare a response action plan that would describe responses to be initiated by the owner or operator when leakage through the top liner exceeded the action leakage rate.

(1) Landfill cost analysis. In estimating the cost of complying with the composite bottom-liner and leak detection system provisions, EPA assumed that the number of landfills would remain equal to the current number in the affected population and that each unit would have a 20-year operating life and a 30-year post-closure care period. This simplifying assumption was necessary due to lack of data on the current and future number of new landfill units, replacement units, and lateral expansions. EPA also assumed that one cell would be opened and closed each year during the 20-year operating life of a unit. EPA also assumed that landfill owners or operators currently use double liners (but only a clay bottom liner) with leachate collection systems above and between the liners as required by the interim statutory design requirements, codified in §§ 264.301 and 265.301.

Based on facilities listed in the HWDMS and RCRIS National Oversight Data Base, the affected population was found to include 74 landfill facilities each with at least one unit, ranging in size from 500 MT/year to 150,000 MT/year. The affected population and the total incremental costs (above current statutory requirements) of the leak detection system provisions are shown in Table 1. This figure includes an annual allowance for repair costs similar to an insurance premium based on an assumption that 5 percent of units of all types and sizes will experience a leak at some time during their 20-year life large enough to require implementation of the response action plan. We believe the 5 percent rate is a reasonable upper limit for properly constructed units, based on an analysis of flow rates in leak detection systems at 82 landfill and surface impoundment [illegible] Unit repair costs range from [illegible]0 for a 500 MT/year landfill to $6,100,000 for a 150,000 MT/year landfill (1990 dollars). EPA estimates that the incremental annualized costs for landfills required to comply with the liner and leak detection system provisions would be approximately $4,850,000.

TABLE 1.—COST OF COMPLIANCE WITH DOUBLE LINER AND LEAK DETECTIONS SYSTEM PROVISIONS FOR LANDFILL UNITS

[1990 Dollars]

Size	Number of active units	Incremental annualized present value unit cost ($1,000)	Incremental annualized present value total cost [1] ($1,000)	Allowance for repairs—Annualized present value total costs for all units [1] ($1,000)	Total costs per metric ton per year ($1,000)
500 mt/yr	28	11.1	310.5	39.2	25
1,000 mt/yr	8	14.6	116.5	22.4	17
2,000 mt/yr	5	19.9	99.7	26.0	13
6,000 mt/yr	12	37.2	446.2	168.0	9
15,000 mt/yr	13	55.4	720.8	436.7	5
35,000 mt/yr	4	98.0	392.0	302.4	5
60,000 mt/yr	1	134.7	134.7	126.0	4

Total				4850.2	

[1] Totals may not compute exactly due to roundoff.

S-310999 0022(01)(28-JAN-92-11:01:52)

(2) Surface Impoundment Cost Analysis. To estimate the cost of the complete bottom-liner and leak detection system provisions, EPA assumed that the number of surface impoundment units would remain equal to the current number in the affected population (except that no new impoundments larger than 15 acres would be constructed) and that each unit would have a 20-year operating life. EPA also assumed that double liners (but only clay bottom liners) with a leachate collection system in between as required by the interim statutory design requirements, codified in §§ 264.221 and 265.221 are currently being used. We assumed that leachate collection drainage media having a permeability of 10^{-2} cm/sec are currently being used. Based on facilities identified in the data base, we estimated the affected population to include 329 surface impoundment units at 143 facilities. The units range in size from 0.25 acres to 15 acres. The affected population and the total incremental annualized costs (above current statutory requirements) of compliance with the leak detection system provisions are shown in Table 2. As with landfills, these costs include an allowance for repair costs based on an assumption that 5 percent will require repair during their 20-year life. Unit repair costs range from $28,000 for a 0.25-acre surface impoundment to $1,680,000 for a 15-acre unit (1990 dollars). EPA estimates that the incremental annualized costs of complying with the composite bottom-liner and leak detection system provisions would be approximately $2,650,000.

TABLE 2.—COST OF COMPLIANCE WITH DOUBLE LINER AND LEAK DETECTION SYSTEM PROVISIONS FOR SURFACE IMPOUNDMENT UNITS

[1990 Dollars]

Size	Number of active units [1]	Incremental annualized present value unit cost ($1,000)	Incremental annualized present value total cost [2] ($1,000)	Allowance for repairs—annualized present value total costs for all units ($1,000) [2]
0.25 AC	133	4.4	582.8	9.3
0.50 AC	81	5.2	422.7	11.3
1.00 AC	44	7.2	314.8	12.3
2.00 AC	46	10.8	494.8	25.8
5.00 AC	18	22.0	395.3	25.2
15.00 AC	7	47.0	329.1	29.4
Subtotal	329		2539.5	113.3
Total				2652.8

[1] Based on 2.3 impoundments per active facility.
[2] Totals may not compute exactly due to roundoff.

(3) Waste Pile Cost Analysis. EPA assumed that new, replacement, or expanded waste piles would have to add two geomembrane liners with a leak detection system in between. Current waste pile regulations require only a clay liner with a leachate collection system above. In estimating the cost of compliance with the double liner and leak detection system provisions, EPA assumed that the number of waste pile units would remain the same as the current number and that each unit would have an operating life of 20 years. Based on facilities identified in the data base, the affected population was found to include 35 waste pile facilities ranging in size from 250 cubic feet to 1,000,000 cubic feet.

The affected population and the total incremental costs (above current statutory requirements) of compliance with the double liner and leak detection system provisions are shown in Table 3. As with landfills and surface impoundments, this figure includes an allowance for repair costs based on an assumption that a maximum of 5 percent will require repair during their life. Unit repair costs range from $5,600 for a 250-cubic-foot waste pile to $450,000 for a 1 million-cubic-foot waste pile (1990 dollars). EPA estimates that the incremental annualized costs of compliance with the double liner and leak detection system requirements would be approximately $428,000.

TABLE 3.—COST OF COMPLIANCE WITH DOUBLE LINER AND LEAK DETECTION SYSTEM PROVISIONS FOR SURFACE WASTE PILE UNITS

[1990 Dollars]

Size	Number of active units [1]	Incremental annualized present value unit cost ($1,000)	Incremental annualized present value total cost [2] ($1,000)	Allowance for repairs—annualized present value total costs for all units ($1,000) [2]
250 cu. ft	3	5.2	15.5	<0.1
1,000 cu. ft	7	5.5	38.4	0.2
5,000 cu. ft	7	6.5	45.5	0.3

100,000 cu. ft	5	12.9	64.4	1.0
500,000 cu. ft	3	24.4	73.3	2.1
1,000,000 cu. ft	3	43.8	131.4	3.4
Subtotal	74		420.1	7.5
Total				427.6

[1] Outdoor (uncovered) waste piles.
[2] Total may not compute exactly due to roundoff error.

c. CQA. The final rule would require the owner/operator to complete a CQA plan, implement the plan during construction, and have a professional engineer certify that construction was completed in accordance with the CQA plan. As noted above, costs estimated for the 1987 proposal were used in this analysis except additional costs were added for test fills and certification of a professional engineer, and specific costs associated with closure were not included.

The proposed rule estimated that test fill costs would add about $10,000 (in 1987 dollars) to the cost of each facility. EPA has since determined that this figure is low and we have adjusted test fill costs upward to $50,000 (in 1990 dollars) for all types of units. Tables 4, 5, and 6 depict costs for implementing CQA (including test fills and construction certification) for landfills, surface impoundments, and waste piles, respectively.

d. Total Incremental Costs of the Leak Detection System, CQA, and Double-Liner Requirements. The total costs of the leak detection system, CQA, and double liner provisions are shown in Table 7 for landfills, surface impoundments, and waste piles. The total incremental annualized cost of the provisions would be approximately $7,930,000 for the leak detection system and double liner requirements and $13,400,000 for CQA, for a total of approximately $21,300,000. Table 8 compares the incremental costs from this rulemaking with costs from the July 15, 1985 codification rule and the July 26, 1982 permitting rule.

TABLE 4.—COST OF COMPLIANCE WITH CONSTRUCTION QUALITY ASSURANCE PROVISIONS FOR LANDFILL UNITS

[1990 Dollars]

Size	Number of active units	Incremental annualized present value unit cost ($1,000)	Incremental annualized present value total cost [1] ($1,000)	Total costs per metric ton per year ($1,000)

TABLE 8.—INCREMENTAL COSTS OF DESIGN REQUIREMENTS

[In Millions of 1990 Dollars]

Facility type	1982 liner/ LCS require-ments [1,3]	1985 Double-liner require-ments [2,3]	Today's rule [4]
Landfill	13.8-27.0	4.5	14.3
Surface Impoundment	10.4-40.9	11.9	6.2
Waste Pile	0.5-0.9		0.8
Total	24.7-68.8	16.4	21.3

[1] 47 FR 32274.
[2] 50 FR 28702.
[3] Incremental costs above previous Agency rules, costs adjusted to account for current number of units and 1990 dollars.
[4] Incremental costs above previous Agency rules. Costs do not consider potential savings due to use of 1% versus 2% minimum slope.

B. Regulatory Flexibility Act

The Regulatory Flexibility Act (RFA) of 1980 (Pub. L. 96-354) 5 U.S.C. 601 *et seq.*, which amends the Administrative Procedure Act, requires Federal regulatory agencies to consider small entities throughout the regulatory process. The purposes of the RFA are to describe the effects the regulations will have on small entities and to examine alternatives that may reduce these effects. As indicated at proposal, EPA has determined that today's rule will not have a significant impact on a substantial number of small entities. EPA conducted an evaluation of the impacts of this rule on small businesses. For purposes of this analysis, EPA used Small Business Administration criteria for identifying small businesses and evaluated the impact of today's rule using regulation-induced business closures as the key indicator of regulatory impact. The test assumed that any cost greater than 3 percent of total assets per year will result in forced closures. EPA also considered a second impact measure that compares increased annual compliance costs to total production costs with 5 percent of the threshold for significance. Using these tests, EPA has determined that the regulatory costs of today's rule will not have a significant impact on a substantial number of small entities.

C. Paperwork Reduction Act

The information collection requirements in this rule have been submitted for approval to the Office of Management and Budget (OMB) under the Paperwork Reduction Act, 44 U.S.C. 3501 *et seq.*, and assigned OMB control number ICR No. 995.06 as amended. These requirements are not effective until OMB approves them and a technical amendment to that effect is published in the Federal Register. An Information Collection Request document has been prepared by EPA (ICR No. 995.06) and a copy may be obtained from Sandy Farmer, Information Policy Branch, EPA, 401 M Street, SW. (PM-223Y), Washington, DC 20460 or by calling (202) 260-2740.

The public reporting burden for this collection of information is estimated to average 248 hours per response, including time for reviewing instructions, searching existing data sources, gathering and maintaining the required data, and completing and reviewing the collection of information.

Send comments regarding the burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden, to Chief, Information Policy Branch, PM-223Y, U.S. Environmental Protection Agency, 401 M Street, SW., Washington, DC 20460; and to the Office of Information and Regulatory Affairs, Office of Management and Budget, Washington, DC 20503, marked "Attention: Jonathan Gledhill."

VII. Supporting Documents

The following documents have been prepared in support of this rulemaking and placed in docket number F-92 LLDF-FFFFF.

1. U.S. EPA, "Liner and Leak Detection Rule Background Document", EPA/530-SW-87-015, May, 1987.
2. U.S. EPA, "Bottom Liner Performance in Double-Lined Landfills and Surface Impoundments Background Document", EPA/530-SW-87-013, April, 1987.
3. U.S. EPA, "Compilation of Current Practices at Land Disposal Facilities", January, 1992.
4. U.S. EPA, "Action Leakage Rate for Leak Detection Systems", January, 1992.
5. U.S. EPA, "Response to Public Comments on Final Double-Liner and Leak Detection Rule", January, 1992.
6. U.S. EPA Memorandum, "Revisions to Cost Analysis for the Final Rulemaking Entitled *Liners and Leak Detection Systems for Hazardous Waste Land Disposal Units*," January, 1992.

List of Subjects in 40 CFR Parts 260, 264, 265, 270, and 271

Administrative practice and procedure, Confidential business information, Hazardous materials transportation, Hazardous waste, Indian lands, Intergovernmental relations, Penalties, Insurance, Packaging and containers, Reporting and recordkeeping requirements, Security measures, Surety

bonds, Water pollution control, Water supply.

Dated: January 15, 1992.

William K. Reilly,

Administrator.

For the reasons set out in the preamble, chapter I of title 40 of the Code of Federal Regulations is amended as follows:

PART 260—HAZARDOUS WASTE MANAGEMENT SYSTEM: GENERAL

1. The authority citation for part 260 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6921–6927, 6930, 6934, 6935, 6937, 6938, 6939, and 6974.

2. Section 260.10 is amended by adding the definition of "replacement unit" in alphabetical order, and revising the definition of "sump" to read as follows:

§ 260.10 Definitions.

* * * * *

Replacement unit means a landfill, surface impoundment, or waste pile unit (1) from which all or substantially all of the waste is removed, and (2) that is subsequently reused to treat, store, or dispose of hazardous waste. "Replacement unit" does not apply to a unit from which waste is removed during closure, if the subsequent reuse solely involves the disposal of waste from that unit and other closing units or corrective action areas at the facility, in accordance with an approved closure plan or EPA or State approved corrective action.

* * * * *

Sump means any pit or reservoir that meets the definition of tank and those troughs/trenches connected to it that serve to collect hazardous waste for transport to hazardous waste storage, treatment, or disposal facilities; except that as used in the landfill, surface impoundment, and waste pile rules, "sump" means any lined pit or reservoir that serves to collect liquids drained from a leachate collection and removal system or leak detection system for subsequent removal from the system.

* * * * *

PART 264—STANDARDS FOR OWNERS AND OPERATORS OF HAZARDOUS WASTE TREATMENT, STORAGE, AND DISPOSAL FACILITIES

1. The authority citation for part 264 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6924, and 6925.

2. Section 264.15 is amended by revising paragraph (b)(4) to read as follows:

§ 264.15 General inspection requirements.

* * * * *

(b) * * *

(4) The frequency of inspection may vary for the items on the schedule. However, it should be based on the rate of deterioration of the equipment and the probability of an environmental or human health incident if the deterioration, malfunction, or any operator error goes undetected between inspections. Areas subject to spills, such as loading and unloading areas, must be inspected daily when in use. At a minimum, the inspection schedule must include the items and frequencies called for in §§ 264.174, 264.193, 264.195, 264.226, 264.254, 264.278, 264.303, 264.347, 264.602, 264.1033, 264.1052, 264.1053, and 264.1058, where applicable.

* * * * *

3. Subpart B is amended by adding § 264.19 as follows:

§ 264.19 Construction quality assurance program.

(a) *COA program.* (1) A construction quality assurance (CQA) program is required for all surface impoundment, waste pile, and landfill units that are required to comply with §§ 264.221 (c) and (d), 264.251 (c) and (d), and 264.301 (c) and (d). The program must ensure that the constructed unit meets or exceeds all design criteria and specifications in the permit. The program must be developed and implemented under the direction of a CQA officer who is a registered professional engineer.

(2) The CQA program must address the following physical components, where applicable:

(i) Foundations;

(ii) Dikes;

(iii) Low-permeability soil liners;

(iv) Geomembranes (flexible membrane liners);

(v) Leachate collection and removal systems and leak detection systems; and

(vi) Final cover systems.

(b) *Written CQA plan.* The owner or operator of units subject to the CQA program under paragraph (a) of this section must develop and implement a written CQA plan. The plan must identify steps that will be used to monitor and document the quality of materials and the condition and manner of their installation. The CQA plan must include:

(1) Identification of applicable units, and a description of how they will be constructed.

(2) Identification of key personnel in the development and implementation of the CQA plan, and CQA officer qualifications.

(3) A description of inspection and sampling activities for all unit components identified in paragraph (a)(2) of this section, including observations and tests that will be used before, during, and after construction to ensure that the construction materials and the installed unit components meet the design specifications. The description must cover: Sampling size and locations; frequency of testing; data evaluation procedures; acceptance and rejection criteria for construction materials; plans for implementing corrective measures; and data or other information to be recorded and retained in the operating record under § 264.73.

(c) *Contents of program.* (1) The CQA program must include observations, inspections, tests, and measurements sufficient to ensure:

(i) Structural stability and integrity of all components of the unit identified in paragraph (a)(2) of this section;

(ii) Proper construction of all components of the liners, leachate collection and removal system, leak detection system, and final cover system, according to permit specifications and good engineering practices, and proper installation of all components (e.g., pipes) according to design specifications;

(iii) Conformity of all materials used with design and other material specifications under §§ 264.221, 264.251, and 264.301.

(2) The CQA program shall include test fills for compacted soil liners, using the same compaction methods as in the full scale unit, to ensure that the liners are constructed to meet the hydraulic conductivity requirements of §§ 264.221(c)(1)(i)(B), 264.251(c)(1)(i)(B), and 264.301(c)(1)(i)(B) in the field. Compliance with the hydraulic conductivity requirements must be verified by using in-situ testing on the constructed test fill. The Regional Administrator may accept an alternative demonstration, in lieu of a test fill, where data are sufficient to show that a constructed soil liner will meet the hydraulic conductivity requirements of §§ 264.221(c)(1)(i)(B), 264.251(c)(1)(i)(B), and 264.301(c)(1)(i)(B) in the field.

(d) *Certification.* Waste shall not be received in a unit subject to § 264.19 until the owner or operator has submitted to the Regional Administrator by certified mail or hand delivery a certification signed by the CQA officer that the approved CQA plan has been successfully carried out and that the unit

PART 260-HAZARDOUS WASTE MANAGEMENT SYSTEM: GENERAL

1. The authority citation for part 260 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6921-6927, 6930, 6934, 6935, 6937, 6938, 6939, and 6974.

2. Section 260.10 is amended by adding the definition of "replacement unit" in alphabetical order, and revising the definition of "sump" to read as follows:

§ 260.10 Definitions.

* * * * *

Replacement unit means a landfill, surface impoundment, or waste pile unit (1) from which all or substantially all of the waste is removed, and (2) that is subsequently reused to treat, store, or dispose of hazardous waste. "Replacement unit" does not apply to a unit from which waste is removed during closure, if the subsequent reuse solely involves the disposal of waste from that unit and other closing units or corrective action areas at the facility, in accordance with an approved closure plan or EPA or State approved corrective action.

* * * * *

Sump means any pit or reservoir that meets the definition of tank and those troughs/trenches connected to it that serve to collect hazardous waste for transport to hazardous waste storage, treatment, or disposal facilities; except that as used in the landfill, surface impoundment, and waste pile rules, "sump" means any lined pit or reservoir that serves to collect liquids drained from a leachate collection and removal system or leak detection system for subsequent removal from the system.

* * * * *

PART 264-STANDARDS FOR OWNERS AND OPERATORS OF HAZARDOUS WASTE TREATMENT, STORAGE, AND DISPOSAL FACILITIES

1. The authority citation for part 264 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6924, and 6925.

2. Section 264.15 is amended by revising paragraph (b)(4) to read as follows:

§ 264.15 General inspection requirements.

* * * * *

(b) * * *

(4) The frequency of inspection may vary for the items on the schedule. However, it should be based on the rate of deterioration of the equipment and the probability of an environmental or human health incident if the deterioration, malfunction, or any operator error goes undetected between inspections. Areas subject to spills, such as loading and unloading areas, must be inspected daily when in use. At a minimum, the inspection schedule must include the items and frequencies called for in §§ 264.174, 264.193, 264.195, 264.226, 264.254, 264.278, 264.303, 264.347, 264.602, 264.1033, 264.1052, 264.1053, and 264.1058, where applicable.

* * * * *

3. Subpart B is amended by adding § 264.19 as follows:

§ 264.19 Construction quality assurance program.

(a) COA program. (1) A construction quality assurance (CQA) program is required for all surface impoundment, waste pile, and landfill units that are required to comply with §§ 264.221 (c) and (d), 264.251 (c) and (d), and 264.301 (c) and (d). The program must ensure that the constructed unit meets or exceeds all design criteria and specifications in the permit. The program must be developed and implemented under the direction of a CQA officer who is a registered professional engineer.

(2) The CQA program must address the following physical components, where applicable:

(i) Foundations;

(ii) Dikes;

(iii) Low-permeability soil liners;

(iv) Geomembranes (flexible membrane liners);

(v) Leachate collection and removal systems and leak detection systems; and

(vi) Final cover systems.

(b) Written CQA plan. The owner or operator of units subject to the CQA program under paragraph (a) of this section must develop and implement a written CQA plan. The plan must identify steps that will be used to monitor and document the quality of materials and the condition and manner of their installation. The CQA plan must include:

(1) Identification of applicable units, and a description of how they will be constructed.

(2) Identification of key personnel in the development and implementation of the CQA plan, and CQA officer qualifications.

(3) A description of inspection and sampling activities for all unit components identified in paragraph (a)(2) of this section, including observations and tests that will be used before, during, and after construction to ensure that the construction materials and the installed unit components meet the design specifications. The description must cover: Sampling size and locations; frequency of testing; data evaluation procedures; acceptance and rejection criteria for construction materials; plans for implementing corrective measures; and data or other information to be recorded and retained in the operating record under § 264.73.

(c) Contents of program. (1) The CQA program must include observations, inspections, tests, and measurements sufficient to ensure:

(i) Structural stability and integrity of all components of the unit identified in paragraph (a)(2) of this section;

(ii) Proper construction of all components of the liners, leachate collection and removal system, leak detection system, and final cover system, according to permit specifications and good engineering practices, and proper installation of all components (e.g., pipes) according to design specifications;

(iii) Conformity of all materials used with design and other material specifications under §§ 264.221, 264.251, and 264.301.

(2) The CQA program shall include test fills for compacted soil liners, using the same compaction methods as in the full scale unit, to ensure that the liners are constructed to meet the hydraulic conductivity requirements of §§ 264.221(c)(1)(i)(B), 264.251(c)(1)(i)(B), and 264.301(c)(1)(i)(B) in the field. Compliance with the hydraulic conductivity requirements must be verified by using in-situ testing on the constructed test fill. The Regional Administrator may accept an alternative demonstration, in lieu of a test fill, where data are sufficient to show that a constructed soil liner will meet the hydraulic conductivity requirements of §§ 264.221(c)(1)(i)(B), 264.251(c)(1)(i)(B), and 264.301(c)(1)(i)(B) in the field.

(d) Certification. Waste shall not be received in a unit subject to § 264.19 until the owner or operator has submitted to the Regional Administrator by certified mail or hand delivery a certification signed by the CQA officer that the approved CQA plan has been successfully carried out and that the unit meets the requirements of §§ 264.221 (c) or (d), 264.251 (c) or (d), or 264.301 (c) or (d); and the procedure in § 270.30(l)(2)(ii) of this chapter has been completed. Documentation supporting the CQA officer's certification must be furnished to the Regional Administrator upon request.

4. Section 264.73 is amended by revising paragraph (b)(6) to read as follows:

§ 264.73 Operating record.

* * * * *

(b) * * *

(6) Monitoring, testing or analytical data, and corrective action where required by subpart F and §§ 264.19, 264.191, 264.193, 264.195, 264.222, 264.223, 264.226, 264.252-264.254, 264.276, 264.278, 264.280, 264.302-264.304, 264.309, 264.347, 264.602, 264.1034(c)-264.1034(f), 264.1035, 264.1063(d)-264.1063(i), and 264.1064.

* * * * *

5. Section 264.221 is amended by redesignating paragraphs (f), (g), and (h) as paragraphs (g), (h), and (i), respectively; by revising paragraphs (c) and (d); and by adding new paragraph (f) to read as follows:

§ 264.221 Design and operating requirements.

* * * * *

(c) The owner or operator of each new surface impoundment unit on which construction commences after January 29, 1992, each lateral expansion of a surface impoundment unit on which construction commences after July 29, 1992 and each replacement of an existing surface impoundment unit that is to commence reuse after July 29, 1992 must install two or more liners and a leachate collection and removal system between such liners. "Construction commences" is as defined in § 260.10 of this chapter under "existing facility".

(1)(i) The liner system must include:

(A) A top liner designed and constructed of materials (e.g., a geomembrane) to prevent the migration of hazardous constituents into such liner during the active life and post-closure care period; and

(B) A composite bottom liner, consisting of at least two components. The upper component must be designed and constructed of materials (e.g., a geomembrane) to prevent the migration of hazardous constituents into this component during the active life and post-closure care period. The lower component must be designed and constructed of materials to minimize the migration of hazardous constituents if a breach in the upper component were to occur. The lower component must be constructed of at least 3 feet (91 cm) of compacted soil material with a hydraulic conductivity of no more than $1X10/^{-7}$/cm/sec.

(ii) The liners must comply with paragraphs (a) (1), (2), and (3) of this section.

(2) The leachate collection and removal system between the liners, and immediately above the bottom composite liner in the case of multiple leachate collection

and removal systems, is also a leak detection system. This leak detection system must be capable of detecting, collecting, and removing leaks of hazardous constituents at the earliest practicable time through all areas of the top liner likely to be exposed to waste or leachate during the active life and post-closure care period. The requirements for a leak detection system in this paragraph are satisfied by installation of a system that is, at a minimum:

(i) Constructed with a bottom slope of one percent or more;

(ii) Constructed of granular drainage materials with a hydraulic conductivity of $1X10/^{-1}$/cm/sec or more and a thickness of 12 inches (30.5 cm) or more; or constructed of synthetic or geonet drainage materials with a transmissivity of $3X10/^{-4}/m^2$sec or more;

(iii) Constructed of materials that are chemically resistant to the waste managed in the surface impoundment and the leachate expected to be generated, and of sufficient strength and thickness to prevent collapse under the pressures exerted by overlying wastes and any waste cover materials or equipment used at the surface impoundment;

(iv) Designed and operated to minimize clogging during the active life and post-closure care period; and

(v) Constructed with sumps and liquid removal methods (e.g., pumps) of sufficient size to collect and remove liquids from the sump and prevent liquids from backing up into the drainage layer. Each unit must have its own sump(s). The design of each sump and removal system must provide a method for measuring and recording the volume of liquids present in the sump and of liquids removed.

(3) The owner or operator shall collect and remove pumpable liquids in the sumps to minimize the head on the bottom liner.

(4) The owner or operator of a leak detection system that is not located completely above the seasonal high water table must demonstrate that the operation of the leak detection system will not be adversely affected by the presence of ground water.

(d) The Regional Administrator may approve alternative design or operating practices to those specified in paragraph (c) of this section if the owner or operator demonstrates to the Regional Administrator that such design and operating practices, together with location characteristics:

(1) Will prevent the migration of any hazardous constituent into the ground water or surface water at least as effectively as the liners and leachate collection and removal system specified in paragraph (c) of this section; and

(2) Will allow detection of leaks of hazardous constituents through the top liner at least as effectively.

* * * * *

(f) The owner or operator of any replacement surface impoundment unit is exempt from paragraph (c) of this section if:

(1) The existing unit was constructed in compliance with the design standards of sections 3004 (o)(1)(A)(i) and (o)(5) of the Resource Conservation and Recovery Act; and

(2) There is no reason to believe that the liner is not functioning as designed.

* * * * *

6. New §§ 264.222 and 264.223 are added to read as follows:

§ 264.222 Action leakage rate.

(a) The Regional Administrator shall approve an action leakage rate for surface impoundment units subject to § 264.221 (c) or (d). The action leakage rate is the maximum design flow rate that the leak detection system (LDS) can remove without the fluid head on the bottom liner exceeding 1 foot. The action leakage rate must include an adequate safety margin to allow for uncertainties in the design (e.g., slope, hydraulic conductivity, thickness of drainage material), construction, operation, and location of the LDS, waste and leachate characteristics, likelihood and amounts of other sources of liquids in the LDS, and proposed response actions (e.g., the action leakage rate must consider decreases in the flow capacity of the system over time resulting from siltation and clogging, rib layover and creep of synthetic components of the system, overburden pressures, etc.).

(b) To determine if the action leakage rate has been exceeded, the owner or operator must convert the weekly or monthly flow rate from the monitoring data obtained under § 264.226(d) to an average daily flow rate (gallons per acre per day) for each sump. Unless the Regional Administrator approves a different calculation, the average daily flow rate for each sump must be calculated weekly during the active life and closure period, and if the unit is closed in accordance with § 264.228(b), monthly during the post-closure care period when monthly monitoring is required under § 264.226(d).

§ 264.223 Response actions.

(a) The owner or operator of surface impoundment units subject to § 264.221 (c) or (d) must have an approved response action plan before receipt of waste. The response action plan must set forth the actions to be taken if the action leakage rate has

been exceeded. At a minimum, the response action plan must describe the actions specified in paragraph (b) of this section.

(b) If the flow rate into the leak detection system exceeds the action leakage rate for any sump, the owner or operator must:

(1) Notify the Regional Administrator in writing of the exceedence within 7 days of the determination;

(2) Submit a preliminary written assessment to the Regional Administrator within 14 days of the determination, as to the amount of liquids, likely sources of liquids, possible location, size, and cause of any leaks, and short-term actions taken and planned;

(3) Determine to the extent practicable the location, size, and cause of any leak;

(4) Determine whether waste receipt should cease or be curtailed, whether any waste should be removed from the unit for inspection, repairs, or controls, and whether or not the unit should be closed;

(5) Determine any other short-term and longer-term actions to be taken to mitigate or stop any leaks; and

(6) Within 30 days after the notification that the action leakage rate has been exceeded, submit to the Regional Administrator the results of the analyses specified in paragraphs (b) (3), (4), and (5) of this section, the results of actions taken, and actions planned. Monthly thereafter, as long as the flow rate in the leak detection system exceeds the action leakage rate, the owner or operator must submit to the Regional Administrator a report summarizing the results of any remedial actions taken and actions planned.

(c) To make the leak and/or remediation determinations in paragraphs (b) (3), (4), and (5) of this section, the owner or operator must:

(1)(i) Assess the source of liquids and amounts of liquids by source,

(ii) Conduct a fingerprint, hazardous constituent, or other analyses of the liquids in the leak detection system to identify the source of liquids and possible location of any leaks, and the hazard and mobility of the liquid; and

(iii) Assess the seriousness of any leaks in terms of potential for escaping into the environment; or

(2) Document why such assessments are not needed.

7. Section 264.226 is amended by adding new paragraph (d) to read as follows:

§ 264.226 Monitoring and inspection.

* * * * *

(d)(1) An owner or operator required to have a leak detection system under § 264.221 (c) or (d) must record the amount of liquids removed from each leak detection system sump at least once each week during the active life and closure period.

(2) After the final cover is installed, the amount of liquids removed from each leak detection system sump must be recorded at least monthly. If the liquid level in the sump stays below the pump operating level for two consecutive months, the amount of liquids in the sumps must be recorded at least quarterly. If the liquid level in the sump stays below the pump operating level for two consecutive quarters, the amount of liquids in the sumps must be recorded at least semi-annually. If at any time during the post-closure care period the pump operating level is exceeded at units on quarterly or semi-annual recording schedules, the owner or operator must return to monthly recording of amounts of liquids removed from each sump until the liquid level again stays below the pump operating level for two consecutive months.

(3) "Pump operating level" is a liquid level proposed by the owner or operator and approved by the Regional Administrator based on pump activation level, sump dimensions, and level that avoids backup into the drainage layer and minimizes head in the sump.

8. Section 264.228 is amended by redesignating paragraphs (b)(2) and (b)(3) as paragraphs (b)(3) and (b)(4) respectively, and by adding a new paragraph (b)(2) to read as follows:

§ 264.228 Closure and post-closure care.

* * * * *

(b) * * *

(2) Maintain and monitor the leak detection system in accordance with §§ 264.221(c)(2)(iv) and (3) and 264.226(d), and comply with all other applicable leak detection system requirements of this part;

* * * * *

9. Section 264.251 is amended by redesignating paragraphs (c), (d), (e), (f), and (g) as paragraphs (g), (h), (i), (j) and (k), respectively, and by adding new paragraphs (c), (d), (e), and (f) to read as follows:

§ 264.251 Design and operating requirements.

* * * * *

(c) The owner or operator of each new waste pile unit on which construction commences after January 29, 1992, each lateral expansion of a waste pile unit on which construction commences after July 29, 1992, and each replacement of an existing waste pile unit that is to commence reuse after July 29, 1992 must install two or more liners and a leachate collection and removal system above and between such liners. "Construction commences" is as defined in § 260.10 under "existing facility".

(1)(i) The liner system must include:

(A) A top liner designed and constructed of materials (e.g., a geomembrane) to prevent the migration of hazardous constituents into such liner during the active life and post-closure care period; and

(B) A composite bottom liner, consisting of at least two components. The upper component must be designed and constructed of materials (e.g., a geomembrane) to prevent the migration of hazardous constituents into this component during the active life and post-closure care period. The lower component must be designed and constructed of materials to minimize the migration of hazardous constituents if a breach in the upper component were to occur. The lower component must be constructed of at least 3 feet (91 cm) of compacted soil material with a hydraulic conductivity of no more than $1X10^{-7}$ cm/sec.

(ii) The liners must comply with paragraphs (a)(1)(i), (ii), and (iii) of this section.

(2) The leachate collection and removal system immediately above the top liner must be designed, constructed, operated, and maintained to collect and remove leachate from the waste pile during the active life and post-closure care period. The Regional Administrator will specify design and operating conditions in the permit to ensure that the leachate depth over the liner does not exceed 30 cm (one foot). The leachate collection and removal system must comply with paragraphs (c)(3)(iii) and (iv) of this section.

(3) The leachate collection and removal system between the liners, and immediately above the bottom composite liner in the case of multiple leachate collection and removal systems, is also a leak detection system. This leak detection system must be capable of detecting, collecting, and removing leaks of hazardous constituents at the earliest practicable time through all areas of the top liner likely to be exposed to waste or leachate during the active life and post-closure care period. The requirements for a leak detection system in this paragraph are satisfied by installation of a system that is, at a minimum:

(i) Constructed with a bottom slope of one percent or more;

(ii) Constructed of granular drainage materials with a hydraulic conductivity of $1X10^{-2}$ cm/sec or more and a thickness of 12 inches (30.5 cm) or more; or constructed of synthetic or geonet drainage materials with a transmissivity of $3X10^{-5}$ m^2/sec or more:

(iii) Constructed of materials that are chemically resistant to the waste managed in the waste pile and the leachate expected to be generated, and of sufficient strength and thickness to prevent collapse under the pressures exerted by overlying wastes, waste cover materials, and equipment used at the waste pile;

(iv) Designed and operated to minimize clogging during the active life and post-closure care period; and

(v) Constructed with sumps and liquid removal methods (e.g., pumps) of sufficient size to collect and remove liquids from the sump and prevent liquids from backing up into the drainage layer. Each unit must have its own sump(s). The design of each sump and removal system must provide a method for measuring and recording the volume of liquids present in the sump and of liquids removed.

(4) The owner or operator shall collect and remove pumpable liquids in the leak detection system sumps to minimize the head on the bottom liner.

(5) The owner or operator of a leak detection system that is not located completely above the seasonal high water table must demonstrate that the operation of the leak detection system will not be adversely affected by the presence of ground water.

(d) The Regional Administrator may approve alternative design or operating practices to those specified in paragraph (c) of this section if the owner or operator demonstrates to the Regional Administrator that such design and operating practices, together with location characteristics:

(1) Will prevent the migration of any hazardous constituent into the ground water or surface water at least as effectively as the liners and leachate collection and removal systems specified in paragraph (c) of this section; and

(2) Will allow detection of leaks of hazardous constituents through the top liner at least as effectively.

(e) Paragraph (c) of this section does not apply to monofills that are granted a waiver by the Regional Administrator in accordance with § 264.221(e).

(f) The owner or operator of any replacement waste pile unit is exempt from paragraph (c) of this section if:

(1) The existing unit was constructed in compliance with the design standards of section 3004(o)(1)(A)(i) and (o)(5) of the Resource Conservation and Recovery Act; and

(2) There is no reason to believe that the liner is not functioning as designed.

* * * * *

10. New §§ 264.252 and 264.253 are added to read as follows:

§ 264.252 Action leakage rate.

(a) The Regional Administrator shall approve an action leakage rate for surface impoundment units subject to § 264.251(c) or (d). The action leakage rate is the maximum design flow rate that the leak detection system (LDS) can remove without the fluid head on the bottom liner exceeding 1 foot. The action leakage rate must include an adequate safety margin to allow for uncertainties in the design (e.g., slope, hydraulic conductivity, thickness of drainage material), construction, operation, and location of the LDS, waste and leachate characteristics, likelihood and amounts of other sources of liquids in the LDS, and proposed response actions (e.g., the action leakage rate must consider decreases in the flow capacity of the system over time resulting from siltation and clogging, rib layover and creep of synthetic components of the system, overburden pressures, etc.).

(b) To determine if the action leakage rate has been exceeded, the owner or operator must convert the weekly flow rate from the monitoring data obtained under § 264.254(c), to an average daily flow rate (gallons per acre per day) for each sump. Unless the Regional Administrator approves a different calculation, the average daily flow rate for each sump must be calculated weekly during the active life and closure period.

§ 264.253 Response actions.

(a) The owner or operator of waste pile units subject to § 264.251 (c) or (d) must have an approved response action plan before receipt of waste. The response action plan must set forth the actions to be taken if the action leakage rate has been exceeded. At a minimum, the response action plan must describe the actions specified in paragraph (b) of this section.

(b) If the flow rate into the leak detection system exceeds the action leakage rate for any sump, the owner or operator must:

(1) Notify the Regional Administrator in writing of the exceedance within 7 days of the determination;

(2) Submit a preliminary written assessment to the Regional Administrator within 14 days of the determination, as to the amount of liquids, likely sources of liquids, possible location, size, and cause of any leaks, and short-term actions taken and planned;

(3) Determine to the extent practicable the location, size, and cause of any leak;

(4) Determine whether waste receipt should cease or be curtailed, whether any waste should be removed from the unit for inspection, repairs, or controls, and whether or not the unit should be closed;

(5) Determine any other short-term and long-term actions to be taken to mitigate or stop any leaks; and

(6) Within 30 days after the notification that the action leakage rate has been exceeded, submit to the Regional Administrator the results of the analyses specified in paragraphs (b) (3), (4), and (5) of this section, the results of actions taken, and actions planned. Monthly thereafter, as long as the flow rate in the leak detection system exceeds the action leakage rate, the owner or operator must submit to the Regional Administrator a report summarizing the results of any remedial actions taken and actions planned.

(c) To make the leak and/or remediation determinations in paragraphs (b) (3), (4), and (5) of this section, the owner or operator must:

(1)(i) Assess the source of liquids and amounts of liquids by source,

(ii) Conduct a fingerprint, hazardous constituent, or other analyses of the liquids in the leak detection system to identify the source of liquids and possible location of any leaks, and the hazard and mobility of the liquid; and

(iii) Assess the seriousness of any leaks in terms of potential for escaping into the environment; or

(2) Document why such assessments are not needed.

11. Section 264.254 is amended by adding new paragraph (c) to read as follows:

§ 264.254 Monitoring and inspection.

* * * * *

(c) An owner or operator required to have a leak detection system under § 264.251(c) must record the amount of liquids removed from each leak detection system sump at least once each week during the active life and closure period.

12. Section 264.301 is amended by redesignating paragraphs (f), (g), (h), (i), (j), and (k) as paragraphs (g), (h), (i), (j), (k), and (l), respectively, by revising paragraphs (c) and (d), and by adding new paragraph (f) to read as follows:

§ 264.301 Design and operating requirements.

* * * * *

(c) The owner or operator of each new landfill unit on which construction commences after January 29, 1992, each lateral expansion of a landfill unit on which construction commences after July 29, 1992, and each replacement of an existing landfill unit that is to commence reuse after July 29, 1992 must install two or more liners and a leachate collection and removal system above and between such liners. "Construction commences" is as defined in § 260.10 of this chapter under "existing facility".

(1)(i) The liner system must include:

(A) A top liner designed and constructed of materials (e.g., a geomembrane) to prevent the migration of hazardous constituents into such liner during the active life and post-closure care period; and

(B) A composite bottom liner, consisting of at least two components. The upper component must be designed and constructed of materials (e.g., a geomembrane) to prevent the migration of hazardous constituents into this component during the active life and post-closure care period. The lower component must be designed and constructed of materials to minimize the migration of hazardous constituents if a breach in the upper component were to occur. The lower component must be constructed of at least 3 feet (91 cm) of compacted soil material with a hydraulic conductivity of no more than $1X10^{-7}$ cm/sec.

(ii) The liners must comply with paragraphs (a)(1) (i), (ii), and (iii) of this section.

(2) The leachate collection and removal system immediately above the top liner must be designed, constructed, operated, and maintained to collect and remove leachate from the landfill during the active life and post-closure care period. The Regional Administrator will specify design and operating conditions in the permit to ensure that the leachate depth over the liner does not exceed 30 cm (one foot). The leachate collection and removal system must comply with paragraphs (3)(c) (iii) and (iv) of this section.

(3) The leachate collection and removal system between the liners, and immediately above the bottom composite liner in the case of multiple leachate collection and removal systems, is also a leak detection system. This leak detection system must be capable of detecting, collecting, and removing leaks of hazardous constituents at the earliest practicable time through all areas of the top liner likely to be exposed to waste or leachate during the active life and post-closure care period. The requirements for a leak detection system in this paragraph are satisfied by installation of a system that is, at a minimum:

(i) Constructed with a bottom slope of one percent or more;

(ii) Constructed of granular drainage materials with a hydraulic conductivity of $1X10^{-2}$ cm/sec or more and a thickness of 12 inches (30.5 cm) or more; or constructed of synthetic or geonet drainage materials with a transmissivity of $3X10^{-5}$ m^2/sec or more;

(iii) Constructed of materials that are chemically resistant to the waste managed in the landfill and the leachate expected to be generated, and of sufficient strength and thickness to prevent collapse under the pressures exerted by overlying wastes, waste cover materials, and equipment used at the landfill;

(iv) Designed and operated to minimize clogging during the active life and post-closure care period; and

(v) Constructed with sumps and liquid removal methods (e.g., pumps) of sufficient size to collect and remove liquids from the sump and prevent liquids from backing up into the drainage layer. Each unit must have its own sump(s). The design of each sump and removal system must provide a method for measuring and recording the volume of liquids present in the sump and of liquids removed.

(4) The owner or operator shall collect and remove pumpable liquids in the leak detection system sumps to minimize the head on the bottom liner.

(5) The owner or operator of a leak detection system that is not located completely above the seasonal high water table must demonstrate that the operation of the leak detection system will not be adversely affected by the presence of ground water.

(d) The Regional Administrator may approve alternative design or operating practices to those specified in paragraph (c) of this section if the owner or operator demonstrates to the Regional Administrator that such design and operating practices, together with location characteristics:

(1) Will prevent the migration of any hazardous constituent into the ground water or surface water at least as effectively as the liners and leachate collection and removal systems specified in paragraph (c) of this section; and

(2) Will allow detection of leaks of hazardous constituents through the top liner at least as effectively.

* * * * *

(f) The owner or operator of any replacement landfill unit is exempt from paragraph (c) of this section if:

(1) The existing unit was constructed in compliance with the design standards of section 3004(o)(1)(A)(i) and (o)(5) of the Resource Conservation and Recovery Act; and

(2) There is no reason to believe that the liner is not functioning as designed.

* * * * *

13. New § 264.302 is added to read as follows:

§ 264.302 Action leakage rate.

(a) The Regional Administrator shall approve an action leakage rate for surface impoundment units subject to § 264.301(c) or (d). The action leakage rate is the maximum design flow rate that the leak detection system (LDS) can remove without the fluid head on the bottom liner exceeding l foot. The action leakage rate must include an adequate safety margin to allow for uncertainties in the design (e.g., slope, hydraulic conductivity, thickness of drainage material), construction, operation, and location of the LDS, waste and leachate characteristics, likelihood and amounts of other sources of liquids in the LDS, and proposed response actions (e.g., the action leakage rate must consider decreases in the flow capacity of the system over time resulting from siltation and clogging, rib layover and creep of synthetic components of the system, overburden pressures, etc.).

(b) To determine if the action leakage rate has been exceeded, the owner or operator must convert the weekly or monthly flow rate from the monitoring data obtained under § 264.303(c), to an average daily flow rate (gallons per acre per day) for each sump. Unless the Regional Administrator approves a different calculation, the average daily flow rate for each sump must be calculated weekly during the active life and closure period, and monthly during the post-closure care period when monthly monitoring is required under § 264.303(c).

14. Section 264.303 is amended by adding new paragraph (c) to read as follows:

§ 264.303 Monitoring and inspection.

* * * * *

(c)(1) An owner or operator required to have a leak detection system under § 264.301(c) or (d) must record the amount of liquids removed from each leak detection system sump at least once each week during the active life and closure period.

(2) After the final cover is installed, the amount of liquids removed from each leak detection system sump must be recorded at least monthly. If the liquid level in the sump stays below the pump operating level for two consecutive months, the amount of liquids in the sumps must be recorded at least quarterly. If the liquid level in the sump stays below the pump operating level for two consecutive quarters, the amount of liquids in the sumps must be recorded at least semi-annually. If at any time during the post-closure care period the pump operating level is exceeded at units on quarterly or semi-

annual recording schedules, the owner or operator must return to monthly recording of amounts of liquids removed from each sump until the liquid level again stays below the pump operating level for two consecutive months.

(3) "Pump operating level" is a liquid level proposed by the owner or operator and approved by the Regional Administrator based on pump activation level, sump dimensions, and level that avoids backup into the drainage layer and minimizes head in the sump.

15. New § 264.304 is added to read as follows:

§ 264.304 Response actions.

(a) The owner or operator of landfill units subject to § 264.301(c) or (d) must have an approved response action plan before receipt of waste. The response action plan must set forth the actions to be taken if the action leakage rate has been exceeded. At a minimum, the response action plan must describe the actions specified in paragraph (b) of this section.

(b) If the flow rate into the leak detection system exceeds the action leakage rate for any sump, the owner or operator must:

(1) Notify the Regional Administrator in writing of the exceedence within 7 days of the determination;

(2) Submit a preliminary written assessment to the Regional Administrator within 14 days of the determination, as to the amount of liquids, likely sources of liquids, possible location, size, and cause of any leaks, and short-term actions taken and planned;

(3) Determine to the extent practicable the location, size, and cause of any leak;

(4) Determine whether waste receipt should cease or be curtailed, whether any waste should be removed from the unit for inspection, repairs, or controls, and whether or not the unit should be closed;

(5) Determine any other short-term and longer-term actions to be taken to mitigate or stop any leaks; and

(6) Within 30 days after the notification that the action leakage rate has been exceeded, submit to the Regional Administrator the results of the analyses specified in paragraphs (b)(3), (4), and (5) of this section, the results of actions taken, and actions planned. Monthly thereafter, as long as the flow rate in the leak detection system exceeds the action leakage rate, the owner or operator must submit to the Regional Administrator a report summarizing the results of any remedial actions taken and actions planned.

(c) To make the leak and/or remediation determinations in paragraphs (b)(3), (4), and (5) of this section, the owner or operator must:

(1)(i) Assess the source of liquids and amounts of liquids by source,

(ii) Conduct a fingerprint, hazardous constituent, or other analyses of the liquids in the leak detection system to identify the source of liquids and possible location of any leaks, and the hazard and mobility of the liquid; and

(iii) Assess the seriousness of any leaks in terms of potential for escaping into the environment; or

(2) Document why such assessments are not needed.

16. Section 264.310 is amended by redesignating paragraphs (b)(3), (4), and (5) as paragraphs (b)(4), (5), and (6) respectively, and by adding a new paragraph (b)(3) to read as follows:

§ 264.310 Closure and post-closure care.

* * * * *

(b) * * *

(3) Maintain and monitor the leak detection system in accordance with §§ 264.301(c)(3)(iv) and (4) and 264.303(c), and comply with all other applicable leak detection system requirements of this part;

* * * * *

PART 265-INTERIM STATUS STANDARDS FOR OWNERS AND OPERATORS OF HAZARDOUS WASTE TREATMENT, STORAGE, AND DISPOSAL FACILITIES

1. The authority citation for Part 265 is revised to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6924, 6925, 6935, and 6936.

2. Section 265.15 is amended by revising paragraph (b)(4) to read as follows:

§ 265.15 General inspection requirements.

* * * * *

(b)* * *

(4) The frequency of inspection may vary for the items on the schedule. However, it should be based on the rate of deterioration of the equipment and the probability of an environmental or human health incident if the deterioration, malfunction, or any operator error goes undetected between inspections. Areas subject to spills, such as loading and unloading areas, must be inspected daily when in use. At a minimum, the inspection schedule must include the items and frequencies called for in §§ 265.174, 265.193, 265.195, 265.226, 265.260, 265.278, 265.304, 265.347, 265.377, 265.403, 265.1033, 265.1052, 265.1053, and 265.1058, where applicable.

* * * * *

3. Subpart B is amended by adding § 265.19 to read as follows:

§ 265.19 Construction quality assurance program.

(a) CQA program. (1) A construction quality assurance (CQA) program is required for all surface impoundment, waste pile, and landfill units that are required to comply with §§ 265.221(a), 265.254, and 265.301(a). The program must ensure that the constructed unit meets or exceeds all design criteria and specifications in the permit. The program must be developed and implemented under the direction of a CQA officer who is a registered professional engineer.

(2) The CQA program must address the following physical components, where applicable:

(i) Foundations;

(ii) Dikes;

(iii) Low-permeability soil liners;

(iv) Geomembranes (flexible membrane liners);

(v) Leachate collection and removal systems and leak detection systems; and

(vi) Final cover systems.

(b) Written CQA plan. Before construction begins on a unit subject to the CQA program under paragraph (a) of this section, the owner or operator must develop a written CQA plan. The plan must identify steps that will be used to monitor and document the quality of materials and the condition and manner of their installation. The CQA plan must include:

(1) Identification of applicable units, and a description of how they will be constructed.

(2) Identification of key personnel in the development and implementation of the CQA plan, and CQA officer qualifications.

(3) A description of inspection and sampling activities for all unit components identified in paragraph (a)(2) of this section, including observations and tests that will be used before, during, and after construction to ensure that the construction materials and the installed unit components meet the design specifications. The description must cover: Sampling size and locations; frequency of testing; data evaluation procedures; acceptance and rejection criteria for construction materials; plans for implementing corrective measures; and data or other information to be recorded and retained in the operating record under § 265.73.

(c) Contents of program. (1) The CQA program must include observations, inspections, tests, and measurements sufficient to ensure:

(i) Structural stability and integrity of all components of the unit identified in paragraph (a)(2) of this section;

(ii) Proper construction of all components of the liners, leachate collection and removal system, leak detection system, and final cover system, according to permit specifications and good engineering practices, and proper installation of all components (e.g., pipes) according to design specifications;

(iii) Conformity of all materials used with design and other material specifications under §§ 264.221, 264.251, and 264.301 of this chapter.

(2) The CQA program shall include test fills for compacted soil liners, using the same compaction methods as in the full-scale unit, to ensure that the liners are constructed to meet the hydraulic conductivity requirements of §§ 264.221(c)(1), 264.251(c)(1), and 264.301(c)(1) of this chapter in the field. Compliance with the hydraulic conductivity requirements must be verified by using in-situ testing on the constructed test fill. The test fill requirement is waived where data are sufficient to show that a constructed soil liner meets the hydraulic conductivity requirements of §§ 264.221(c)(1), 264.254(c)(1), and 264.301(c)(1) of this chapter in the field.

(d) Certification. The owner or operator of units subject to § 265.19 must submit to the Regional Administrator by certified mail or hand delivery, at least 30 days prior to receiving waste, a certification signed by the CQA officer that the CQA plan has been successfully carried out and that the unit meets the requirements of §§ 265.221(a), 265.254, or 265.301(a). The owner or operator may receive waste in the unit after 30 days from the Regional Administrator's receipt of the CQA certification unless the Regional Administrator determines in writing that the construction is not acceptable, or extends the review period for a maximum of 30 more days, or seeks additional information from the owner or operator during this period. Documentation supporting the CQA officer's certification must be furnished to the Regional Administrator upon request.

4. Section 265.73 is amended by revising paragraph (b)(6) to read as follows:

§ 265.73 Operating record.

* * * * *

(b)* * *

(6) Monitoring, testing, or analytical data, and corrective action where required by subpart F and §§ 265.19, 265.90, 265.94, 265.191, 265.193, 265.195, 265.222, 265.223, 265.226, 265.255, 265.259, 265.260, 265.276, 265.278, 265.280(d)(1), 265.302-265.304, 265.347, 265.377, 265.1034(c)-265.1034(f), 265.1035, 265.1063(d)-264.1063(i), and 265.1064.

* * * * *

5. Section 265.221 is amended by revising the section heading and by revising paragraphs (a) and (c) to read as follows:

§ 265.221 Design and operating requirements.

(a) The owner or operator of each new surface impoundment unit on which construction commences after January 29, 1992, each lateral expansion of a surface impoundment unit on which construction commences after July 29, 1992, and each replacement of an existing surface impoundment unit that is to commence reuse after July 29, 1992 must install two or more liners and a leachate collection and removal system between such liners, and operate the leachate collection and removal system, in accordance with § 264.221(c), unless exempted under § 264.221(d), (e), or (f), of this chapter. "Construction commences" is as defined in § 260.10 of this chapter under "existing facility."

* * * * *

(c) The owner or operator of any replacement surface impoundment unit is exempt from paragraph (a) of this section if:

(1) The existing unit was constructed in compliance with the design standards of § 3004(o)(1)(A)(i) and (o)(5) of the Resource Conservation and Recovery Act; and

(2) There is no reason to believe that the liner is not functioning as designed.

* * * * *

6. Paragraphs (a) and (b) of § 265.222 are transferred to § 265.221 and redesignated as paragraphs (f) and (g), respectively.

7. Section 265.222, is amended by revising, the section heading and adding paragraphs (a) through (c) and § 265.223 is added to read as follows:

§ 265.222 Action leakage rate.

(a) The owner or operator of surface impoundment units subject to § 265.221(a) must submit a proposed action leakage rate to the Regional Administrator when submitting the notice required under § 265.221(b). Within 60 days of receipt of the notification, the Regional Administrator will: Establish an action leakage rate, either as proposed by the owner or operator or modified using the criteria in this section; or extend the review period for up to 30 days. If no action is taken by the Regional Administrator before the original 60 or extended 90 day review periods, the action leakage rate will be approved as proposed by the owner or operator.

(b) The Regional Administrator shall approve an action leakage rate for surface impoundment units subject to § 265.221(a). The action leakage rate is the maximum design flow rate that the leak detection system (LDS) can remove without the fluid head on the bottom liner exceeding 1 foot. The action leakage rate must include an adequate safety margin to allow for uncertainties in the design (e.g., slope, hydraulic conductivity, thickness of drainage material), construction, operation, and location of the LDS, waste and leachate characteristics, likelihood and amounts of other sources of liquids in the LDS, and proposed response actions (e.g., the action leakage rate must consider decreases in the flow capacity of the system over time resulting from siltation and clogging, rib layover and creep of synthetic components of the system, overburden pressures, etc.).

(c) To determine if the action leakage rate has been exceeded, the owner or operator must convert the weekly or monthly flow rate from the monitoring data obtained under § 265.226(b), to an average daily flow rate (gallons per acre per day) for each sump. Unless the Regional Administrator approves a different calculation, the average daily flow rate for each sump must be calculated weekly during the active life and closure period, and if the unit closes in accordance with § 265.228(a)(2), monthly during the post-closure care period when monthly monitoring is required under § 265.226(b).

§ 265.223 Response actions.

(a) The owner or operator of surface impoundment units subject to § 265.221(a) must submit a response action plan to the Regional Administrator when submitting the proposed action leakage rate under § 265.222. The response action plan must set forth the actions to be taken if the action leakage rate has been exceeded. At a minimum, the response action plan must describe the actions specified in paragraph (b) of this section.

(b) If the flow rate into the leak detection system exceeds the action leakage rate for any sump, the owner or operator must:

(1) Notify the Regional Administrator in writing of the exceedence within 7 days of the determination;

(2) Submit a preliminary written assessment to the Regional Administrator within 14 days of the determination, as to the amount of liquids, likely sources of liquids, possible location, size, and cause of any leaks, and short-term actions taken and planned;

(3) Determine to the extent practicable the location, size, and cause of any leak;

(4) Determine whether waste receipt should cease or be curtailed, whether any waste should be removed from the unit for inspection, repairs, or controls, and whether or not the unit should be closed;

(5) Determine any other short-term and longer-term actions to be taken to mitigate or stop any leaks; and

(6) Within 30 days after the notification that the action leakage rate has been exceeded, submit to the Regional Administrator the results of the analyses specified in paragraphs (b)(3), (4), and (5) of this section, the results of actions taken, and actions planned. Monthly thereafter, as long as the flow rate in the leak detection system exceeds the action leakage rate, the owner or operator must submit to the Regional Administrator a report summarizing the results of any remedial actions taken and actions planned.

(c) To make the leak and/or remediation determinations in paragraphs (b)(3), (4), and (5) of this section, the owner or operator must:

(1)(i) Assess the source of liquids and amounts of liquids by source,

(ii) Conduct a fingerprint, hazardous constituent, or other analyses of the liquids in the leak detection system to identify the source of liquids and possible location of any leaks, and the hazard and mobility of the liquid; and

(iii) Assess the seriousness of any leaks in terms of potential for escaping into the environment; or

(2) Document why such assessments are not needed.

8. Section 265.226 is amended by revising the section heading and adding new paragraph (b) to read as follows:

§ 265.226 Monitoring and inspection.

* * * * *

(b)(1) An owner or operator required to have a leak detection system under § 265.221(a) must record the amount of liquids removed from each leak detection system sump at least once each week during the active life and closure period.

(2) After the final cover is installed, the amount of liquids removed from each leak detection system sump must be recorded at least monthly. If the liquid level in the sump stays below the pump operating level for two consecutive months, the amount of liquids in the sumps must be recorded at least quarterly. If the liquid level in the sump stays below the pump operating level for two consecutive quarters, the amount of liquids in the sumps must be recorded at least semi-annually. If at any time during the post-closure care period the pump operating level is exceeded at units on quarterly or semi-annual recording schedules, the owner or operator must return to monthly recording of amounts of liquids removed from each sump until the liquid level again stays below the pump operating level for two consecutive months.

(3) "Pump operating level" is a liquid level proposed by the owner or operator and approved by the Regional Administrator based on pump activation level, sump dimensions, and level that avoids backup into the drainage layer and minimizes head in the sump. The timing for submission and approval of the proposed "pump operating level" will be in accordance with § 265.222(a).

9. Section 265.228 is amended by redesignating paragraphs (b)(2) and (3) as paragraphs (b)(3) and (4) respectively, and by adding a new paragraph (b)(2) to read as follows:

§ 265.228 Closure and post-closure care.

* * * * * * *

(b) * * *

(2) Maintain and monitor the leak detection system in accordance with §§ 265.221(c)(2)(iv) and (3) of this chapter and 265.226(b) and comply with all other applicable leak detection system requirements of this part;

* * * * * * *

10. Section 265.254 is revised, including the section heading, to read as follows:

§ 265.254 Design and operating requirements.

The owner or operator of each new waste pile on which construction commences after January 29, 1992, each lateral expansion of a waste pile unit on which construction commences after July 29, 1992, and each such replacement of an existing waste pile unit that is to commence reuse after July 29, 1992 must install two or more liners and a leachate collection and removal system above and between such liners, and operate the leachate collection and removal systems, in accordance with §

264.251(c), unless exempted under § 264.251(d), (e), or (f), of this chapter; and must comply with the procedures of § 265.221(b). "Construction commences" is as defined in § 260.10 of this chapter under "existing facility".

11. New §§ 265.255, 265.259, and 265.260 are added to read as follows:

§ 265.255 Action leakage rates

(a) The owner or operator of waste pile units subject to § 265.254 must submit a proposed action leakage rate to the Regional Administrator when submitting the notice required under § 265.254. Within 60 days of receipt of the notification, the Regional Administrator will: Establish an action leakage rate, either as proposed by the owner or operator or modified using the criteria in this section; or extend the review period for up to 30 days. If no action is taken by the Regional Administrator before the original 60 or extended 90 day review periods, the action leakage rate will be approved as proposed by the owner or operator.

(b) The Regional Administrator shall approve an action leakage rate for surface impoundment units subject to § 265.254. The action leakage rate is the maximum design flow rate that the leak detection system (LDS) can remove without the fluid head on the bottom liner exceeding 1 foot. The action leakage rate must include an adequate safety margin to allow for uncertainties in the design (e.g., slope, hydraulic conductivity, thickness of drainage material), construction, operation, and location of the LDS, waste and leachate characteristics, likelihood and amounts of other sources of liquids in the LDS, and proposed response actions (e.g., the action leakage rate must consider decreases in the flow capacity of the system over time resulting from siltation and clogging, rib layover and creep of synthetic components of the system, overburden pressures, etc.).

(c) To determine if the action leakage rate has been exceeded, the owner or operator must convert the weekly flow rate from the monitoring data obtained under § 265.260, to an average daily flow rate (gallons per acre per day) for each sump. Unless the Regional Administrator approves a different calculation, the average daily flow rate for each sump must be calculated weekly during the active life and closure period.

§ 265.259 Response actions.

(a) The owner or operator of waste pile units subject to § 265.254 must submit a response action plan to the Regional Administrator when submitting the proposed action leakage rate under § 265.255. The response action plan must set forth the actions to be taken if the action leakage rate has been exceeded. At a minimum, the response action plan must describe the actions specified in paragraph (b) of this section.

(b) If the flow rate into the leak determination system exceeds the action leakage rate for any sump, the owner or operator must:

(1) Notify the Regional Administrator in writing of the exceedence within 7 days of the determination;

(2) Submit a preliminary written assessment to the Regional Administrator within 14 days of the determination, as to the amount of liquids, likely sources of liquids, possible location, size, and cause of any leaks, and short-term actions taken and planned;

(3) Determine to the extent practicable the location, size, and cause of any leak;

(4) Determine whether waste receipts should cease or be curtailed, whether any waste should be removed from the unit for inspection, repairs, or controls, and whether or not the unit should be closed;

(5) Determine any other short-term and longer-term actions to be taken to mitigate or stop any leaks; and

(6) Within 30 days after the notification that the action leakage rate has been exceeded, submit to the Regional Administrator the results of the analyses specified in paragraphs (b)(3), (4), and (5) of this section, the results of actions taken, and actions planned. Monthly thereafter, as long as the flow rate in the leak detection system exceeds the action leakage rate, the owner or operator must submit to the Regional Administrator a report summarizing the results of any remedial actions taken and actions planned.

(c) To make the leak and/or remediation determinations in paragraphs (b)(3), (4), and (5) of this section, the owner or operator must:

(1)(i) Assess the source of liquids and amounts of liquids by source,

(ii) Conduct a fingerprint, hazardous constituent, or other analyses of the liquids in the leak detection system to identify the source of liquids and possible location of any leaks, and the hazard and mobility of the liquid; and

(iii) Assess the seriousness of any leaks in terms of potential for escaping into the environment; or

(2) Document why such assessments are not needed.

§ 265.260 Monitoring and inspection.

An owner or operator required to have a leak detection system under § 265.254 must record the amount of liquids removed from each leak detection system sump at least once each week during the active life and closure period.

12. Section 265.301 is amended by revising the section heading and by revising paragraphs (a) and (c) to read as follows:

§ 265.301 Design and operating requirements.

(a) The owner or operator of each new landfill unit on which construction commences after January 29, 1992, each lateral expansion of a landfill unit on which construction commences after July 29, 1992, and each replacement of an existing landfill unit that is to commence reuse after July 29, 1992 must install two or more liners and a leachate collection and removal system above and between such liners, and operate the leachate collection and removal systems, in accordance with § 264.301(d), (e), or (f), of this chapter. "Construction commences" is as defined in § 260.10 of this chapter under "existing facility".

* * * * * * *

(c) The owner or operator of any replacement landfill unit is exempt from paragraph (a) of this section if:

(1) The existing unit was constructed in compliance with the design standards of section 3004(o)(1)(A)(i) and (o)(5) of the Resource Conservation and Recovery Act; and

(2) There is no reason to believe that the liner is not functioning as designed.

* * * * * * *

13. Paragraphs (a), (b), (c), and (d) of § 265.302 are transferred to § 265.301 and redesignated as paragraphs (f), (g), (h), and (i), respectively.

14. Section 265.302, is amended by revising the section heading and adding paragraphs (a) through (c) and new §§ 265.303 and 265.304 are added to read as follows:

§ 265.302 Action leakage rate.

(a) The owner or operator of landfill units subject to § 265.301(a) must submit a proposed action leakage rate to the Regional Administrator when submitting the notice required under § 265.301(b). Within 60 days of receipt of the notification, the Regional Administrator will: Establish an action leakage rate, either as proposed by the owner or operator or modified using the criteria in this section; or extend the review period for up to 30 days. If no action is taken by the Regional Administrator before the original 60 or extended 90 day review periods, the action leakage rate will be approved as proposed by the owner or operator.

(b) The Regional Administrator shall approve an action leakage rate for surface impoundment units subject to § 265.301(a). The action leakage rate is the maximum

design flow rate that the leak detection system (LDS) can remove without the fluid head on the bottom liner exceeding 1 foot. The action leakage rate must include an adequate safety margin to allow for uncertainties in the design (e.g., slope, hydraulic conductivity, thickness of drainage material), construction, operation, and location of the LDS, waste and leachate characteristics, likelihood and amounts of other sources of liquids in the LDS, and proposed response actions (e.g., the action leakage rate must consider decreases in the flow capacity of the system over time resulting from siltation and clogging, rib layover and creep of synthetic components of the system, overburden pressures, etc.).

(c) To determine if the action leakage rate has been exceeded, the owner or operator must convert the weekly or monthly flow rate from the monitoring data obtained under § 265.304 to an average daily flow rate (gallons per acre per day) for each sump. Unless the Regional Administrator approves a different calculation, the average daily flow rate for each sump must be calculated weekly during the active life and closure period, and monthly during the post-closure care period when monthly monitoring is required under § 265.304(b).

§ 265.303 Response actions.

(a) The owner or operator of landfill units subject to § 265.301(a) must submit a response action plan to the Regional Administrator when submitting the proposed action leakage rate under § 265.302. The response action plan must set forth the actions to be taken if the action leakage rate has been exceeded. At a minimum, the response action plan must describe the actions specified in paragraph (b) of this section.

(b) If the flow rate into the leak detection system exceeds the action leakage rate for any sump, the owner or operator must:

(1) Notify the Regional Administrator in writing of the exceedence within 7 days of the determination;

(2) Submit a preliminary written assessment to the Regional Administrator within 14 days of the determination, as to the amount of liquids, likely sources of liquids, possible location, size, and cause of any leaks, and short-term actions taken and planned;

(3) Determine to the extent practicable the location, size, and cause of any leak;

(4) Determine whether waste receipt should cease or be curtailed, whether any waste should be removed from the unit for inspection, repairs, or controls, and whether or not the unit should be closed;

(5) Determine any other short-term and longer-term actions to be taken to mitigate or stop any leaks; and

(6) Within 30 days after the notification that the action leakage rate has been exceeded, submit to the Regional Administrator the results of the analyses specified in paragraphs (b)(3), (4), and (5) of this section, the results of actions taken, and actions planned. Monthly thereafter, as long as the flow rate in the leak detection system exceeds the action leakage rate, the owner or operator must submit to the Regional Administrator a report summarizing the results of any remedial actions taken and actions planned.

(c) To make the leak and/or remediation determinations in paragraphs (b)(3), (4), and (5) of this section, the owner or operator must:

(1)(i) Assess the source of liquids and amounts of liquids by source,

(ii) Conduct a fingerprint, hazardous constituent, or other analyses of the liquids in the leak detection system to identify the source of liquids and possible location of any leaks, and the hazard and mobility of the liquid; and

(iii) Assess the seriousness of any leaks in terms of potential for escaping into the environment; or

(2) Document why such assessments are not needed.

§ 265.304 Monitoring and inspection.

(a) An owner or operator required to have a leak detection system under § 265.301(a) must record the amount of liquids removed from each leak detection system sump at least once each week during the active life and closure period.

(b) After the final cover is installed, the amount of liquids removed from each leak detection system sump must be recorded at least monthly. If the liquid level in the sump stays below the pump operating level for two consecutive months, the amount of liquids in the sumps must be recorded at least quarterly. If the liquid level in the sump stays below the pump operating level for two consecutive quarters, the amount of liquids in the sumps must be recorded at least semi-annually. If at any time during the post-closure care period the pump operating level is exceeded at units on quarterly or semi-annual recording schedules, the owner or operator must return to monthly recording of amounts of liquids removed from each sump until the liquid level again stays below the pump operating level for two consecutive months.

(c) "Pump operating level" is a liquid level proposed by the owner or operator and approved by the Regional Administrator based on pump activation level, sump dimensions, and level that avoids backup into the drainage layer and minimizes head in the sump. The timing for submission and approval of the proposed "pump operating level" will be in accordance with § 265.302(a).

15. Section 265.310 is amended by redesignating paragraphs (b)(2), (3), and (4) as paragraphs (b)(3), (4), and (5), respectively, and by adding a new paragraph (b)(2) to read as follows:

§ 265.310 Closure and post-closure care.

* * * * *

(b) * * *

(2) Maintain and monitor the leak detection system in accordance with §§ 264.301(c)(3)(iv) and (4) of this chapter and 265.304(b), and comply with all other applicable leak detection system requirements of this part;

* * * * *

PART 270-EPA ADMINISTERED PERMIT PROGRAMS: THE HAZARDOUS WASTE PERMIT PROGRAM

1. The authority citation for part 270 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912, 6924, 6925, 6927, 6939, and 6974.

2. Section 270.4 is amended by revising paragraph (a) to read as follows:

§ 270.4 Effect of a permit.

(a) Compliance with a RCRA permit during its term constitutes compliance, for purposes of enforcement, with subtitle C of RCRA except for those requirements not included in the permit which:

(1) Become effective by statute;

(2) Are promulgated under part 268 of this chapter restricting the placement of hazardous wastes in or on the land; or

(3) Are promulgated under part 264 of this chapter regarding leak detection systems for new and replacement surface impoundment, waste pile, and landfill units, and lateral expansions of surface impoundment, waste pile, and landfill units. The leak detection system requirements include double liners, CQA programs, monitoring, action leakage rates, and response action plans, and will be implemented through the procedures of § 270.42 Class 1* permit modifications.

* * * * *

(3) Section 270.17 is amended by redesignating paragraphs (b)(2) and (3) as (b)(6) and (7) respectively; revising paragraph (b); introductory text; adding paragraphs (b)(2) through (b)(5); and revising paragraph (c) to read as follows:

§ 270.17 Specific Part B information requirements for surface impoundments.

* * * * *

(b) Detailed plans and an engineering report describing how the surface impoundment is designed and is or will be constructed, operated, and maintained to meet the requirements of §§ 264.19, 264.221, 264.222, and 264.223 of this chapter, addressing the following items:

(1) * * *

(2) The double liner and leak (leachate) detection, collection, and removal system, if the surface impoundment must meet the requirements of § 264.221(c) of this chapter. If an exemption from the requirements for double liners and a leak detection, collection, and removal system or alternative design is sought as provided by § 264.221(d), (e), or (f) of this chapter, submit appropriate information;

(3) If the leak detection system is located in a saturated zone, submit detailed plans and an engineering report explaining the leak detection system design and operation, and the location of the saturated zone in relation to the leak detection system;

(4) The construction quality assurance (CQA) plan if required under § 264.19 of this chapter;

(5) Proposed action leakage rate, with rationale, if required under § 264.222 of this chapter, and response action plan, if required under § 264.223 of this chapter;

* * * * *

(c) A description of how each surface impoundment, including the double liner system, leak detection system, cover system, and appurtenances for control of overtopping, will be inspected in order to meet the requirements of § 264.226(a), (b), and (d) of this chapter. This information must be included in the inspection plan submitted under § 270.14(b)(5);

* * * * *

4. Section 270.18 is amended by revising paragraphs (c) introductory text, (c)(1) and (d) to read as follows:

§ 270.18 Specific Part B information for waste piles.

* * * * *

(c) Detailed plans and an engineering report describing how the waste pile is designed and is or will be constructed, operated, and maintained to meet the requirements of §§ 264.19, 264.251, 264.252, and 264.253 of this chapter, addressing the following items:

(1)(i) The liner system (except for an existing portion of a waste pile), if the waste pile must meet the requirements of § 264.251(a) of this chapter. If an exemption from the requirement for a liner is sought as provided by § 264.251(b) of this chapter, submit detailed plans, and engineering and hydrogeological reports, as appropriate, describing alternate designs and operating practices that will, in conjunction with location aspects, prevent the migration of any hazardous constituents into the ground water or surface water at any future time;

(ii) The double liner and leak (leachate) detection, collection, and removal system, if the waste pile must meet the requirements of § 264.251(c) of this chapter. If an exemption from the requirements for double liners and a leak detection, collection, and removal system or alternative design is sought as provided by § 264.251(d), (e), or (f) of this chapter, submit appropriate information;

(iii) If the leak detection system is located in a saturated zone, submit detailed plans and an engineering report explaining the leak detection system design and operation, and the location of the saturated zone in relation to the leak detection system;

(iv) The construction quality assurance (CQA) plan if required under § 264.19 of this chapter;

(v) Proposed action leakage rate, with rationale, if required under § 264.252 of this chapter, and response action plan, if required under § 264.253 of this chapter;

* * * * *

(d) A description of how each waste pile, including the double liner system, leachate collection and removal system, leak detection system, cover system, and appurtenances for control of run-on and run-off, will be inspected in order to meet the requirements of § 264.254(a), (b), and (c) of this chapter. This information must be included in the inspection plan submitted under § 270.14(b)(5);

* * * * *

5. Section 270.21 is amended by revising paragraphs (b) introductory text, (b)(1) and (c) to read as follows:

§ 270.21 Specific Part B information requirements for landfills.

* * * * *

(b) Detailed plans and an engineering report describing how the landfill is designed and is or will be constructed, operated, and maintained to meet the requirements of §§ 264.19, 264.301, 264.302, and 264.303 of this chapter, addressing the following items:

(1)(i) The liner system (except for an existing portion of a landfill), if the landfill must meet the requirements of § 264.301(a) of this chapter. If an exemption from the requirement for a liner is sought as provided by § 264.301(b) of this chapter, submit detailed plans, and engineering and hydrogeological reports, as appropriate, describing alternate designs and operating practices that will, in conjunction with location aspects, prevent the migration of any hazardous constituents into the ground water or surface water at any future time;

(ii) The double liner and leak (leachate) detection, collection, and removal system, if the landfill must meet the requirements of § 264.301(c) of this chapter. If an exemption from the requirements for double liners and a leak detection, collection, and removal system or alternative design is sought as provided by § 264.301(d), (e), or (f) of this chapter, submit appropriate information;

(iii) If the leak detection system is located in a saturated zone, submit detailed plans and an engineering report explaining the leak detection system design and operation, and the location of the saturated zone in relation to the leak detection system;

(iv) The construction quality assurance (CQA) plan if required under § 264.19 of this chapter;

(v) Proposed action leakage rate, with rationale, if required under § 264.302 of this chapter, and response action plan, if required under § 264.303 of this chapter;

* * * * *

(c) A description of how each landfill, including the double liner system, leachate collection and removal system, leak detection system, cover system, and appurtenances for control of run-on and run-off, will be inspected in order to meet the requirements of § 264.303(a), (b), and (c) of this chapter. This information must be included in the inspection plan submitted under § 270.14(b)(5);

* * * * *

6. Section 270.42 is amended by adding the following to Appendix I:

§ 270.42 Permit modification at the request of the permittee.

* * * * *

Appendix I To § 270.42.-Classification of Permit Modification

Modification	Class

* * * * *

Hazardous Waste Management System; Identification and Listing of Hazardous Waste; Toxicity Characteristic; Corrections

Volume: 57 Issue: 133 Page: 30657
CITATION NUMBER: 57 FR 30657
Date: FRIDAY, JULY 10, 1992

AGENCY: Environmental Protection Agency--(EPA); Office of Solid Waste--(OSW); Office of Solid Waste and Emergency Response--(OSWER)
DOCUMENT TYPE: Rules and Regulations
CFR: 40 CFR Part 261
NUMBERS: EPA/OSW-FRL-4151-2; RIN 2050-AA78
DATES: Effective: 19920710
Appeared in FR: 19900329
CONTACT INFORMATION: RCRA-Superfund Hotline, 800-424-9346,, 202-260-3000; or; Dave Topping, 202-260-7737
ACTION: Final rule; corrections
INTERNAL DATA: (FR Doc. 92-15967 Filed 7-9-92; 8:45 am)
Word Count: 937

SUMMARY: On March 29, 1990, the Environmental Protection Agency (EPA) promulgated a rule (55 FR 11798) to revise the existing toxicity characteristics (TC) used to identify certain wastes defined as hazardous; these wastes are regulated under subtitle C of the Resource Conservation and Recovery Act (RCRA) due to their potential to leach significant concentrations of specific toxic constituents. In the preamble, the exclusion from subtitle C regulation for arsenical-treated wood and wood products was revised inappropriately. This rule corrects that revision. Today's rule also deletes two additional references in the Code of Federal Regulations (CFR) to the Extraction Procedure (EP) Toxicity Characteristic and replaces them with references to the TC.

40 CFR Part 261

(EPA/OSW-FRL-4151-2)

RIN 2050-AA78

Hazardous Waste Management System; Identification and Listing of Hazardous Waste; Toxicity Characteristic; Corrections

AGENCY: Environmental Protection Agency, (EPA).

ACTION: Final rule; corrections.

SUMMARY: On March 29, 1990, the Environmental Protection Agency (EPA) promulgated a rule (55 FR 11798) to revise the existing toxicity characteristics (TC) used to identify certain wastes defined as hazardous; these wastes are regulated under subtitle C of the Resource Conservation and Recovery Act (RCRA) due to their potential to leach significant concentrations of specific toxic constituents. In the preamble, the

exclusion from subtitle C regulation for arsenical-treated wood and wood products was revised inappropriately. This rule corrects that revision. Today's rule also deletes two additional references in the Code of Federal Regulations (CFR) to the Extraction Procedure (EP) Toxicity Characteristic and replaces them with references to the TC.

EFFECTIVE DATE: The revision is effective July 10, 1992.

FOR FURTHER INFORMATION CONTACT: For general information about this notice, contact the RCRA/Superfund Hotline at (800) 424-9346 (toll free) or (202) 260-3000 in the Washington, DC metropolitan area. For information on specific aspects of this notice, contact Dave Topping, Waste Identification Branch, Office of Solid Waste (OS-332), U.S. Environmental Protection Agency, 401 M Street, SW., Washington, DC 20460, (202) 260-7737.

SUPPLEMENTARY INFORMATION:

A. Background

On March 29, 1990 (55 FR 11798), EPA promulgated a rule to revise the existing toxicity characteristics used to identify certain wastes defined as hazardous; these waste are regulated under subtitle C of RCRA. This rule broadened the scope of the hazardous waste regulatory program and fulfilled specific statutory mandates under the Hazardous and Solid Waste Amendments of 1984. The existing Extraction Procedure was replaced by the Toxicity Characteristic Leaching Procedure (TCLP), and additional constituents were added to the list that could cause a waste to be hazardous under the toxicity characteristic. Technical corrections to this rule were published on June 29, 1990 (55 FR 26986), August 2, 1990 (55 FR 31387), and September 27, 1990 (55 FR 39409).

B. Arsenical-Treated Wood

Today's rule corrects an error made at the time of promulgation of the final Toxicity Characteristic (TC) rule. The 1990 rule amended the preexisting exclusion from the characteristic of EP Toxicity to arsenical-treated wood and wood products. Previously, 40 CFR 261.4(b)(9) excluded from the definition of hazardous waste those discarded arsenical-treated wood or wood products that failed the test for EP toxicity characteristic (EPTC) and were not hazardous for any other reason, if the waste was generated by persons who utilize the arsenical-treated wood and wood products for these materials' intended end use.

When the TC was promulgated, EPA revised that provision to reflect the new characteristics. However, the Agency unintentionally narrowed the scope of the exclusion by rewording the provision so that only arsenical-treated wood and wood products that failed the TC "solely for arsenic" would be excluded.

Therefore, arsenical-treated wood and wood products that failed the TC for other EP constituents (e.g., chromium) would not become regulated as hazardous waste. However, EPA had not intended to change the scope of the arsenical-treated wood exclusion. As noted in the preamble (55 FR 11805), EPA had intended only to replace references to the EPTC with the TC. Today's rule, therefore, corrects the arsenical-treated wood and wood products exclusion by excluding these materials from RCRA subtitle C if they exhibit the TC for any of the EP constituents but are not hazardous for any other reason and are used for their intended purpose.

C. Other Technical Corrections

Today's rule also corrects the regulatory language in 40 CFR 261.4(b)(6)(ii) and 265.301(d)(1) by deleting references to the Extraction Procedure (EP) Toxicity Characteristic and by correctly referencing the TC. 40 CFR 261.4(b)(6)(ii) contains the list of specific chromium bearing wastes that are not hazardous wastes if they do not exhibit the TC or other characteristics of hazardous waste. Also, the technical correction in 40 CFR 265.301(d)(1) applies to the double liner design requirements for landfills at interim status facilities. This correction makes the requirements identical to those for permitted facilities, as found in 40 CFR 264.301(e)(1).

D. Rulemaking Procedures

Because the revisions in this notice correct inadvertent errors or omissions from the 1990 TC rule and are not substantive changes in the scope or content of the affected provisions, public notice and comment on these revisions is necessary. See 5 U.S.C. 553(b)(3)(B). For the same reasons, an immediate effective date is appropriate. 5 U.S.C. 553(d).

Richard J. Guimond,
Deputy Assistant Administrator, Solid Waste and Emergency Response.

For the reasons set out in the preamble, chapter I of title 40 of the Code of Federal Regulations is amended as follows:

PART 261--IDENTIFICATION AND LISTING OF HAZARDOUS WASTE

1. The authority citation for part 261 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6922, and 6938.

2. Section 261.4 is amended by revising paragraph (b)(6)(ii) introductory text to read as follows:

Sec. 261.4 Exclusions.

* * * * *

(b) * * *
(6) * * *
(ii) Specific waste which meet the standard in paragraphs (b)(6)(i) (A), (B), and (C) (so long as they do not fail the test for the toxicity characteristic for any other constituent, and do not exhibit any other characteristic) are: * * *

3. Section 261.4 is amended further by revising paragraph (b)(9) to read as follows:

Sec. 261.4 Exclusions
* * * * *

(b) * * *
(9) Solid waste which consists of discarded arsenical-treated wood or wood products which fails the test for the Toxicity Characteristic for Hazardous Waste Codes D004 through D017 and which is not a hazardous waste for any other reason if the waste is generated by persons who utilize the

arsenical- treated wood and wood product for these materials' intended end use.

* * * * *

PART 265--INTERIM STATUS STANDARDS FOR OWNERS AND OPERATORS OF HAZARDOUS WASTE TREATMENT, STORAGE, AND DISPOSAL FACILITIES

4. The authority citation for part 265 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6924, 6925, and 6935.

5. Section 265.301 is amended by revising paragraph (d)(1) to read as follows:

Sec. 265.301 Design requirements.

* * * * *

(d) * * *
(1) The monofill contains only hazardous wastes from foundry furnace emission controls or metal casting molding sand, and such waste does not contain constituents which would render the wastes hazardous for reasons other than the Toxicity Characteristic in Sec. 261.4 of this chapter, with EPA Hazardous Waste Number D004 through D017; and

ACTION: Final rule
INTERNAL DATA: (FR Doc. 92-15997 Filed 8-17-92; 8:45 am)
Word Count: 87054
SUMMARY: The Environmental Protection Agency (EPA) is finalizing treatment standards under the land disposal restrictions (LDR) program for certain hazardous wastes listed after November 8, 1984, pursuant to a proposed consent decree filed with the District Court that established a promulgation date of June 1992 (EDF v. Reilly, Civ. No. 89-0598, D.D.C.). EPA is also finalizing revised treatment standards for debris contaminated with listed hazardous waste or debris that exhibits certain hazardous waste characteristics (hereinafter referred to as hazardous debris), and several revisions to previously promulgated standards and requirements. These actions are being taken as part of the RCRA Reform Initiative, and are expected to facilitate implementation of the LDR program.

Land Disposal Restrictions for Newly Listed Wastes and Hazardous Debris

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: The Environmental Protection Agency (EPA) is finalizing treatment

standards under the land disposal restrictions (LDR) program for certain hazardous wastes listed after November 8, 1984, pursuant to a proposed consent decree filed with the District Court that established a promulgation date of June 1992 (EDF v. Reilly, Civ. No. 89-0598, D.D.C.). EPA is also finalizing revised treatment standards for debris contaminated with listed hazardous waste or debris that exhibits certain hazardous waste characteristics (hereinafter referred to as hazardous debris), and several revisions to previously promulgated standards and requirements. These actions are being taken as part of the RCRA Reform Initiative, and are expected to facilitate implementation of the LDR program.

EFFECTIVE DATES: This final rule is effective on June 30, 1992, except for Secs. 148.17(a), 260.10, 261.3(c)(2)(ii)(C), 268.2, 268.5, 268.7, 268.9, 268.36(a), 268.40, 268.41, 268.42, 268.43, 268.45, 268.46, 268.50, 270.14, 270.42, 270.72, and 271.1, which are effective November 16, 1992; and Secs. 262.34, 264.110, 264.111, 264.112, 264.140, 264.142, part 264 subpart DD, 265.110, 265.111, 265.112, 265.140, 265.142, 265.221, and part 265 subpart DD, which are effective February 18, 1993.

ADDRESSES: The official record for this rulemaking is identified as Docket Number F-92-CD2F-FFFFF, and is located in the EPA RCRA Docket, room 2427, 401 M Street SW., Washington, DC 20460. The docket is open from 9 a.m. to 4 p.m., Monday through Friday, except on Federal holidays. The public must make an appointment to review docket materials by calling (202) 260-9327. A maximum of 100 pages from the docket may be copied at no cost. Additional copies cost $.15 per page.

FOR FURTHER INFORMATION CONTACT: For general information, contact the RCRA Hotline at (800) 424-9346 (toll free) or (703) 920-9810 locally. For information on treatment standards for newly listed wastes or hazardous debris, contact the Waste Treatment Branch, Office of Solid Waste (OS-322W), U.S. Environmental Protection Agency, 401 M St., SW., Washington, DC 20460, (703) 308-8434. For information on capacity determinations or national capacity variances, contact the Capacity Programs Branch, Office of Solid Waste (OS-321W), U.S. Environmental Protection Agency, 401 M Street, SW., Washington, DC 20460, (703) 308-8440.

SUPPLEMENTARY INFORMATION:

Outline

I. Background

A. Summary of the Hazardous and Solid Waste Amendments of 1984

The Hazardous and Solid Waste Amendments (HSWA) to the Resource Conservation and Recovery Act (RCRA), enacted on November 8, 1984, allow hazardous wastes to be land disposed only if they satisfy either of two conditions: (1) They can either be treated, or otherwise satisfy, the requirement of section 3004(m), which provision requires EPA to set levels or methods of treatment, if any, which substantially diminish the toxicity of the waste or substantially reduce the likelihood of migration of hazardous constituents from the waste so that short-term and long-term threats to human health and the environment are minimized; or (2) they can be land disposed in units satisfying the so-called no-migration standard in sections 3004 (d)(1), (e)(1), and (g)(5). Land disposal includes any placement of hazardous waste in a landfill, surface impoundment, waste pile, injection well, land treatment facility, salt dome formation, salt bed formation, or underground mine or cave. RCRA section 3004(k).

EPA was required to promulgate land disposal prohibitions and treatment standards by May 8, 1990 for all wastes that were either listed or identified as hazardous at the time of the 1984 amendments, a task EPA completed within the statutory timeframes. RCRA section 3004 (d), (e), and (g). EPA is also required to promulgate prohibitions and treatment standards for wastes identified or listed after the date of the 1984 amendments (wastes referred to in this notice as "newly listed and identified wastes") within six months after the listing or identification takes effect. RCRA section 3004(g)(4).

EPA has filed with the District Court a proposed consent decree that would put the Agency on a schedule for adopting prohibitions and treatment standards for newly identified and listed wastes. The promulgation date for

the newly identified and listed wastes dealt with in this rule is set for June 1992. (EDT v. Reilly, Civ. No. 89-0598, D.D.C.)

The land disposal restrictions are effective upon promulgation. RCRA section 3004(h)(1). However, the Administrator may grant a national capacity variance from the effective date and establish a later effective date (not to exceed two years) based on the earliest date on which adequate alternative treatment, recovery, or disposal capacity which protects human health and the environment will be available. RCRA section 3004(h)(2). The Administrator may also grant a case-by-case extension of the effective date for up to one year, renewable once for up to one additional year, when an applicant(s) successfully makes certain demonstrations. RCRA section 3004(h)(3). See 55 FR 22526 (June 1, 1990) for a more detailed discussion on national capacity variances and case-by-case extensions.

In addition to prohibiting land disposal of hazardous wastes, Congress prohibited storage of any waste which is prohibited from land disposal unless such storage is solely for the purpose of the accumulation of such quantities of hazardous waste as are necessary to facilitate proper recovery, treatment or disposal. RCRA section 3004(j). The provision applies, of course, only to storage which is not also defined as land disposal in section 3004(k).

B. Pollution Prevention (Waste Minimization) Benefits

EPA's progress over the years in improving environmental quality through its media-specific pollution control programs has been substantial. Over the past two decades, standard industrial practice for pollution control concentrated to a large extent on "end-of-pipe" treatment or land disposal of hazardous and nonhazardous wastes. EPA believes that reducing or eliminating discharges and/or emissions to the environment through the implementation of environmentally sound recycling and source reduction practices sometimes offer more cost effective ways of achieving environmental goals.

The Agency has identified a number of waste streams where environmentally sound recycling has been identified as BDAT. For example, we are promulgating today in section IV.C alternate treatment standards for electroplating sludges (F006) and spent pickle liquor (K062), based on high temperature metals recovery (HTMR). The Agency has determined that many of these wastes have sufficient concentrations of metals (nickel and chromium), with low concentrations of interfering chemicals, to be amenable for recovery in HTMR units. Moreover, the Agency is granting a generic exclusion for F006 and K062 HTMR nonwastewater residuals, provided that these residuals meet designated concentration levels, are disposed of in Subtitle D units, and exhibit no characteristics of hazardous waste. (This exclusion is similar to the one that was promulgated on August 8, 1991 for K061. See 56 FR 41164, August 19, 1991.) The Agency expects that these provisions will encourage more generators to choose treatment technologies for their wastes which also recover some materials for reuse. In addition, treatment standards for the newly listed petroleum refining wastes (F037 and F038) are based on some recovery technologies (critical fluid extraction and thermal desorption), as well as on incineration.

II. Summary of Final Rule

Today's final rule is the first rulemaking adopting treatment standards

for newly identified and listed wastes as outlined in the consent decree described above.

Before discussing the final rule, EPA notes that certain aspects of the rule could be affected by the recently proposed rule (57 FR 21450, May 20, 1992) dealing with the question of when wastes are hazardous, concentration levels and circumstances when wastes are not hazardous, as well as circumstances when land disposal prohibitions might and might not apply. At present, however, the mixture and derived from rules remain in effect (57 FR 7628, March 3, 1992), and so apply to the rule adopted today. In addition, as explained in more detail later in the preamble, the Agency is codifying the so-called contained-in policy with respect to contaminated debris, and the preamble likewise explains how and when debris can be a hazardous waste based on application of this principle.

A. Newly Listed Wastes

EPA has promulgated a number of hazardous waste listings since enactment of HSWA in 1984. Section III of today's rule describes the treatment and/or recycling technologies that have been identified as BDAT for 20 of these listings and finalizes LDR treatment standards based on BDAT. Wastes included in today's rule include petroleum refining wastes (F037 and F038), wastes from the production of unsymmetrical dimethylhydrazine (K107-K110), wastes from the production of dinitrotoluene and toluenediamine (K111 and K112), wastes from the production of ethylene dibromide (K117, K118, and K136), wastes from the production of ethylenebisdithiocarbamic acid (K123-K126), wastes from the production of methyl bromide (K131 and K132), and several organic U wastes (U328, U353, and U359). Future proposals will include newly listed wastes not covered in today's rule. Soil contaminated with the newly listed wastes for which standards are finalized today will be addressed in a future proposal.

B. Changes to Current Regulations

The Agency is finalizing revisions to the existing treatment standards for organic constituents in F001-F005 wastes, involving conversion from TCLP standards to standards based on total concentrations. In addition, the Agency is finalizing the conversion of wastewater standards for 24 F and K waste codes based on wastewater treatment data for the constituents of concern.

EPA is also finalizing alternate treatment standards for F006 and K062, and is also extending the K061 generic exclusion published on August 19, 1991 (56 FR 41164) to certain F006 and K062 wastes. The generic exclusion levels have been slightly revised to reflect a somewhat different fate and transport model, the EPA Composite Model for Landfills (EPA CML).

EPA is also revising the notification and certification for prohibited characteristic wastes and clarifying existing rules regarding the status under part 268 of wastes listed solely because they exhibit a characteristic.

Finally, EPA is establishing a new waste management unit known as a containment building. EPA is indicating that containment buildings are not land disposal units, so that hazardous wastes may be managed in such units without first meeting treatment standards.

C. Hazardous Debris

Debris contaminated with listed prohibited wastes is already subject to the LDR treatment standards for those wastes, as is debris exhibiting a hazardous waste characteristic for which EPA has promulgated treatment standards.

Today, the Agency is revising the treatment standards for such debris. The Agency is also finalizing treatment standards for debris that is contaminated with those newly listed wastes for which standards are promulgated in this rule. This rule does not identify or list any debris as hazardous, and so does not bring any additional debris into the subtitle C management system.

Only hazardous debris that is currently subject to subtitle C standards is covered by today's rule. The Agency is requiring hazardous debris to be treated prior to land disposal, using specific technologies from one or more of the following families of debris treatment technologies: Extraction, destruction, or immobilization. In the alternative, hazardous debris may continue to be handled in accordance with the Agency's contained-in policy, and so may be land disposed if it no longer "contains" a hazardous waste.

To ensure effective treatment of debris (i.e., treatment sufficient to constitute BDAT), treatment must be performed in accordance with specified performance standards (see new Table 1 in today's rule). The consequence of performing this treatment would be two-fold. Not only would the debris no longer be prohibited from land disposal, but EPA would consider the treated debris to no longer be or contain a hazardous waste provided a destruction or extraction technology is used for all debris types/contaminant combinations and provided that the treated debris does not exhibit any characteristic of hazardous waste. Such treated debris could, therefore, be reused, returned to the natural environment, or disposed of in a subtitle D facility.

Residuals generated from the treatment of debris contaminated with listed wastes would still be hazardous wastes by virtue of the derived-from rule and would be subject to the hazardous waste management system. The Agency is today requiring that residuals generated from the treatment of hazardous debris be subject to the numerical treatment standards for the wastes contaminating the debris. A detailed discussion is provided in section V.G.

Finally, the Agency considered and rejected proposing numerical standards for hazardous debris because of the difficulty of sampling hazardous debris.

However, based on numerous comments to the proposed rule, EPA is allowing people the option of treating debris to meet the existing treatment standards. Such debris would remain hazardous waste under the derived-from rule, unless delisted.

III. Detailed Discussion of Final Rule: Newly Listed Wastes

Since the enactment of HSWA in 1984, EPA has promulgated a number of hazardous waste listings under 40 CFR part 261 subpart D and has expanded the number of wastes covered under 40 CFR part 261 subpart C. This section of today's rule describes the treatment and/or recycling technologies that

have been identified as BDAT for 20 of these "newly listed" wastes. The Agency is finalizing treatment standards under 40 CFR 268.41, .42, and .43 for these wastes based on the transfer of performance data from treating other hazardous wastes that have been determined to be similar or more difficult to treat than these wastes.

This section does not, however, finalize treatment standards for the following newly identified or listed hazardous wastes: Those recently identified under the TC rule (D018-D043); characteristic wastes generated by mineral processing activities; spent potliners from aluminum manufacturing (K088); and listed wastes from wood preserving (F032, F034, and F035). These wastes, as well as wastes from coking operations and chlorotoluene production, will be addressed in subsequent Federal Register notices.

Before discussing these new treatment standards, the Agency wishes to clarify one point as to its methodology in establishing treatment standards.

The Agency has explained in a number of past preambles that it accounts for treatment process variability in establishing treatment standards, and does so by applying a statistically derived variability factor to the mean concentration of constituent concentrations in treatment residues from the model BDAT technologies (see 55 FR 22539 as an example). This variability factor, EPA has explained, is derived through a quantitative procedure that determines the statistical 99th percentile for the treatment standard.

Some commenters have inferred from this explanation that the treatment standards can only be achieved 99 percent of the time even by properly operated treatment units. This is an incorrect inference, although EPA acknowledges that some of its preamble language has promoted this reading. In fact, EPA expects the treatment standards to be achievable 100 percent of the time by properly operating facilities. Data points above the 99th percentile of the statistical model would in fact represent extreme departures from the mean and almost certainly reflect quality control problems in operation of the treatment technology. All of the data used in establishing treatment standards are actually much lower than 99th percentile values, as well as values in excess of that 99th percentile. (In addition, as EPA has already explained, for standards based on combustion technology, the technology routinely reduces waste concentrations to lower than detection values, yet the treatment standards nevertheless apply a variability factor to a numerical detection limit, resulting in treatment standards that are "greater than the achievable levels (which are at or below the detection limits) and should be easily met by a well-designed, well-operated incineration system."

A. Recent Petroleum Refining Wastes (F037 and F038)

F037--Any sludge generated from the gravitational separation of oil/water/solids during the storage or treatment of process wastewaters and oily cooling wastewaters from petroleum refineries. Such sludges include, but are not limited to, those generated in: Oil/water/solids separators; tanks and impoundments; ditches and other conveyances; sumps; and stormwater units receiving dry weather flow. Sludge generated in storm water units that do not receive dry weather flow, sludges generated from non-contact once-through cooling waters segregated for treatment from other process or oily cooling waters, sludges generated in aggressive biological treatment units as defined in 40 CFR Sec. 261.31(b)(2) (including sludges generated in one or more additional units after wastewaters have been treated in

aggressive biological treatment units) and K051 wastes are not included in this listing

F038--Any sludge and/or float generated from the physical and/or chemical separation of oil/water/solids in process wastewaters and oily cooling wastewaters from wastewaters from petroleum refineries. Such wastes include, but are not limited to, all sludges and floats generated in: Induced air flotation (IAF) units, tanks and impoundments, and all sludges generated in DAF units. Sludges generated in storm water units that do not receive dry weather flow, sludges generated from non-contact once-through cooling waters segregated for treatment from other process or oily cooling waters, sludges and floats generated in aggressive biological treatment units as defined in Sec. 261.31(b)(2) (including sludges and floats generated in one or more additional units after wastewaters have been treated in aggressive biological treatment units) and F037, K048, and K051 wastes are not included in this listing

F037 and F038 are hazardous wastes generated by facilities in the petroleum refining industry. Detailed technical descriptions of the specific processes or operations that generate these two wastes can be found in 45 FR 74884, May 19, 1980; 55 FR 46354, November 2, 1990; 56 FR 21955, May 13, 1991; and the associated listing background document.

EPA is today promulgating treatment standards for F037 and F038; these standards are the same as those proposed on January 9, 1992 (57 FR 958). (The specific regulated constituents and treatment standards for these wastes are listed in the tables at the end of this section). Since EPA is promulgating concentration levels as the treatment standards for wastewater and nonwastewater forms of F037 and F038, any treatment technology capable of reaching the treatment standards can be used except for impermissible dilution.

EPA's rationale and technical details for promulgating today's treatment standards can be found later in this section of the preamble and in the Final BDAT Background Document for F037 and F038. However, in summary, commenters to the January 9, 1992, proposal generally concurred with EPA's assertion that F037 and F038 have similar treatment characteristics to those of K051 and K048 (as well as other petroleum wastes). Most commenters also supported the transfer of available K048-K052 performance data from K048 to F038 and from K051 and K049 to F037. In fact, new data submitted to EPA in response to the May 30, 1991, Advance Notice of Proposed Rulemaking (ANPRM) and the January 9, 1992, proposal corroborates EPA's transferring of existing K048- K052 performance data to F037 and F038. These new data show that there are other technologies in addition to incineration and solvent extraction that are capable of achieving the treatment standards for the regulated constituents of concern in petroleum wastes believed as difficult to treat as F037 and F038.

The majority of commenters also supported EPA's proposal for regulating the same constituents in F037 and F038 that are regulated in K051 and K048. These commenters agreed with EPA that adoption of the proposal should reduce the administrative requirements and compliance efforts required for the petroleum wastes.

1. Regulated Constituents

EPA proposed regulating up to 18 BDAT List hazardous constituents that are

known to be present in wastewater or non-wastewater forms of F037 or F038 as well as additional hazardous constituents likely to be present in F037 and F038 because they are known to be present in K048 and K051. (See discussion in January 9, 1992, proposed rule, 57 FR 962.)

One commenter who generates petroleum wastes such as API and DAF sludges, submitted data characterizing "four K sludges and five potential refinery F waste sludges from five surface impoundments." The commenter believes that these data do not support the inclusion of most of the constituents of concern associated with the LDRs.

EPA is not persuaded to change its proposed approach. The fact that the commenter's presumably untreated K or F sludges do not show certain constituents at or above detection levels should not be construed as an indication that those undetected constituents were absent. EPA's treatment studies on petroleum wastes have shown, in fact, that it is not unusual for hazardous constituents to go undetected in untreated wastes due to analytic matrix interferences and, later on, be measured in the treated wastes when the interferences are removed by treatment. In addition, several members of the regulated community responding to the ANPRM of May 30, 1991, commented that F037 and F038 wastes are likely to show variabilities in chemical and physical composition and in the treatment characteristics for the same K or F wastes from one refinery to another.

EPA is therefore promulgating treatment standards for all those constituents proposed for regulation. Regulating the same constituents present in K048 and K051 should reduce the administrative requirements and compliance efforts for all of these petroleum wastes. (See Response to Technical Comments Background Document for additional discussion.)

2. Treatment Standards for Wastewaters

EPA proposed to transfer the treatment standards for organics in wastewater forms of F037 and F038 from the F039 wastewater treatment standards (multi- source leachate). These F039 wastewater treatment standards were also proposed as a revision to K048 and K051. All commenters supported this proposal. As a result, EPA is promulgating these wastewater treatment standards for F037 and F038.

For metals in wastewater forms of F037 and F038, the treatment standards are based on chromium reduction followed by lime and sulfide precipitation and vacuum filtration. For cyanides in wastewater forms of F037 and F038, the treatment standards are based on incineration. Levels of cyanide were measured, in fact, in K048 incineration scrubber waters. EPA does not expect any constituents in F037 and F038 to interfere or behave differently from those constituents in K048-K052 or from the other wastes from which performance data were transferred.

3. Treatment Standards for Nonwastewaters

EPA is promulgating the treatment standards for F037 and F038 nonwastewaters that were proposed. In particular, the treatment standards proposed for the metals in nonwastewater forms of F037 and F038 were based on stablization of K048-K052 solvent extraction residuals; thus, these standards are set as concentrations measured in waste extracts (as measured by the TCLP). Similarly, EPA proposed for cyanide in nonwastewater forms of F037 and F038 treatment standards based on incineration of K048 and K051. Owing to the similarities in waste composition of F037 and F038 to

K048-K052, stabilization is considered BDAT for the metals in F037 and F038 nonwastewaters and incineration is considered BDAT for cyanide in F037 and F038 nonwastewaters.

The proposed treatment standards for the organics in nonwastewater forms of F037 and F038 were based on the incineration and solvent extraction of K048- K052. Owing to the similarities in waste composition of F037 and F038 to K048-K052, EPA has determined that incineration and solvent extraction are also BDAT for F037 and F038. The majority of the commenters supported this determination by EPA. In doing so, EPA is applying the same approach as used to develop treatment standards for the K048-K052 wastes in the Third Third rule. In essence, allowing somewhat more lenient treatment standards than those based on performance of incineration alone, which standards nevertheless result in substantial reductions in waste toxicity and also allow for hydrocarbon recovery, furthering statutory resource recovery objectives.

EPA's modified methodology of June 1, 1990, incorporates protocols that take into account several concerns that were expressed by members of the regulated community and hazardous waste treatment industry at that time with regard to the use and the applicability of hydrocarbon recovery technologies for the whole spectrum of petroleum refining wastes. EPA also adopted the modified statistical analysis for determining which technology performs best so as not to preclude the use of one or more hydrocarbon recovery technologies that can significantly reduce levels of toxic organics in these wastes, and also recover some of the wastes' hydrocarbon values.

After evaluating comments on the Third Third proposal, EPA determined that it was appropriate to promulgate treatment standards based on both incineration and hydrocarbon recovery technologies. EPA concluded further that although treatment standards based on solvent extraction may be somewhat higher (i.e., less stringent) than those based on incineration, solvent extraction was still providing substantial treatment to the organics of concern. In addition, EPA determined that solvent extraction provided the benefit of recovering valuable oil, and this benefit could also be provided by other available hydrocarbon recovery technologies such as thermal distillation. (See 55 FR 22596, June 1, 1990). This same reasoning applies to the F037/F038 wastes that are the subject of today's rule.

4. Response to Major Comments

The Agency is responding in this preamble to a number of the major comments received in response to the January 9, 1992, proposal. The major issues raised and addressed in this section are:

** Grab versus Composite Samples.

** Must the Treatment Standards for Nonwastewater Organics be More Stringent?

Other comments received by the Agency, including the review of new performance data, are addressed by the Agency in the Response to Technical Comments Background Document that is available in the docket associated with this rulemaking.

a. Grab versus Composite Samples. The American Petroleum Institute (API)

and the National Petroleum Refiners Association (NPRA) are both trade associations that represent most members of the petroleum refining regulated community. API and NPRA support EPA's proposed treatment standards for the organics in wastewater forms of F037 and F038. Since the majority of the treatment performance data are based on composite samples from wastewater treatment processes, API and NPRA urged the Agency to enforce the applicable treatment standards for wastewater forms based on composite samples and not on grab samples.

EPA in fact, enforces treatment standards based on the sampling analysis protocol used (i.e., grab or composite) to support promulgation of the standard, Secs. 268.41(a), 268.43(a). EPA's proposal mistakenly stated in the preamble tables that enforcement of these wastewater treatment standards would be based solely on grab samples for all the regulated constituents. EPA is correcting this error in the final rule. (See 268.41 and 268.43).

b. Should the Treatment Standards for Nonwastewater Organics be More Stringent? TDI Thermal Dynamics (formerly Southdown Thermal Dynamics) resubmitted comments on a thermal process that enables the recovery of valuable organics from petroleum wastes while reducing the volume of wastes needing land disposal. TDI's data are based on the treatment of K048, K049, and K051 by a thermal distillation patented process referred to by the commenter as "HT-5 Process." TDI's data show that all the proposed organic treatment standards can be achieved, indeed, potentially surpassed, through use of this technology.

Another treatment company, Retec, also submitted comments in support of the proposed treatment standards. Retec's comments include performance data from an "8,000 gallon prototype unit" and some "field data" that have treated sludges of K048, K050, K051, F037, and F038 by biological treatment. Retec refers to its biological treatment process as the "bioslurry process." These data show that most of the constituents of concern can be treated to achieve (or, in some cases, surpass) the treatment standards.

The two commenters' ultimate point is that their technologies remove more toxics than the proposed levels and should therefore be the basis for the promulgated standards.

Comments submitted by TDI and the Natural Resources Defense Council (NRDC) also state that EPA's proposed F037 and F038 treatment standards are not protective of human health and the environment and so do not satisfy the RCRA section 3004(m) criteria requiring substantial reduction in the toxicity of the waste so that threats to human health and the environment are minimized.

TDI believes, in fact, that their "HT-5 Process", the CF Systems' five-path process, and fluidized incineration meet the 3004(m) criteria and that data from these three processes should support promulgation of more stringent standards. TDI and NRDC also urged EPA to promulgate treatment standards that are pursuant to EPA's protocols to establish "best" treatment and that conform to Congressional intent in section 3004(m).

EPA has reviewed comments from TDI and NRDC. Based on this review, EPA is not persuaded to promulgate more stringent standards. EPA also believes (contrary to TDI's and NRDC's positions) that today's promulgated treatment standards provide substantial treatment of F037 and F038 wastes.

First, EPA is not persuaded by NRDC's comments that, by setting treatment standards for F037 and F038 based on "less effective treatment technologies such as incineration (and solvent extraction), (EPA) may diminish the market and the availability of HT-5 for mixed wastes." Even if this were a relevant consideration, which it most likely is not, today's promulgated treatment standards are expressed as a concentration-based level for all of the (organic) constituents regulated in nonwastewater forms of F037 and F038. EPA has clearly emphasized that today's standards do not preclude the use of other treatment or recovery technologies.

The actual issue is whether the statute requires that technology-based treatment standards be optimized, i.e., be technology-forcing, in all cases (always assuming that the jurisdictional minimize threat level is not yet reached), or whether treatment that results in substantial reduction of waste toxicity is sufficient.

Technology-based treatment standards are permissible as a means of achieving the statutory objective of treatment that minimizes threats given the current uncertainty in determining what that level is (see 55 FR 6641, February 26, 1990) and HWTC v. EPA, 886 F. 2d 355, 362 (D.C. Cir. 1989).
(However, technology standards are not the only means to achieve the statutory objectives. For example, the Agency recently proposed concentration levels that could serve as "minimize threat levels", which could require modification of a purely technology-based approach to establishing treatment standards (57 FR 21450, May 20, 1992.)) However, these technology-based standards need not be technology forcing. Rather, the Agency has stated that treatment standards are to be based on the use of available technologies that are capable of substantially reducing the threats that the wastes may pose when they are land disposed (55 FR 6641).

The legislative history confirms that Congress did not necessarily envision section 3004(m) treatment standards to be technology-forcing, such as these the commenters advocate. Rather, such standards were intended to require the use of generally available effective types of treatment (see 125 Cong. Rec.
S9178, July 25, 1984, statement of Senator Chaffee introducing the amendment that became section 3004 (m)):

The requisite levels (or) methods of treatment established by the Agency should be the best that has (sic) been demonstrated to be available. This does not require a BAT-type process as under the Clean Air or Clean Water Acts which contemplates technology-forcing standards. The intent here is to require utilization of available technologies in lieu of continued land disposal without prior treatment. (Congressional Record of July 25, 1984, S9178).

Thus, standards based on use of "best" treatment technologies need not be limited to optimally performing treatment (as under the Clean Water Act), but include available types of treatment that substantially reduce wastes' toxicity and short-term and long-term threats the wastes could pose when land disposed.

In light of this legislative intent, and the fact that BDAT for F037 and F038 wastes is based on the performance of two commercially available treatment technologies that provide substantial treatment to petroleum wastes that are as difficult to treat as F037 and F038, EPA believes that

the BDAT Methodology adopted in this rulemaking is justified and allowed under 3004(m). Detailed discussions of EPA's data analysis and rationale can be further found in the Final BDAT Background Document for F037 and F038.

TDI also argued that EPA's approach is inconsistent with the Agency's own promulgated methodology for establishing treatment standards. To some extent, this argument reprises the point just addressed. (For example, the commenter's point that use of Analysis of Variability protocols show that performance of its technology to be superior really raises the further question of whether treatment standards must therefore be based on performance of that technology). In any case, EPA used the same revised methodology it adopted in developing the treatment standards for K048-K052 wastes in the Third Third rule.

TDI submitted comments regarding EPA's Methodology and Protocols for Developing BDAT Treatment Standards for F037/F038 wastes. TDI disputes EPA's evaluation of their performance data and, in particular, EPA's determination of the proposed treatment standards for organics in nonwastewater forms of F037 and F038. TDI submitted a report entitled Analysis of U.S. EPA's Proposed Land Disposal Restrictions for F037 and F038 Newly Listed Petroleum Refining Wastes. On the basis of this report, TDI believes EPA has violated its own "standard protocol procedures", and, after reanalyzing all the performance data, TDI urged EPA to withdraw the proposed treatment standards.
TDI's comments (and TDI's technical report) seem to indicate that TDI analyzed the F037 and F038 proposal's performance data based on EPA's protocols and statistical procedures found in the Final Best Demonstrated Available Technology (BDAT) Background Document for Quality Assurance/Quality Control Procedures and Methodology of October 23, 1991. TDI reviewed the available performance data based on analyses and methodologies that EPA employs when developing treatment standards that are based on destruction or immobilization treatment technologies.

However, the QA/QC document clearly states that when EPA identifies the potential for developing treatment standards based on recovery or recycling technologies, EPA may choose to modify its methodology in developing BDAT treatment standards (EPA also used modified methodologies in the promulgation of amended organic treatment standards for K048-K052, in the Third Third final rule, and the recent final rule for K061, High Zinc Subcategory nonwastewaters. A brief description of each of EPA's modified approaches is presented in the October 23, 1991, document (see pp. 3-12--3-17, of the October 23, 1991, Quality Assurance/Quality Control Document)). This is exactly what EPA is doing here; see the Proposed BDAT Background Document for F037 and F038 for the explanation.

BDAT Treatment Standards for F037
(Nonwastewaters)

Regulated constituent	Maximum for any single grab sample--Total composition (mg/kg)
Anthracene	28
Benzene	14
Benzo(a)anthracene	20
Benzo(a)pyrene	12

B. Wastes from the Production of Unsymmetrical

Dimethylhydrazine (K107, K108, K109, and K110)
K107--Column bottoms from product separation from the production of 1,1-dimethylhydrazine from carboxylic acid hydrazides
K108--Condensed column overheads from product separation and condensed reactor vent gases from the production of 1,1-dimethylhydrazides from carboxylic acid hydrazine
K109--Spent filter cartridges from product purification from the production of 1,1-dimethylhydrazides from carboxylic acid intermediates
K110--Condensed column overheads from intermediate separation from the production of 1,1-dimethylhydrazine from carboxylic acid hydrazide intermediates

EPA proposed on January 9, 1992 (57 FR 965) to establish treatment standards for these wastes expressed as required methods of treatment. As was discussed in the preamble to the proposed rule, these wastes are being regulated despite the fact that EPA is not aware of facilities generating them. For nonwastewater forms of these wastes, the required method of treatment was incineration. For wastewater forms, the required methods of treatment were incineration or, alternatively, chemical oxidation followed by carbon adsorption. The basis for expressing the proposed treatment standards as required methods of treatment was that these wastes are relatively unstable in water resulting in difficulties in accurate quantification in treatment residues. (See 57 FR 965.)
The wastewater standards promulgated today for these wastes differ from the proposed standards in that EPA is adding biodegradation followed by carbon adsorption, (BIODEG fb CARBN) to the methods designated as method-of- treatment standards for K107-K110 wastewaters in tables 1 and 2 of 40 CFR 268.42. The Agency is adding this standard to be consistent with other sections of this rulemaking, where in response to comments supporting the use of biodegradation as an alternative method of treatment, the Agency is promulgating biological treatment as equivalent to chemical oxidation. The Agency is including biodegradation plus carbon adsorption for these hydrazine wastes based on hydrolysis data indicating that hydrazines break down rapidly in water.

The definition of BIODEG as a technology-based standard for listed wastewaters calls for operating the unit such that "a surrogate compound or indicator parameter has been substantially reduced in concentration in the residuals." EPA believes that this provision allows permitting and compliance authorities enough control over the BIODEG unit so that

biodegradation can be designated BDAT for these wastes, which are known to hydrolyze rapidly to compounds amenable to biological degradation.

EPA received no comments on its proposed treatment standards for the nonwastewater forms of these wastes. Therefore, the Agency is promulgating the treatment standards for K107-K110 nonwastewaters as proposed: incineration (INCIN) as a method of treatment.

C. 2-Ethoxyethanol Wastes (U359)

EPA is promulgating methods of treatment for 2-ethoxyethanol wastes (U359), whose generation and characteristics are described in the proposed rule preamble (57 FR 968). The promulgated standards differ somewhat from the proposed standards; first, EPA is adding biodegradation followed by carbon adsorption, (BIODEG fb CARBN) to the methods designated as method-of- treatment standards for U359 wastewaters in Tables 1 and 2 of 40 CFR 268.42.

The proposed wastewater treatment standard was incineration or chemical oxidation followed by biological treatment or carbon adsorption. Second, EPA is promulgating also fuel substitution (FSUBS) as an alternative standard to incineration (INCIN) for U359 nonwastewaters. (See 57 FR 969.)

EPA had proposed methods-of-treatment as standards, rather than concentration-based numerical standards, because this waste is relatively unstable in water, resulting in difficulties in accurate quantification in treatment residuals. Several commenters, however, requested that the Agency set concentration-based standards for 2-ethoxyethanol wastes and suggested several innovative analytical methods to quantify 2-ethoxyethanol. EPA acknowledges that 2-ethoxyethanol can be quantified by direct injection methods (i.e. those not requiring a purge step in the analytical procedure).

EPA is, nevertheless, promulgating methods of treatment as standards because EPA has only limited treatability data for 2-ethoxyethanol to serve as a basis for calculating numerical treatment standards. EPA's decision to change the wastewater standards to include biodegradation followed by activated carbon adsorption is consistent with the revision in this rule of the K107- Kl10 wastewater standards allowing BIODEG as a method-of-treatment based on the waste components' extreme instability in water.

The definition of BIODEG as a technology-based standard for listed wastewaters calls for operating the unit such that "a surrogate compound or indicator parameter has been substantially reduced in concentration in the residuals." EPA believes that this provision allows permitting and compliance authorities adequate control over the BIODEG unit so that biodegradation can be designated BDAT for these wastes since 2-ethoxyethanol is known to hydrolyze rapidly to ethanol, which is known to be amenable to biological treatment.

EPA is promulgating incineration (INCIN) as a method-of-treatment standard for U359 nonwastewaters as proposed, but is also including fuel substitution (FSUBS) as an alternative. EPA is adding FSUBS because 2-ethoxyethanol is a readily oxidizable carbon, hydrogen, and oxygen compound that will not release undesirable combustion products such as halogen acids, nitrogen, or sulfur dioxides.

D. Wastes From the Production of Dinitrotoluene and Toluenediamine (K111

and K112, U328 and U353)

K111--Product wash waters from the production of dinitrotoluene via nitration of toluene
K112--Reaction byproducts from the drying column in the production of toluenediamine via hydrogenation of dinitrotoluene
U328--Ortho-toluidine
U353--Para-toluidine

EPA proposed on January 9, 1992, to establish treatment standards for these wastes expressed as required methods of treatment. The proposed rule discussed the generation and characteristics of these wastes in greater detail (57 FR 965). For nonwastewater forms of these wastes, the required method of treatment was incineration. For wastewater forms, the required methods of treatment were incineration or, alternatively, chemical oxidation followed by carbon adsorption. The basis for expressing the proposed treatment standards as required methods of treatment was that many constituents of these wastes are relatively unstable in water resulting in difficulties in accurate quantification in treatment residues. (See 57 FR 965)
The Agency is finalizing the proposed standards with two substantive changes for K111, K112, U328, and U353: First, EPA is replacing the proposed methods-of-treatment standards for K111 wastewaters and nonwastewaters with concentration-based standards numerically equal to the F039 standards for 2,4-dinitrotoluene and 2,6-dinitrotoluene. Second, EPA is adding biodegradation followed by carbon adsorption (BIODEG fb CARBN) to the methods of treatment specified as treatment standards for K112, U328, and U353 wastewaters in Tables 1 and 2 of 40 CFR 268.42.

In particular, data from one commenter indicated that the concentrations of 2,4-dinitrotoluene and 2,6-dinitrotoluene in K111 wastewaters and nonwastewaters are sufficiently high such that treating the K111 wastes to the F039 treatment standards for these constituents should be an acceptable surrogate to ensure that the other constituents are treated to acceptably low levels.

The other constituents include nitrocresols, nitrophenols, and nitrobenzoic acid; since reliable analytical methods are not available to quantify these constituents in waste matrices, the Agency will not set concentration-based treatment standards for them. By setting concentration-based standards for the quantifiable components of K111 wastewaters and nonwastewaters, EPA is allowing the use of any treatment system (other than impermissible dilution) that meet these numbers for the dinitrotoluenes.

Data from this same commenter also indicated that biological treatment can achieve significant reductions in the concentration of toluenediamines in K112 wastewater streams. Based on the commenter's data demonstrating substantial reductions in K112 wastewater toluenediamine concentrations in the course of biological treatment, EPA is adding biodegradation (BIODEG) to the set of methods-of-treatment designated as treatment standards for K112 wastewaters.

EPA believes, in addition, that o-toluidine and p-toluidine, the listing components of U328 and U359, are sufficiently chemically similar to toluenediamines that the treatment standards for K112 should also apply to U328 and U359 wastes. EPA is, therefore, including BIODEG among the

methods- of-treatment standards promulgated for U328 and U359 wastewaters.

The definition of BIODEG as a technology-based standard for listed wastewaters calls for operating the unit such that "a surrogate compound or indicator parameter has been substantially reduced in concentration in the residuals." EPA believes that this provision allows permitting and compliance authorities adequate control over the BIODEG unit so that biodegradation can be designated BDAT for these wastes, which have been documented to amenable to biological treatment.

EPA is promulgating treatment standards for K112, U328 and U359 nonwastewaters as proposed: incineration (INCIN) as a method of treatment.

BDAT Treatment Standards for K111
(Nonwastewaters)

Regulated constituent	Maximum for any single grab sample--Total composition (mg/kg)
2,4-Dinitrotoluene	140
2,6-Dinitrotoluene	28

BDAT Treatment Standards for K111
(Wastewaters)

Regulated constituent	Maximum for any single grab sample--Total composition (mg/l)
2,4-Dinitrotoluene	0.32
2,6-Dinitrotoluene	0.55

E. Wastes From the Production of Ethylene Dibromide (K117, K118 and K136) and Wastes From the Production of Methyl Bromide (K131 and K132)

K117--Wastewater production from the reactor vent gas scrubber in the production of ethylene dibromide via bromination of ethylene.

K118--Spent adsorbent solids from purification of ethylene dibromide via bromination of ethylene dibromide via bromination of ethylene.

K136--Still bottoms from the purification of ethylene dibromide in the production of ethylene dibromide via bromination of ethylene.

K131--Wastewater from the reactor and spent sulfuric acid from the acid dryer from the production of methyl bromide.

K132--Spent adsorbent and wastewater separator solids from the production of methyl bromide.

With one exception, today's rule promulgates the treatment standards for ethylene dibromide wastes (K117, Kl18 and K136) and methyl bromide wastes (K131 and K132) that the Agency proposed in the January 9, 1992 proposed rule, where it discussed the generation and characteristics of these wastes

(57 FR 966-967). These are concentration-based standards numerically equal to the FO39 standards for the constituents of these wastes; the BDAT Background Document for U and P Wastes and Multi-Source Leachate (F039) (volumes A and C) describes how each standard was calculated. The nonwastewater standards (volume C) are based on the results of a series of incineration tests performed by the Agency in the course of developing treatment standards for earlier land disposal restrictions rulemakings. The wastewater standards (volume A) are based on data collected by EPA's Office of Water and Office of Research and Development and reflect a variety of industrial wastewater technologies. Technologies used to develop the wastewater numbers promulgated here include steam stripping, activated sludge, and air stripping.

The one change that EPA is making is as follows: EPA proposed treatment standards for "1,1,2-tribromomethane" in the January 9, 1992, notice (57 FR 996 and 997). (This was a misprint for 1,1,2-tribromoethane, a constituent present in the ethylene dibromide process waste stream K118). At the time of the proposed rule, EPA was considering adding 1,1,2-tribromoethane to its BDAT List of constituents known to be amenable to quantification in waste matrices with existing SW-846 methods. EPA has since decided not to add 1,1,2-tribromoethane to the BDAT List and is consequently not promulgating treatment standards for this compound.

As a result of soliciting data on the proposed standards in the May 30, 1991, Advance Notice of Proposed Rulemaking and then in the January 9, 1992, Proposed Rule, EPA received comments from the two facilities believed to generate all of these waste streams. Both supported the use of steam stripping for treating brominated wastewaters. One of the two commenters submitted data characterizing the results of steam stripping groundwater that had become contaminated with ethylene dibromide and several other brominated and chlorinated compounds. Because these data did not clearly identify corresponding influent and effluent streams, they could not be used to evaluate the performance of the system in terms of contaminant removal.

This commenter also endorsed the incineration-based numerical treatment standards for nonwastewater forms of these wastes. A second commenter objected, however, to the incineration-based nonwastewater standards. In particular, the commenter claimed that bromine forms corrosive hydrogen bromide in incinerator combustion chambers. This commenter, the sole generator of K118, reported difficulties in incinerating a batch of K118 nonwastewater at a commercial facility and requested that EPA base all treatment standards for organobromine wastes on steam stripping.

The Agency acknowledges that there may be difficulties in incinerating brominated wastes (even though one commenter explicitly endorses incineration-based standards for K117, K118, K131, and K132 nonwastewaters).

In the absence of performance data on an alternative process for nonwastewaters, EPA is promulgating the incineration-based nonwastewater standards that were originally proposed. Steam stripping, and any other forms of waste treatment other than impermissible dilution, may also be used to achieve the numerical treatment standards regardless of which technology served as the basis of the standards. Furthermore, the regulated community has options, including applying for treatability or capacity variances, for overcoming technical difficulties in treating especially problematic batches of wastes.

BDAT Treatment Standards for K117, K118, and K136 (Nonwastewaters)

Regulated constituent	Maximum for any single grab sample--Total composition (mg/kg)
Ethylene dibromide	15.0
Bromomethane	15.0
Chloroform	5.6

BDAT Treatment Standards for K117, K118, and K136 (Wastewaters)

Regulated constituent	Maximum for any single grab sample--Total composition (mg/l)
Ethylene dibromide	0.028
Bromomethane	0.11
Chloroform	0.046

BDAT Treatment Standards for K131 and K132 (Nonwastewaters)

Regulated constituent	Maximum for any single grab sample--Total composition (mg/kg)
Bromomethane (methyl bromide)	15

BDAT Treatment Standards for K131 and K132 (Wastewaters)

Regulated constituent	Maximum for any single grab sample--Total composition (mg/l)
Bromomethane (methyl bromide)	0.11

F. Wastes From the Production of Ethylenebisdithiocarbamic Acid (K123, K124, K125, and K126)

K123--Process wastewater (including supernatants, filtrates and wash waters) from the production of ethylenebisdithiocarbamic acid and its salts.

K124--Reactor vent scrubber water from the production of ethylenebisdithiocarbamic acid and its salts.

K125--Purification solids (including filtration, evaporation and centrifugation solids) from the production of ethylenebisdithiocarbamic acid and its salts.

K126--Baghouse dust and floor sweepings in milling and packaging operations from the production of ethylenebisdithiocarbamic acid and its salts.

EPA is promulgating the treatment standards as proposed for ethylenebisdithiocarbamic acid wastes (EDBC) (K123-K126). The preamble in the proposed rule describes the generation and characteristics of these wastes in greater detail (57 FR 967). The Agency proposed incineration (INCIN) as a method of treatment as the treatment standard for K123-K126 nonwastewaters and incineration or chemical oxidation followed by biological treatment or carbon adsorption (INCIN or CHOXD) for K123-K126 wastewaters. EPA received no comments challenging these treatment standards.

Although EPA is expanding the set of methods of treatment as standards to include BIODEG by itself for the methyl hydrazine wastes K107-K110, the toluenediamine waste K112, the toluidine wastes U326 and U353, and 2-ethoxyethanol U359, EPA is not adding BIODEG alone to the set of methods of treatment for the EDBC wastewaters. For each of the cases where EPA is today adding BIODEG to the list of promulgated methods of treatment as standards, EPA has either treatability data documenting successful treatment of these wastes or their close analogues in a biological unit or data demonstrating that these wastes readily hydrolyze to simple, relatively nontoxic compounds known to be readily amenable to biological degradation. In the absence of any such data about EDBC waste amenability to hydrolysis or biodegradation, EPA chooses not to include BIODEG as a primary method of treatment for EDBC wastewaters.

IV. Detailed Discussion of Final Rule: Changes to Existing Regulations

A. Revisions to the F001-F005 Spent Solvents Treatment Standards

F001--The following spent halogenated solvents used in degreasing: Tetrachloroethylene, trichloroethylene, methylene chloride, 1,1,1-trichloroethane, carbon tetrachloride, and chlorinated fluorocarbons; all spent solvent mixtures/blends used in degreasing containing, before use, a total of 10 percent or more (by volume) of one or more of the above halogenated solvents or those solvents listed in F002, F004, and F005 and still bottoms from the recovery of these spent solvents and spent solvent mixtures.

F002--The following spent halogenated solvents: Tetrachloroethylene, methylene chloride, trichloroethylene, 1,1,1-trichloroethane, chlorobenzene, 1,1,2-trichloro-1,2,2-trifluoroethane, ortho- dichlorobenzene, trichlorofluoromethane, and 1,1,2-trichloroethane; all spent solvent mixtures/blends containing, before use, a total of 10 percent or more of the above halogenated solvents or those listed in F001, F004, or F005; and still bottoms from the recovery of these spent solvents and spent solvent mixtures.

F003--The following spent nonhalogenated solvents: Xylene, acetone, ethyl acetate, ethyl benzene, ethyl ether, methyl isobutyl ketone, n-butyl

alcohol, cyclohexanone, and methanol; all spent solvent mixtures/blends containing, before use, only the above spent nonhalogenated solvents; and all spent solvent mixtures/blends containing, before use, one or more of the-above nonhalogenated solvents, and a total of 10 percent or more (by volume) of one or more of those solvents listed in F001, F002, F004, and F005; and still bottoms from the recovery of these spent solvents and spent solvent mixtures.

F004--The following spent nonhalogenated solvents: Cresol and cresylic acid and nitrobenzene; all spent solvent mixtures/blends containing, before use, a total of 10 percent or more (by volume) of one or more of the above nonhalogenated solvents or those solvents listed in F001, F002, and F005; and still bottoms from the recovery of these spent solvents and spent solvent mixtures.

F005--The following spent nonhalogenated solvents: Toluene, methyl ethyl ketone, carbon disulfide, isobutanol, pyridine, benzene, 2-ethoxyethanol, and 2-nitropropane; all spent solvent mixtures/blends containing, before use, a total of 10 percent or more (by volume) of one or more of the above nonhalogenated solvents or those solvents listed in F001, F002, or F004; and still bottoms from the recovery of these spent solvents and spent solvent mixtures.

The Agency is promulgating revised treatment standards for solvent wastewaters of F001-F005 wastes as proposed in the January 9, 1992 notice (57 FR 969-971).

1. Regulatory Background

a. Listing Definitions. On May 19, 1980 (45 FR 33119), the Environmental Protection Agency (EPA) listed 26 commonly used organic solvents as hazardous wastes when spent or discarded. The solvents were listed as EPA Hazardous Waste Nos. F001, F002, F003, F004, and F005. These listed wastes included certain spent halogenated and nonhalogenated solvents, including still bottoms from the recovery of these solvents.

On December 31, 1985 (50 FR 53315), the Agency promulgated an amendment to the listings to include mixtures containing a total of 10 percent or more (by volume) of one or more of the listed solvents (the 10 percent threshold always applied to solvent mixtures before use). The Agency believed that establishing a threshold level below the minimum solvent concentration typically used in solvent formulations would bring the majority of solvent mixtures used in commerce into the hazardous waste management system, while excluding dilute mixtures. The Agency also clarified in the December 31, 1985, Federal Register (50 FR 53315), that the listings cover only those solvents that are used for their "solvent" properties, i.e., to solubilize (dissolve) or mobilize other constituents. Manufacturing process wastes where solvents were used as reactants or ingredients in the formulation of commercial chemical products are not covered by the listing.

The definition of the spent solvents listing did not include four solvents that were added to the F001-F005 listing on February 25, 1986 (51 FR 40607): Benzene, 2-ethoxyethanol, 2-nitropropane, and 1,1,2-trichloroethane .

b. F001-F005 Treatment Standards. The Agency promulgated treatment standards for the F001-F005 spent solvent wastes on November 7, 1986 (51 FR 40593). The Agency also promulgated a requirement that compliance with the treatment standard be measured in the waste extract as measured by the Toxicity Characteristic Leaching Procedure (TCLP).

This approach was taken because useful data were not available on total constituent concentrations in treated residuals, and as a result, the TCLP data were considered to be the best measure of performance.

Since that time EPA has based treatment standards for all organic constituents on the total constituent concentration analysis found in the treated waste. EPA has based this decision on the fact that the best demonstrated available treatment (BDAT) for organic wastes generally destroy the hazardous organic constituents. Accordingly, treatment should reflect the extent to which the various organic compounds have been destroyed or the total amount of constituent remaining after treatment.

c. Methylene Chloride Standard Revised. As part of the First Third Rule, the Agency revised and promulgated the treatment standard for methylene chloride in F001-F005 wastewaters from the pharmaceutical industry (53 FR 31152). The revised treatment standard was based on the transfer of wastewater treatment data from steam stripping of methylene chloride. Compliance with this treatment standard is measured by a total constituent analysis.

d. Setting Treatment Standards for Four (4) "Newly Listed" Constituents (51 FR 6737, February 25, 1986). In the Third Third rule (55 FR 22576), the Agency promulgated treatment standards for 1,1,2-trichloroethane, benzene, 2- ethoxyethanol, and 2-nitropropane in F002 and F005 spent solvents. (EPA did not amend the previously promulgated treatment standards for the other solvent constituents in F002 and F005). The concentration-based treatment standards for 1,1,2-trichloroethane and benzene in wastewater forms were based on performance data generated from: biological treatment, steam stripping, carbon adsorption, liquid extraction, and others. The concentration-based treatment standards promulgated for 1,1,2-trichloroetha ne and benzene in nonwastewater forms were based on performance data from incineration. These treatment standards are measured by total constituent analysis. EPA had also determined that the available data were insufficient to establish concentration-based treatment standards for wastewater and nonwastewater forms of F005 containing 2-nitropropane and 2-ethoxyethanol and instead promulgated methods of treatment as the treatment standards. Again, EPA is not revising this previously promulgated treatment standard.

2. Overlap Between F001-F005 Solvents and Other BDAT Standards.

Many of the solvent constituents that are regulated in F001-F005 wastes are also regulated in the First, Second, and Third Third rules, as discussed in the preamble to the January 9, 1992 proposed rule (57 FR 970).

In the November 22, 1989 proposed rule for the Third Third wastes, EPA proposed two alternative sets of concentration-based treatment standards for wastewater forms for the majority of the U and P listed wastes, many of which are solvent constituents found in F001-F005 wastes. One set of treatment standards was based on the concentration of each constituent in

incinerator scrubber water; whereas, the second set of treatment standards was based on wastewater treatment performance data for each constituent. On the basis of comments received, the Agency promulgated treatment standards based on wastewater treatment performance data. These treatment standards were promulgated on June 1, 1990 (55 FR 22601).

The Agency also proposed treatment standards for nonwastewater forms of U and P listed wastes on November 22, 1989 (54 FR 48372). In the final Third Third rule, the Agency promulgated treatment standards for approximately 75 constituents, establishing either concentration-based standards, or incineration as a method of treatment as BDAT.

Treatment standards for several F and K listed wastes containing the same solvent constituents as are present in F001-F005 solvent wastes were also promulgated in the Third Third rule as discussed in the January 9, 1992 proposed rule (57 FR 970).

3. Comments Received on the January 9, 1992 Proposed Rule

The Agency received a number of generally favorable comments on the proposed approach--that is, most commenters supported revising the nonwastewater treatment standards from the existing TCLP standards to standards based on total concentrations. Hazardous Waste Treatment Council (HWTC) expressed concerns, however, with regard to meeting concentration based standards for five constituents: chlorobenzene, n-butyl alcohol, o-cresol, ethyl acetate, and nitrobenzeneone. EPA acknowledges HWTC's concerns with regard to potential analytical difficulties in the analysis of these five constituents. EPA has, in fact, addressed this issue in the June 1, 1990 final rule (55 FR 22541). If the treater uses incineration to treat these wastes and achieves a non-detect level within an order of magnitude of the promulgated treatment standards, then they are considered to have achieved the standard (see 55 FR 22541, June 1, 1990).

Most of HWTC's problem constituents would be able to comply with the treatment standard after the order of magnitude allowance is taken into account. One constituent, o-cresol, according to the data submitted by HWTC, appears to exceed the proposed treatment standard. After reviewing available incineration and combustion data for this constituent, EPA believes the proposed treatment standards (and the one order of magnitude allowance) are reasonable and achievable. In fact, the Agency has promulgated treatment standards for o-cresol in K019, F039 and U052 at a level of 5.6 ppm with detection limits of less than 2.0 ppm. Also, o-cresol is a regulated constituent in K052, whose treatment standard of 6.2 ppm is based on a detection limit of 2.2 ppm which was based on treatment data submitted from industry (55 FR 22594). EPA is therefore, promulgating today, treatment standards for each one of the five constituents as proposed on January 9, 1992 (57 FR 971).

4. Final Approach

The Agency is promulgating revised treatment standards for both nonwastewater and wastewater forms of F001-F005 wastes as proposed. (See the Table at end of this section for specific treatment levels.) The methodology used to develop the treatment standards for both nonwastewater and wastewater forms of F039 (multisource leachate) was used to determine the revised treatment standards for the F001-F005 spent solvents. These

revisions do not, however, include the four solvents that were added to the solvents listings: benzene, 2-ethoxyethanol, 2-nitropropane, and 1,1,2-trichloroethane.
Treatment standards for these constituents were promulgated in the Third Third final rule in accordance with the previously mentioned methodology.

Today's rule does not include revised treatment standards for nonwastewater forms of carbon disulfide, cyclohexanone, or methanol based on total constituent analysis. These three constituents are not well suited for total constituent analysis, and, in fact, are more appropriately analyzed by the TCLP methodology. The Agency did not propose to revise the existing TCLP treatment standards, for these three constituents, in the January 9, 1992 rulemaking. The Agency is retaining the existing TCLP standards for these three constituents in F001-F005 nonwastewaters in today's rulemaking. (TCLP treatment standards for these three constituents appear in a table at the end of this section).

Because the Agency does not want to require unnecessary and burdensome testing, the TCLP test will only have to be performed if the waste includes only one, two or all three of these constituents. If the waste contains any of these three constituents along with any of the other 26 constituents found in F001-F005 for which the Agency is promulgating treatment standards based on total constituents analysis, only the total analysis need be performed. It is assumed that after treatment is performed, for these organic constituents, and the total constituent standards are achieved, that these three constituents will also have been treated.

a. Revisions to the Standards for Cresols. In the Solvents and Dioxins rule, the Agency promulgated BDAT treatment standards for "cresols." At that time, the Agency did not distinguish between the various isomers that are present in cresols. As a result, the Agency promulgated a concentration-based treatment standard for cresol wastewaters of 2.82 mg/l based on the performance of activated carbon adsorption. For nonwastewaters, the Agency had no data on TCLP extracts of residues from the incineration of cresols (cresylic acid) to use in the development of the treatment standard. EPA, instead, used chemical structure as the basis for transferring the treatment data from methyl ethyl ketone to cresols (cresylic acid) in spent solvents.
The treatment standard of 0.75 mg/l for nonwastewaters is based on the transferred data.

In the Third Third rule, EPA promulgated treatment standards for U052. U052 is listed as "cresols (Cresylic acid). U052 typically contains various levels of ortho-cresol, meta-cresol, and para-cresol. Analytical methods are usually reported for o-cresol (CAS No. 95-48-7) and a combination of m- and p- cresols, because m-cresol and p-cresol cannot generally be distinguished by analytical methods. Thus, the Agency promulgated concentration-based standards for U052 based on an analysis for o-cresol and the mixture of m- cresol and p-cresol.

Based on this, the Agency is today modifying the current treatment standards for the constituent "cresols" in F001-F005 wastes as proposed. (57 FR 970, January 9, 1992).

b. Modification to the Regulatory Placement of F001-F005 Standards. In today's rule, EPA is promulgating revised treatment standards for solvent wastewaters (F001-F005) in Table CCW (40 CFR 268.43) as proposed. (The

following treatment standards for wastewaters are based on F039 wastewater data, and for nonwastewater is based on incineration data).

Promulgated BDAT Treatment Standards for F001-F005 Spent Solvent Wastes
(Wastewater; Total Concentration)

Regulated constituent	Wastewater (mg/l)
Acetone	0.28
n-Butyl alcohol	5.6
Carbon disulfide	0.014
Carbon tetrachloride	0.057
Chlorobenzene	0.057
Cresol(m- and p- isomers)	0.77
o-Cresol	0.11
Cyclohexanone	0.36
1,2-Dichlorobenzene	0.088
Ethyl acetate	0.34
Ethyl benzene	0.057
Ethyl ether	0.12
Isobutyl alcohol	5.6
Methanol	5.6
Methylene chloride	/1/ 0.089
Methyl ethyl ketone	0.28
Methyl isobutyl ketone	0.14
Nitrobenzene	0.068
Pyridine	0.014
Tetrachloroethylene	0.056
Toluene	0.08
1,1,1-Trichloroethane	0.054
Trichloroethylene	0.054
1,1,2-Trichloro-1,2,2,-trifluoroethane	0.057
Trichloromonofluoromethane	0.02
Xylenes (total)	0.32

/1/ The methylene chloride treatment standard for wastewaters generated from pharmaceutical plants is 0.44 mg/l.
NA: Not applicable.

Promulgated BDAT Treatment Standards for F001-F005 Spent Solvent Wastes
(Nonwastewater; Total Concentration)

Regulated constituent	Nonwastewater (mg/kg)
Acetone	160
n-Butyl alcohol	2.6
Carbon disulfide	/1/ NA
Carbon tetrachloride	5.6
Chlorobenzene	5.7
Cresol(m- and p- isomers)	3.2
o-Cresol	5.6
Cyclohexanone	/1/ NA
1,2-Dichlorobenzene	6.2
Ethyl acetate	33
Ethyl benzene	6.0
Ethyl ether	160

Toluene	28
1,1,1-Trichloroethane	5.6
Trichloroethylene	5.6
1,1,2-Trichloro-1,2,2,-trifluoroethane	28
Trichloromonofluoromethane	33
Xylenes (total)	28

/1/ These treatment standards are based on TCLP, not total constituent concentration (see following table with TCLP treatment standards).
NA: Not applicable.

Promulgated BDAT Treatment Standards for F001-F005 Spent Solvent Wastes (Nonwastewater; Toxicity Characteristic Leaching Procedure)

Regulated constituent	Nonwastewater (mg/l)
Carbon disulfide	4.8
Cyclohexanone	0.75
Methanol	0.75

B. Conversion of Wastewater Standards Based on Scrubber Water

K015--Still bottoms from the distillation of benzyl chloride
K016--Heavy ends or distillation residues from the production of carbon tetrachloride
K018--Heavy ends from the fractionation column in ethyl chloride production
K019--Heavy ends from the distillation of ethylene dichloride in ethylene dichloride production
K020--Heavy ends from the distillation of vinyl chloride in vinyl chloride production
K023--Distillation light ends from the production of phthalic anhydride from naphthalene
K024--Distillation bottom tars from the production of phthalic anhydride from naphthalene
K028--Spent catalyst from the hydrochlorinator reactor in the production of 1,1,1-trichloroethane
K030--Column bottoms or heavy ends from the combined production of trichloroethylene and perchloroethylene
K048--Dissolved air flotation (DAF) float from the petroleum refining industry
K049--Slop oil emulsion solids from the petroleum refining industry
K050--Heat exchanger bundle cleaning sludge from the petroleum refining industry
K051--API separator sludge from the petroleum refining industry
K052--Tank bottoms (leaded) from the petroleum refining industry
K087--Decanter tank tar sludge from coking operations
K093--Distillation light ends from the production of phthalic anhydride from ortho-xylene
K094--Distillation bottoms from the production of phthalic anhydride from ortho-xylene

U028--Bis(2-ethylhexyl)phthalate
U069--Di-n-butyl phthalate
U088--Diethyl phthalate
U102--Dimethyl phthalate
U107--Di-n-octyl phthalate
U190--Phthalic anhydride (measured as Phthalic acid)

On November 22, 1989 (54 FR 48372), EPA proposed as part of the Third Third rule concentration-based treatment standards for numerous listed wastes based on the performance of incineration. For the wastewaters, the treatment standards were based on the concentration of the constituents of concern in incineration scrubber waters. In the final rule (55 FR 22520), however, EPA altered its approach to setting these standards and promulgated treatment standards for wastewaters based on actual wastewater treatment data for the constituents of concern. This change was adopted for a number of reasons.

First, it was stated in the final rule for the Second Third wastes (54 FR 26629) and reiterated in the final rule for Third Third wastes (55 FR 22577) that when the Agency had appropriate wastewater treatment data from well- designed and well-operated wastewater treatment units it preferred to use those data rather than scrubber water data to develop wastewater treatment standards. This is because incineration is not a normal treatment method for wastewaters. In addition, alternative standards were proposed in the Third Third notice for multisource leachate (F039) wastewaters based on a transfer of performance data from various sources. Second, commenters on the proposed Third Third rule had urged the Agency to develop treatment standards for wastewater forms based on residues from wastewater treatment technologies rather than incineration scrubber waters. Commenters on previous rules had also stated that when EPA had performance data from technologies treating wastewaters containing the same or similar constituents that EPA should use it to develop treatment standards.

The Agency reviewed all of the aforementioned data during the Third Third comment period and promulgated constituent-specific concentration-based standards. Detailed information on the development of the wastewater treatment standards can be found in the background document titled Final Best Demonstrated Available Technology (BDAT) Background Document for U and P Wastes and Multi-Source Leachates (F039), Volume A: Wastewater Forms of Organic U and P Wastes and Multi-Source Leachates (F039) for Which There Are Concentration-Based Treatment Standards. (This document can be found in the RCRA docket for the Third Third final rule).

As part of the First Third and Second Third rules, EPA promulgated treatment standards for wastewater forms of 23 K and U wastes (i.e., K015, K016, K018, K019, K020, K023, K024, K028, K030, K048, K049, K050, K051, K052, K087, K093, K094, U028, U069, U088, U102, U107, and U190). These wastewater treatment standards were based on data from incineration scrubber waters.

Upon review of all available data and comments, the Agency believes that BDAT for these wastewaters is better represented by concentration-based treatment standards based on actual wastewater treatment technologies rather than scrubber waters generated from incineration. Therefore, the Agency is today promulgating concentration-based treatment standards for these wastewaters as proposed. The wastes affected by this change come primarily from three general treatability groups: chlorinated organics, petroleum wastes, and phthalate wastes. The Agency believes that this change is consistent with the changes made to the wastewater standards in

the final Third Third rule. It should be noted, however, that any technology not otherwise prohibited (e.g., impermissible dilution) may be used to meet the concentration-based treatment standards for these wastewaters, including incineration.

Finally, during the development of the Third Third rule, the Agency determined that for pentachloroethane (a regulated constituent in K018, K028, and K030), complications arose in terms of how reliably the constituent could be quantified (55 FR 22611). As such, the Agency made a decision to promulgate a method (or methods) of treatment, rather than a constituent- specific standard. Today, EPA is deleting pentachloroethane from further regulation in the wastewater forms of K018, K028, and K030, as discussed in the January 9, 1992 proposed rule. Treatment of other constituents will act as reliable surrogates for the treatment of pentachloroethane in these wastes.

Promulgated Treatment Standards for Various F and K Wastewaters

C. Revisions to Treatment Standards for K061, K062, and F006

With two exceptions, the Agency is promulgating as proposed the treatment standards for the iron and steel process wastes K061 and K062 and the electroplating waste F006. The January 9, 1992, proposed rule (57 FR 975-977) contained three major provisions for K061, K062, and F006: (1) Removing the Low Zinc and High Zinc subcategories for K061 electric arc furnace dust wastes and establishing the high zinc subcategory

nonwastewater standards for all K061 nonwastewaters regardless of zinc level; (2) setting alternative treatment standards for K062 and F006 nonwastewaters with recoverable amounts of nickel and chromium; and (3) excluding from regulation as a hazardous waste nonwastewater residues generated from high-temperature metals recovery (HTMR) treatment of F006 and K062 provided the residues meet the designated generic exclusion levels, they are disposed of in a subtitle D unit, and they do not exhibit one or more of the hazardous waste characteristics.

One of the two changes the Agency has made between proposal and promulgation consists of basing the promulgated generic exclusion on a different fate-and-transport model than the proposed exclusion and thus promulgating different exclusion levels for several contaminants. The second change is that EPA is promulgating neither treatment standards nor exclusion levels for vanadium, thus effectively deleting vanadium from the K061, K062, and F006 rulemaking.

The August 19, 1991 (56 FR 41164), final rule for K061 (electric arc dust) set numerical treatment standards for high-zinc K061 nonwastewaters based on the performance of high-temperature metals recovery units. This final rule also promulgated a generic exclusion from the derived-from rule for nonwastewater residues generated from HTMR processing of K061 wastes.

Today's rule extends both the HTMR-based treatment standards and the generic exclusion criteria for HTMR residues to K062 (steel finishing pickle liquor) and F006 (electroplating wastewater treatment sludges) nonwastewaters.

1. Removal of the Low Zinc Subcategory for K061 Wastes

The Agency is today transferring the treatment standards promulgated for high-zinc (greater than 15 percent) K061 nonwastewaters (56 FR 41164, August 19, 1991) to low-zinc K061 nonwastewaters; by doing this, the Agency eliminates the low- vs. high-zinc categories and regulates all K061 nonwastewaters with the same numerical treatment standards and generic exclusion levels. The promulgated treatment standards are based on the performance of high-temperature metals recovery (HTMR); however, since these are concentration-based standards, any technology, including stabilization, that meets the treatment standards can be used.

2. Alternative Treatment Standards for F006 and K062 Nonwastewaters Based on High Temperature Metals Recovery (HTMR)

The Agency is promulgating alternative treatment standards for K062 and F006 nonwastewaters as proposed. These treatment standards, based on HTMR, are the same as those promulgated in August 1991 for "high-zinc" nonwastewaters and the standards promulgated in this rule for all K061 nonwastewaters.

EPA is also promulgating a new regulatory section (40 CFR 268.46) for any treatment standards serving as alternates for compliance with standards in 40 CFR 268.41, 268.42 and 268.43.

The alternative treatment standards for F006 includes standards for cyanides. Although the Agency has no HTMR performance data for cyanide, EPA

believes (as discussed in the proposed rule at 57 FR 975) that HTMR treats cyanide to a level comparable to incineration. Since no commenters challenged this belief and there is no reason to believe HTMR units will not destroy cyanide as efficiently as incineration, EPA is promulgating alternative cyanide standards for F006 developed from incinerator performance. The HTMR- based alternative treatment standards are higher numerically for several constituents (chromium in K062; cadmium, nickel and silver in F006) than the original stabilization-based standards. These higher numbers are acceptable to the Agency as alternative treatment standards because the HTMR-based alternatives regulate more constituents than the original stabilization-based standards, and also because they express the Agency's preference for recycling methods.

3. Generic Exclusion of F006 and K062 HTMR Nonwastewater Residues

EPA is promulgating generic exclusion levels for nonwastewater residues generated from HTMR of F006 and K062 in rotary kilns, flame reactors, electric furnaces, plasma arc furnaces, slag reactors, rotary hearth furnace/ electric furnace combinations, or industrial furnaces. These residues can go into subtitle D units if the residues meet the generic exclusion levels for all constituents and these residues that do not exhibit any of the hazardous characteristics. The Agency received a variety of comments on the generic exclusion for all K061, K062, and F006 HTMR residues. Some of the comments supported this extension of the generic exclusion: Others objected to the exclusion levels and to the Agency's decision to limit the generic exclusion to HTMR residues.

Although the vertical and horizontal spread (VHS) model was the basis for calculating the proposed generic exclusion levels, EPA indicated in the January 9, 1992 proposed rule preamble that it also was considering basing exclusion levels on an alternative model, the EPA Composite Model for Landfills (EPACML) (see 57 FR 976; see also 56 FR 67197, December 30, 1991 for adopting use of the model in site specific delistings). Most commenters discussed the EPACML alternative and urged the Agency to use it rather than the VHS model to develop generic exclusion levels for this rule.

The most salient consequence of the change in models from VHS to EPACML is that EPACML generic exclusion levels for arsenic and zinc are higher than the BDAT standards in the HTMR-based alternative treatment standards for K062 and F006 and in the HTMR-based BDAT standards for K061. EPA retained the EPACML- based generic exclusion numbers regardless of their values relative to HTMR BDAT standards because the generic exclusion is independent from BDAT in such a way that EPA has no reason to adjust generic exclusion levels in order to reconcile them with BDAT standards when the numerical values differ significantly for a particular compound. The different, and occasionally overlapping, sets of numbers for BDAT standards and generic exclusion levels reflect the fact that these are two different sets of regulatory controls on HTMR residues from K061, K062, F006. BDAT standards apply to residuals from treatment of hazardous waste--which are themselves still hazardous wastes because of the derived-from rule intended for land disposal. They reflect the best level of performance that treatment technology can provide and they apply to hazardous wastes concentrations of contaminants determined (by the model) to pose minimal health risks when the waste is disposed in a unit permitted under RCRA Subtitle D. A generic exclusion takes a waste out of the hazardous-waste universe because when a waste meets generic exclusion

levels the exclusion essentially exempts it from subtitle C management.

The Agency also received a number of significant comments on the proposal to grant a generic exclusion for residues from HTMR processing of F006 and K062 nonwastewaters. Many commenters favored the proposed exclusion. Waste Management Inc., (WMI) and the Hazardous Waste Treatment Council (HWTC) objected, however, on several grounds.

WMI submitted comments similar to those it previously submitted for the K061 high-zinc subcategory rule. In particular, the commenter objected to the generic exclusion for a number of reasons. First, there are relatively few HTMR treaters of F006 and K062; site-specific delistings are a more appropriate alternative. Second, excluding slag to be used as a road-base material is an inappropriate application of the VHS. Third, EPA based the exclusion decision on inadequate data regarding the different types of HTMR processes that are potentially subject to the exclusion and on inadequate data on the fate of organic species that may be present in the feedstocks.

Fourth, the VHS model to exclude K061 did not consider exposures from runoff or wind dispersion. Fifth, there is concern about unaddressed air emissions problems with the HTMR processes themselves.

The Agency responded to the substantive issues in these comments in the K061 high-zinc subcategory final rulemaking. EPA's position remains that, although the generic exclusion may affect a small number of facilities at the time of promulgation, other HTMR facilities may be constructed in the future.

More important, however, EPA's generic exclusion decision in regard to these wastes depends on the potential hazard (e.g., waste volume, composition) of the waste generated, not on the number of facilities generating the waste.

In today's final rule, the Agency is using EPACML instead of the VHS model to represent more accurately the groundwater hydraulics at landfills. EPACML predicts the potential for groundwater contamination from wastes that are co- disposed with municipal solid waste in an unlined land disposal unit and is, therefore, an appropriately conservative methodology for evaluating the risk from landfilled HTMR residue. In addition, as in the August 19, 1991 rule for K061, the Agency is limiting the generic exclusion to F006 and K062 HTMR residues, among other things, disposed of in a subtitle D unit and thus is not evaluating the appropriateness of EPACML for quantifying the safety of any use constituting a disposa1 scenario such as-use as roadbase.

Consequently, this generic exclusion does not cover material to be used as a product.

The Agency disagrees with the comment that inadequate data were collected from the different types of HTMR processes that are potentially subject to exclusion. In determining the BDAT treatment levels, the Agency reviewed all the treatment performance data available from various HTMR processes. (These data are available in the Background Document supporting this rulemaking).

EPA then calculated the final treatment standards based on the data from well-designed and well-operated HTMR processes. Thus, EPA believes that it has adequately characterized the performance of the major HTMR processes with respect to achieving the BDAT treatment levels. EPA notes further that since the exclusion levels are essentially risk-based numbers (i.e., the numbers are based either on the model or are the slightly lower technology-based numbers), the issue of the sufficiency of treatment

performance characterization data does not affect the validity of the generic exclusion standards. To address the Agency's intent to establish "minimize threat levels" which could require modification of the purely technology-based BDAT standards, EPA is evaluating the alternatives proposed in the Hazardous Waste Identification Rule (HWIR) (see 57 FR 21450, May 20, 1992).

In response to the commenter's concern about the fate of organic species in the feed to HTMR processes, the Agency remains convinced that, considering that HTMR units operate at higher temperatures and longer residence times than incinerators, that HTMR units will destroy organic constituents as well as incinerators. All available data showed no quantifiable levels of organic constituents in treated residues, confirming EPA's engineering opinion; nor do the processed wastes typically contain appreciable concentrations of organics. (The Agency notes that while developing the BDAT treatment standards for nonwastewater HTMR K061 residues it investigated whether toxic organic constituents were present in the HTMR residues. The available treatment performance data did not indicate the presence of BDAT list organic constituents at detectable levels). In addition, as part of its delisting petition request for residual slag from treatment of K061 waste by HTMR, Horsehead Resource and Development Company (HRD) analyzed residual slag samples for sixteen polycyclic aromatic hydrocarbon (PAHs) constituents most likely to be products of incomplete combustion. None of the sixteen PAHs was detected in any of the samples generated from coke-fired and coal-fired processing.

WMI objected that using the VHS model to generate generic exclusion levels for K061, K062, and F006 is not appropriate because it only considered contaminant transport in groundwater and excludes exposures from run-off or wind dispersion.

As already indicated, the Agency has chosen to limit the scope of the current generic exclusion to slag disposed of in a subtitle D unit. The Agency is confident that the EPACML is appropriate for a land disposal scenario and is therefore finalizing the generic exclusion for F006 and K062 residues from HTMR processes with the condition that such disposal occur. See the discussion of the EPACML model at 56 FR 32993, July 18, 1991.

The Hazardous Waste Treatment Council (HWTC) also objected to the Agency's proposal to include F006 and K062 residues resulting from HTMR processing in the generic exclusion. HWTC was concerned that the exclusion was an automatic, self-implementing process requiring neither analytical verification nor review by EPA or the public. Section IV.E. of today's rule describes EPA's revised recordkeeping requirements for generically excluded HTMR K061, K062, and F006 residues (and characteristic wastes). This section explains EPA's choice of a tracking and handling system for generically excluded wastes.

With respect to the issue concerning air emissions, the Agency notes that all existing HTMR units use baghouses, wet scrubbers, or some other form of air pollution control device (APCD) to capture particulate matter present in the off-gases. These units may also be addressed pursuant to amended section 112 of the Clean Air Act. The amended section 112 requires the application of maximum achievable control technology (MCAT) controls to major sources of hazardous air pollutants, plus further risk-based controls (if necessary) at a later time. Therefore, EPA does not believe that these

units need also be subject to the BIF regulations (see 56 FR 7142, February 21, 1991 for further discussion on EPA's basis for not regulating air emissions from these units under subtitle C).

Another issue was HWTC's objection to EPA's granting a generic exclusion for HTMR residuals from processing F006 and K062 while denying the exclusion for other non-HTMR recycling and treatment technologies treating F006 and K062.

The Agency based the decision to grant a generic exclusion for HTMR residues only for the following reasons: The generic exclusion will only apply to those nonwastewater residues generated by HTMR processes and not to other non-HTMR processes, such as hydrometallurgical processes or stabilization. The Agency currently lacks sufficient data to evaluate the residues from hydrometallurgical processes or to develop an appropriate sampling and analysis methodology for residues from hydrometallurgical processes.

The Agency presented the reasons for not generically excluding stabilized residues in the August 19, 1991 K061 high zinc final rule (56 FR 41173). The HTMR residues demonstrate consistent leaching behavior whereas stabilized matrices do not. The chemical bonding that occurs in the high temperature and oxidation/reduction conditions within the HTMR units is inherently different from the bonding that forms the basis of cementitious and pozzolanic stabilization. In addition, the kinetics of the reaction forming the bonds in these HTMR processes are superior in terms of immobilizing metals to the kinetics of bond formation in cementitious reactions because they are faster.
(Common forms of cement are not typically considered set until after a minimum of 72 hours and often not considered fully cured until after 28 days). Furthermore, stabilization is highly matrix-dependent and prone to chemical interference. Most commercial stabilization facilities develop special mixes to control curing time and/or product integrity.

EPA reminds the regulated community that it is not prohibiting stabilization as treatment for K061, K062, and F006 waste, and that facility- specific delisting remains an option for stabilized K061, K062, and F006 wastes. Because of the inherent differences between HTMR and stabilization stated above and because existing data do not support a generic exclusion for stabilized K061, K062, and F006 wastes, the Agency chooses not to extend generic exclusion to these stabilized residues.

D. Vanadium: Treatment Standards and Appendix VIII

The Agency is deferring the expansion of the list of inorganic constituents in appendix VIII and is not including vanadium in the treatment standards.
These remain technical issues that EPA has not yet resolved in the brief time allocated in promulgating today's regulations. The proposed HWIR (57 FR 21450, May 20, 1992) identified exclusion criteria for Vanadium, and the Agency is continuing to assess how to address Vanadium in HWIR and future Land Disposal Restrictions.

Because of concerns about Vanadium's low volatility and consequent tendency to accumulate in slag residual, the August 19, 1991, rule for high-zinc K061 nonwastewaters reserved vanadium rather than set a numerical

treatment standard. Data reviewed by the Agency for the high-zinc rule since that time does not support setting a treatment standard for vanadium. EPA is therefore not promulgating treatment standards for vanadium in K061 nor promulgating vanadium standards in alternative standards for K062 and F006 wastes in this rule.

Final Generic Exclusion Levels for K061 and K062 HTMR Residues (Nonwastewaters)

Regulated constituent	Maximum for any single composite sample--TCLP (mg/l)
Antimony	0.10
Arsenic	0.50
Barium	7.6

E. Notification and Certification for Characteristic Wastes

The Agency is finalizing a revision to the recordkeeping requirements for certain wastes that meet LDR standards and are treated to nonhazardous levels. The change in notification and certification requirements affects two groups of wastes: characteristic wastes that meet LDR standards and are treated below the regulatory levels established for characteristic wastes, and K061, K062, and F006 residues from high temperature metal recovery that meet the generic exclusion levels and do not exhibit any hazardous waste characteristics. As proposed (see 57 FR 977), the Agency will no longer require the generator or treater to submit to EPA or an authorized state a notification and certification for each off-site shipment of these wastes. Instead, amended Sec. 268.9(d) and Sec. 261.3(c)(2)(ii)(C) now require that the generator or treater prepare the notification and certification for the initial shipment only, place one copy in the generator's or treater's own files, and send another copy to the appropriate EPA region or authorized state. The documentation must be retained by the generator or treater for at least five years. The generator's or treater's records must be updated if the process or operation generating the waste changes and/or if the subtitle D facility receiving the waste changes; however, the generator or treator need only notify EPA or an authorized state on an annual basis (at the end of the calendar year but no later than December

31) if the process or operation generating the waste changes or if the subtitle D facility receiving the waste changes. The document must include the name and address of the subtitle D facility receiving the waste, a waste description, applicable treatment standards, and a certification that the standards have been met. For K061, K062, and F006 residues from high temperature metal recovery, the recordkeeping requirements in Sec. 261.3(c)(2)(ii)(C) supersede those in Sec.
268.7(a)(6).

The Agency proposed this change because the existing requirements appeared to pose an unnecessary paperwork burden. It did not appear necessary for EPA or the states to be notified concerning every shipment of characteristic wastes and K061, K062, and F006 residues treated to nonhazardous levels; yet, at the same time, EPA and the states still need to be able to verify such treatment when conducting inspections of waste management operations. The Agency requested comment on the paperwork burden of the existing requirements, on its proposal, and on several alternative requirements that would also reduce the recordkeeping burden (see 57 FR 977).

Several commenters described the existing burden as "significant" or "onerous." One commenter said the requirement is especially burdensome for facilities with multiple shipments per day and is unnecessary since the waste is deemed nonhazardous. Another commenter stated that one of its plants had submitted over 1300 identical notification and certification documents in an eighteen-month period as a result of the Sec. 268.9(d) requirement. Still other commenters said the existing requirement is not onerous, since facilities can use fill-in-the-blank type forms.

The majority of commenters, however, supported the requirement being finalized today. Those who supported the requirement promulgated today interpreted it to require a reasonable level of recordkeeping while providing readily available information to allow identification of the subtitle D facilities receiving the waste. Several of these commenters said the alternative proposals were overly burdensome without providing attendant benefits.

Commenters who supported the existing recordkeeping requirements argued that submittal of a certification to EPA is the only incentive for generators to ensure that excluded waste going to subtitle D units is properly treated.
One commenter argued that the new proposal would weaken the RCRA system of cradle-to-grave protection. Another commenter advocated notification to the subtitle D facility receiving the waste, because only the generator or treater has sufficient information to determine if it meets the land disposal restrictions.

After considering all comments, EPA is finalizing the proposed revision because it is confident that there is little need for documentation of every shipment of the identical nonhazardous waste, nor is there a need for EPA or states to be informed of each shipment for disposal, as long as the information is available to inspectors. As for requiring notification of subtitle D facilities receiving the waste, EPA remains concerned that such a requirement would be counterproductive (see discussion at 55 FR 22662 to 22663).

F. Wastes Listed Because They Exhibit a Characteristic

In the January 9, 1992 proposed rule, EPA proposed a clarifying change to the existing regulations dealing with the applicability of land disposal prohibitions to wastes that are listed solely because they exhibit a non-toxic characteristic of hazardous wastes (see 57 FR 978). An example are the non-chlorinated solvents listed as F003 for which EPA promulgated numerical treatment standards in 1986. EPA had previously stated that such wastes cannot be diluted to meet the treatment standards and that these wastes must be treated to meet the part 268 treatment standards (56 FR 3871, January 31, 1991; 57 FR 978). Put another way, the land disposal prohibitions would apply at the point of generation for such wastes. EPA's proposed clarification was that the same principles apply with respect to mixtures of wastes listed because they exhibit a characteristic and other solid wastes (57 FR 978).

Upon reviewing this issue further, however, EPA realized that the principle appeared inconsistent (or could be read to be inconsistent), with respect to wastewaters listed because they exhibit a characteristic, with the rules adopted in the Third Third regulation regarding management of characteristic wastewaters. In the Third Third regulation, EPA applied prohibitions at the point of disposal for wastes that are hazardous because they exhibit a characteristic and are disposed in non-hazardous Class I injection wells; the Agency also applied dilution prohibitions at the point of disposal for most characteristic wastewaters managed in wastewater treatment systems ultimately discharging pursuant to sections 307 or 402 of the Clean Water Act. See Secs. 148.1(d), 268.3(b); and 55 FR 22656-22659 (June 1, 1990). This would indicate that wastewaters which are listed because they exhibit a characteristic would not be prohibited from disposal by underground injection provided they do not exhibit a characteristic when they are injected. In addition, such wastewaters can permissibly be diluted to meet the treatment standards before management in surface impoundments, provided the impoundments are part of treatment systems that are discharging pursuant to Clean Water Act requirements and provided the waste does not exhibit a characteristic when placed in an impoundment.

After considering this issue, and after soliciting and receiving further public comment on the point, EPA is interpreting its rules so as to be consistent with the approach of the Third Third rule with respect to wastewaters that exhibit a characteristic for the reasons set out in that rule. Thus, prohibitions for wastewaters that are listed solely because they exhibit a characteristic will apply at the point of disposal as explained above. Put another way, EPA is reading the existing rules in Secs. 148.1 and 268.3(b) as applying to wastewaters that are listed solely because they exhibit a non-toxic characteristic.

The Agency is not reconsidering, or reopening, the issue of treatment standards for nonwastewaters that are listed because they exhibit a characteristic. Thus, such wastes cannot be land disposed until treated to meet the applicable treatment standards, and cannot be diluted to meet those treatment standards (56 FR 3871). This would also be true of mixtures involving such listed wastes, since otherwise the prohibitions would have no real meaning.

Finally, with respect to wastewaters, the Agency recognizes that the issue of the legality of the Agency's application of prohibitions for

characteristic wastewaters at the point of disposal has been submitted for judgment to a panel of the District of Columbia Circuit Court as part of the litigation over the Third Third rule (Chemical Waste Management v. EPA, No.
90-1230). The Agency's action today clarifying that the same rules apply to wastewaters listed because they exhibit a characteristic and other characteristic wastewaters thus would be subject to the decision reached in this litigation.

G. Storage and Treatment in Containment Buildings

In some cases, hazardous wastes prohibited from land disposal must be stored for short periods of time to facilitate recycling, recovery, treatment, or transport off site to meet LDR standards; treatment may also be performed while these materials are being stored. Some of these non-liquid hazardous wastes are generated in large volumes (often in batches), and may not be amenable to management in RCRA tanks or containers. These wastes are sometimes stored or treated on concrete pads or similar floors inside buildings.

EPA currently classifies this type of management unit as an indoor waste pile, which EPA considers to be a land disposal unit based on the statutory definition of land disposal in section 3004(k). See 52 FR 40605 (November 7, 1986). Lead slags and spent potliners from primary aluminum production are examples of hazardous wastes that are amenable to management in such units because of their volume or bulk; contaminated debris may also be managed in such units. EPA believes that management of a hazardous waste inside a unit designed and operated to contain the hazardous waste within the unit--akin to storage in a RCRA tank or container--does not pose the types of potential harms or uncertainties Congress sought to address in defining land disposal, as it did in RCRA section 3004(k). These include uncertainties regarding containment of hazardous constituents placed on the land and the potential for persistence, toxicity, mobility and bioaccumulation of hazardous wastes placed on the land. A unit designed, constructed, and operated to contain the hazardous waste within it may, moreover, fulfill the congressional goal of waste management that is protective of human health and the environment. See section 3004(d)(1)(A)-(C) and 1003(a)(5).

EPA is today promulgating standards allowing management of hazardous wastes, including but not limited to lead slags, spent potliners, and contaminated debris within units, to be termed "containment buildings", which will not be considered placement on the land and thus not constitute land disposal as defined in section 3004(k) of RCRA. To allow storage and treatment of prohibited wastes in containment buildings, EPA today is establishing a new definition of containment building, amending the existing definition of pile to exclude containment buildings, and including containment buildings within those units covered by Sec. 268.50 as permissible for storage of prohibited wastes (since these buildings are no longer land disposal units), albeit subject to the prohibition on extended storage. EPA is also establishing specific design and operating standards for such units under Secs. 264 and 265, and allowing generators' containment buildings to be eligible under Sec. 262.34 for the 90-day generator provisions if their unit(s) meets all of the technical requirements for containment buildings (refer to discussion on 90-day applicability upcoming in this section).

Under today's rule, all containment buildings--both permitted and unpermitted--must achieve the same level of performance. Accordingly, EPA today is promulgating standards that require containment buildings operating under the part 265, subpart DD interim status standards to be designed, operated, and maintained to meet the same design and operating requirements as permitted containment buildings. These are either the design and operating standards in subparts DD of parts 264 or 265.

Virtually all public comments supported the establishment of this new type of management unit. The rule promulgated today incorporates only minor changes from the proposed rule.

To provide adequate time for design and construction of containment buildings, the effective date for these provisions shall be February 18, 1993. However, owner/operators who wish to begin operating containment buildings under these provisions prior to the effective date may do so provided that they notify the Regional Administrator of their intent, and they comply with the requirements of subpart DD prior to beginning operation.

1. Containment Buildings Are Not Land Disposal Units

The final rule indicates that containment buildings are not land disposal units. Thus, prohibited wastes can be stored in containment buildings without first meeting a treatment standard.

We explain below in detail how containment buildings are defined. However, the key features for determining that they are not land disposal units are that wastes are stored indoors in a secure structure (securely walled, roofed, and floored) that is designed to provide containment comparable to that provided by tanks or containers. EPA sees no statutory command precluding Agency discretion to define such units as not involving land disposal, nor did any commenter suggest that the Agency was barred from this determination. Moreover, storage in such units does not raise the types of environmental concerns and uncertainties (see section 1002(b)(7) and 3004(d)(1)(A)-(C)) that Congress sought to address in requiring hazardous wastes to be pretreated before being land disposed. Also, by defining containment buildings as not involving land disposal, the Agency is preventing the anomaly of bulk hazardous wastes not amenable to tank storage, yet requiring storage before treatment, being unable to be legally stored because non-tank or container storage would be defined as land disposal. An example is battery parts and groups that must be staged before being smelted.
(55 FR 22637.) Accordingly, EPA is exercising its discretion to define containment buildings as not being land disposal units.

2. Definition of Containment Building

EPA today defines in Sec. 260.10 a new unit, "containment building," as a "hazardous waste management unit that is used to store or treat hazardous waste under the provisions of subpart DD of parts 264 and 265." Subpart DD of parts 264 and 265 enumerates the design and operating standards for these units that ensure containment comparable to that of a RCRA tank or container.
EPA is also modifying the definition of "waste pile" to exclude these

units.

Under today's rule, a containment building unit is not defined as land disposal pursuant to RCRA section 3004(k) if the unit meets the requirements of Sec. 264.1100 and Sec. 265.1100. The unit must, among other things, be completely enclosed and have self-supporting walls, a primary barrier, designed to be sufficiently durable to withstand the movement of personnel, wastes, and handling equipment in the unit, a secondary containment system (unless the unit manages non-liquid wastes only or has obtained a variance from the secondary containment standard), a liquid collection system, and controls for fugitive dust. The floors, walls, and roof of the unit must be constructed of man-made materials with sufficient structural strength to support themselves, the waste contents, and any personnel and heavy equipment that operate within the unit. The unit also must be designed and operated to prevent tracking of materials out of the unit.

3. Applicability of the 90-Day Accumulation Exclusion in Sec. 262.34

a. Containment Buildings Are Eligible for 90-Day Status. Under Sec. 262.34, a generator may accumulate hazardous waste on-site for 90 days or less without a permit or without having interim status provided he complies with the requirements of subpart I, J, or W of 40 CFR part 265, among other requirements. To date, EPA has limited applicability of this 90-day provision to generators' containers, tanks, or drip pads (see 55 FR 50450, December 6, 1990). EPA today is extending the 90-day generator exemption in Sec. 262.34 to include containment buildings. The extension of the 90-day generator exemption to containment buildings is consistent with the application of the 90-day generator exemption to similar types of hazardous waste storage units, e.g., tanks and containers.

Commenters to the proposed rule overwhelmingly supported the extension of the 90-day generator exemption to these units. Some commenters also suggested that EPA extend this exemption to all containment buildings; others suggested extending this exemption beyond 90 days. The 90-day generator provision is premised on the need to avoid undue interference with generators' production processes (45 FR 2730, February 26, 1980) and stands as a narrow exception to otherwise applicable permitting requirements. This rationale does not appear to apply to off-site facilities. Therefore, the Agency is not extending its applicability in today's rule. However, EPA notes that extensions may be granted to the 90-day time period under existing rules when certain specific circumstances apply (see 55 FR 50450, December 6, 1990).

Specific to the comments suggesting that EPA extend the 90-day generator provision to all containment buildings including off-site facilities, EPA is not taking action in today's rule. EPA will, however, take comment on a proposal to expand the 90-day generator exemption to all containment buildings in the upcoming proposal for petroleum contaminated debris to be deferred from the TC. At that time, the Agency will evaluate whether the Agency's narrow exemption for 90-day units to generators should be expanded to off-site units for all tanks, containers, and containment buildings.

b. Documenting Compliance with 90-Day Limitations. In the proposed rule, EPA requested comment on whether generators who store or treat hazardous waste in containment buildings pursuant to the 90-day accumulator

provisions should be required to maintain on site, for the operating life of the containment building, a description of the procedures ensuring that no waste remains in the containment building for more than 90 days. EPA proposed that documentation of each waste removal be required in the generator's on-site files recording, at a minimum, the quantity of waste removed and the date and time of removal. EPA also noted that certain operations, for example, the continuous processing of wastes or blending of wastes, might complicate the generator's ability to determine when a particular waste volume ceased to be present within the containment building. EPA requested public comment on how best to ensure and document generator compliance with the requirement limiting the time waste may be accumulated within the containment building to 90 days or less.

Several commenters suggested a "mass balance" approach wherein the volume removed from a containment building over the course of 90 days would be required to be at least equal to the amount placed in the unit during that period to ensure compliance with the time limit. EPA does not believe that this would be adequate. While such an approach might ensure that the average residence time of wastes in the unit is less than 90 days, it could not assure that all wastes reside in the unit for less than that period.

Instead, EPA agrees with commenters who suggested that documented procedures ought to assure that each volume of waste resides in the unit for no more than 90 days. This requirement could be met in two ways: (1) By documenting that the unit is emptied at least once every 90 days, or (2) by having and documenting (in writing) the procedures in place to ensure that wastes in the unit are segregated by age and that no portion of the stored wastes is allowed to remain beyond the time limit. As part of that latter demonstration, owner/operators must document that the nature of their hazardous waste management operation is consistent with respecting that 90-day limit. For example, a generator who plans to use such a unit to accumulate waste for off-site shipment on a monthly basis should be able to meet this test; one who ships waste off site semi-annually could not do so. Given the statute's normal permitting scheme as well as the constraints on extended storage in section 3004(j), EPA believes this degree of assurance of actual waste turnover is justified.

EPA does not seek to require documentation of each individual addition or removal of waste from the unit; rather, the required written documentation must show that procedures are in place to ensure that individual additions and removals of wastes are consistent with the 90-day time limit for each portion of the wastes managed in the unit. However, if the generator cannot meet the 90-day time limit or if a hazardous waste is stored or treated in an off-site containment building, the unit must have interim status or a permit in accordance with existing regulations.

c. Reclassification of Regulated Units to 90-Day Status. EPA anticipates that some currently operating units that have been previously classified as waste piles will be converted to containment buildings as a result of today's rule. It is possible that there may be (or have been) releases of hazardous wastes from such units. When this rule was proposed, EPA raised the issue of whether unit-specific corrective action authority under RCRA should be retained for new units and for existing interim status or permitted units that subsequently become 90-day generators with containment buildings as their only RCRA activity. EPA pointed out that, even without RCRA corrective action authority, generators would still be liable for any releases under CERCLA.

Several commenters suggested that some or all units converted to containment buildings should not be subject to corrective action. While the Agency understands these commenters' concerns, the Agency believes that unit- specific corrective action is an appropriate part of the standards for containment buildings to remediate releases that conceivably occur or may occur from the unit. Such standards are a routine part of every standard for a RCRA hazardous waste management unit, including 90-day generator units.

See, e.g. Sec. 265.196 (corrective action for tanks including 90-day tanks) and Sec. 265.443(m) (corrective action for drip pads including 90-day drip pads). The Agency knows of no legal or policy justification for excluding these units from corrective action requirements (i.e., not redressing hazardous waste releases from such units).

However, new units operating under the 90-day generator provision will not trigger facility-wide corrective action under RCRA by themselves under the terms of today's rule, because no permit is required for their operations and the units have never had interim status or permits (see RCRA sections 3004(u) and 3008(h)). These units, however, must remediate unit-specific releases as just discussed, and also would be solid waste management units if the facility requires a RCRA permit for other units.

For previously regulated units, EPA expects that the "unit" for the purpose of corrective action will include the entire structure, or the entire portion of the structure operated, when the containment building is a part of a larger structure.

As noted above, 90-day containment buildings must meet the same substantive standards as permitted and interim status units. This includes a requirement of obtaining certification by a professional engineer that the unit is designed and constructed to meet the requirements for containment buildings and must maintain such certification at the facility (Sec. 262.34(a)(1)(iv)).

The subject of such certifications is discussed at greater length below.

Generators planning to convert to or install containment buildings in advance of the effective date for these requirements are required to place certifications for these units in the facility's operating record no later than 60 days from the date of initial operation of the unit as a containment building. After February 18, 1993, PE certification is required prior to operation of the unit.

4. Containment Building Requirements

The specific requirements for a containment building restrict the types of hazardous wastes that may be stored or treated in the unit and specify performance standards for the design and operation of the unit to ensure a measure of protection of human health and the environment greater than that provided by an indoor waste pile, and substantially equivalent to that provided by a RCRA tank or container. See subpart DD, parts 264 and 265.

a. Acceptable Wastes. Many commenters supported EPA's proposal to allow dry wastes or wastes with "very small quantities" of free liquids to be managed in containment buildings. Comments were divided on whether the term "very small" used in the proposal required an explicit definition or implied an unnecessary and arbitrary limit on the amount of liquid included

in a hazardous waste to be managed in a containment building. Today's rule states that wastes managed in containment buildings not be liquid in form (i.e., flow under their own weight to fill the vessel in which they are placed, or contain so much liquid that they are readily pumpable) or release such large quantities of liquid into the unit that liquid removal systems cannot prevent accumulation of liquid to significant depths. (These liquid wastes can, of course, be managed in tanks and containers that are inside containment buildings.)

EPA developed the containment building standards so that owner/operators could store or treat hazardous wastes that are not liquid in form, and which are not amenable to management in tanks or containers (perhaps because the waste occurs in a bulky form, or because it is produced in great volume.) This can facilitate owner/operator compliance with the prescribed BDAT standards. However, any waste that is non-liquid in form can also be stored/ treated in containment buildings even if the waste already comply with the land disposal restriction standards. The standards discussed below will ensure that these wastes will not pose a hazard to human health or the environment when managed in containment buildings.

Prior to incorporating these concepts into this rule, EPA considered developing a Policy Directive whereby certain hazardous wastes, i.e., aluminum spent potliners, recycled lead batteries, and possibly electric arc furnace dusts, were definitively identified as candidates for management within containment buildings. Although EPA believed wastes that are non- liquid in form could also be managed more practicably in containment buildings rather than tanks or containers, information on such wastes remained lacking. EPA considered two options regarding hazardous wastes eligible for management in these units: (1) All hazardous wastes, including contaminated debris; and (2) only contaminated debris and certain additional bulky, high volume hazardous wastes that EPA currently understands cannot be practicably stored/treated in tanks or containers. Public comments on the proposed rule stated that EPA should not limit eligibility to debris and certain bulky, high volume hazardous wastes or to specific waste codes, and that a specific limitation on the amount of liquid included in the waste was also not appropriate.

EPA sees no reason to restrict eligibility to only those hazardous wastes for which EPA has data available or to only prohibited wastes. When designed, constructed, and operated in accordance with the standards being promulgated today, a containment building managing hazardous waste that is non-liquid in form will ensure protection of human health and the environment.

Example: A secondary lead smelting facility recovers lead from battery plates and groups taken from lead-acid batteries. One of the steps involved in this process, battery cracking, necessarily generates wet lead-bearing materials. For process efficiency, among other reasons, free liquids are removed to the extent feasible prior to staging the materials for furnace feed. However, some residual free liquid remains and cannot be removed easily. In this example, the overall form of the material is non-liquid, even though some amount of free liquid remains despite attempts to remove it.

These wastes are eligible for management in containment buildings.

Example: A facility is cleaning up an area containing contaminated soil.

The excavated soil contains water in the soil matrix, and is at or near the point of saturation. Visual inspection of the soil reveals that the

amount of free liquid expected to be released in a containment building is very small in comparison with the total volume of the waste and the liquids management capacity of the unit. This material may be managed in a containment building.

b. Acceptable Activities. Containment buildings can be used to store hazardous waste for such activities as treatment (including recovery or other recycling) or transport off site to meet LDR treatment standards. As noted elsewhere in today's rule, wastes may be treated in containment buildings as well as stored in them. Examples of such treatment could include some of the technologies discussed in appendix I to this preamble for treatment of contaminated debris. Many of these technologies require the use of liquid. In many cases, such treatment would be conducted in tanks or containers within such buildings, and the existing standards for tanks and containers would apply. For example, a method for treating hazardous debris could include treatment in a tank within a containment building followed by storage for a short-period in the containment building. In this example, treatment in the tank would be regulated under the RCRA tank standards, while subsequent storage of the treated waste would be regulated under the containment building standards.

In other cases, treatment in tanks and containers as such may not be possible. For example, personnel may not be able to apply safely some of the prescribed debris treatment technologies to large bulky debris within a tank or container. Therefore, EPA is also allowing treatment that utilizes the addition of liquid as part of BDAT treatment in designated areas within containment buildings. Any drainage or accumulation of liquids applied to hazardous debris must comply with relevant regulations. EPA is requiring that liquids be removed from the containment building at the earliest practicable time in order to preserve the effectiveness of liquid containment systems (Sec. 264.1101(b)(2)(ii) and Sec. 265.1101(b)(2)(ii)).

c. Design and Operating Standards. EPA is promulgating the following design and operating standards for permitted units, units operated under interim status, and units under the 90-day accumulation exemption. In general, the design and operating standards are intended to ensure containment of waste equivalent (or, with regard to air emissions superior) to the containment achieved by tanks. Thus, the units must be designed to contain releases to land through primary and in some cases secondary containment systems, and to contain potential particulate emissions as well. The unit is also to be designed to prevent exposure of waste to precipitation and wind. As noted above, EPA is determining that these units are not engaged in land disposal based on designs for this level of containment. Moreover, the design and operating standards should ensure protection of human health and the environment (as do the tank standards).

Thus, to distinguish these units from waste piles--i.e., land disposal units--hazardous wastes managed in these units must be fully contained within the unit. As such, the unit must be completely enclosed with a floor, walls and a roof to prevent exposure to precipitation and wind (Sec. 264.1101(a)(1) and Sec. 265.1101(a)(1)). Many of the hazardous wastes currently managed in these waste piles may have significant volumes of fine particulates. EPA believes that enclosure within a structure, in conjunction with other measures to control fugitive dust emissions, will prevent the escape of these fine particulates from the unit. Although a number of commenters to the proposed rule did not believe complete enclosure to be necessary, EPA continues to regard this as key to ensuring

complete containment of wastes managed in these units, and thus distinguishing these units from land disposal units such as piles.

i. Floors, Walls, and Roof. The floor, walls, and roof of the unit must be constructed of man-made materials with sufficient structural strength to support themselves, the waste contents, and any personnel and heavy equipment that operate within the unit. Fragile barriers that would not withstand repeated contact with handling equipment used in the unit thus are not suitable, and units designed with such ineffective barriers would not be containment buildings. Operating events such as deliberate or accidental placement of materials against containment walls must be taken into account in designing and constructing the unit. Factors such as settlement, frost- heave, and exposure to wind force must also be considered. All surfaces to be in contact with hazardous wastes must be chemically compatible with those wastes. Because the intended use for these units is short-term storage or treatment, the unit must be designed to accommodate appropriate levels of loading and unloading activity during its operating lifetime. (See Sec.
264.1101(a)(2) and Sec. 265.1101(a)(2).)

ii. Primary and Secondary Containment. EPA is requiring several measures to ensure that hazardous wastes are managed in a fashion that ensures containment of contaminants and prevents releases into the environment. All containment buildings must be equipped with a primary barrier designed and constructed of materials to prevent hazardous wastes from being accidentally or deliberately placed on the land beneath or outside the unit. The design and construction of the primary barrier will vary depending on the type of waste to be managed in the unit. For containment buildings used to manage wastes without free liquids, the primary barrier may be a concrete floor if the wastes to be managed will not migrate into the concrete matrix.

Containment buildings used to manage wastes with even small amounts of free liquids must be provided with a primary barrier designed and constructed of materials to prevent migration of hazardous constituents into the barrier and a liquid collection and removal system that will minimize the accumulation of liquid on the primary barrier (Sec. 264.1101(b)(2) and Sec. 265.1101(b)(2)).

In this case, the primary barrier might be a steel or flexible membrane liner covered by a concrete wear surface. The liquid collection and removal system above the primary barrier should be designed, constructed, and operated to minimize the accumulation of liquids above the primary barrier. EPA expects that a minimum one degree slope for the primary barrier combined with appropriate means for collecting and removing liquids (e.g. troughs, drains, dikes, or sumps and/or pumps as necessary) will meet this goal. The determination of the presence of free liquids must be made using, for example, the paint filter test (EPA test method SW-86) if applicable, a visual examinations, or other appropriate means.

The primary barrier must be sloped to drain liquids or other wastes to the collection system, and to ensure that liquids are not released into any portions of the unit that are not provided with secondary containment. This latter requirement for separation between "wet" and "dry" areas of a containment building is discussed below in greater detail.

In all cases, the primary barrier must be designed to withstand the movement of personnel, wastes, and handling equipment in the unit. (See Sec.
264.1101(a)(4) and Sec. 265.1101(a)(4).) By this, EPA means that coatings or membranes that might be exposed to abrasion or tearing by personnel,

wastes, or equipment must be sufficiently durable to withstand that activity, be protected from it, or be scheduled for replacement on a regular basis as needed as part of the design of the unit. The primary barrier must be maintained to be free of cracks, gaps, corrosion, or other deterioration that could result in the significant release of hazardous waste.

Portions of containment buildings used to manage hazardous wastes containing free liquids must, in addition, be provided with secondary containment systems including (1) a secondary barrier and (2) a leak detection system. The secondary barrier must be designed and constructed of materials to prevent the migration of hazardous constituents into this barrier. The leak detection system, which lies below the primary barrier and above the secondary barrier, must be capable of detecting, collecting, and removing leaks of hazardous constituents through the primary barrier at the earliest practicable time. In keeping with the design standards for liners and leak detection systems (57 FR 3462), this may be achieved by installation of a system that is, at a minimum: (1) Constructed with a bottom slope of 1 percent or more; and (2) constructed of a granular drainage material with a hydraulic conductivity of 1x10-2 cm/sec or more and a thickness of 12 inches (30.5 cm) or more, or constructed of synthetic or geonet drainage materials with a transmissivity of 3x10-5 m2/sec or more. The secondary containment system must be constructed of materials that are chemically resistant to the waste managed in the containment building and of sufficient strength and thickness to prevent collapse under the pressure exerted by overlaying materials and by any equipment used in the containment building.

If only portions of a containment building are equipped with secondary containment, then "dry" areas (those without secondary containment) and "wet" areas (those areas with secondary containment) must be hydraulically separate. By this, EPA means that the containment building must be designed and operated so that liquids managed in "wet" areas are prevented from draining into "dry" areas by measures such as dikes, walls, trenches, differences in grade, etc. (See Sec. 264.1101(b)(3)(i) and Sec. 265.1101(b)(3)(i).) Wastes entering a "dry" area of the containment building, from a "wet" area of the unit must not contain more than de minimis amounts of free liquids (and a paint filter or equivalent test could be passed, if the physical form of the material would allow such a test to be performed).

In addition, today's rule clarifies that treatment of hazardous wastes within containment buildings may involve the addition of free liquids. As with any "wet" containment building areas, portions of containment buildings where wastes are treated with liquids must meet design standards that the Agency is promulgating today and that are equivalent to those applicable to tanks. These areas thus must be designed to prevent any release of liquids, wet materials, or liquid aerosols to other portions of the unit. In particular, treatment technologies involving liquids under high pressure such as high pressure washing must be restricted to dedicated cells or areas within the containment buildings designed and operated to prevent such releases. Barriers to such releases should be designed and constructed to be appropriate to the nature of the physical and chemical nature of the treatment to be performed, and should ensure proper control of wastes and moisture throughout the operating life of the unit. EPA notes that use of a number of treatment technologies including technologies specified elsewhere in today's rule may require barriers to movement of

moisture into unit walls equivalent to those generally required to prevent migration of hazardous constituents into the primary barrier.

For example, soil washing may be conducted in a treatment area of the containment building. After treatment, the soil is allowed to drain. While significant quantities of free liquid remain, the soil must be managed in "wet" areas with secondary containment. When only de minimis quantities free liquids remain the materials may be managed in "dry" areas without secondary containment.

EPA recommends, but is not requiring, that owner/operators of containment buildings consider providing the entire unit with secondary containment in order to guard against contaminant releases and their associated costs in the event of operator error, equipment failure, or other unanticipated circumstance.

EPA believes containment buildings can serve as secondary containment systems for tanks placed within the building under certain conditions. A containment building can serve as an external liner system for a tank, provided it meets the requirements of Sec. 264.193(d)(1), i.e. that it is designed and operated to contain 100 percent of the capacity of the largest tank within its boundary, designed and operated to prevent run-on or infiltration of precipitation into the secondary containment system, free of cracks or gaps, and designed and installed to surround the tank completely and to cover all surrounding areas likely to come into contact with the waste. In addition, the containment building must meet the requirements of Sec. 264.193(b) and Sec. 264.193(c)(1) and (2) to be considered an acceptable secondary containment system for a tank.

iii. Waiver from and Delay of Compliance with Secondary Containment. Under today's rule, the Regional Administrator has the discretion to waive the secondary containment requirement for containment buildings or areas of containment buildings where the only liquids to be used in the unit are liquids that will be used to control dust or to otherwise protect worker health and safety in accordance with OSHA requirements. Thus, in some cases, the Regional Administrator may determine on a case-by-case basis that secondary containment is not necessary where liquids are used in this fashion. For 90-day units where owner/operators wish to use liquids to control dust or otherwise protect worker health and safety and do not believe that secondary containment is necessary, the owner or operator must make a demonstration that the use of liquids in such a manner will not result in the release of contaminants and have a professional engineer certify to the fact.

EPA is also allowing the option of a delayed compliance date for the secondary containment requirement. Existing units converting to containment buildings and which are equipped with a primary barrier and a liquid collection system may be granted up to a two-year delay for compliance with the secondary containment requirement if these units substantially meet all other standards spelled out in today's rule. This may be the case for some existing buildings currently surpassing the design requirements applicable to indoor waste piles but not having secondary containment.

To avail themselves of this extension, owner/operators must provide a written request to the Regional Administrator by February 18, 1993. This request must include a description of the unit and its operating practices with special reference to the design and performance of any existing

barrier layer(s), liquid collection and removal systems. Existing data and/or reports on materials, permeability, and drainage characteristics must be included, together with existing available quality assurance data on how the existing unit was constructed. It must describe specific plans including a schedule for retrofitting these units to meet the standards promulgated today.

The Regional Administrator will review this plan, and approve or provide comments. If owner/operators receive comments from the Regional Administrator, they will have 30 days to revise their submissions and respond to comments. The Regional Administrator will review the revised submission, and decide whether to grant up to a 2-year delay for secondary containment and may specify conditions for its approval. This decision will be based on whether the Regional Administrator has confidence that substantially meets the other standards in the rule, so that the unit will not release contaminants to the land prior to the required retrofit.

iv. Height of Waste in Unit. Another measure to ensure containment of hazardous waste managed in these units is today's requirement that the level of the waste inside the unit cannot exceed the height of the containment walls intended to come in contact with the hazardous waste. (See Sec. 264.1101(c)(1)(ii) and Sec. 265.1101(c)(1)(ii).) EPA considers it a necessary good housekeeping practice to prevent stored/treated hazardous waste from spilling over the walls of the unit and, in the case of certain hazardous wastes, to be able to contain any potential "landsliding" of material out of the unit. It is important to note that the walls referred to in this provision are those containment walls, or parts thereof, designed and constructed to be in contact with the hazardous waste and to support its weight. The following example highlights this distinction.

Example: A facility has constructed a containment building to accumulate its hazardous waste prior to conducting treatment to meet LDR standards. The unit has a reinforced concrete floor and 10-foot high reinforced concrete walls. The remainder of the sidewalls, built atop the concrete wall and extending to the roof, are constructed of steel framing with fiberglass panels. In this example, the hazardous waste stored/treated inside the unit must not be piled any higher than the 10-foot reinforced concrete walls. The remainder or upper portion of the walls are not designed to support the weight of the waste and may not provide adequate containment of the waste in the event of an unexpected shift in the position of a portion of the waste, i.e., hazardous waste could escape through the panel joints.

A number of commenters to the proposed rule had concerns with the prohibition on piling wastes above the height of the walls intended to contain them, noting correctly that many wastes can be formed into conical piles extending substantially above the height of walls which may be supporting a portion of their weight. EPA's reason for including this requirement is to assure that there was no possibility of accidentally overtopping the containment walls. Accordingly, today's rule retains this requirement. EPA notes, however, that this requirement is intended to apply only to those walls that could come into contact with the waste and are intended to contain the waste. The examples below clarify EPA's intent.

Example: If waste is stored in a room within the containment building, where the interior walls, i.e., the walls of that room, are designed to

support and/or contain hazardous wastes, those walls must meet the standards for containment walls. Exterior walls that could not come into contact with the waste would not have to meet those requirements in this case.

Example: If waste is stored in "stalls" within the containment building, where the walls that define the stalls are not designed and constructed to meet the requirements for containment walls, then the exterior walls must do so. Note, however, if the stalls are intended to separate wet and dry areas or to document that wastes are accumulated for less than 90 days, the stalls must be constructed to fulfill their function under normal operating conditions.

v. Standards for Doors and Other Openings. A related set of issues in the proposed rule refers to specifications for door and other wall openings used for equipment and personnel. EPA proposed that these doors and openings should be capable of providing the same level of structural support and containment as the rest of the wall, and invited public comment on specific standards for doors and openings that are part of a wall otherwise providing support and containment of hazardous waste managed within a containment building.

Today's rule departs somewhat from the proposed rule on these issues. In response to many public comments, EPA is clarifying that doors and other openings do not necessarily need to meet the same structural standards as walls. Depending on the nature of the wastes and the operations to be carried out in a particular unit, a relatively light-weight door may be adequate if: (1) It provides an effective barrier that controls fugitive dust emissions from the unit to meet the no visible emissions standard (see Sec.

264.1101(c)(1)(iv) and Sec. 265.1101(c)(1)(iv)), and (2) the unit is designed and operated in a fashion that assures that wastes will not actually come in contact with the door. This latter requirement could be satisfied, in many cases, by a set-back of wastes stored in the unit. As noted above, these requirements may be satisfied by either interior or exterior walls, subject to constraints posed by the way the waste is managed.

vi. Measures to Prevent Tracking. EPA believes routine handling of hazardous waste within many of these units demands the frequent, if not constant, presence of personnel and handling equipment, e.g., front-end loaders, cranes. As such, particularly when the hazardous waste includes small particulates or where handling of the hazardous waste generates dust, the potential for tracking hazardous waste out of the unit may be significant. Therefore, EPA is requiring that the owner/operator ensure the containment of hazardous waste within the unit with appropriate measures to prevent this. (See Sec. 264.1101(c)(1)(iii) and Sec. 265.1101(c)(1)(iii).) Wash-down of vehicles and equipment prior to exiting the unit and dedicating vehicles and equipment for the sole purpose of operating within the unit are examples of measures that owners/operators of these units could take when the potential exists for tracking of hazardous waste out of the unit. In addition, owner/operators must prevent tracking of water or wet materials from "wet" areas to "dry" areas.

vii. Control of Fugitive Dust Emissions. Because of the dusty nature of many of the hazardous wastes that may be managed in these units and the dusty conditions that can be caused by the handling of these wastes within the unit, EPA also is requiring that owner/operators control fugitive dust

emissions during normal operating conditions. (See Sec. 264.1101(c)(1)(iv) and Sec. 265.1101(c)(1)(iv).) EPA has revised these requirements from the proposed rule based on extensive public comment. Today's rule provides substantial additional flexibility to owner/operators in how they may achieve the required degree of control. However, EPA is also specifying the standard more rigorously, and clarifying the presumption that owner/operators must install and operate systems to control fugitive dust emissions unless they can demonstrate that the wastes to be managed in the unit will not release significant amounts of fine particulates from the building as they are handled or treated.

The proposed rule required a system whereby a negative pressure was maintained within the unit and particulates collected, e.g., by fabric filter or electrostatic precipitator. In response to public comments, today's rule provides greater flexibility in controlling fugitive dust, but more specificity in the degree of control that must be attained.

The final rule requires that there be no visible emissions through any unit openings. This state of no visible emissions must be maintained effectively at all times during routine and operating and maintenance conditions, including when vehicles and personnel are entering and exiting the containment building. This standard is based on current standards required by EPA's Air Office. A test method found in 40 CFR part 60 appendix A, Method 22--Visual Determination of Fugitive Emissions from Material Sources and Smoke Emissions from Flares--can be used to determine compliance with the no visible emissions requirement. It is a timed method where an observer, using a stopwatch, determines if for a given period of time a source has visible emissions. If used to meet these standards, negative pressure dust control systems should assure that the air flow through openings such as windows and doors is inward at all times. All dust control systems must be operated and maintained in accordance with sound air pollution control practices (these practices are described in more detail in 40 CFR part 60, subpart 292).

Techniques other than the maintenance of negative pressure may be utilized where they can be shown to maintain no visible emissions from openings in the unit. The owner or operator of a containment building is required to maintain control of fugitive dust emissions such that any unit openings (e.g., doors, windows, seams, vents, cracks, etc.) exhibit no visible emissions outside the containment building. Compliance with this requirement may include such measures as double door (airlock-type) entry designs. All units must have the certification of a professional engineer that any dust control system is designed to achieve the no visible emissions standard.

Notwithstanding any other requirements of subpart DD of parts 264 and 265, if the method of controlling fugitive dust emissions includes the application of liquids, the Regional Administrator has the discretion to waive the secondary containment requirement for containment buildings or areas of containment buildings where liquids will be used to control dust or to otherwise protect worker health and safety in accordance with OSHA requirements. (See Sec. 264.1101(e) and Sec. 265.1101(e).) EPA notes that the application of free liquids alone may not be sufficient to control fugitive dust emissions.

viii. Inspection Plan. To ensure the unit is operating as designed, EPA is requiring all owner/operators to have an inspection plan for all

containment buildings that establishes an inspection program that ensures maintenance of the structural integrity of the unit and prompt detection of any leaks or releases to the air, ground, or water. EPA is requiring an inspection schedule for these units whereby, at least every seven days, monitoring/leak detection equipment, the containment building, and the area surrounding the containment building is checked to ensure the unit is being properly operated and that no leaks/releases have occurred to the air, ground, or water. (See Sec. 264.1101(c)(4) and Sec. 265.1101(c)(4).) This is consistent with the existing inspection requirements for drip pads and for liner and leak detection systems. These observations must be recorded in the facility's operating record. In the event that a condition is detected that has led or could lead to a release of hazardous waste, the owner or operator must repair the condition within a reasonably prompt time following discovery in accordance with the standard procedures for similar units. (See Sec.
264.1101(c)(3) and Sec. 265.1101(c)(3).)

In response to comments on these inspection requirements, EPA points out in today's rule that these weekly inspections need not be unduly burdensome.

Electronic monitoring of liquid in secondary containment systems or of air pressure differentials between the inside and outside of a containment building are examples of relatively cost-effective monitoring techniques.

ix. Engineering Certification. In the proposed rule, EPA identified that it was considering but was not proposing a requirement for written certification by an independent registered professional engineer (e.g., one who is not an employee of the company, or of its parent or subsidiary.) The benefit of such a certification would be to ensure that any new or existing containment building is designed and constructed with sufficient structural integrity to safely manage and contain the hazardous waste. Public comment was divided on the appropriateness of requiring independent certification. EPA has decided not to require that this certification be made by an independent professional engineer. Since professional engineers are certified and licensed by States and thus have a substantial incentive to maintain their professional reputation, a professional engineer must certify that the containment building has been designed with sufficient structural integrity and is acceptable for storing and treating hazardous waste according to the standards specified by EPA. The assessment must show that the foundation, structural support, primary barrier, secondary containment system (where required), fugitive dust control system, and leak detection system are designed to meet today's standards and that the containment building has sufficient structural strength and compatibility with the waste to be stored or treated. (See Sec. 264.1101(c)(2) and Sec. 265.1101(c)(2).)

x. Temporary Containment Buildings. Finally, EPA is aware that in situations such as hazardous waste site remediation efforts, appropriately designed and operated containment buildings could serve to enhance the performance of bioremediation treatment technologies. It may not always be appropriate for containment buildings intended for temporary use to be constructed or operated in exactly the fashion outlined in today's rule. EPA plans to address temporary containment buildings in a future rulemaking.

d. Closure Requirements. Today's rule promulgates requirements for closure of containment buildings that are consistent with the closure requirements that apply to waste piles (Secs. 264.258 and 265.258) and tanks (Secs.
264.197 and 265.197). At closure, owners or operators of both permitted

and 90-day containment buildings will be required to clean close the units by removing all hazardous waste from the containment building and by removing or decontaminating all hazardous waste residues, contaminated containment system components, contaminated subsoils, and structures and equipment contaminated with waste, and managing them in accordance with the Subtitle C regulations.

If the unit containment building cannot be clean closed, the unit must satisfy the requirements for closure that apply to landfills under Sec. 264.310 or 265.310. For a discussion of the requirements for clean closure and the "remove or decontaminate" standard, see 52 FR 8504, March 19, 1987.

Owner/operators of interim status waste piles who wish to convert these units to interim status containment buildings need not necessarily clean close their units prior to conversion; closure requirements applicable to these units may be deferred until closure of the containment building.

5. Revised Definition of Pile

EPA today is revising the regulatory definition of pile to exclude containment buildings. Specifically, EPA is revising the definition of "pile" to explicitly exclude containment buildings that accumulate or treat prohibited wastes under the proposed requirements of Parts 264 and 265.

Although EPA has previously classified all roofed structures used to manage dry wastes as indoor waste piles, EPA believes that there are distinctions between indoor waste piles that constitute land placement and containment buildings.

Most commenters generally supported these changes as proposed, although a limited number of commenters suggested that EPA revise the definitions of "pile" and "tank" more extensively. EPA may refine those definitions further in separate action at a later date, but EPA believes that the definitions in today's rule (which are substantially similar to those in the proposed rule) identify the distinctions between the various types of units with sufficient clarity to indicate which are land disposal and which aren't.

Under existing Sec. 264.250, indoor waste piles are required to exclude liquids or material containing free liquids, be protected from surface water run-on, control dispersal of waste by means other than wetting, and not generate leachate through decomposition or other reactions. In contrast, the containment building design and operating standards provide a higher level of containment and are in many ways comparable to RCRA tanks--that is, the hazardous waste is contained during storage or treatment. For example, containment buildings must be fully enclosed, have weight-bearing walls and floor systems designed and constructed of materials to prevent migration of hazardous constituents, be equipped with a secondary containment system in areas where the hazardous waste contains significant quantities of free liquids, and be provided with fugitive dust emission controls. Whereas containment buildings are designed to manage moisture associated with non- liquid wastes, indoor waste piles are precluded from including any water whatsoever.

6. Amendment of Sec. 268.50 Storage Prohibition and Permit Requirements

Under existing Sec. 268.50, the storage of hazardous wastes prohibited

from land disposal is also prohibited unless, among other requirements, the waste is stored in tanks or containers on site solely for the purpose of the accumulation of such quantities of hazardous waste as are necessary to facilitate recovery, treatment, or disposal. At the time EPA adopted this provision, tanks and containers were the only types of storage units that did not also involve land disposal. Under today's rule, there will also be other types of storage units (i.e., containment buildings, subpart X storage units) not involving land disposal. There may also be other types of miscellaneous storage units in the future, which units would be regulated under subpart X.

EPA is thus promulgating this rule to conform Sec. 268.50 to include these units.

7. Amendments to the Permit Modification Procedures in Sec. 270.42

Today's rule also amends appendix I of Sec. 270.42 by adding section M which will classify permit modifications involving containment buildings. In addition, today's rule amends the modifications for waste piles by adding an item which classifies a modification to a waste pile to meet the standards for a containment building as a Class 2 modification. EPA believes that many facilities will make modifications to their permitted waste piles to meet the standards for containment buildings. For more information on these permit modification procedures, see 53 FR 37912, September 28, 1988.

EPA is also amending section I of appendix I of Sec. 270.42 to add item I.6, which allows permitted facilities to convert existing waste piles to containment buildings by submitting a Class 2 modification to the Agency. EPA believes that the public should have the opportunity to comment on the modification request, which the Class 2 procedures provide. However, EPA believes that this modification is not significant enough to warrant the Class 3 procedures because the unit is an existing unit, and the technical standards are more stringent for containment buildings than for waste piles.

Some of the hazardous debris treatment processes that were proposed as BDAT under Sec. 268.45 would take place in units that EPA proposed to define as containment buildings. To assist in the development of treatment capacity by permitted facilities to meet the requirements of this rule, the Agency proposed to change the criteria that must be met to grant a temporary authorization. The existing regulation at Sec. 270.42(e)(3)(ii)(B) allows approval of the request if the activity is necessary to treat or store restricted wastes in tanks or containers in accordance with part 268. Today's rule amends these criteria to include the treatment or storage of hazardous debris in containment buildings meeting the requirements in proposed subpart DD, parts 264 and 265.

8. Amendments to the Change During Interim Status Procedures in Sec. 270.72

Section 270.72(b)(6) lifts the reconstruction limit for changes to treat or store in tanks and containers hazardous waste subject to land disposal restrictions imposed by part 268, provided that such changes are made solely for the purpose of complying with part 268. EPA believes that this change should also apply to treatment or storage of hazardous wastes in containment buildings. Today's rule amends Sec. 270.72(b)(6) to make

treatment or storage in containment buildings as regulated under subpart DD, parts 264 and 265, exempt from the reconstruction limit.

9. Amendment of Sec. 268.7 Waste Analysis and Recordkeeping Requirements

Today's rule amends Sec. 268.7 Waste Analysis and Recordkeeping requirements to include the management or treatment of prohibited waste in containment buildings.

10. Revision of Sec. 260.10 Definition of Miscellaneous Unit

Today's rule also makes a conforming change to the Sec. 260.10 definition of a miscellaneous unit by excluding containment buildings from that definition.

H. Retrofitting Surface Impoundments Under Land Disposal Restrictions

1. Regulatory Background

On February 4, 1992, EPA proposed a rule reconciling apparent conflicts in statutory language regarding surface impoundments receiving newly identified and listed prohibited hazardous wastes that have not been treated to meet a treatment standard (57 FR 4170). EPA is taking final action on that proposal in this FR Notice because the issue is relevant to wastes (particularly F037/F038) for which standards are being adopted today. (EPA also discussed this issue in the proposal to this rule at 57 FR 999-1000.)

a. Issue. EPA has identified a conflict in the Resource Conservation and Recovery Act (RCRA) concerning the deadline by which surface impoundments managing wastes that are both newly identified or listed as hazardous (i.e., identified or listed after the date of enactment of HSWA) and prohibited from land disposal must come into compliance with the minimum technological requirements (MTRs) of section 3004 (o)(1)(A) and 3005(j)(1). The MTRs require surface impoundments to have a double liner with a leak detection system, and a ground-water monitoring system./1/ In a typical situation, an impoundment will be receiving a hazardous, prohibited wastewater or generating a hazardous, prohibited sludge in the impoundment. These wastes typically will not meet treatment standards when placed in impoundments. The statutory conflict arises because one set of provisions states that impoundments can receive untreated prohibited wastes only if they meet MTRs.

Moreover, it is assumed that the lack of MTR impoundments creates a shortage of treatment capacity, justifying a variance. A further potential problem exists because normally only MTR impoundments are allowed to receive restricted wastes subject to capacity variances. On the other hand, a different statutory provision allows impoundments up to four years to achieve compliance with MTRs (or to close). The conflict arises if the LDR prohibitions come into play before this four-year period expires.

NOTE /1/ EPA has stated that land disposal facilities newly regulated under subtitle C of RCRA as a result of a newly identified or listed hazardous waste must install a ground-water monitoring system within one year of the effective date of the listing or characteristic rule (55 FR

39409, September 27, 1990). This deadline will not change as a result of this final rule.

We now describe the relevant statutory provisions in more detail. Section 3005(j)(6) allows a four-year compliance period for meeting the surface impoundment MTRs after the promulgation of additional listings or characteristics of hazardous waste. At the end of the four-year period, the impoundment must either meet MTRs or cease receiving, treating, or storing hazardous waste (referred to as "closing" in this discussion). (Thus impoundments newly in the system are given the same four years to retrofit or close that existing impoundments receive. Section 3005(j)(1).) Congress thus acknowledged that retrofitting or closure is not a quick process, but rather one that requires time, thus tempering the need to protect the environment with an acknowledgement that there must be a reasonable period for changing operations./2/

NOTE /2/ Section 3005(j) is actually a series of deadlines connected with the retrofitting of surface impoundments. For those units that undoubtedly have to retrofit, the time period is four years, while those that may qualify for variances are subject to interim deadlines for application and action on the variance request, and then a period, if the variance is denied, to retrofit within the time remaining in the four-year period. There are also retrofit deadlines for units initially granted variances, but later found to be leaking. These units are given shorter periods (two or three years depending on the variance), but this is appropriate where there is an actual leak.

Section 3004(g)(4) requires EPA to prohibit newly identified or listed hazardous wastes from land disposal (i.e., promulgate treatment standards for all such wastes not disposed in no migration units) within six months of the date of the new listing or characteristic. Section 3004(h)(4), which also deals with land disposal restrictions, states that during a national capacity variance (which EPA issues if sufficient treatment capacity is unavailable nationwide) or case-by-case extension period (for individual facilities demonstrating that they are unable to find existing treatment but have a binding contractual commitment to provide treatment capacity), wastes not meeting the treatment standards may be placed in a surface impoundment only if the impoundment is in compliance with the MTRs./3/ Mobil Oil Corp. v. EPA, 871 F.2d 149 (D.C. Cir. 1989). Finally, section 3005(j)(11) states that only surface impoundments meeting MTRs, and that are dredged annually, may receive prohibited wastes that have not yet met a treatment standard.

NOTE /3/ RCRA sections 3004(h)(2) and 3004(h)(3) restrict the duration of national capacity variances and case-by-case extensions to a maximum of four years. If capacity becomes available sooner, it must be used.

As noted above, these provisions raise two sources of potential conflict. The first is how long non-MTR impoundments can continue to receive prohibited wastes (i.e., wastes not meeting a treatment standard and for which there is no capacity variance). Section 3005(j)(6) indicates four years while section 3005(j)(11) does not allow it. A second conflict occurs for impoundments managing wastes granted a national capacity variance or

case-by-case extension when treatment standards are promulgated, because it is unclear whether surface impoundments must be in compliance with the MTRs at that time (per section 3004(h)(4)) or four years after the promulgation of the new listing or characteristic.

b. History. This conflict was not apparent when Congress enacted the Hazardous and Solid Waste Amendments of 1984 (HSWA) or when EPA first implemented the land disposal restrictions, even though the earliest land disposal restrictions dates (24 months from the enactment of HSWA for solvents and dioxins and 36 months for the California list wastes) would appear to cut short the November 8, 1988 retrofit deadline (four years after HSWA enactment) for interim status surface impoundments if they received wastes for which EPA granted a capacity variance. The issue did not arise because EPA interpreted section 3004(h) differently at that time; rather than requiring an individual unit receiving restricted waste to meet the MTRs, EPA required only those units within the same facility that were otherwise subject to the MTRs to be in compliance. As a practical matter, that meant that only new, replacement, or expansion units had to meet the MTRs.

In the August 17, 1988 rule promulgating the land disposal restrictions for the First Third Scheduled Wastes (53 FR 31138), EPA changed its interpretation to require individual units to comply with the MTRs. That reinterpretation became effective four years after the enactment of HSWA and was upheld in Mobil Oil Corp. v. EPA, 871 F.2d 149 (D.C. Cir. 1989). There was no conflict at that time because the four-year retrofitting period ended at the same time that the revised interpretation took effect.

The conflict was mentioned in the Third Third proposal (54 FR 48499, November 22, 1989), which stated that if EPA issues a capacity variance for newly identified or listed hazardous wastes, it would have to reconcile the differences in sections 3005(j)(6) and 3004(h)(4). (The notice did not allude to potential conflicts with section 3005(j)(11) because it was assumed that the lack of MTR impoundments would give rise to circumstances justifying capacity variances, triggering the potential conflict with section 3004(h)(4).) Several commenters responded to this issue. Some stated that section 3005(j)(6) explicitly afforded four years to retrofit surface impoundments newly brought under subtitle C regulation. Another commented that the four years provided to retrofit surface impoundments managing regulated mineral processing wastes may not be adequate, and that the schedule should be determined site-specifically.

Others disagreed, however, that a conflict exists between sections 3004(h)(4) and 3005(j)(6). They argued that: (1) EPA's interpretation of section 3004(h)(4), rather than any inherent flaw in the statute, led to the apparent "conflict," and (2) the general language of section 3004(h)(4) cannot override the specific language of section 3005(j)(6), wherein the issue of newly identified or listed hazardous waste is addressed directly. EPA did not resolve this issue in the final Third Third land disposal restrictions rule, but rather left it for later resolution. EPA is taking this opportunity to resolve the conflict.

2. Agency Interpretation

a. How long can impoundments continue to be used to receive or generate newly identified or listed hazardous wastes? The first set of provisions

potentially in conflict are 3005(j)(6) and 3005(j)(11). As noted above, one provision allows four years to retrofit or close an impoundment, the other says that only MTR impoundments can receive prohibited wastes not meeting a treatment standard. Once EPA promulgates a treatment standard, the question is whether a non-MTR impoundment can receive prohibited wastewaters, and continue to generate prohibited sludges, i.e., whether these wastes can continue to be land disposed (section 3004(k)) within the non-MTR impoundment, assuming, as is almost certain, that the wastes do not meet the treatment standard when they are disposed in the impoundment./4/

NOTE /4/ The Agency adheres to its consistently held view that wastes generated in surface impoundments are land disposed within the meaning of section 3004(k). The Land Disposal Restrictions for Solvents and Dioxins final rule, which laid the foundation for future Land Disposal Restriction rules, stated that "residuals that exceed the treatment standards must be removed at least annually from the time the waste is first placed in the impoundment" (51 FR 40601, Nov. 7, 1986). Hence, it presupposed that sludges generated in surface impoundments would be regulated by the rule. This presupposition is also apparent at 53 FR 17581, Aug. 17, 1988, and 54 FR 26598, June 23, 1989. Certainly, generation of a sludge in an impoundment fits the definition of land disposal in section 3004(k): "any placement of such hazardous waste in a * * * surface impoundment * * *" In addition, since sludges are virtually never generated outside of impoundments and then put into them, any construction that sludges generated in impoundments are not also disposed in them would result in the overwhelming majority of impoundments managing hazardous wastes being outside the scope of the land disposal restrictions. This would undermine a principal Congressional purpose, since impoundments are singled out as the most environmentally adverse form of hazardous waste management unit. See, e.g., RCRA section 1002(b)(7); CMA v. EPA, 9 F.2d 158 (D.C. Cir. 1990). EPA has consistently taken into account the volumes of sludges generated in surface impoundments in the capacity determinations required for RCRA section 3004(h) (53 FR 17607, May 17, 1988; 53 FR 31191, Aug. 17, 1988; 54 FR 26636, June 23, 1989; 54 FR 48471, Nov. 22, 1989; and 55 FR 22632, June 1, 1990).

As noted below, the same question arises if one assumes that lack of existence of MTR impoundments triggers capacity variances, because Sec. 268.5(h) (codifying section 3004(h) (4)) indicates that only MTR impoundments are eligible to receive the restricted wastes subject to the variance (assuming impoundments disposal).

EPA believes that this set of provisions is in conflict, since any other reading means that Congress gave a four-year window for continued non-MTR impoundment use with one hand, and snatched it away with the other by means of section 3005(j)(11)./5/ The Agency is resolving this conflict by allowing interim status surface impoundments a four-year period (from the effective date of the waste identification or listing) to continue using the impoundment to receive prohibited wastewaters and generate prohibited sludges. This allows the period Congress appeared to deem typically necessary to close or retrofit an impoundment (see also section 3005(j)(1) where Congress provided the same four-year period for impoundments managing wastes identified or listed as hazardous on the date of enactment of the 1984 amendments).

NOTE /5/ The Agency does not believe it fruitful to argue about which provision is more specific. One is more specific with regard to dealing with newly listed waste, but the other is more specific in addressing the relationship of impoundments and the land disposal restriction provisions.

Although Congress' goal is not to put untreated wastes into non-MTR-compliant surface impoundments, it recognized that MTR compliance cannot be achieved immediately. Although the legislative history does not expressly articulate it, the structure of section 3005(j) shows that Congress thought that the goal of environmental protection (served by retrofitting) needed to be balanced against the goal of avoiding sudden disruptions and capacity losses in waste treatment and disposal that a six-month deadline could cause.
Congress felt that four years struck an appropriate balance.

Although EPA recognizes that not all impoundments will take four years to close or retrofit (see 57 FR at 4173-74 (Feb. 4, 1992)), an interpretation that would allow EPA to review individual determinations of whether a full four-year period is needed to close or retrofit (for example, through review of applications for case-by-case capacity extensions) appears unduly disruptive of plant waste management determinations (i.e., EPA or State officials second-guessing determinations of the necessary length of time to close or retrofit), and wasteful of Agency resources as well. In addition, Congress indicated that a four-year window was appropriate. Thus, the Agency is interpreting these provisions to state that non-MTR impoundments can remain operating for four years after the effective date of the waste identification or listing notwithstanding that they are receiving prohibited waste not meeting a treatment standard./6/

NOTE /6/ As noted above, another way of viewing this question is to say that the conditions for some form of treatment capacity variance are satisfied because even if treatment capacity exists outside the surface impoundment, wastes must continue to be land disposed in the impoundment for some period of time while the impoundment is closed or retrofitted. EPA would give the same answer (i.e., four years of continued use) if the question were conceptualized in terms of capacity variances.

This same potential conflict is raised in duplicative fashion during the period of a national or case-by-case capacity variance. Not only is there the conflict with section 3005(j)(11) as discussed above, but a conflict with section 3004(h)(4) as well, since under that provision (as implemented in section 268.5(h)) only MTR impoundments can receive wastes during the period of a capacity variance. EPA is resolving this conflict by allowing a four- year retrofit period for the same reasons given above. Thus, the Agency reads section 3005(j)(6) as an exception to the general rule of section 3004(h)(4) (and 3005(j)(11)); that is, surface impoundments newly brought into the subtitle C system by a new listing or characteristic have four years to retrofit even if they receive wastes subject to a national capacity variance or case-by-case extension. However, EPA notes that the potential conflict between statutory provisions exists whether or not treatment capacity exists outside of the surface impoundment (see fn. 6)./7/

NOTE /7/ Of course, prohibited sludges generated outside of impoundments could not be managed in a non-MTR impoundment in any case. If treatment

capacity is available for such sludges, it must be utilized. If treatment capacity is unavailable (i.e., there is a capacity variance in place for such wastes), the wastes must be disposed in an MTR landfill, or impoundment, or some other type of land disposal units such as land treatment (Sec.
268.5(h)).

b. Resolution where treatment capacity exists outside the surface impoundment. If treatment capacity exists outside the surface impoundment, however, a further issue exists with respect to sludges generated within a surface impoundment, since these sludges can be removed for treatment elsewhere. In the January 9, 1992 proposed rule, the Agency proposed to resolve these issues by requiring annual dredging of F037 and F038 sludges, plus requiring clean closure of the unit (assuming the unit would be closed rather than retrofitted). The proposal was premised on the logic that if retrofitted impoundments receiving wastes not meeting a treatment standards had to be dredged annually (because of section 3005(j)(11)), unretrofitted impoundments should be subject to the same standard if there was a means of treating the waste being removed. The proposed clean closure requirement was based on the notion that if treatment capacity exists, it should be used in preference to disposal in a non-MTR impoundment. In the Feb. 4 proposal, EPA also noted a general principle of requiring use of treatment capacity for wastes in section 3005(j)(6) impoundments where such treatment capacity exists. (57 FR 4170.)

Commenters noted that aspects of the proposal did not necessarily make environmental sense. They noted that an annual dredging requirement was unlikely to provide significant environmental benefit because the impoundments were likely to be closed in a short time in any event, when some sludge removal was likely. Before closure, the impoundment would be monitored and subject to corrective action requirements. In addition, an annual dredging requirement could interfere with on-going use of the impoundment.

With respect to clean closure, commenters pointed out (correctly) that this would entail removal not only of accumulated sludges but subsurface contaminated soils as well which are not the focus of the treatment requirements, and that forcing clean closure could interfere with otherwise available and potentially more cost-effective types of closure options.

EPA finds many of these comments persuasive and believes that the following interpretation best resolves these issues. First, EPA is not interpreting these provisions as necessitating annual dredging of accumulated sludges.

Either the impoundment will close in a short time (no more than four years), or it will be retrofitted and become subject to the annual dredging requirement in section 3005(j)(11) (as implemented by Sec. 268.4(a)(2)(ii)).

If the impoundment closes, EPA is interpreting the provisions to allow closure with wastes in place (unless the unit operator chooses to clean close the impoundment). Thus, under this reading, continued use of the impoundment would be allowed during the four-year retrofit/closure period (as explained in section 1 above), use of the impoundment during that time would not be disrupted by a dredging requirement, and the impoundment would be allowed to close with wastes in place. These are the same options that were available to impoundments in 1984 managing wastes already identified or listed as hazardous.

3. Technical Analysis

a. Introduction. Owners or operators of surface impoundments managing newly listed or characteristic hazardous wastes have several options for complying with the minimum technological requirements. Facilities may retrofit the surface impoundments with liners and leak detection systems in compliance with the requirements of section 3004(o)(1)(A)(i). Alternatively, facilities may replace their treatment surface impoundments with wastewater treatment tanks regulated under the Clean Water Act or may opt to close the surface impoundments and send the waste off-site.

EPA believes that very few facilities managing newly regulated wastes in surface impoundments will choose to retrofit their impoundments. For example, the Chemical Manufacturers Association (CMA) conducted an informal survey of 582 chemical manufacturing facilities in the fall of 1989 to obtain information about the management of "non-hazardous wastes" in surface impoundments. Twenty-seven facilities reported that 85 surface impoundments would be newly regulated as a result of the Toxicity Characteristic rule (55 FR 11798, March 29, 1990); of these 85, only 9 would be retrofitted with liners and leak detection systems. Replacing surface impoundments with tank systems was the most frequently planned method of compliance for the respondents to this survey. Past experience also indicates that surface impoundment owners or operators are more likely to replace their surface impoundments with tank systems than to retrofit the impoundments. RCRA section 3005(j)(1) required surface impoundments that were in existence and that qualified for interim status on the date of enactment of HSWA to come into compliance with the MTRs by November 8, 1988. Most facilities with surface impoundments replaced their impoundments with tanks in response to this deadline. Less than five percent of these facilities actually retrofitted their surface impoundments.

To support today's rulemaking, EPA undertook an analysis to determine how much time is needed for owners or operators of newly regulated surface impoundments to comply with the MTRs either by replacing the impoundments with wastewater treatment tanks exempt from RCRA subtitle C standards, or by retrofitting the surface impoundments with liners and leak detection systems according to the requirements of section 3004(o)(1)(A)(i). EPA collected information from a variety of sources, including facilities that have implemented these practices in the past or plan to do so in the future (e.g., in response to the TC), tank manufacturers, and engineers. The results were summarized in the proposed rule (57 FR 4170), and are available in the background document./8/

NOTE /8/ It should be noted that the potential statutory conflict at issue in this rulemaking is most immediately relevant to wastes newly regulated as a result of the Toxicity Characteristic (TC) rule (55 FR 11798, March 29, 1990). According to the regulatory impact analysis for the TC, about 730,000,000 metric tons per year of wastewaters managed in surface impoundments at over 2,000 facilities are estimated to exhibit the TC (U.S. EPA, OSW. U.S. EPA Background Document. Toxicity Characteristic Regulatory Impact Analysis. Final Report. March 1990). This potential conflict will also arise with respect to all future newly identified or listed hazardous wastes; however, the TC rule is used as an example throughout this section.

4. Conclusion

EPA found that the time needed to comply with the MTRs varies considerably based on case-by-case factors (e.g., current waste management practices, land availability) and regional factors (e.g., climate). According to EPA's information sources, six months appears not to be enough time to either retrofit a surface impoundment or replace the impoundment with a wastewater treatment tank. Replacing a surface impoundment with a tank frequently takes two to four years, and retrofitting a surface impoundment frequently takes two to three years.

EPA believes that most interim status surface impoundments managing wastes newly identified or listed as hazardous will be able to comply with the surface impoundment MTRs within four years of the date promulgating the listing or characteristic. Thus, the four-year period allowed in section 3005(j)(6) is a reasonable period within which to come into compliance.

V. Detailed Discussion of Final Rule: Hazardous Debris

A. Overview

The Agency is today promulgating a final rule for the treatment of hazardous debris. Until today, debris destined for land disposal that was contaminated with a prohibited RCRA hazardous waste or that exhibited a prohibited RCRA hazardous characteristic was subject to the treatment standard for that listed waste or characteristic. See, e.g., 55 FR 22649 and RCRA sections 3004 (d)(3) and (e)(3). Although hazardous waste debris (as well as contaminated media) is subject to the LDR prohibitions, there is no requirement that it have the same treatment standards as the wastes with which it is contaminated. Indeed, because hazardous debris may be a matrix significantly different from the underlying prohibited waste, it is appropriate as a technical matter to determine whether different treatment standards were appropriate.

Today, EPA is promulgating treatment standards for hazardous debris prohibited from land disposal. Under today's rule, hazardous debris must be treated by specified technologies based on the type of debris and type of contaminant(s) present or, as an alternative, meet the LDRs for the specified prohibited listed or characteristic waste with which it is contaminated.

EPA has specified a number of BDAT technologies for hazardous debris, with the choice of technology left up to the generator and/or treater managing the waste. The technologies include widely used treatment methods. EPA thus believes that it is preserving in this rule as much flexibility for the treatment of hazardous debris as possible.

Prohibited hazardous debris is defined generally as solid material (that is not a process waste) having a particle size of 60 mm or larger and that is intended for land disposal and exhibits a prohibited characteristic of hazardous waste or that is contaminated with a prohibited listed hazardous waste. Hazardous debris must be treated by one of the specified treatment technologies for each "contaminant subject to treatment" defined as: (1) The BDAT constituents for the listed waste that are subject to land disposal restriction standards (as found in Sec. 268.41 and 268.43); and (2) the RCRA hazardous waste constituent(s) for which the hazardous debris fails the Extraction Procedure toxicity characteristic, in addition to any

other characteristic which causes the debris to be hazardous (i.e., ignitability, reactivity). As an alternative, the generator of the hazardous debris may choose to treat the hazardous debris to the existing waste-specific treatment standards for the waste contaminating the debris. However, in choosing this alternative, the generator or treater would be required to sample and analyze the treated debris to ensure compliance with the treatment standards prior to disposal in a Subtitle C land disposal unit.

To ensure effective treatment, the treatment unit would be required to meet performance standards or design and operating conditions specified in the rule. In addition, the treatment unit would generally be subject to the Part 264 and 265 standards for treatment facilities to ensure protection of human health and the environment.

The rule addresses not only the issue of when hazardous debris is sufficiently treated, but the further question of when it is a hazardous waste. Under the rule, treated hazardous debris would be excluded from the definition of hazardous waste provided that: (1) The debris is treated to the performance or design and operating standards by an extraction or destruction technology rather than an immobilization technology /9/; and (2) the treated debris does not exhibit a characteristic of hazardous waste. If an immobilization technology is used, the treated debris would not be automatically deemed a nonhazardous waste. In addition, the Agency could determine on a case-by-case basis under today's rule that debris no longer "contains" hazardous waste and is excluded from Subtitle 6 regulation.

NOTE /9/ In the Phase II land disposal restrictions rule, the Agency will reopen and request comment on the issue of whether immobilized debris should be excluded from Subtitle C regulation. (See discussion in Section V.D.2.)

Residuals generated by the treatment of hazardous debris are subject to the numerical treatment standards for the waste contaminating the debris.

B. Definitions of Debris and Hazardous Debris

1. Definition of Debris

EPA is today defining debris as solid material exceeding 60 mm (2.5 inch) particle size that is: (1) A manufactured object; or (2) plant or animal matter; or (3) natural geologic material (e.g., cobbles and boulders), except that any material for which a specific treatment standard is provided in Subpart D, part 268, is not debris./10/ A mixture of debris and other material such as soil or sludge is also subject to regulation as debris if the mixture is comprised primarily of debris by volume, based on visual inspection. Process residuals such as smelter slag and residues from the treatment of waste (e.g., incinerator ash), wastewater, sludges, or air emissions residues (e.g., collected particulate matter) are not debris. We discuss below that debris must be intended for discard (i.e., rather than continued use), that debris must be a solid material, the rationale for selecting a 60 mm particle size criterion for debris (i.e., as opposed to the 9.5 mm particle size proposed) and for applying the size criterion to all debris (i.e., not just to geologic materials as proposed), the

rationale for regulating as debris mixtures of primarily debris and other materials, the rationale for not regulating process residuals as debris, and the rationale for regulating nonempty containers as hazardous waste subject to existing LDRs rather than as debris.

NOTE /10/ For example, lead acid or cadmium batteries are not debris because they are subject to specific treatment standards under Sec. 268.42.

a. Debris Must Be Discarded or Intended for Discard. Debris must of course be either a solid waste or media (e.g., boulders) that is discarded or intended for discard to be subject to the treatment standards in today's rule. Those commenters on the proposed rule expressing concern that the proposed rule in some way vitiated (or was intended to vitiate) this basic principle were mistaken. This means that such materials that might at some later time become debris, such as equipment or building structures, but that are still in use are not subject to the treatment standards. Such in-use material is not a solid waste because it has not been discarded or intended for discard, as these terms are used in Sec. 261.33 (i.e., likely abandoned, as defined in Sec. 261.2 (a)(2)(i) and (b))
Media debris (e.g., boulders) is also not subject to regulation as solid waste unless discarded or intended for discard and so is not automatically subject to the treatment standards.

Once debris becomes a solid waste by virtue of being discarded (including media debris that becomes subject to regulation as solid waste by virtue of being discarded), it is not necessarily subject to the treatment standards. For example, contaminated debris that is not actively managed after the effective date of the prohibitions (i.e., the effective date of the LDRs for the hazardous waste contaminating the debris) would not be subject to the standards. See 53 FR 31148 (Aug. 17, 1988). On the other hand, debris which is contaminated with hazardous waste disposed before the hazardous waste listing effective date and which is actively managed is subject to the prohibitions and so would have to be treated to satisfy the treatment standards promulgated today before the debris could be land disposed (assuming disposal will not occur in a no-migration unit). Chemical Waste Management v. EPA, 869 F. 2d 1526 (D.C. Cir. 1989).

b. Debris Must Be a Solid Material. The rule defines debris as a "solid material." This means solid in a literal sense as defined in a common dictionary. A solid material is a material that retains its volume at room temperature without the need for support by a container. Examples of solid materials that are debris if intended for discard and if their particle size is 60 mm (2.5 inches) or greater include: (1) Glass; (2) concrete (excluding cementitious or pozzolanic stabilized hazardous wastes); (3) masonry and refractory bricks; (4) nonintact containers /11/ e.g., crushed drums); (5) tanks; (6) pipes, valves, appliances, or industrial equipment; (7) scrap metal (as defined in 40 CFR 261.1(c)(6)); (8) animal carcasses; (9) tree stumps and other plant matter; (10) rock (e.g., cobbles and boulders); and (11) paper, plastic, and rubber. Not only is defining debris as solid material in accord with the common-sense view of what debris is, but, more importantly, it is geared to the treatment standards adopted today that ensure effective decontamination of solid materials by removal or destruction of hazardous waste. Clearly, if a liquid could be considered debris, the concept of cleaning off the outer surface to remove contamination does not make sense./12/

NOTE /11/ See discussion in section V.B.1.f of the text regarding regulation of intact and nonintact containers.

NOTE /12/ While most of the debris treatment methods are extraction methods, some methods destroy the hazardous constituents; although these would be applicable to liquid material, most of the treatment methods simply remove the contamination from the debris for subsequent detoxification treatment.

Even though debris must be a solid material, it may contain or be mixed with free liquids./13/ The liquids may be waste or ground or surface water that may be entrapped in the debris (e.g., in partially crushed containers (see discussion below on regulation of containers)) or may be still oozing from the debris if the debris was newly generated or newly excavated from a remediation site. (If liquids separate from hazardous debris prior to treatment of the debris, they must be managed as hazardous waste.) Liquids that are entrapped in debris will be effectively treated under today's treatment standards for extraction or destruction technologies. If an extraction technology is used, the toxic constituents in the liquid will be removed from the debris as a treatment residue and is subject to the LDRs for the waste contaminating the debris. If a destruction technology is used, the toxic constituents in the liquid should be destroyed.

NOTE /13/ To determine otherwise would result in large quantities of solid materials being subject to the existing LDRs for the waste contaminating the materials. Those solid materials would be very difficult to sample representatively to document compliance with the LDRs. Further, the solid materials would be readily amenable to the debris treatment standards promulgated today notwithstanding the presence of free liquids, and hence appropriately classified as debris.

We note, however, that debris that is immobilized prior to land filling may not contain free liquids as provided by Secs. 264.314 and 265.314. Thus, free liquids (including liquids in crushed containers) cannot be present in debris that is macroencapsulated or sealed, and cannot be present in debris that has been micorencapsulated.

c. Debris Has a Particle Size Larger Than 60 mm. Today's rule defines debris as solid material with a particle size of 60 mm (2.5 inches) or greater. We discuss below the rationale for increasing the particle size to 60 mm from the proposed 9.5 mm particle size, the rationale for applying the size criterion to all debris, not just to geologic matter as proposed, the rationale for defining 60 mm or larger clumps of fine-grained materials (e.g., clumps of compacted clay) as nondebris material, and how the particle size criterion is to be implemented.

(1) Rationale for Increasing the Particle Size of Debris From 9.5 mm to 60 mm. The Agency is today defining debris as solid material with a particle size of 60 mm (2.5 inches) or greater for a number of reasons: (a) Fine grain materials (e.g., soil, glass cullet) are not amenable to the surface removal technologies specified in today's rule and are not commonly thought of as debris; (b) fine grain materials are likely to be amenable to the

treatment technologies that were the basis for the LDRs for the waste contaminating the material; (c) fine grain materials, unlike large particle size materials, can be reasonably sampled for analysis to document compliance with the concentration-based LDRs for the waste contaminating the material; (d) material normally considered to be soil should be subject to the Agency's planned LDRs for contaminated soil rather than defined as debris /14/; (e) the selection of a 60 mm particle size criterion is within the range of reasonable particle sizes the Agency could have selected for defining debris; and (f) many commenters suggested a larger particle size, and the only commenters that suggested a particular size suggested 60 mm.

NOTE /14/ We note that numerous commenters were concerned that the proposed particle size criterion of 9.5 mm would inappropriately define most soil as debris. (We note further that the proposed rule could have been interpreted to define as debris geologic material that was comprised of only one particle (e.g., a rock) with a particle size of 9.5 mm or greater. Thus, fine grain soil containing one 9.5 mm or greater sized rock could have been considered debris. The final rule addresses mixtures by defining as debris mixtures of primarily debris with other materials. See discussion in the text in Section V.B.1.d).

We note that a number of commenters suggested that the Agency consider raising the particle size breakpoint as the Agency is doing here. Two commenters suggested an alternative sieve size of 60 mm, stating that existing soil-washing equipment such as rotary screens and wet vibratory screens are capable of handling particles sizes of several inches, and the suggested 60 mm cut-off size would result in more soil being subject to the existing LDRs which require sampling and analysis to document compliance with concentration-based treatment standards.

While the Agency believes that it could have selected other particle sizes, the Agency selected the 60 mm (2.5 inch) particle size from the range of 9.5 mm (3/8 inch) to 200 mm (8 inches) because: (1) It is a commonly used sieve size that is commercially available, (2) it would define as soil pebbles and smaller particles, and define as debris cobbles and boulders /15/ in accord both with common understanding and with materials most amenable to effective treatment by the methods adopted today; and (3) it meets the criteria discussed above (e.g., smaller particle size material can be readily sampled to document compliance with the numerical LDR treatment standards for the waste contaminating the material)./16/ In addition, this size object is normally readily amenable to effective treatment by the methods specified in today's rule.

NOTE /15/ See the May 11, 1992, memorandum from Kerry Rice, Radian to Mark Mercer, EPA, entitled "Particle Size Definitions and Sieve Sizes"; and the May 18, 1992, memorandum from Peter Shields, Radian, to Mark Mercer, EPA, entitled "Sieves with Openings Greater than Four Inches".

NOTE /16/ We note that the Agency is considering proposing Phase II land disposal restrictions that would establish treatment standards for contaminated soil. In that proposal, the Agency is considering requesting comment in particular on whether soils with a particle size between 9.5 mm and 60 mm can be effectively treated under those proposed standards.

(2) Rationale for Applying the Particle Size Criterion to All Debris. The Agency has broadened the particle size test to apply to all debris, not just to geologic debris as proposed. We believe that the reasons enumerated above for increasing the particle size to 60 mm apply equally to applying the particle size to all debris (e.g., small particle size objects--e.g., glass, metal fragments--can be readily sampled representatively to document compliance with the LDRs for the waste contaminating the material).

(3) Compacted Clumps of Fine Grained Materials are not Defined as Debris. The Agency is basing the size criterion on the particle size of the solid material rather than the sieve size to ensure that 60 mm (or larger) compacted clumps of materials with a particle size less than 60 mm are not defined as debris. The most common example is clayey soil. Clay particles are extremely cohesive and can form clumps during normal excavation and handling operations. The contaminated debris treatment methods are not intended to clean clumps of clay. Clumps of agglomerated clay soil are subject to the treatment standards for the waste contaminating the soil.

In addition, the Agency is concerned that generators may have the incentive to intentionally agglomerate small particle size materials (e.g., soil or even manufactured materials) so that they would meet the definition of debris and so be excluded from regulation under subtitle C upon treatment by an extraction or destruction technology. If such contaminated materials were not regulated as debris, they would be subject to the LDRs for the waste contaminating them and would remain subject to subtitle C regulation after treatment. Basing the size criterion on particle size rather than sieve size precludes the potential for such sham activities.

(4) Implementation of the Particle Size Criterion. To make today's rule workable, equipment operators need to be able to determine quickly whether material being remediated is debris or nondebris (e.g., soil, waste). In some cases, the determination will vary from one front end loader bucketfull of material to another. Accordingly, the Agency intends for the size criterion to be implemented by visual observation. Screening is not required. If screening is used, however, the screen may be either a square grid with openings 60 mm on a side or a circular grid with circles with a 60 mm diameter.

(d) Waste for Which a Specific Treatment Standard Has Been Established is not Debris. There is one further exception to this definition of debris. EPA is indicating that debris-like material for which the Agency has promulgated a specific treatment standard is not considered to be debris. The reason is that the Agency will have determined that specific treatment standards are appropriate for the material, rather than the assortment of technologies adopted for debris generally. See 57 FR 983 c.3 (Jan. 9, 1992).

The chief examples of a material subject to a specific treatment standard rather than the general debris standards are lead acid batteries and cadmium batteries. EPA has promulgated a treatment standard of metal recovery for each of these materials. See Sec. 268.42. Thus, this more specific treatment standard takes precedence over the more general debris standard adopted today./17/

NOTE /17/ A number of commenters questioned the jurisdictional basis for regulating battery plates and groups from lead acid batteries as "solid

wastes" subject to subtitle C regulation. EPA adheres to the response set out at 57 FR 960-961 in the proposed rule.

d. Mixtures of Debris with Other Materials are Subject to Regulation as Debris if Debris is the Primary Material Present. A further issue needing to be addressed is the status of mixtures of debris and other materials such as soils or sludge. This situation arises often, particularly in remedial situations where debris is rarely present in a pristine state. Since the treatment standards for debris and other materials--sludge or contaminated soil--differ, the issue of classification is an important one. In developing a means of classification, the Agency on the one hand is seeking to prevent the debris classification from invariably overriding the treatment standards for other hazardous wastes. On the other hand, it is important to have a means of classification that is easy to apply by equipment operators in the field.

The Agency has therefore decided to classify /18/ as debris any mixture where the debris portion comprises the largest amount of material present by volume, to be determined by visual inspection./19/ Thus, for example, if upon examination, a mixture of cobbles (i.e., with a particle size of 60 mm or more), soil, and sludge is comprised mostly of cobbles, the mixture is classified as debris. After being treated by one of the treatment methods for debris promulgated in today's rule, it could then be land disposed. (Residues from applying the treatment method could be land disposed after being treated to meet the treatment standards for the prohibited waste contaminating the debris.)

NOTE /18/ We note that although such mixtures are classified as debris and are subject to the debris treatment standards, if the nondebris materials are separated from the debris prior to treatment by a specified technology, the separated material is no longer classified as debris. If the separated material is a hazardous waste (or soil contaminated with a hazardous waste), it is subject to the waste-specific treatment standards. When treatment residue (i.e., soil, waste, or other nondebris material) is separated from treated debris as required by today's debris standards for extraction or destruction technologies, the residue is subject to the waste-specific standards for the waste contaminating the debris.

NOTE /19/ Some materials (e.g., soil) mixed with debris may contain free liquids that may still be oozing from the material. The volume of such entrapped liquids need not be considered in determining whether the mixture is primarily debris because it is impracticable to determine the volume of such liquids by visual inspection.

The definition of debris encompasses this classification principle by stating that "A mixture of debris and other material such as soil or sludge is also debris if the mixture is comprised primarily of debris by volume, based on visual inspection." It should be clear from this discussion that the rule does not require debris and nondebris materials to be separated prior to treatment (an unintended implication of the proposed rule). Rather, mixtures are either classified as debris or some other type of waste treatability group according to the classification test discussed above.

We note that the "primary material" test for classifying debris does not

apply to intact, nonempty containers. Given that such containers are not debris (see discussion below in section V.B.1.f) and can be readily separated from debris (or mixtures of debris and other materials), they are not considered in applying the "primary material" test. Consequently, intact, nonempty containers must not be included in making the volume determinations to classify mixtures of debris.

There is one further point to be made. Although EPA is classifying mixtures that are predominantly debris as debris, this does not mean that debris can be deliberately mixed with other wastes in order to change their treatment classification. Such mixing is impermissible dilution under Sec. 268.3 since it is a substitute for adequate treatment. See also 53 FR 31145 (Aug. 17, 1988); dilution to change treatability groups is ordinarily impermissible. In addition, such situations where debris is used merely to dilute another prohibited waste, the mixture would remain subject to the most stringent treatment standard of any waste that is part of the mixture. See Sec.
268.41(b).

e. Process Residuals Are Not Debris. Today's definition of debris explicitly excludes process residuals by stating: "Process residuals such as smelter slag and residues from the treatment of waste (e.g., incinerator ash), wastewater, sludges, or air emissions residues (e.g., collected particulate matter) are not debris." The Agency believes that debris should be limited to manufactured objects (e.g., metal, glass) and naturally occurring objects (e.g., boulders, tree stumps). The Agency developed the treatment standards generally to ensure effective treatment of hazardous waste contaminating an object, rather than effective treatment of a large particle size hazardous waste such as slag./20/

NOTE /20/ We note that previous debris definitions (see Sec. 268.2(g)) considered "slag" as debris. The Agency has reconsidered this issue and has determined the slag is not debris because it is not the type of material for which today's debris treatment standards were developed--objects contaminated (generally surficially) with hazardous waste.

Several commenters requested clarification as to what the Agency meant in the proposed rule by excluding from the definition of debris "solids that are listed wastes or can be identified as being residues from treatment of wastes and/or wastewaters." The commenters felt that it was unclear whether this phrase exempts from the definition of debris only pollution control residues, or material such as metal filters, ceramic column packing, or discarded pollution control equipment. Commenters suggested that EPA clarify, through examples, that discarded industrial equipment (such as filters, pumps, etc.) would be included in the definition of debris even if the equipment was used to treat wastes or wastewaters. The commenters are correct. A discarded pump or filter used to treat a waste is debris, but the waste pumped or filtered is not debris. Although some filtered or pumped waste will contaminate the pump or filter (indeed, that is the basis for subjecting the filter or pump to the treatment standards), the contaminated pump or filter will virtually always be comprised primarily of debris rather than waste and so would be classified as debris.

f. Intact Containers Are Not Debris. A number of commenters requested comment on the relationship between the proposed treatment standards for debris and the so-called empty container rule in Sec. 261.7. That rule states in essence that with respect to containers holding hazardous waste,

what is regulated is the hazardous waste in the container and not the container itself. Thus, empty containers are not regulated, and the hazardous wastes in nonempty containers are. An empty container is one from which all hazardous wastes have been removed using practices commonly utilized for waste removal, and in which not more than 2.5 centimeters of waste remains. (Slightly different tests apply to containers holding acutely hazardous wastes.)

Since containers are potentially a form of debris, there is a question whether either empty or nonempty containers are subject to the treatment standards for debris notwithstanding Sec. 261.7. EPA is indicating in this rule that the debris treatment standards do not override the empty container rule, so that rule remains in effect. EPA is taking this step largely because it did not propose the issue for comment, and any fundamental changes to the empty container rule merit fuller public participation than afforded here. In addition, EPA has not fully studied the implications of making changes in the empty container rule to accommodate regulations under the land disposal prohibitions program.

Today's final rule thus indicates that intact containers are never considered to be debris, and thus would never be subject to treatment standards for debris. Intact containers are either empty or nonempty. If empty they are not subject to regulation, as provided by Sec. 261.7(a)(1). If nonempty, the hazardous waste within the container is subject to the land disposal prohibitions (as well as the rest of subtitle C regulations). EPA also does not consider intact tanks to be debris, so that any hazardous wastes in tanks would be subject to the standards for those wastes, not (potentially) to treatment standards for debris.

It should be noted, however, that EPA is reading the empty container rule in Sec. 261.7 to apply to intact containers. The Agency is doing so because the rule was clearly intended for devices that function as containers, not for crumpled drums that are not easily emptied by normal means. See Sec. 261.7(b)(1)(i). Nonfunctional containers are more naturally classifiable as debris and the treatment standards adopted today are appropriate for such damaged containers being disposed.

By "intact container", the Agency means a container that can still function as a container. The Agency believes that a container that is unbroken and still retains at least 75% of its original holding capacity (i.e., has not been crushed more than 25%) is still intact. The Agency selected the 75% criterion because: (1) It is within a reasonable range of 50% to 90%; (2) selecting an original volume criterion on the high end of the range (e.g., 90%) would result in containers containing large quantities of waste being considered debris even though the containers could be readily separated from debris; and (3) selecting an original volume criterion on the low end of the range (e.g., 50%) would subject the waste in containers that have been severely crushed to the treatment standards for the waste. This would require removal of the waste from the container for treatment which may be impracticable for severely crushed containers.

Finally, it should be noted that by observing the empty container rule, EPA is creating a limited exception to the nonsegregation principle discussed above. In situations where intact containers are mixed with true debris (i.e., materials classified as debris under today's rule), the intact containers thus would have to be removed and managed separately.

The following example indicates how these principles would apply. At a remediation site, ruptured drums are discovered still containing some prohibited hazardous waste. Mixed in with these drums are other drums some of which are not significantly damaged or crumpled and all still contain prohibited hazardous wastes. All of these drums are going to be disposed of off site.

Under today's rule, the ruptured drums are debris (broken or ruptured containers are always debris if contaminated with prohibited waste) and cannot be land disposed until they are treated by one of the debris treatment methods. If hazardous waste is removed from the drum during treatment, the waste, like all treatment residues, is subject to the treatment standards for the prohibited waste. With respect to the unruptured drums, those that are intact (i.e., those that retain at least 75% of their original volume) are nonempty containers under Sec. 261.7. The waste in these drums is subject to the treatment standards for the prohibited waste. Those that are not intact (i.e., those that retain less than 75% of their original volume) are debris.

2. Definition of Hazardous Debris

a. Which Debris is Hazardous, and of this Debris, Which is Prohibited? This rule applies only to debris that is subject to subtitle C regulation when it is generated. As EPA proposed, this means: (1) Debris that contains listed hazardous wastes (either on the debris surface, or in its interstices, such as pore structure); or (2) debris that exhibits a characteristic of hazardous. See 57 FR 983. To be prohibited, and hence subject to the treatment standards adopted today, the debris would have to be contaminated with listed wastes that are also prohibited, or exhibit a prohibited characteristic. Thus, only debris that is contaminated with a listed waste for which EPA has established a treatment standard, and debris exhibiting the characteristics of ignitability, corrosivity, reactivity, or EP toxicity (plus exhibiting the TC characteristic, since the debris must still be a hazardous waste) are subject to the treatment standards adopted today. (Most of these debris wastes, of course, are already prohibited by virtue of previous rulemakings; only debris contaminated exclusively with the newly listed wastes for which EPA is adopting treatment standards today would be newly prohibited under today's rule.)

b. Codification of Contained in Principle for Debris. In adopting the definition that debris containing listed hazardous waste is regulated under subtitle C, EPA is codifying the "contained in" principle, which has heretofore served as an interpretive gloss on the existing mixture and derived from rules. See 57 FR 983, CMA v. EPA, 869 F. 2d 1526 (D.C. Cir. 1989). As explained at proposal, id. at 986, the contained in concept will apply to both media and nonmedia debris (an approach with unanimous support in the public comments).

Furthermore, EPA is also codifying the corollary part of the contained in principle: That debris which no longer "contains" listed hazardous waste would no longer be subject to subtitle C regulation, provided that it does not exhibit any hazardous waste characteristic. This involves a case-by-case determination by EPA, made upon request, that debris does not contain hazardous waste at significant levels, taking into consideration such factors as site hydrogeology and potential exposure pathways, but excluding management practices./21/ Debris found not to contain hazardous waste (and not exhibiting a hazardous waste characteristic) would not be

subject to further subtitle C regulation, and so could be land disposed without further treatment. In addition, these levels could be achieved by any form of treatment other than impermissible dilution, and thus need not result from application of the debris treatment methods adopted today. Id. at 983-84.

NOTE /21/ We note that consideration of management practices for exclusion from subtitle C is being evaluated through the proposed Hazardous Waste Identification Rule discussed below in the text.

3. Relation of Today's Rule to the Hazardous Waste Identification Rule

On May 20, 1992, EPA proposed comprehensive revisions to the regulatory definition of hazardous waste, asking for comment on a series of options for redefining what a hazardous waste is. See 57 FR 21450. These rules could affect which debris is considered to be hazardous when it is generated (both through modifications to the hazardous waste definitions and the contained in principle), and so could affect both the definition of hazardous debris used in this rule, and possibly the extent such debris must be treated by prescribed methods of treatment. EPA has attempted to note in each of the sections below the potential overlap of this proposed rule on the rules adopted today.

Although the Hazardous Waste Identification Rule (HWIR) when promulgated will affect the definition of hazardous debris subject to today's treatment standards, the Agency believes that it is nonetheless appropriate to make the treatment standards effective immediately upon promulgation. The Agency does not believe that today's rule will place an unreasonable burden on generators of hazardous debris that may subsequently be determined by HWIR not to be hazardous because the Agency has provided a national, case-by-case capacity variance for hazardous debris that defers the effective date of today's treatment standards until May 8, 1993. By that time, the Agency believes that the final HWIR will be promulgated and the treatment of debris that HWIR determines is no longer hazardous will be precluded.

C. Treatment Standards for Hazardous Debris

1. Overview

In this section, we discuss: (1) The treatment technologies proposed as BDAT; (2) the contaminants subject to treatment; (3) the debris treatment standards; (4) alternative LDR standard; (5) performance standards that must be met to ensure effective treatment and to comply with the BDAT standards; (6) contaminant restrictions for certain treatment methods; (7) use of treatment trains for multiple contaminants and debris types; (8) treatment of characteristic debris; (9) standards for debris that is inherently toxic (i.e., it fails the TC and EP for metal contamination because it is fabricated from a toxic metal); (10) relationship of TSCA PCB rules to today's rule; (11) relationship of existing agency standards for asbestos to today's rule; (12) special requirements for radioactive debris; and (13) implementation of treatment standards.

2. BDAT Debris Treatment Technologies

a. Identification of BDAT Treatment Technologies. The Agency considered a treatment technology to be "available" if the technology itself or the services of the technology are able to be purchased, and the technology substantially diminishes the toxicity of the waste or reduces the likelihood of migration of the waste's hazardous constituents. The technologies that the Agency has identified as best demonstrated available technologies (BDAT) have been used to treat hazardous debris at Superfund sites, to remove radioactive metals from debris, to treat debris-like material contaminated with compounds similar to one or more of the compounds in the debris contaminant categories or, based on engineering judgment, are applicable to debris.

The Agency considered a technology to be demonstrated for a particular waste if the technology currently is in commercial operation for treatment of the waste or constituent of interest or similar wastes or constituents of interest, including wastes not regulated under RCRA, such as PCBs and radioactive waste. The Agency identified demonstrated technologies either through a review of the literature in which current waste treatment practices were discussed, or through information provided by specific facilities currently treating the waste or similar wastes. EPA also considered as demonstrated technologies those used to separate or otherwise process chemicals and other materials which are similar to the waste or constituent of interest.

The Agency also reviewed the properties of debris which may directly affect the efficiency of treatment technologies. Debris characteristics which may affect the performance or effectiveness of treatment technologies to clean various types of debris include:

** Destructibility;
** Hardness and brittleness;
** Moisture content;
** Permeability;
** Size, homogeneity, and location (in situ versus ex situ);
** Surface texture; and
** Total organic carbon (TOC).

Under today's rule, the Agency has identified the following 17 treatment technologies as BDAT for hazardous debris:

** Extraction Technologies:

--Physical Extraction --Abrasive blasting --Scarification, grinding, and planing --Spalling --Vibratory finishing --High pressure steam and water sprays
--Chemical Extraction --Water washing and spraying --Liquid phase solvent extraction --Vapor phase solvent extraction
--Thermal Extraction --High temperature metals recovery --Thermal desorption

** Destruction Technologies

--Biodegradation
--Chemical oxidation
--Chemical reduction
--Thermal destruction

** Immobilization Technologies

--Macroencapsulation
--Microencapsulation
--Sealing

Summary descriptions of these technologies are presented in Appendix I of today's preamble and treatment performance standards for each technology are prescribed in Table I, Sec. 268.45. Further, detailed information on the various treatment technologies is presented in the Hazardous Debris Final Rule Technical Support Document.

b. Changes in Identification of BDAT Technologies From Proposal. Based on public comment and the Agency's further evaluation, the Agency has determined that two debris treatment technologies proposed as BDAT--electropolishing and ultraviolet radiation--are not BDAT, and an additional technology not proposed as BDAT--high temperature metal recovery--is, in fact, BDAT for hazardous debris. The basis for these determinations is discussed below.

(1) Electropolishing Is Not BDAT. The Agency has determined that electropolishing is not BDAT for hazardous debris because of concerns that the technology is intended primarily for smoothing clean metal parts. Painted or contaminated metal parts might not be effectively treated by this method.
A contaminating organic waste or paint could electrically insulate the surface from the solution and prevent surface removal of contaminants.

(2) Ultraviolet Radiation Is Not BDAT. The Agency deleted ultraviolet radiation treatment from the list of BDAT technologies for hazardous debris because of difficulties of specifying performance standards that would ensure effective treatment in all cases. This technology is primarily intended for liquid waste treatment where the fluid is passed by a ultraviolet radiation source in a thin stream. This approach is designed to ensure that the ultraviolet light reaches all of the toxic molecules and detoxifies them. If the technology were to be applied to hazardous debris, it would be virtually impossible to ensure that all toxic molecules contaminating the debris were adequately radiated. Sludge and soil caked onto debris would preclude radiation of both inner layers of caked material and the debris surface.
Further, even for debris that is relatively free of caked-on materials, the debris would have to be systematically turned to expose all contaminated surfaces to the radiation. The use of sunlight to provide the ultraviolet radiation as proposed as an alternative to an artificial source poses even greater problems of ensuring exposure to ultraviolet radiation at levels that would ensure effective treatment. The Agency's effort to provide for innovative debris treatment at proposal simply went too far.

(3) High Temperature Metal Recovery Is BDAT. The Agency has added high temperature metal recovery (HTMR) to the list of acceptable debris treatment technologies. It is a very effective method for treatment of recoverable metal values in both metal debris and debris that is contaminated with metal- bearing hazardous waste. The Agency did not include HTMR as BDAT at proposal simply because of oversight. Several commenters suggested that we include this method, and the Agency agrees.

We note that HTMR can also effectively treat toxic organic contaminants. If the debris contains more than a total of 500 ppm of toxic organic compounds listed in appendix VIII, part 261, the HTMR facility is subject

to the Boiler and Industrial Furnace (BIF) Rule. See Sec. 266.100. The HTMR would be subject to the same controls on organic emissions /22/ as other BIFs burning hazardous waste. When the total concentration of toxic organic compounds in the waste is less than 500 ppm, the Agency believes that any emissions of organic compounds attributable to those organic compounds will not pose a hazard to human health and the environment.

NOTE /22/ Emissions of metals, HCl, Cl2, and particulate matter are also controlled by the BIF rule.

3. Contaminants Subject to Treatment

Today's rule requires hazardous debris to be treated by one of the specified technologies /23/ for each "contaminant subject to treatment" defined as: (1) the BDAT constituents identified in Secs. 268.41 and 268.43 for the listed waste contaminating the debris that are present at detectable levels; /24/ (2) the constituents for which the debris exhibits Extraction Procedure toxicity; and (3) cyanide or sulfide if debris exhibits reactivity due to the presence of those constituents. As discussed in section V.C.5 below, although debris may contain several contaminants subject to treatment, the treatment standards generally do not require treatment by multiple technologies (i.e., a treatment train). This is because many of the specified technologies effectively treat various types of contaminants (e.g., metals, aromatic and aliphatic organic compounds, halogenated and nonhalogenated organic compounds).

NOTE /23/ Unless EPA determines the hazardous debris no longer contains hazardous waste (see discussion in section V.B.2 of the text) or unless the generator elects to comply with the waste-specific treatment standards for the waste contaminating the debris (see discussion in section V.C.4 of the text).

NOTE /24/ We note that the generator may presume that the BDAT constituents for the listed waste are present at detectable levels and is not required to sample and analyze the debris to make that determination. If, however, the generator elects to sample and analyze the debris, the Agency acknowledges that this may be a difficult task for many types of debris and debris mixtures. In this situation, the generator must use best engineering judgement to obtain samples that are as representative as practicable.

In the proposed rule, the Agency proposed a broader definition of "contaminants subject to treatment" that would have included constituents on appendix VIII, part 261, that the generator could reasonably know may contaminate the debris at detectable levels. Further, the Agency requested comment on whether the rule should require that debris that is hazardous solely because it exhibits a characteristic (i.e., toxicity, ignitability, or reactivity) be treated for all constituents on appendix VIII, part 261, that the generator could reasonably know may contaminate the debris at detectable levels. The Agency addressed these provisions at proposal because of concern that all toxic constituents present be effectively treated given that debris treated by an extraction or destruction

technology and that does not exhibit a characteristic is excluded from subtitle C regulation.

We have determined, however, that neither of these provisions is likely to be necessary to ensure effective treatment of hazardous debris for a number of reasons. Thus, these provisions are not included in today's rule. First, we believe that enough contaminants subject to treatment will be identified for most debris to ensure effective treatment of other toxic contaminants that may be present. Given that most debris is generated by remediation, the debris is often associated with a variety of wastes that will result in a number of contaminants being designated contaminants subject to treatment-- either because listed wastes or known to be present, or more likely, because the debris fails the EP /25/ for one or more constituents. For example, it is highly unlikely that debris will exhibit only ignitability or reactivity and not fail the TC or be contaminated with a listed waste (and thus, require only deactivation of the ignitability or reactivity characteristic under today's rule) if, in fact, toxic constituents are present at significant levels. Given that most of the debris treatment technologies specified in today's rule are not restricted to specific contaminants other than metal vs.
nonmetal contaminants and that many technologies (e.g., surface removal, incineration) have no contaminant restrictions (see section V.C.5 below), the designation of a few contaminants subject to treatment should be sufficient to ensure effective treatment of other toxic contaminants that may be present.

NOTE /25/ We note that the Agency is considering proposing treatment standards for TC wastes and debris contaminated with TC wastes. If that rule is promulgated, debris will be identified as hazardous debris if it exhibits the TC for an additional 26 organic compounds many of which are commonly found at remediation sites. Thus, over time, additional debris contaminants will become designated contaminants subject to treatment.

Further, commenters argued, and the Agency agrees, that it would be difficult to implement and enforce a rule that required generators to treat toxic constituents that they have reason to know are present at detectable levels. First, whether the generator, in fact, could have reason to know that a toxic constituent is present is highly subjective and difficult to enforce.
Second, the Agency upon additional consideration believes that, if treatment of such additional toxic constituents were to be required, treatment should only be required if the constituent is present at significant levels, not merely at detection levels. This raises the issue of what is a significant level. Possible criteria include a level of potential health significance or the F039 treatment levels. (We note that the Agency, in fact, requested comment on using these criteria to determine when these other (i.e., other than BDAT constituents for listed waste contaminating the debris and the constituents for which the debris fails the EP) toxic constituents known to be present would be contaminants subject to treatment. See 57 FR 984, n. 11.) Not only is the Agency unsure which approach would be more appropriate, but under either approach--i.e, health-based levels or F039 levels--sampling and analysis would be required if the generator did not want to presume that a toxic constituent known to be present was present at the trigger level. Since it is particularly difficult to take representative samples of untreated debris, EPA considers

this approach to be inadvisable.

4. Debris May Be Treated to the Existing Waste-Specific LDRs in Lieu of Today's Debris Treatment Standards

Today's rule gives generators the option of treating hazardous debris to the existing waste-specific treatment standards for the waste contaminating the debris. The treated debris, however, must continue to be managed under subtitle C. If land disposed, the debris must be disposed in a subtitle C landfill. However, such debris would be excluded from subtitle C regulation if the Agency determined that it no longer contained hazardous waste (see discussion above in section V.B.2) or if the treater determined that the debris no longer contained hazardous constituents at levels that may be established under a final Hazardous Waste Identification Rule (see discussion above in section V.B.3).

The Agency is providing this option in today's rule based on the request of numerous commenters. For example, one commenter routinely adds the tyvek suits and rubber gloves worn by facility operators to the waste stream leaving his factory, and wishes to continue doing so. The proposed rule would have required the tyvek suits and rubber gloves (as debris) to be separated from the waste for treatment by the specified technology. The commenter preferred to treat the waste/debris mixture to the waste-specific standards and the Agency believes that this practice is appropriate to provide an additional means of treating debris that substantially reduces toxicant mobility or concentration.

The Agency developed special treatment standards for hazardous debris because of concern that, in most cases, the waste-specific standards would not be practicable for debris given the difficulty in obtaining representative samples of treated debris to document compliance with the concentration-based waste-specific standards. The Agency acknowledges, however, that some types of debris may be amenable to representative sampling and therefore compliance with the waste-specific standards may be workable./26/

NOTE /26/ We note that commenters may have requested this option out of frustration that the proposed rule did not effectively address the issue of debris mixtures. The proposed rule appeared to require either separation of debris types prior to treatment or the extensive use of treatment trains to treat different debris types. This problem has been remedied in today's final rule by acknowledging the ability of the treatment technologies to treat a greater variety of debris types than proposed. See discussion in section V.C.5 of the text.

Debris that is treated to the waste-specific treatment standards rather than today's debris treatment standards remains subject to subtitle C regulation because toxic constituents may continue to be present at levels that could pose a hazard to human health and the environment. EPA believes that this position is appropriate for two reasons. First, there is no reason to exclude from subtitle C regulation hazardous debris treated to the waste- specific standards when the waste itself is not excluded when treated to those standards. Second, and moreover, the Agency believes that today's treatment standards will treat debris to levels resulting in minimum threat to human health and the environment. See discussion below.

Although meeting the waste-specific standards may result in some cases in levels of toxic constituents in the treated debris that do not pose a hazard to human health and the environment, the Agency is not certain that this will be the case in all situations (and in any case, the issue is more appropriate for resolution in the context of the May 20, 1992, proposed rule, 57 FR 21450).

5. Treatment Standards

In this section, we provide the rationale for the treatment standards for each technology and explain how the standards work, and we explain how the final treatment standards differ from those proposed.

a. Overview. Today's rule establishes performance and/or design and operating requirements for 17 treatment technologies that the Agency has designated as BDAT for hazardous debris. See Table I of Sec. 268.45. Although any technology may be used to treat any debris, the treatment standards vary for many technologies according to the type of debris treated./27/ In addition, the rule prohibits the use of some technologies to treat specific types of contaminants. For example, the physical extraction technologies (e.g., abrasive blasting) have no contaminant type restrictions, while thermal desorption may not be used to treat metals other than mercury.

Generators (and owners and operators of treatment facilities) may select any treatment technology that is not restricted for the contaminant subject to treatment.

NOTE /27/ In addition, although the rule does not prohibit treatment of specific debris types by a technology, the treatment standards cannot be met as a practical matter for certain debris/technology combinations (e.g., high pressure steam and water sprays cannot remove 0.6 cm of the surface layer of brick, concrete, etc). In other situations, the definition of the technology as a practical matter precludes the use of some technologies for some debris types (e.g., the definition of spalling cannot be met when applied to treat cloth).

The Agency has attempted to establish performance or design and operating requirements for each of the extraction and destruction technologies that will optimize treatment effectiveness such that hazardous contaminants would not be present at residual levels in the debris that could pose a hazard to human health and the environment. Thus, the treated debris could be excluded from subtitle C regulation. Unfortunately, the Agency was not able to develop objective performance or design and operating standards for all extraction and destruction technologies that would ensure treatment to minimum threat levels (e.g., thermal desorption, biodegradation, and chemical destruction; see discussion below). For these technologies, the Agency is concerned that residual levels of hazardous contaminants may remain in the debris at levels that could pose a hazard to human health and the environment. Consequently, today's rule requires for these technologies that the owner or operator of the treatment unit must make an "Equivalency Demonstration" to the Agency under existing Sec. 268.42(b) that documents that the technology treats contaminants subject to treatment to a level equivalent to that required by the performance and design and operating standards for the other technologies in Table 1, Sec. 268.45, such that

residual levels of hazardous contaminants will not pose a hazard to human health and the environment absent subtitle C control.

Today's treatment standards establish performance standards rather than design and operating standards where supporting data were available. The Agency believes that performance standards will better ensure effective treatment given the variability in contaminant and debris types and properties that affect treatability. Further, performance standards give the owner and operator of the treatment unit the flexibility to tailor the design and operation of the unit to the specific debris/contaminant(s) being treated. An example of a performance standard is the standard for physical extraction technologies (e.g., abrasive blasting) used to treat a metal object where the standard requires decontamination to a "clean metal finish" as defined in the regulation. An example of a design and operating standard is the standard for thermal desorption that limits the thickness of porous debris to 10 cm (4 inches).

EPA recommends that the generator or owner or operator of the treatment facility consider the thermal, chemical, and physical properties of the debris and the contaminants on the debris before selecting a treatment technology to ensure that the performance or design and operating requirements can by achieved. The Agency plans to develop a nonregulatory implementation assistance document to provide assistance on how to select the most appropriate technologies for a given debris/contaminant combination.

Although hazardous debris treatment operations are generally subject to regulation under the interim status or permit standards of parts 270 and 264, 265, or 266,/28/ today's hazardous debris performance or design and operating standards are neither interim status nor permit standards. The hazardous debris treatment standards are adopted pursuant to section 3004(m) of RCRA to ensure that debris is treated to minimize the hazardous constituents' toxicity or mobility during future management, while the interim status and permit standards are designed to protect human health and the environment from the operation of the storage, treatment, or disposal facility itself. It is for this reason that today's treatment standards do not address control of emissions that can occur from debris treatment; the Agency is relying on the applicable interim status and permit standards to control treatment emissions. See discussion below in section V.F.

NOTE /28/ Unless treatment occurs in an on-site container, tank, or containment building, the hazardous debris is treated within 90 days of generation, and the unit complies with the appropriate standards of part 265, or unless the treatment occurs within the Area of Containment (AOC) at a Superfund remediation site and the generator complying with today's treatment standards in order to remove the treated debris from the AOC and manage it as debris excluded from subtitle C. See discussion in section V.F. of the text.

The Agency has grouped the various treatment technologies into categories of like treatment type. Each category is based on the same (or similar) performance or design and operating standards. See Table 1 of Sec. 268.45. We discuss below for each group of treatment technologies the basis for the standards and how the standards will work. Note that the performance or

design and operating standards must be met for all debris surfaces that are contaminated with hazardous waste. Thus, if a pipe or pump was used to manage hazardous waste, the performance standards must be met for the inside surfaces of the pipe or pump. Decontamination of the outer surfaces only does not constitute compliance with the debris treatment standards.

b. Extraction Technologies. The Agency has classified the extraction technologies as physical extraction, chemical extraction, and thermal extraction.

(1) Physical Extraction Technologies. The physical extraction technologies are: abrasive blasting; scarification, grinding, and planing; spalling; vibratory finishing; and high pressure steam and water sprays. For these technologies, the rule establishes performance standards based on removal of the contaminated layer of the debris. Any contaminant subject to treatment may be treated by these technologies,/29/ because the contaminants are removed as residue /30/ subject to the treatment standards for the waste contaminating the debris.

NOTE /29/ As discussed below in the text, today's rule establishes additional requirements for certain technologies in order to exclude the treated debris from subtitle C when the debris is contaminated with waste that is listed for dioxins (EPA Hazardous Waste Numbers F020, F021, F022, F023, F026, or F027).
The Agency did establish such additional requirements for treatment of debris contaminated with dioxin-listed waste when treated by the physical extraction technologies, however, because the Agency believes that it is highly unlikely that compliance with the rigorous performance standards for these physical extraction technologies will allow significant residual levels of contaminants such that even highly toxic contaminants could pose a hazard to human health and the environment absent subtitle C control.

NOTE /30/ Except that for spalling, the spalled material is considered untreated debris, not residue, and must be treated before land disposal. See additional discussion in the text.

In addition, any debris type (e.g., metal, concrete, wood, paper, cloth) may be treated by these technologies. The Agency reasoned that any debris type would be effectively treated provided that the contaminated layer of the debris is removed. We note that, although the rule allows the use of physical extraction technologies on any debris type, it will be impracticable to use these technologies on some debris types and the performance standards cannot be met for some technology/debris combinations. For example, it is impracticable to spall paper or cloth. However, we realize that debris often is comprised of a mixture of debris types, and physical extraction may be the most reasonable technology for the predominate debris type while other types of debris present would be removed as residue. An example is large chunks of concrete that have paper labels adhered to them. Spalling or another physical extraction technology may be practicable for the concrete and the paper labels will be removed as residue. An example of where the performance standard cannot be met for a technology/debris combination is high pressure steam and water spray used to treat brick or concrete. As discussed below, because these debris types are porous and toxic contaminants may be adsorbed below the surface of the

debris, the performance standard requires removal of at least the outer 0.6 centimeter surface layer. This technology cannot meet that performance standard for those types of debris. Rather than explicitly prohibiting such practices, however, such practices will be precluded because of the inability to comply with the standards.

To ensure that the contaminated layer of debris is removed and to account for the physical properties of different types of debris, the rule establishes different performance standards for different types of debris.

(a) Metal Objects. Metal objects must be treated to remove foreign matter adhering to the metal to produce a "clean debris surface". The rule defines a "clean debris surface" as a surface that, when viewed without magnification, shall be free of all visible contaminated soil and hazardous waste, except that residual staining caused by soil and waste consisting of light shadows, slight streaks, or minor discolorations, and soil and waste in cracks, crevices, and pits may be present provided that such staining and soil and waste in cracks, crevices, and pits shall be limited to no more than 5% of each square inch of surface area.

The rule allows minor residual staining caused by soil and waste and soil and waste to remain in cracks, crevices, and pits of up to 5% of each square inch of surface area /31/ because of the impracticability of cleaning metal debris to a "white metal finish" as proposed. The Agency selected the 5% surface area criterion because: (1) it is within the range of reasonable levels--1% to 10%--that could have been selected; (2) it is generally equivalent to the Steel Structures Painting Council's specification for "Near-White Blast Cleaning" for cleaning steel surfaces by the use of abrasives; /32/ and (3) it should not allow toxic contaminants to remain at levels that could pose a hazard to human health and the environment absent subtitle C regulation, and should remove contaminants so that threats posed by disposal of the debris are minimized.

NOTE /31/ Note that the 5% surface area criterion is applied to each square inch of the debris surface that has been contaminated with hazardous waste.
The area covered by large stains cannot be averaged against large unstained areas. Only 5% of the area within any square inch can contain a residual stain.

NOTE /32/ See the May 18, 1992, memorandum from Peter Shields, Radian, to Mark Mercer, EPA, entitled "Industry Standards for Cleanliness of Metal Surfaces".

(b) Brick, Cloth, Concrete, Paper, Rock, Pavement, and Wood. The performance standard for these types of debris requires: (1) Removal of at least 0.6 centimeters of the surface layer; and (2) treatment to a "clean debris surface." Removal of 0.6 centimeters of the surface layer is required for these types of debris because they may be porous and toxic contaminants may by absorbed within the debris. (The Agency recognizes that, as a practical matter, the 0.6 cm surface removal requirement precludes the use of this technology for most porous debris.) To ensure removal of contaminants that may be absorbed to depths beyond 0.6 centimeters, the rule requires removal of virtually all staining that could

be indicative of the presence of toxic contaminants. The rule allows minor residual staining and foreign matter in cracks and crevices on up to 5% of the surface area (on a square inch basis) as a reasonable and practicable method to help ensure that the standards do not require treatment to a level beyond that necessary to ensure that the treated debris does not pose a hazard to human health and the environment absent subtitle C regulation. We note that staining that is not indicative of the potential presence of hazardous waste or contaminated soil (e.g., rust stains on concrete adjacent to steel reinforcing bars) need not be removed and is not considered in determining compliance with the maximum 5% surface area limit on residual staining. The basis for the 5% surface area limit (on a square inch basis) on residual staining and foreign matter in cracks and crevices is the same as the basis discussed above for the definition of clean metal finish.

(c) Glass, Rubber, Plastic. The physical extraction performance standards for these types of debris are the same as for brick, concrete, etc., except that removal of at least 0.6 centimeters of the surface layer is not required. Removal of the surface layer for glass, rubber, or plastic is not required because glass is nonporous and will not absorb contaminants below the surface, and rubber and plastic, although permeable, are not likely to leach absorbed contaminants at substantial rates.

(2) Chemical Extraction. The technologies classified as chemical extraction are water washing and spraying; liquid phase solvent extraction; and vapor phase solvent extraction. The performance standards for these technologies are based on dissolution of the contaminants into the cleaning solution.
Removal of the outer debris layer is not intended.

(a) Water Washing and Spraying. Water sprays or water baths will effectively treat debris when sufficient temperature, pressure, residence time, agitation, surfactants, acids, bases, and/or detergents are used to meet the performance standards in accord with the contaminant restrictions.
The rule requires that the debris must be treated to a "clean debris surface" (see discussion above) to ensure effective treatment to levels of hazardous contaminants that are not likely to pose a hazard to human health and the environment absent subtitle C control.
For porous debris--brick, cloth, concrete, paper, pavement, rock, and wood--the rule provides two other requirements. The thickness (i.e., one dimension) of each piece of porous debris may not be more than 1.2 cm (i.e., 1/2 inch), and the contaminants must be soluble to at least 5% by weight in the water solution or 5% by weight in the emulsion, as applicable. The Agency is applying these standards for porous debris to ensure effective extraction of toxic contaminants that may be absorbed below the surface layer of the debris.

If reducing the thickness of debris to 1.2 cm to meet the treatment standards results in debris that no longer meets the 60 mm minimum particle size limit for debris, such material is subject to the waste-specific treatment standards for the waste contaminating the material, unless the debris has been cleaned and separated from contaminated soil and hazardous waste before size reduction. This is consistent with the Agency's position that material with a particle size less than 60 mm is amenable to conventional treatment for process waste and small particle-sized material (i.e., as opposed to large debris objects) and that such material can be reasonably sampled for analysis to document compliance with the

concentration-based treatment standards for the waste contaminating the material.

If the debris has been cleaned and separated from contaminated soil and hazardous waste before size reduction, the material remains classified as debris subject to today's treatment standards even if it no longer has a 60 mm particle size. The Agency believes that cleaning and separation of contaminated soil and hazardous waste will substantially reduce the concentration of toxic constituents such that the debris should contain minimum threat levels subsequent to treatment by an extraction or destruction technology. The level of cleaning and separation that is required is the same as required for separation of treatment residue from treated debris. See Note 9 to Table 1, Sec. 268.45. At a minimum, simple physical or mechanical methods must be used such as vibratory or trommel screening or water washing.

The debris surface need not be cleaned to a "clean debris surface" as defined in Table 1; rather, the surface must be free of caked soil, waste, or other nondebris material. Nondebris materials so separated are subject to the waste-specific treatment standards for the waste contaminating the material.

Porous debris (i.e., brick, cloth, concrete, paper, pavement, rock, or wood) that is contaminated with a waste listed for dioxin--EPA Hazardous Waste Numbers F020, F021, F022, F023, F026, or F027--is subject to additional controls. Because of the potential toxicity of the constituents in these wastes, the Agency believes that it is prudent to require additional controls to ensure that the potentially highly toxic constituents in these wastes are extracted from below the debris surface and that the treated debris poses minimum threat to human health and the environment absent subtitle C control.

Accordingly, the rule requires the treater to make an "Equivalency Demonstration" to the Agency under existing Sec. 268.42(b) that documents that the technology treats contaminants subject to treatment in these dioxin- listed wastes to a level equivalent to that required for these contaminants by the performance and design and operating standards for other technologies in 'Table 1, Sec. 268.45, such that residual levels of hazardous contaminants will not pose a hazard to human health and the environment absent subtitle C control.

(b) Liquid Phase Solvent Extraction. This technology decontaminates debris surfaces by applying a nonaqueous liquid or liquid solution which causes the toxic contaminants to enter the liquid phase and be flushed away from the debris along with the liquid or liquid solution using agitation, temperature, and residence time sufficient to meet the performance standards. The treatment standards for this technology are the same as for water washing and spraying because the technologies use the same principles to extract toxic contaminants from debris.

(c) Vapor Phase Solvent Extraction. This technology decontaminates debris surfaces by applying an organic vapor which causes the toxic contaminants to enter the vapor phase using sufficient agitation, residence time, and temperature and to be flushed away with the organic vapor such that the performance standards are achieved. The treatment standards for this technology are the same as for water washing and spraying, except that porous debris surfaces must be in contact with the organic vapor for more than 60 minutes. This treatment time is consistent with state-of-the-art practices and is necessary to ensure effective extraction of contaminants.

(3) Thermal Extraction. The Agency has classified two technologies as thermal extraction: High temperature metals recovery and thermal desorption.

(a) High Temperature Metals Recovery (HTMR). HTMR furnaces are smelting, melting, or refining furnaces (including pyrometallurgical devices such as cupolas, reverberator furnaces, sintering machines, roasters, and foundry furnaces (see Sec. 260.10 definition of "industrial furnace")) that use sufficient heat, residence time, mixing, fluxing agents, and/or carbon to extract metals from debris. HTMR furnaces are potentially subject to regulation under the Boiler and Industrial Furnace (BIF) Rule (subpart H, part 266) when they burn hazardous debris./33/

NOTE /33/ See Sec. 266.100(c) that states generally that a smelting, melting, or refining furnace that burns a hazardous waste with a heating value of 5,000 Btu/lb or more or that contains a total concentration of toxic organic compounds exceeding 500 ppm by weight is subject to the BIF Rule.

Today's rule requires that, for nonslagging furnaces (e.g., refining furnaces), treatment residuals must be separated from the debris. In addition, such separated residue must meet the waste-specific treatment standards for organic compounds in the waste contaminating the debris prior to further treatment. Further, these residues must meet the waste-specific treatment standards for all BDAT constituents in the waste contaminating the debris prior to land disposal. Finally, if debris is contaminated with a dioxin-listed waste, HTMR is not BDAT and the treated debris is not excluded from subtitle C unless the treater makes an "Equivalent Technology" demonstration to the Agency under Sec. 268.42(b) that documents that the technology treats contaminants subject to treatment to a level equivalent to that required by the performance and design and operating standards for other technologies in Table 1, Sec. 268.45, such that residual levels of hazardous contaminants will not pose a hazard to human health and the environment absent subtitle C control.

Today's rule does not establish performance or design and operating standards for slagging HTMR furnaces (other than the requirements inherent in the definition--a melting or smelting furnace must melt metals and extract the metals from debris) because a slagging furnace is likely to provide effective treatment for all contaminants, except perhaps for chlorinated dioxins as discussed below, and for all debris types.

For nonslagging (i.e., refining furnaces such as roasters) HTMR furnaces, the rule ensures treatment of both metal and organic contaminants. First, the definition of HTMR furnaces requires that metals must be separated from the debris. Thus, not only will metals be removed, but temperatures hot enough to separate metals from debris should also remove organic contaminants from the debris (with perhaps the exception of dioxins, as discussed below). Second, to help ensure that the HTMR unit has effectively removed organic contaminants in the debris the rule requires that the residue be separated from the treated debris and that the separated residue must meet the waste- specific treatment standards for the BDAT organic contaminants in the waste contaminating the debris prior to further treatment.

In addition, the Agency is concerned that potentially extremely toxic

contaminants may not be destroyed (or removed with the residue) to levels that would not pose a hazard to human health and the environment absent subtitle C control. Consequently, if debris is contaminated with a dioxin-listed waste, HTMR is not BDAT for the debris and the debris is not excluded from subtitle C after treatment unless the treater obtains approval from the Director under an equivalent technology demonstration provided by Sec.
268.42(b) for the design and operating conditions of the HTMR unit. The rule provides this restriction for dioxin-listed waste because of concern that if such contaminants remained undestroyed even at low concentrations in the residue and were not completely removed from the treated debris, that the debris could pose a health or environmental hazard absent subtitle C control.

(b) Thermal Desorption. Thermal desorption is heating in an enclosed chamber under either oxidizing or nonoxidizing atmospheres at sufficient operating temperature and residence time such that the contaminants subject to treatment are vaporized and removed from the heating chamber in a gaseous exhaust streams./34/ The rule establishes operating and performance standards and contaminant restrictions, and requires the treater to make a demonstration of "Equivalent Technology" under Sec. 268.42(b) to document that the technology treats contaminants subject to treatment to a level equivalent to that required by the performance and design and operating standards for other technologies in Table 1, Sec. 268.45, such that residual levels of hazardous contaminants will not pose a hazard to human health and the environment absent subtitle C control.

NOTE /34/ We note that a thermal desorber is regulated either as an incinerator (if the device is direct-fired or if the off-gas is burned in an afterburner) under subpart O of part 264 or 265, or as a thermal treatment unit under subpart X, part 264 or subpart P, part 265. To distinguish between thermal desorption and thermal destruction (for which separate debris treatment standards are provided) for purposes of complying with this rule, the primary purpose of thermal desorption is to volatilize contaminants and to remove them from the treatment chamber for subsequent destruction or treatment. We note that the treatment standards in Table 1, Sec. 268.45 for thermal destruction specifically excludes thermal desorbers.

The Agency attempted to develop objective treatment standards that would obviate the need for an equivalency demonstration (see discussion above). The Agency determined, however, that it was very difficult to establish universal operating limits for the key operating parameters that affect treatment efficiency--temperature, residence time, size of porous debris, bed depth, and volatility of the contaminant--that would strike a balance between ensuring treatment to minimum threat levels and establishing requirements that could grossly over-regulate in many situations. Rather, the Agency believes that operating requirements can best be determined on a case-by-case basis (i.e., under an equivalent technology demonstration under Sec.
268.42(b)) considering the parameters listed above. In addition, the Agency believes that the performance standard used for physical and chemical extraction--treatment to a clean debris surface--is not practicable for thermal desorption because treated debris surfaces will continue to have a dusting of residue after separation of the debris from

the residue by simple, physical or mechanical means (unless water washing is used). See discussion below regarding the requirement for separation of debris from residue.

The treatment standards for thermal desorption require, in addition to the case-by-case Agency approval of design and operating conditions, that hazardous contaminants be vaporized (by virtue of the definition of thermal desorption), and restricts the use of the technology for metal contaminants other than mercury (i.e., thermal desorption is not BDAT for metals other than mercury). In addition, to help ensure extraction of contaminants from below the surface of porous debris, the rule establishes a maximum thickness (in one dimension) for porous debris of 10 cm (4 inches)./35/ The 4 inch maximum thickness limit is consistent with state-of-the-art practices. The restriction on metals other than mercury is provided because they are not likely to be extracted from below the debris surface at normal desorption temperatures and residence times.

NOTE /35/ See previous discussion in the text that, if size reduction of debris to meet the treatment standards reduces the particle size to below the minimum 60 mm size limit for the definition of debris, such nondebris material is subject to the waste-specific treatment standards for the waste contaminating the material, unless the debris has been cleaned and separated from contaminated soil and waste prior to size reduction.

We note that we considered restricting the use of thermal desorption for only porous debris that is contaminated with a metal other than mercury. We reasoned that metal contaminants in soil or waste on the surface of nonporous debris will be physically separated from the debris along with the soil or waste during or after desorption, and thus a restriction would not be necessary. However, we are also concerned about metal contaminants that may remain on the surface of nonporous (and porous) debris after desorption and after separation of the treated debris from the residue. An example is a piece of steel contaminated with a metal-bearing paint that causes the steel to fail the TC. The metal may not be desorbed and the paint would not be separated from the steel during the simple physical or mechanical separation of residue from debris. Although the steel would continue to fail the TC, it would have been treated to meet BDAT and could be land disposed in a subtitle C facility. This is inconsistent with the Agency's view that BDAT for a TC waste must cause the waste to no longer exhibit the TC.

The treatment standard for thermal desorption also requires separation of the treated debris from treatment residuals and soil, waste, or other nondebris material (collectively referred to as residuals) because residuals are subject to the treatment standards for the waste contaminating the debris. See discussion in Section V.E. Not only will these residuals contain unvolatilized metals that require further treatment, but the Agency is using the residue separated from debris as a surrogate means to ensure effective debris treatment. The rule achieves this objective by requiring that the residue separated from the treated debris must meet the waste-specific treatment standards for organic compounds in the waste contaminating the debris. If the residue (prior to further treatment) does not meet applicable treatment standards for organic compounds, it is an indication that the desorption process did not effectively extract the organic contaminants subject to treatment. Thus,

the treatment is not BDAT, the treated debris is not excluded from subtitle C, and both the residues and the debris cannot be land disposed without further treatment.

Separation of the desorbed debris from treatment residuals (i.e., soil, waste, or other nondebris materials) must be accomplished using simple physical or mechanical means such as vibratory or trommel screens or water washing. The separation process need not produce a "clean debris surface" /36/ as discussed above, however; rather the debris surface must be free of caked residuals or nondebris materials such as soil or waste. For example, debris need not be water washed after trommel screening to remove dust from residuals or nondebris material. (Note that the use of water washing to separate thermally desorbed debris from residuals and nondebris materials need not comply with the treatment standards for water washing (e.g., treatment to a "clean debris surface") because the debris has already been treated by an alternative technology.)

NOTE /36/ "Clean debris surface" means the surface, when viewed without magnification, shall be free of all visible soil, waste, paint, or other foreign (i.e., nondebris) matter, except that residual staining consisting of light shadows, slight streaks, or minor discolorations, and foreign matter in cracks and crevices may be present provided that such staining and foreign matter in cracks and crevices shall be limited to no more than 5% of each square inch of surface area.

c. Destruction Technologies. The Agency has identified two classifications of destruction technologies: chemical destruction and thermal destruction. These technologies are designed and operated to destroy hazardous contaminants on debris surfaces and in surface pores.

(1) Biodegradation. Biodegradation is the removal of hazardous contaminants from debris surfaces and surface pores in an aqueous solution and biodegradation of organic or nonmetallic inorganic compounds (i.e., inorganics that contain phosphorus, nitrogen, or sulfur) in units operated under either aerobic or anaerobic conditions. The rule establishes operating and performance standards and contaminant restrictions, and requires the treater to make a demonstration of "Equivalent Technology" under Sec.
268.42(b) to document that the technology treats contaminants subject to treatment to a level equivalent to that required by the performance and design and operating standards for other technologies in Table 1, Sec.
268.45, such that residual levels of hazardous contaminants will not pose a hazard to human health and the environment absent subtitle C control.

The Agency attempted to develop objective treatment standards that would obviate the need for an equivalency demonstration (see discussion above). The Agency determined, however, that it was very difficult to establish universal operating limits for the key operating parameters that affect treatment efficiency--type of matrix contaminating the debris, biological proprieties of the contaminant, temperature, pH, treatment time, biomass concentration, moisture level, and for aerobic biodegradation, oxygen concentration--that would strike a balance between ensuring treatment to minimum threat levels and establishing requirements that could grossly over-regulate in many situations. Rather, the Agency believes that operating requirements can best be determined on a case-by-case basis (i.e., under an equivalent technology demonstration under Sec. 268.42(b))

considering the parameters listed above.

In addition, the Agency believes that the performance standard used for physical and chemical extraction--treatment to a clean debris surface--is not practicable for biodegradation because treated debris surfaces are likely to fail that standard even though organic contaminants may have been destroyed and metal contaminants may have been extracted. Further, the Agency could not identify a generic standard that would ensure effective treatment of organic contaminants that may be beneath the surface of porous debris.

In addition to the requirement to make an equivalency demonstration, the treatment standards establish a maximum thickness (in one dimension) for porous debris of 1.2 cm (1/2 inch./37/ These requirements will help ensure extraction of contaminants from below the surface of porous debris.

NOTE /37/ See previous discussion in the text that, if size reduction of debris to meet the treatment standards reduces the particle size to below the minimum 60 mm size limit for the definition of debris, such nondebris material is subject to the waste-specific treatment standards for the waste contaminating the material, unless the debris has been cleaned and separated from contaminated soil and waste prior to size reduction.

The rule also restricts the use of biodegradation for metal contaminants because metals are not destroyed by the biomass (i.e., biodegradation is not BDAT for metals). Further, the performance and design and operating standards would not ensure that undestroyed metal would partition to the biomass for treatment to the numeric standards for the waste contaminating the debris.

This is because the performance standard does not require treatment to a "clean debris surface" as discussed above, so that neither the performance standard nor the requirement to separate treated debris from residuals (see discussion below) would ensure that metal contaminants would partition to the residue.

The treatment standard for biodegradation requires separation of the treated debris from treatment residuals (i.e., soil, waste, or other nondebris material) because residuals are subject to the numerical treatment standards for the waste contaminating the debris. See discussion in section V.E. Not only will these residuals contain metal contaminants that require further treatment, but the Agency is using the residue separated from debris as a surrogate means to ensure effective debris treatment. Accordingly, the debris treatment standard also requires that the residue separated from the treated debris must meet the waste-specific treatment standards for organic compounds in the waste contaminating the debris prior to further treatment.

If the residue (prior to further treatment) does not meet applicable treatment standards for organic compounds, it is an indication that the biodegradation process did not effectively destroy the organic contaminants subject to treatment. Thus, the treatment is not BDAT, treated debris is not excluded from subtitle C, and both the residues and the debris cannot be land disposed without further treatment.

Separation of the biodegraded debris from treatment residuals, soil, waste, or other nondebris materials (collectively referred to as residuals and subject to the treatment standards for residuals) must be accomplished

using simple physical or mechanical means such as vibratory or trommel screens or water washing. The separation process need not produce a "clean debris surface" as discussed above, however; rather the debris surface must be free of caked biomass or nondebris materials such as soil or waste. For example, the use of water to wash off the biomass or other foreign matter from the debris after removal from the treatment process does not subject the debris to the treatment standards for water washing (e.g., treatment to a "clean debris surface"). This is because the debris has already been treated by an alternative technology.

(2) Chemical Destruction. The rule establishes two chemical destruction technologies as BDAT: Chemical oxidation and chemical reduction.

(a) Chemical Oxidation. Chemical oxidation is chemical or electolytic oxidation utilizing the following oxidation reagents (or waste reagents) or combination of reagents: Hypochlorite (e.g., bleach); chlorine; chlorine dioxide; ozone or UV (ultraviolet light) assisted ozone; peroxides; persulfates; perchlorates; permanganates; and/or other oxidizing reagents of equivalent destruction efficiency. Chemical oxidation specifically includes what is referred to as alkaline chlorination.

The Agency was not able to develop objective performance or design and operation standards because of the variety of oxidation reagents that could be used and the variety of chemical and physical properties of debris and hazardous contaminants. In addition, the Agency believes that the performance standard used for physical and chemical extraction--treatment to a clean debris surface--is not practicable for chemical oxidation because treated debris surfaces are likely to fail that standard even though organic contaminants may have been destroyed and metal contaminants may have been extracted. Further, the Agency could not identify a generic standard that would ensure effective treatment of organic contaminants that may be beneath the surface of porous debris. Consequently, the primary treatment standard for chemical oxidation requires the treater to make a demonstration of "Equivalent Technology" under Sec. 268.42(b) to document that the technology treats contaminants subject to treatment to a level equivalent to that required by the performance and design and operating standards for other technologies in Table 1, Sec. 268.45, such that residual levels of hazardous contaminants will not pose a hazard to human health and the environment absent subtitle C control. See discussion above.

The rule also restricts the use of chemical oxidation for metal contaminants because metals are not destroyed by the chemical reagents (i.e., chemical oxidation is not BDAT for metals). Further, the performance and design and operating standards would not ensure that undestroyed metal would partition to the residue for treatment to the numeric standards for the waste contaminating the debris. This is because the performance standard does not require treatment to a "clean debris surface" as discussed above, so that neither the performance standard nor the requirement to separate treated debris from residuals (see discussion below) would ensure that metal contaminants would partition to the residue.

In addition, to help ensure effective treatment, the treatment standard requires that porous debris--brick, cloth, concrete, paper, pavement, rock, and wood--cannot have a thickness exceeding 1.2 cm (1/2 inch) /38/ prior to treatment to ensure effective treatment of contaminants absorbed beyond the debris surface.

NOTE /38/ See previous discussion in the text that, if size reduction of debris to meet the treatment standards reduces the particle size to below the minimum 60 mm size limit for the definition of debris, such nondebris material is subject to the waste-specific treatment standards for the waste contaminating the material, unless the debris has been cleaned and separated from contaminated soil and waste prior to size reduction.

Finally, the rule requires that the treated debris must be separated from treatment residues, and that such separated residue must meet the waste-specific treatment standards for organic compounds for the waste contaminating the debris. See discussion above for rationale and information on how this provision works.

(b) Chemical Reduction. Chemical reduction is a chemical reaction utilizing the following reducing reagents (or waste reagents) or a combination of reagents: Sulfur dioxide; sodium, potassium, or alkali salts of sulfites, bisulfites, and metabisulfites, and polyethylene glycols (e.g., NaPEG and KPEG); sodium hydrosulfide; ferrous salts; and/or other reducing reagents of equivalent efficiency. The treatment standards for chemical reduction are identical to those for chemical oxidation because the technologies are based on similar chemical reactions.

(3) Thermal Destruction. Thermal destruction is treatment in an incinerator operating in accordance with subpart O of part 264 or 265, a boiler or industrial furnace operating in accordance with subpart H of part 266, or other thermal treatment unit operated in accordance with subpart X, part 264 (permit standards) or subpart P, part 265 (interim status standards).

As noted above in the discussion of treatment standards for thermal desorption, a thermal desorber is regulated either as an incinerator (if the device is direct-fired or if the off-gas is burned in an afterburner) under subpart O of part 264 or 265, or as a thermal treatment unit under subpart X, part 264 or subpart P, part 265. To distinguish between thermal desorption and thermal destruction (for which separate debris treatment standards are provided) for purposes of complying with this rule, the primary purpose of thermal desorption is to volatilize contaminants and to remove them from the treatment chamber for subsequent destruction or treatment. The definition of thermal destruction in Table 1, Sec. 268.45, specifically excludes thermal desorbers.

Today's rule requires that treatment residuals be separated from the debris and restricts the use of thermal destruction (i.e., thermal treatment is not BDAT) for inorganic debris contaminated with a metal other than mercury. In addition, if debris is contaminated with a dioxin-listed waste, thermal destruction is not BDAT and the treated debris is not excluded from subtitle C unless the treater makes an "Equivalent Technology" demonstration to the Agency under Sec. 268.42(b) that documents that the technology treats contaminants subject to treatment to a level equivalent to that required by the performance and design and operating standards for other technologies in Table 1, Sec. 268.45, such that residual levels of hazardous contaminants will not pose a hazard to human health and the environment absent subtitle C control. (Note as discussed below that these restrictions do not apply to vitrification.)

Given that thermal destruction uses substantially higher temperatures and

often longer residence times than thermal desorption, the Agency believes that thermal destruction will destroy all but the most toxic hazardous nonmetal contaminants to minimum threat levels. Although metal contaminants will not be destroyed, metal contaminants in organic debris (e.g., wood, paper) will be removed from the treated debris. Metals in organic debris will partition to the residue (i.e., the material resulting from treatment that remains subject to numerical treatment standards) because the organic debris will be destroyed. Given that the treatment standards require separation of treated debris from the residue, the metals from the organic debris will partition to the residue for subsequent treatment to the waste-specific treatment standards for the waste contaminating the debris./39/ Thus, only metals contaminating inorganic debris (e.g., concrete, bricks) may remain untreated if they are not volatilized. To ensure treatment of such metals, the rule restricts the use of thermal destruction (i.e., thermal treatment is not BDAT) for inorganic debris contaminated with a metal other than the highly volatile mercury.

NOTE /39/ Although metals in soil or waste contaminating the debris may be removed by separation of the treated debris from these materials as the rule requires, metals in metal-bearing, heat resistant coatings on inorganic debris may neither be volatilized nor separated from the treated debris.

The treatment standards also require that the residue separated from the treated debris must meet the waste-specific treatment standards for the BDAT organic contaminants in the waste contaminating the debris prior to further treatment. This will help ensure that the thermal destruction unit has effectively destroyed organic contaminants in the debris.

In addition, the Agency is concerned that extremely toxic contaminants may not be destroyed (or removed with the residue) to levels that would not pose a hazard to human health and the environment absent subtitle C control.

Consequently, if debris is contaminated with a dioxin-listed waste, incineration is not BDAT for the debris and the debris is not excluded from subtitle C after treatment unless the treater obtains approval from the Director of the design and operating conditions of the thermal destruction unit. We considered applying this restriction only to porous, inorganic debris under the reasoning that the contaminants in dioxin-listed waste would partition to the residue for nonporous debris (e.g., metal) and organic, porous debris (e.g., wood). We were concerned, however, that if such contaminants remained undestroyed even at low concentrations in the residue and were not completely removed from the treated debris, that the debris could pose a health or environmental hazard absent subtitle C control. Given that the requirements for separation of residue and treated debris do not require a "clean debris surface" but, rather allow a dusting of residue to remain on the debris, we believe that it is prudent to establish this restriction on dioxin-listed waste.

Finally, we note that vitrification is a type of thermal destruction and that the rule establishes special (i.e., reduced) requirements for vitrification. Although the Agency classified vitrification as both thermal destruction and an immobilization technology at proposal (57 FR 1036), the Agency believes that the regulation is more easily understood if vitrification is classified only as thermal destruction with appropriate consideration given to the fact that vitrification heats the debris to

extremely high temperatures resulting in the formation of nonasbestiform glass. The fact that vitrification transforms debris into a glass-like residue is the basis for the special requirements established for vitrification: (1) The restriction on metal contaminants for porous, inorganic debris does not apply; and (2) the requirement for Agency approval of design and operating conditions to treat debris contaminated with dioxin- listed waste does not apply. Nonetheless, the vitrified residue, like all debris treatment residue, is subject to the waste-specific treatment standards for the waste contaminating the debris.

d. Immobilization Technologies. The Agency has identified three immobilization technologies as BDAT for hazardous debris: macroencapsulation, microencapsulation, and sealing. Immobilized debris must be land disposed in a subtitle C facility; /40/ it is not excluded from subtitle C regulation because the contaminants have not been destroyed or removed but rather contained indefinitely. Today's rule establishes only general, nonobjective performance standards for these technologies rather than the more prescriptive standards that were proposed (57 FR 1035-1036) because, based on public comment and the Agency's re-evaluation, the Agency is concerned that the proposed prescriptive standards may be overly restrictive (i.e., by requiring conditions that are more than necessary to ensure immobilization prior to subtitle C management) /41/ in some cases and ineffective in others.

Nonetheless, the Agency believes that the performance standards promulgated will substantially reduce the likelihood of migration of hazardous constituents from the debris as required by RCRA section 3004(m)(1).

NOTE /40/ In the Phase II land disposal restrictions rule, the Agency will reopen and request comment on the issue of whether immobilized debris should be excluded from subtitle C regulation.

NOTE /41/ For example, by requiring a minimum 7 day cure time for microencapsulation when some reagents can adequately stabilize some debris types in much less time.

(a) Macroencapsulation. Macroencapsulation is the application of surface coating materials such as polymeric organics (e.g., resins and plastics) or the use of a jacket of inert inorganic materials to substantially reduce surface exposure to potential leaching media. The treatment standard requires that the encapsulating material must completely encapsulate the debris (i.e., the encapsulant must completely surround the debris and be unbroken).

Further, the encapsulating material must be resistant to degradation by the debris and its contaminants and materials into which it may come into contact after placement (leachate, other waste, microbes) to ensure that the likelihood of migration of toxic contaminants has been substantially reduced.

(b) Microencapsulation. Microencapsulation is stabilization of the debris with the following reagents (or waste reagents) such that the leachability of the hazardous contaminants is reduced: Portland cement; or lime/pozzolans (e.g., fly ash and cement kiln dust). Reagents (e.g., iron salts, silicates, and clays) may be added to enhance the set/cure time

and/or compressive strength, or to reduce the leachability of the hazardous constituents. The performance standard for microencapsulation requires that the leachability of the hazardous contaminants must be reduced.

We note that the proposed rule would have prohibited the presence of free liquids in the microencapsulated debris. Today's rule does not provide this explicit prohibition because free liquids are prohibited from land disposal facilities under existing requirements--Sec. 264.314 or 265.314.

If the treater reduces the particle size of debris to make it amenable to microencapsulation so that the debris no longer meets the 60 mm minimum particle size limit for debris, such material is subject to the waste-specific treatment standards for the waste contaminating the material, unless the debris has been cleaned and separated from contaminated soil and waste before size reduction. This is consistent with the Agency's position that material with a particle size less than 60 mm is amenable to conventional treatment for process waste and small particle-sized material (i.e., as opposed to large debris objects) and that such material can be reasonably sampled for analysis to document compliance with the concentration-based treatment standards for the waste contaminating the material.

If the debris has been cleaned and separated from contaminated soil and hazardous waste /42/ before size reduction, the material remains classified as debris subject to today's treatment standards even if it no longer has a 60 mm particle size. The Agency believes that cleaning and separation of contaminated soil and hazardous waste will substantially reduce the concentration of toxic constituents such that, upon microencapsulation and placement in a subtitle C unit, the toxic constituents should not pose a hazard to human health and the environment.

NOTE /42/ We note that mixtures of contaminated soil, waste, and debris are regulated as debris if the mixture is at least 50% debris by volume. Thus, materials regulated as debris may contain high concentrations of toxic constituents.

The level of cleaning and separation that is required is the same as required for separation of treatment residue from treated debris. See Note 9 to Table 1, Sec. 268.45. At a minimum, simple physical or mechanical methods must be used such as vibratory or trommel screening or water washing. The debris surface need not be cleaned to a "clean debris surface" as defined in Table 1; rather, the surface must be free of caked soil, waste, or other nondebris material. Nondebris materials so separated are subject to the waste-specific treatment standards for the waste contaminating the material.

(c) Sealing. Sealing is the application of an appropriate material which adheres tightly to the debris surface to avoid exposure of the surface to potential leaching media. When necessary to effectively seal the surface, sealing entails pretreatment of the debris surface to remove foreign matter and to clean and roughen the surface. Sealing materials include epoxy, silicone, and urethane compounds; paint may not be used as a sealant.

The performance standard requires that the sealing must be performed to avoid exposure of the debris surface to potential leaching media--that is,

the sealant must completely enclose the debris. Further, the sealant must be resistant to degradation by the debris and its contaminants and materials into which it may come into contact after placement (leachate, other waste, microbes) to ensure that the likelihood of migration of toxic contaminants has been substantially reduced.

e. Changes to the Proposed Rule. In addition to the changes from proposal discussed above, today's final rule greatly simplifies presentation of the treatment standards. Proposed Table 1 (indicating by YES or NO which technologies would be BDAT for which debris types when specific contaminant categories were present) and Table 2 (classifying contaminants by category) are not promulgated. Nonetheless, the final rule will operate essentially as the Agency had intended for the proposal rule. Rather than explicitly identifying acceptable technology/debris/contaminant combinations in two tables and providing the performance or design and operating standards in a third table as proposed, the final rule establishes the treatment standards in a single table--Table 1 of Sec. 268.45. Not only was the proposed approach confusing, but proposed Table 1 forced unintended consequences.

Proposed Table 1 would have prohibited the use of particular technologies to treat certain debris types contaminated with certain hazardous constituents. In most cases, the proposed prohibition was based on the impracticability of applying the technology to the debris type rather than a determination as to whether the technology would effectively treat the debris if it was (or could be) applied. An example is the proposed prohibition on using abrasive blasting for paper, cloth, rubber, and plastic. The Agency has determined that abrasive blasting should be allowed for these types of debris because they may be mixed with debris that is amenable to the technology and would be converted to a treatment residue. An example is a steel I-beam that has paper labels on it. If abrasive blasting was used to treat the I-beam, the performance standards would ensure that the paper labels became part of the treatment residual subject to the treatment standard for the waste contaminating the debris.

We note, however, that depending on the type of contaminants subject to treatment and the technology selected to treat the debris, more than one treatment technology may be required to meet the standards. For example, if water washing was used as an extraction technology for a porous debris (e.g., concrete) with a contaminant subject to treatment that was not soluble to at least 5% by weight in the water solution, another technology (e.g., thermal desorption) must be used to treat that contaminant.

In summary, today's final rule uses the definition of the technology, the performance or design and operating standards, and the contaminant restrictions provided by Table 1 of Sec. 268.45 to ensure effective treatment of hazardous debris.

6. Treatment of Characteristic Debris

EPA proposed that debris that exhibits a characteristic of ignitability or reactivity, or that is contaminated with wastes that are ignitable, reactive, or corrosive, be treated to deactivate the waste. See 57 FR 1021. The Agency solicited comment on the question of whether such debris should also be treated for all Appendix VIII constituents that could reasonably be expected to be contaminating the debris (see 57 FR 984-85), and whether simple dilution should be allowed as a means of achieving deactivation, id.

at 990.

In the third third final rule, EPA established deactivation as a treatment standard for certain ignitable, corrosive, and reactive wastes, and allowed dilution as a means of achieving this standard. In large part, this was due to the enormous diversity of wastes exhibiting these characteristics and the difficulty of ascertaining the existence or extent of contamination not attributable to the characteristic property itself for this enormously disparate group of wastes. See 55 FR 22654. These concerns are less apparent for debris exhibiting ignitability or reactivity, or contaminated with ignitable, corrosive or reactive wastes, because there appears to be much less of it (almost no debris could be ignitable, given that most ignitable wastes must be liquids (see Sec. 261.21(a) (1) and (2)), none is corrosive (only liquids can be corrosive wastes), and also because a large proportion of debris would likely be contaminated with hazardous constituents because most hazardous debris comes from remediation sites. Id. at 985.

Most commenters opposed requiring treatment for specific hazardous contaminants. They also urged that all dilution be allowed as a form of treatment. Some commenters argued that this result was compelled by the statute. (This issue is presently awaiting decision by a panel of the District of Columbia Circuit Court of Appeals.) Others expressed concern with the practical difficulties inherent in sampling for hazardous constituents, or otherwise ascertaining their presence.

After considering the record, the Agency has decided to adopt the same treatment standards for ignitable, corrosive, or reactive (ICR) debris as for other hazardous debris because ICR debris is just as likely to be contaminated with hazardous constituents. See 55 FR 22654. (EPA will subcategorize ICR wastes and develop specific treatment standards, rather than allowing all types of dilution as treatment when a specific toxicity threat is apparent.) We are adopting a treatment standard of deactivation for these wastes but are requiring that the standard be achieved by use of the treatment methods adopted for other debris, unless the generator or treater demonstrates to the Agency that the debris does not contain toxic constituents. See discussion on codification of the contained-in principle above in Section V.B.2.b. (If necessary, petitioners could also make an equivalency demonstration under Sec. 268.42(b) if they wish to treat by some means other than one of the methods set out in the rule.) This will result in some treatment of hazardous constituents that are present, rather than allowing simple dilution to be used. (Many treatment methods for debris involve some type of dilution, and are permissible under today's rule. The effect of today's rule is to prohibit dilution other than that occurring as a result of a designated treatment method. An example of impermissible dilution could be packing ignitable, corrosive, or reactive debris in sand.) In addition, the types of concerns voiced by the Agency in the third third rule against adopting this type of standard for all ignitable, corrosive, and reactive wastes are not present for debris. The Agency is not requiring identification of hazardous contaminants that may be present, as proposed, in part due to the practical concerns voiced by commenters, in part because the Agency is not adopting this approach for other debris, and because most of the treatment methods will provide some treatment of most if not all hazardous contaminants.

EPA is not providing the option of treating by existing treatment standards for these wastes. This is because the existing treatment standard

for most ignitable, corrosive, or reactive wastes can be achieved by deactivation involving any type of dilution. Since this is the very result that the Agency is seeking to avoid, EPA is indicating in the rule that this option is not available for this one class of debris.

EPA noted at proposal that special rules would be needed for debris that is reactive due to presence of cyanide in order that cyanide by treated adequately. See 57 FR 990. We are adopting this approach in the final rule. Any such debris must therefore be treated by one of the specified technologies for which the treatment standards can be achieved for cyanide. In addition, any residues of such treatment may not be disposed until cyanide is treated to levels established in existing Table CCW of Sec. 268.43 (the treatment standard for waste that is reactive because of cyanide). This approach is consistent with that adopted for reactive cyanide wastes in the third third rule and should ensure that the cyanide known to be present is treated adequately before land disposal.

7. Special Requirements for Inherently Hazardous Debris

The proposed rule also considered the regulatory status of debris that is itself hazardous because it is fabricated with toxic constituents. Because such debris will continue to exhibit the toxicity characteristic after treatment by an extraction or destruction technology, today's rule requires treatment by an immobilization technology to reduce the likelihood of migration of hazardous contaminants. See Sec. 268.45(b)(4). Examples are lead pipe, or refractory brick containing chromium. See 57 FR 990. (This debris is referred to in this preamble discussion as "inherently hazardous debris".) Such debris can also be contaminated with listed wastes. In the proposed rule, the Agency discussed how the land disposal restrictions would apply if such debris were disposed of, and also indicated that an alternative for much of this debris would be to recycle it as scrap metal, in which case an existing regulatory exemption could apply. id. EPA also solicited comment on what standards should apply to residues from treating inherently hazardous debris, and also requested comment on whether there were situations when immobilization would not be an appropriate treatment technology for such debris. Id. at n. 26 and 990-91.

The Agency is essentially adopting the proposed approach in the final rule. However, some of the issues raised in the proposal require additional clarification, which is provided below.

a. Inherently Hazardous Debris that Is Disposed. When recycling of inherently hazardous debris is not practicable and it is to be disposed, today's rule requires treatment by an immobilization technology to reduce the likelihood of migration of hazardous contaminants, followed by disposal in a subtitle C facility. In response to commenters' concerns about the need for size reduction for immobilization, we note that the treatment standards for macroencapsulation and sealing may be achieved in some cases without size reductions./43/

NOTE /43/ Certainly, size reduction to that normally achieved prior to microencapsulation is not necessary.

A number of commenters questioned whether any treatment was needed to be performed on inherently hazardous debris or whether it could simply be disposed directly. The statute forecloses that option. Section 3004(m)(1)

indicates that the Agency is to establish "levels or methods of treatment, if any" which substantially reduce waste toxicity and mobility and minimize threats. If there are not such methods, the situation EPA believes contemplated by the clause "if any" in section 3004(m), the waste cannot be land disposed. See section 3004 (d), (e), and (g); see also API v. EPA, 906 F. 2d 729, 738 (D.C. Cir. 1990) (use of comparative risk assessment to compare safety of treatment methods versus land disposal of untreated wastes is unnecesary given that the statute forecloses land disposal as an option).

Thus, some treatment of inherently hazardous debris is needed in order for it to be land disposed. As indicated above, the Agency believes that such methods exist (i.e., immobilization).

If inherently hazardous debris is also contaminated with listed wastes, then that waste also must be treated by one of the prescribed treatment methods, the same approach adopted for all other debris. Note that the contaminants in the waste contaminating the debris need not be treated prior to immobilization of the debris if the performance standards for the immobilization technology can be achieved without such prior treatment.

Residues from treating inherently hazardous debris would not require further treatment unless the residues also exhibited a prohibited hazardous waste characteristic. However, if the inherently hazardous debris is contaminated with a listed waste, residues from treating the debris would remain subject to the numerical standards applicable to that listed waste.

Furthermore, if the debris were treated first to remove or destroy the listed waste (i.e., treated by an extraction or destruction technology prescribed in today's rule) and subsequently treated again by immobilization due to its inherent content, the Agency would not consider the debris to be contaminated any longer with a listed waste, since the initial treatment would have removed or destroyed it. Thus, any residues from subsequent immobilization would not be subject to treatment standards unless those residues exhibited a characteristic. For example, if lead pipe contaminated with listed solvents was first treated to remove the solvent and then treated to immobilize the lead, only residues from removing the solvent would have to meet the numerical solvent treatment standards. This approach mirrors that adopted for all other hazardous debris.

b. Inherently Hazardous Debris that Is Scrap Metal and Is Recycled. EPA's rules provide for an exemption from regulation for scrap metal that is recycled. See Sec. 261.6(a)(3)(iv); scrap metal is defined at Sec. 261.1(c)(6). EPA consequently indicated at proposal that the land disposal prohibitions would not apply to inherently hazardous debris that was also scrap metal being recycled. EPA adheres to that approach, which simply restates current rules (and was not reopened for reconsideration). The only obligation for generators handling such scrap metal is to keep a record of the scrap and its subsequent disposition or recycling by metal reclamation. See Sec. 268.7(a)(6). If the scrap metal is also contaminated with listed waste, the exemption continues to apply since the material would still meet the regulatory definition of scrap metal. However, any residues from processing the waste would remain hazardous by the derived from rule, and would require treatment to meet the standard for that listed waste before it could be land disposed. Thus, persons treating such scrap metal would become hazardous waste generators, and would also incur responsibilities under the land disposal restriction rules (see Sec. 268.7(a) (1) and (2)). As explained in the previous section, however, if the scrap metal were to

be treated first by a prescribed removal or destruction technology, it would no longer be considered to be contaminated with a listed waste, and any residues generated subsequently would not be hazardous wastes unless they exhibited a hazardous waste characteristic. Thus, it may be advantageous to arrange for pretreatment of contaminants before this type of scrap metal is recycled.

c. Status of Stainless Steel Debris. The Agency provided an example in the proposed rule of demolition of a building containing stainless steel fixtures and indicated that if a representative sample of the demolition debris exhibited a characteristic debris would be hazardous waste. The Agency noted that stainless steel could also be removed before demolition and managed separately, perhaps by recycling it as scrap metal. See 57 FR 990.

In providing this example, the Agency was not stating that discarded stainless steel artifacts are hazardous wastes, and in fact has no information indicating that such materials, much less demolition debris containing small bits of stainless steel, would exhibit a characteristic. Although it may be worthwhile (for environmental and economic reasons) to remove metal artifacts for recycling rather than destroying them when demolition occurs, today's rule does not mandate any such conduct.

8. Relationship of the TSCA PCB Rules to Today's Rule

As proposed, the final rule requires that hazardous debris that is also a waste PCB under 40 CFR part 761 must comply with both the applicable PCB requirements and today's debris treatment standards, by satisfying the more stringent applicable requirements.

The treatment standards for hazardous debris also apply to debris contaminated with both PCBs and RCRA hazardous wastes. See Sec. 268.45(a)(5). This is consistent with the approach taken in the third third final rule. See 55 FR 22678 (June 1, 1990). Debris treated to today's performance standards by an extraction or destruction technology (and that does not exhibit a hazardous characteristic) remains subject only to TSCA rules because it is excluded from subtitle C regulation, whereas debris treated by an immobilization technology remains subject to applicable requirements under both statutes.

Under the Toxic Substances Control Act (TSCA), disposal of debris contaminated with PCBs is regulated under 40 CFR 761.60. In addition, disposal of debris and materials resulting from the cleanup of certain PCB spills is subject to the PCB Spill Cleanup Policy, as provided under 40 CFR 761.125.

9. Relationship of Existing Agency Standards for Asbestos to Today's Rule

As proposed, the Agency is today requiring that the treatment standards for hazardous debris also apply to debris subject to standards for asbestos under OSHA, TSCA, and NESHAPs./44/ EPA acknowledges that many of the treatment technologies specified in today's rule for hazardous debris would not be practicable for asbestos debris because of the potential for occupational exposure or environmental release of asbestos. However, the Agency believes that several technologies could be used to treat hazardous

debris in compliance with the applicable OSHA, NESHAPs, and TSCA by using filtration devices on air and water emissions to control asbestos--water washing and spraying; liquid phase solvent extraction; vapor phase solvent extraction; biodegradation; chemical oxidation; chemical reduction; and macroencapsulation.

NOTE /44/ For a summary of OSHA, TSCA, and NESHAP controls on asbestos, see the proposed rule at 57 FR 993-994.

The Agency considered the argument made by several commenters that asbestos-contaminated hazardous debris and hazardous debris contaminated with asbestos should be managed according to existing EPA and OSHA regulations (i.e., bagging) and placing the bagged material in a subtitle C facility. The Agency agrees with the commenters that, if bagging meets the performance standard for macroencapsulation, such debris may then be disposed of in a subtitle C facility.

10. Special Requirements for Radioactive Debris

The Agency is today requiring that hazardous debris that is subject to regulations under the Atomic Energy Act (AEA) because of its radioactivity (i.e., mixed waste) is also subject to today's debris treatment standards./45/ This is consistent with the Agency's regulation of the waste that is contaminating the debris--if a prohibited waste is also a mixed waste, it is nonetheless subject to the treatment standards for the waste.

NOTE /45/ We note that the Agency has established treatment standards in Sec. 268.42 for several types of radioactive wastes (e.g., D008: Radioactive lead solids subcategory) that may be generated in particle sizes greater than 60 mm, the minimum size limit for debris. Nonetheless, such wastes are excluded from the definition of debris (see Sec. 268.2(g)) and are subject to the waste-specific treatment standards.

Commenters expressed concern that the treatment of certain radioactive mixed waste debris may pose an unreasonable risk to human health and the environment due to the radiological nature of the waste. The Agency understands commenters' concerns but believes that there is sufficient flexibility in the debris treatment standards to enable generators or treaters to select a technology that will effectively treat the hazardous contaminants without posing an unreasonable risk to human health and the environment because of the radiological nature of the waste.

11. Documentation of Compliance With the Treatment Standards

When hazardous debris is treated to today's treatment standards, treaters must comply with the applicable residue analysis, notification, certification, and recordkeeping and requirements of revised Sec. 268.7. In today's rule, the Agency has revised several paragraphs in Sec. 268.7 and added one paragraph to accommodate hazardous debris.

Paragraph (a)(1) is revised to require generators who ship their hazardous debris to a storage or treatment facility to provide a notice that includes

the information already required for restricted wastes as well as a listing of the contaminants subject to treatment. This will assist the treater in determining which treatment technology is appropriate for the debris. In addition, the notice must inform the treater that the debris is subject to (i.e., eligible for) the alternative treatment standards of Table 1; Sec. 268.45.

Paragraph (a)(2) is revised to exempt generators of hazardous debris who obtain a determination from the Agency that the debris does not contain hazardous waste (see Sec. 261.3(e)(2)) from the notification requirements of that paragraph for facilities receiving the shipment. Given that such debris is no longer hazardous waste, the notification requirement is not necessary.

Paragraph (a)(3) is revised to require generators whose restricted hazardous debris is not yet prohibited debris (because of, for example, the capacity variance discussed in section V.G below) to provide a notice that includes the information already required for restricted wastes as well as a listing of the contaminants subject to treatment and a statement that the debris is subject to (i.e., eligible for) the alternative treatment standards of Table 1, Sec. 268.45. See discussion above for the rationale for requiring that this additional information be submitted to the receiving facility.

Paragraph (a)(4) is revised to exempt generators who treat their debris by one of the technologies specified in Table 1, Sec. 268.45, from the waste analysis requirements of that paragraph. As discussed elsewhere in today's notice, the debris treatment standards are technology-specified standards rather than numerical concentration standards. Thus, analysis of the debris is generally not necessary (except to determine where knowledge about the debris is not available whether the debris exhibits a characteristic of hazardous waste).

Paragraph (b)(4) is revised to exempt facilities that treat hazardous debris so that it is excluded from the definition of hazardous waste under Sec. 261.3(e) (i.e., debris treated by an extraction or destruction technology provided by Table 1, Sec. 268.45, and debris that the Agency has determined does not contain hazardous waste) from the notification requirements of that paragraph. Paragraph (b)(4) requires treaters of prohibited waste to notify the land disposal facility receiving each shipment of waste of information including the treatment standards applicable to the waste. We revised this requirement because notification of receiving facilities is not necessary for debris that is excluded from subtitle C regulation. We note, however, that treaters of excluded debris are subject to the new notification (to EPA) and certification requirements provided by paragraph (d), as discussed below.

Paragraph (b)(5) is revised to exempt facilities that treat hazardous debris so that it is excluded from the definition of hazardous waste under Sec. 261.3(e) from the certification requirements of that paragraph. Such facilities are subject to the new certification requirements, however, provided by paragraph (d), as discussed below.

Finally, paragraph (d) is added to subject generators and treaters who first claim that their debris is excluded from the definition of hazardous waste under Sec. 261.3(e) to notification and certification requirements. Such generators and treaters are required to submit to EPA a one-time

notice identifying the name and address of the subtitle D facility receiving the excluded debris, a description of the debris before treatment (i.e., as- generated), and, if the debris is excluded because it was treated by an extraction or destruction technology specified in Table 1, Sec. 268.45 (i.e., it is not excluded as a result of a contained-in determination), the treatment technology used. The Agency will use this information for enforcement purposes. Not only will the notification identify those facilities that claim that hazardous debris is excluded from regulation, but the information on the type of debris treated and the technology used will enable the Agency to establish a priority for inspections taking into account how difficult it may be to treat the debris to the performance and design and operating standards with the selected technology.

In addition, for debris treated by a technology specified in Table 1, Sec. 268.45 (i.e., debris not excluded as a result of a contained-in determination), the treater must document and certify compliance with the treatment standards specified in Table 1. The rule requires the treater to record in the facility's files all inspections, evaluations, and analyses (e.g., determinations that a physical extraction technology has removed at least 0.6 cm of the debris surface and that the debris is treated to a "clean debris surface") of the treated debris that the treater made to determine compliance with the standards, as well as any data or information pertaining to key operating parameters the treater may have generated during treatment of the debris (e.g., exit gas temperature and feed rate, of a thermal desorber). The rule also requires the treater to place a certification in the facility's files for each shipment of excluded debris that the debris has been treated in accordance with the standards specified in Table 1. These requirements will enable the Agency to enforce the debris treatment standards.

D. Exclusion of Hazardous Debris From Subtitle C Regulation

Under today's rule, hazardous debris may be excluded from subtitle C regulation either by: (1) the Agency's determination that the debris no longer contains hazardous waste (i.e., the contained-in policy discussed in section V.B.2) as provided by new Sec. 261.3(e) (2); or (2) by compliance with the debris treatment standards for extraction or destruction technologies for exclusion from subtitle C provided in Table 1 of Sec. 268.45 (and provided the debris does not exhibit a hazardous characteristic after treatment). The basis for excluding debris determined to no longer contain hazardous waste is discussed above in section V.B.2. We discuss here the basis for excluding from subtitle C regulation debris that is treated to meet today's performance standards requisite to such exclusion.

1. Basis for Excluding Debris Treated by Extraction or Destruction Technologies and That Is Not Characteristic

Debris treated by a prescribed extraction or destruction technology and that does not exhibit a hazardous characteristic is excluded from subtitle C regulation. As discussed in section V.C.5 above, the Agency has given careful consideration as to whether each debris/contaminant type would be effectively treated by each BDAT technology to levels that present minimum risk (i.e., would no longer pose a hazard to human health or the environment). The Agency believes that debris treated to those standards

would pose minimum risk for a number of reasons. First, the Agency has deleted two technologies (i.e., electropolishing and ultraviolet radiation) from the proposed list of BDAT technologies because they are not likely to provide effective treatment.

Second, the final rule requires separation of nonempty intact containers of hazardous waste from debris for treatment to the waste-specific treatment standards. Thus, containerized waste that is readily amenable to separation from debris by equipment operators in the field and that may have high concentrations of toxic constituents will be subject to concentration-based, waste-specific treatment standards rather than to the debris standards.

Third, the final rule raises the particle size used to define debris from 9.5 mm to 60 mm and applies the size limit to all debris, not just geologic matter. Thus, materials that should be amenable to treatment methods for process waste are subject to the waste-specific treatment standards rather than to the debris standards. Fourth, the final rule specifically excludes process waste of any particle size (e.g., slag) from the definition of debris. Thus, process wastes with potentially high concentrations of hazardous constituents will be subject to the waste-specific treatment standards rather than to the debris standards.

Most important, the performance and design and operating standards that the rule establishes for exclusion of treated debris from subtitle C are rigorous standards. Examples are the requirements that physical extraction technologies treat metal to a "clean metal finish" and other debris surfaces to a "clean debris surface". A minimum of 0.6 cm of the surface layer of porous debris must be removed as well. Another example is the maximum thickness standard for porous debris that is to be treated by chemical extraction.

For several technologies, the Agency was concerned that the performance and design and operating standards may not ensure treatment to minimum risk levels. Consequently for these technologies--thermal desorption, biodegradation, chemical oxidation and reduction and thermal destruction of debris contaminated with dioxin-listed wasted /46/--treated debris would be excluded only after the treater successfully makes an equivalent technology demonstration to the Agency under Sec. 268.42(b) documenting that the technology treats a particular type of debris/contaminant combination as effectively as the other BDAT technologies to residual levels of hazardous contaminants that would not pose a hazard to human health and the environment absent management controls.

NOTE /46/ Note that the standards provide other restrictions for debris contaminated with dioxin-listed waste.

Finally, the rule requires separation of the treated debris from all treatment residues, including soil, waste, or other nondebris material that could remain adhered to the debris surface. This will ensure that metal contaminants in the residue will not continue to contaminate the treated debris and that any waste or contaminated soil in a primarily debris mixture as it was generated is separated from the treated debris prior to exclusion from subtitle C.

The philosophy underlying this approach is similar to that contained in principle: It is not normally the debris itself that is hazardous, but

rather hazardous waste that is contaminating the debris. Thus, the goal of treatment should be to destroy or remove the contamination (if possible) and if this is achieved, to dispose of the cleaned debris as a nonhazardous waste. The removed residues from this treatment contain the contamination, and must meet numerical concentration levels before they can be land disposed.

Not only are the treatment methods developed to achieve this objective, but the various separation requirements (both before and after treatment) forcing removal of all nondebris materials such as soil and other wastes, and the definition of debris itself (which limits the debris classification to materials most amenable to the treatment methods, and classifies materials most amenable to meaningful sampling as nondebris subject to numerical treatment standards) are intended to achieve the same goal. As discussed above, the debris treatment standards are written wherever possible as performance standards to ensure that contamination is in fact removed from the debris. In addition, the rule specifies which contaminants are unsuitable for certain of the treatment methods. In short, the Agency believes that treatment of contaminated debris by the methods established here will result in clean debris which may then be land disposed, and should also no longer be regulated as a hazardous waste.

EPA notes, however, that the notion of excluding wastes from subtitle C regulation without sampling for hazardous constituent concentration levels is potentially at odds with many of the approaches recently proposed for public comment in the Hazardous Waste Identification Rule (HWIR). See 57 FR (May 20, 1992). In that rule, the Agency asked for comment on means of identifying and excluding hazardous wastes from subtitle C regulation that potentially take into account presence of a majority of the hazardous constituents listed in appendix VIII of part 261. If these approaches are adopted, they could provide a principled means of evaluating wastes heretofore excluded from subtitle C regulation without requiring analysis of hazardous constituent concentrations, such as the debris being excluded in today's rule, or residues from "empty containers" discussed above in Section V.B.2. EPA expects that hazardous constituent levels in debris treated by the methods adopted today will be consistent with levels resulting from the May 20 proposal, and in addition, for many types of treated debris there remain difficulties in obtaining representative samples necessary to make hazardous waste identification and listing determinations, and for this reason is finalizing the rule today rather than delaying action pending the results of the May 20 rulemaking. Nevertheless, the Agency believes it an appropriate issue for comment in the HWIR rulemaking the extent to which those standards should be used to replace exclusions from the definition of hazardous waste that are established without requiring analysis of hazardous constituent levels in the excluded waste.

2. Rationale for Continued Subtitle C Regulation of Debris Treated by Immobilization

Debris treated by an immobilization technology would remain subject to subtitle C regulation. EPA currently has insufficient data to demonstrate generically that debris which can be contaminated with both organic and inorganic constituents would be nonhazardous when treated by any of the immobilization technologies. Until the Agency gathers further data, EPA is concerned that, absent subsequent subtitle C management, hazardous

contaminants may migrate from certain immobilized debris at levels that could pose a hazard to human health and the environment. Thus, EPA believes it inappropriate to promulgate a self-implementing exclusion at this time.

Nonetheless, in the Phase II land disposal restrictions rule, the Agency will reopen and request comment on the issue of whether immobilized debris should be excluded from subtitle C regulation. The Agency plans to investigate this issue further and will publish in the Phase II proposed rule any information or data that are available. In addition, the Agency will specifically explore the potential of using the TCLP, and if so, under what circumstances, in determining whether immobilized hazardous debris should be excluded from subtitle C control. To assist the Agency in this effort, we ask for data on the performance of specific immobilization technologies and short- or long- term leachibility studies. Based on past experiences, the Agency has found that uncertainty over the technical performance of immobilization precludes a general exemption from subtitle C for all types of immobilized hazardous debris. However, the Agency will continue to evaluate all available and new information about the performance of immobilization technologies which could limit the technical uncertainty. To the extent that sufficient information that meets proper quality assurance/quality control procedures is available, the Agency plans to propose in the Phase II LDR rule an exclusion from subtitle C for those immobilized hazardous debris.

E. Regulation of Treatment Residuals

1. Overview

In this section, we discuss: (1) The rationale for subjecting treatment residues to the waste-specific treatment standards for the waste contaminating the debris; (2) separation of treated debris from treatment residue; (3) special requirements for debris treated by spalling; (4) special requirements for residue from the treatment of debris contaminated with cyanide reactive waste; and (5) special requirements for ignitable wastewater residue.

2. Treatment Residues Are Subject to the Waste-Specific Treatment Standards for the Waste Contaminating the Debris

Residuals from the treatment of hazardous debris are subject to the waste-specific treatment standards for the waste contaminating the debris. The residual must be treated to those standards for all BDAT constituents specified in Secs. 268.41, 268.42 and 268.43 for the waste.

The Agency had proposed to require treatment of nonsoil residuals to the multi-source leachate F039 levels and soil residuals to the waste-specific treatment standards for the waste contaminating the debris. Based on public comment and the Agency's re-evaluation of this issue, the Agency had determined that it is more appropriate to subject all treatment residues-- soil, wastewater, and nonwastewater--to the waste-specific treatment standards for the waste contaminating the debris for a number of reasons.

First, the waste-specific treatment standards currently apply to treatment residuals, and the Agency does not know of a compelling reason to change that position. Second, requiring compliance with the waste-specific treatment standards rather than the F039 standards may be somewhat easier

to understand and implement because the treatment standards for the BDAT constituents in the residue can be determined at the same time that the BDAT constituents are identified as contaminants subject to treatment (i.e., the contaminants subject to treatment in the contaminated debris are the same contaminants that must be treated in treatment residuals). Third, the Agency is considering simplifying and revising the treatment standards for all prohibited waste to "universal standards" in the Phase II proposed land disposal restrictions rule.

Several commenters suggested that the thermal destruction process of vitrification should be considered immobilization of debris. Thus, commenters argued that such vitrified debris could be land disposed under subtitle C without being subject to the waste-specific treatment standards for the waste contaminating the debris. The Agency disagrees with this view. Vitrification is a type of thermal destruction that produces a residue that is vitrified.

Thus, the vitrified residue is subject to the same treatment standards as any debris treatment residue--the waste-specific standards for the waste contaminating the debris. This is consistent with the Agency's position that slag from high temperature metals recovery is residue, not debris, subject to the waste-specific treatment standards.

3. Treated Debris Mixed With Treatment Residue Is Subject to Regulation as Residue

As discussed above in section V.C.5, treatment residues generally contain high levels of toxic contaminants removed from the debris. Examples are residue from thermal desorption or incineration of debris contaminated with metal-bearing waste, and residue from water washing of debris. As discussed below, treatment residuals are subject to the waste-specific treatment standards for the waste contaminating the debris. Thus, to ensure that treatment residuals are treated effectively before land disposal and to ensure that treated debris is not contaminated with the treatment residue, the treatment standards require that the treated debris must be separated from the treatment residue. If the debris is not separated from the treatment residue, it remains a prohibited waste and may not be land disposed. It also remains subject to all other subtitle C standards.

The Agency defines treatment residuals as residuals such as biomass from biodegradation and ash from incineration as well as soil, waste, or other nondebris material that may remain adhered to the treated debris. We note further that slag from a high temperature metals recovery furnace and vitrified residue from a thermal destruction unit are treatment residues rather than debris. In both cases, the original debris no longer exists and the residuals from soil or waste contaminating the debris are integral components of the slag and vitrified residue.

Separation of the treated debris from treatment residuals must be accomplished using simple physical or mechanical means such as vibratory or trommel screens or water washing. The separation process need not produce a "clean debris surface" /47/ as discussed above, however; rather the debris surface must be free of caked residuals or nondebris materials such as soil or waste. For example, thermal desorption debris need not be water washed after trommel screening to remove dust from residuals or nondebris material.

(Note that the use of water washing to separate thermally desorbed debris

from residuals and nondebris materials need not comply with the treatment standards for water washing (e.g., treatment to a "clean debris surface") because the debris has already been treated by an alternative technology.)

NOTE /47/ "Clean debris surface" means the surface, when viewed without magnification, shall be free of all visible contaminated soil and hazardous waste, except that residual staining consisting of light shadows, slight streaks, or minor discolorations, and soil and waste in cracks, crevices, and pits may be present provided that such staining and soil and waste in cracks, crevices, and pits shall be limited to no more than 5% of each square inch of surface area.

4. Special Requirements for Debris Treated by Spalling

As proposed and as discussed in Section V.C.5, debris removed by spalling remains debris subject to the debris treatment standards. Debris surfaces removed by spalling are, by definition of the technology, large pieces of debris. The Agency believes that such pieces of spalled debris are more debris-like than waste or residual-like and are more amenable to treatment by the debris treatment standards than the waste-specific treatment standards.

5. Special Requirements for Residue From the Treatment of Debris That Is Cyanide-Reactive

As proposed, the final rule requires that residues from the treatment of debris that is reactive because of cyanide is subject to the waste-specific treatment standards for cyanide under Sec. 268.43. As with cyanide-reactive waste, EPA believes that BDAT for cyanide-reactive debris requires treatment of cyanide because of its toxicity.

6. Special Requirements for Ignitable Nonwastewater Residue

As proposed, the final rule requires that ignitable nonwastewater residue containing greater than or equal to 10% total organic carbon be subject to the technology-based standards for D001: "Ignitable Liquids based on 261.21(a)(1)" under Sec. 268.42. This residue must be treated by fuel substitution (i.e., burning as fuel in a boiler or industrial furnace), recovery of organic constituents (e.g., distillation, carbon adsorption), or incineration. EPA has established these technologies as BDAT for high total organic carbon ignitable liquids because they will effectively remove or destroy the toxic organic constituents.

F. Permit Requirements for Treatment Facilities

Treatment of hazardous debris (except as discussed below for 90-day on-site treatment in a container, tank, or containment building) is currently subject to the applicable interim status and permit standards of parts 264, 265, 266, and 270 that ensure protection of human health and the environment from the operation of the treatment unit. (We note that, for containment buildings, interim status and permit standards and requirements for 90-day on-site treatment are promulgated in today's rule as discussed elsewhere in this notice.) Today's debris treatment standards to implement

the land disposal restrictions of section 3004(m) of the statute do not affect those existing facility standards. For example, today's treatment standards do not reopen interim status eligibility for debris treatment facilities. (We note, however, that today's rule does establish the interim status eligibility date for containment buildings given that these units are newly regulated by this rule, assuming that such buildings are located at facilities containing no other regulated units.) Rather, today's debris treatment standards subject generators and treaters to additional requirements to ensure effective treatment of hazardous debris prior to exclusion from subtitle C (for debris treated by an extraction or destruction technology and that does not exhibit a hazardous characteristic) or land disposal in a subtitle C facility (for debris treated by an immobilization technology).

As information for the reader, we note that the existing facility standards for the following common debris treatment operations (other than for 90-day on-site treatment in a container, tank, or containment building) are:

** Debris treatment technologies conducted in tanks such as high pressure steam and water spraying, chemical extraction, and biodegradation are subject to the standards for tank facilities in subpart J of part 264 (permit standards) and part 265 (interim status standards).

** Storage or treatment in containment buildings is subject to the subpart DD, parts 264 and 265, standards also promulgated today (see discussion elsewhere in today's notice).

** Physical extraction technologies such as abrasive blasting or spalling used to treat debris in place but that is intended for discard (e.g., treatment of a contaminated building prior to demolition) are subject to the permit standards of subpart X, part 264 for miscellaneous units or the interim status standards for chemical, physical, or biological treatment in subpart Q, part 265.

** Incinerators are subject to subpart O, part 264 (permit standards) and part 265 (interim status standards).

** High temperature metal recovery furnaces are conditionally exempt from the rules for boilers and industrial furnaces burning hazardous waste in subpart H, part 266.

** Thermal desorbers are subject either to the incinerator or thermal treatment standards, depending on whether the unit meets the incinerator definition. Thermal treatment units are subject to subpart X, part 264 (permit standards for miscellaneous units) and subpart P, part 265 (interim status standards).

1. Adding Capacity for Debris Treatment to Existing Facilities

Today's rule amends the permit and interim status standards of part 270, as proposed, to facilitate the expansion of existing debris treatment capacity and the addition of new debris treatment capacity at existing facilities currently subject either to permit or interim status standards for managing hazardous waste. However, if an owner or operator of a facility that is not currently managing hazardous waste under the permit or interim status standards wants to construct a debris treatment facility, he must first obtain a RCRA permit.

a. Facilities With a RCA Permit. Facilities with a RCRA permit may add new treatment processes and additional capacity by applying for a permit modification under Sec. 270.42. See 53 FR 37912 (Sept. 28, 1988). Although regulations at Sec. 270.42 were promulgated under pre-HSWA authority, EPA may use these regulations in authorized States when necessary to implement HSWA provisions such as the land disposal restrictions. See 53 FR 37933.

The types of modifications needed to add new capacity or processes would likely require submittal of a Class 2 or 3 modification. The Class 2 modification process requires Agency action on the request within 120 days. This action would consist of approval or denial, reclassification as a Class 3 modification, or authorization to conduct activities (in containers, tanks, and containment buildings, as discussed below) for up to 180 days pending Agency action. Further, for Class 2 modifications, construction to implement the requested facility change may commence 60 days after submission of the request. There is no deadline for Agency action for Class 3 modifications, which apply to more substantial changes.

Permitted facilities may apply under existing Sec. 270.42(e)(3)(ii)(B) for a temporary authorization to initiate necessary activities to treat or store restricted wastes (e.g., hazardous debris) in tanks or containers while a Class 2 or 3 permit modification is undergoing review, or to undertake a treatment or storage activity which will be of short duration (e.g., decontamination of a building intended for demolition). Today's rule revises that section to enable the Agency also to grant a temporary authorization for containment buildings meeting the requirements promulgated today in subpart DD of parts 264 and 265.

Any request for a temporary authorization must demonstrate compliance with the part 264 standards and also meet the criteria of Sec. 270.42(e) for approval. Interested members of the public (i.e., those that have previously expressed interest in any permitting action for the facility) will receive notice by mail of a facility's request for a temporary authorization. The temporary authorization may be renewed once if the additional procedures of Sec. 270.42(e) are followed, including submission of appropriate permit modification information and the initiation of public meetings and public comment period. See 53 FR 37919.

b. Facilities Operating Under Interim Status. Facilities managing hazardous waste under interim status may add new treatment processes or additional treatment or storage capacity by using the existing procedures for changes during interim status in Sec. 270.72. Under these procedures, a facility must submit to EPA a revised Part A permit application and justification explaining the need for the change. The change must then be approved by EPA.

Such changes must meet one of several criteria specified in Sec. 270.72, such as being necessary to comply with a Federal, State, or local requirement. However, changes generally may not be made if they amount to reconstruction of the facility. The Agency considers the facility to be "reconstructed" if the capital investment for the changes to the facility exceed 50% of the capital cost of a comparable entirely new facility.

Existing Sec. 270.72(b)(6) lifted the reconstruction limit for changes to treat or store in tanks and containers hazardous waste subject to land disposal restrictions imposed by part 268, provided that such changes are made solely for the purpose of complying with part 268 land disposal

restrictions. Today's rule revises that paragraph to lift the reconstruction limit for containment buildings as well. See the the new subpart DD, part 264 and 265, standards for containment buildings that are also promulgated today.

2. On-Site Treatment of Debris in Containers, Tanks, and Containment Buildings

Existing Sec. 262.34 exempts from permit requirements generators who store or treat hazardous debris on-site in tanks or containers for a period not exceeding 90 days provided that the tank or container is designed and operated in compliance with subpart I (for containers) and subpart J (for tanks) of part 265. Today's rule revises Sec. 262.34, as proposed, to also provide this exemption to containment buildings designed and operated in compliance with the subpart DD, part 265, standards also promulgated today.

G. Capacity Variance for Hazardous Debris

In the May 15, 1992, Notice to Approve Hazardous Debris Case-By-Case Capacity Variance, the Agency approved a generic, one year extension of the LDR effective date applicable to all persons managing hazardous debris (57 FR 20766). For the purpose of the extension, the term "debris" was defined as set out in the preamble to the June 1, 1990 Third Third final rule. See 55 FR 22650 and Sec. 268.2(g). Furthermore, the Agency indicated that it will explain in the debris rule how a change in definition will affect the case- by-case extensions.

Although in general, both definitions will identify the same materials as debris, there are differences that may result in situations where either definition could include debris not included by the other. Of concern is the situation where someone has entered into contracts for, or actually initiated the process of, removing for disposal debris which met the old definition but does not meet the current definition. To avoid possible disruption of on- going activities, which have relied on the previous definition of debris, the Agency will allow the extension to apply to materials meeting either definition through May 8, 1993.

H. Other Issues

1. Applicability of Standards to Contaminated Structures and Equipment

a. Structures and Equipment Contaminated With Hazardous Waste and Intended for Discard Are Regulated Debris. As discussed above in section V.B.1.a of the preamble, structures and equipment contaminated with hazardous waste and that are intended for discard are hazardous debris subject to today's treatment standards. Thus, if a contaminated tank or building is decontaminated before demolition, the debris may not be land disposed unless the tank or building was decontaminated in compliance with today's treatment standards. (We note that, as discussed above in section F.2, such treatment is subject to the permit standards unless conducted in a tank, container, or containment building.)

If the contaminated structure or equipment is being decontaminated for subsequent use, however, the structure or equipment is not debris and the decontamination is neither subject to today's debris treatment standards nor the permit standards for hazardous waste management facilities. Thus,

cleaning a building that is in use is not treatment of debris.

b. Treatment Standards for Concrete Pads and Walls Intended for Discard. The Agency believes that concrete pads and walls are typically decontaminated using "water washing" techniques. These techniques include the following technologies specified in today's rule: Abrasive blasting using water to propel abrasive media, high pressure steam or water sprays, and water washing and spraying.

We note that the performance standards for abrasive blasting and high pressure water sprays require removal of 0.6 cm of the surface because these are physical extraction technologies designed to remove the surface layer of the debris. The performance standards for water washing and spraying limits the thickness of the concrete to 3/8 inch because this technology relies on chemical extraction (i.e., dissolving or removing with surfactants) of contaminants below the concrete surface. If the treater believes that treatment to these performance standards is not necessary to ensure effective treatment to residual levels of hazardous constituents that will not pose a hazard to human health and the environment absent management controls, the treater may: (1) Obtain a waiver of the standards (e.g., the thickness limit for water washing) under an equivalent technology demonstration under Sec. 268.42(b); or (2) demonstrate to the Agency that the debris upon alternative treatment does not contain toxic constituents under the contained-in principle codified in today's rule. See discussion in section V.B.2.b above.

c. Relation of Debris Standards to Closure Rules. Existing closure standards for hazardous waste management facilities require "decontamination" of contaminated structures and equipment. See, e.g., Secs. 264.114 and 265.114. The precise meaning of decontamination presently is determined on a case-by-case basis through review of the facility's closure plan. However, if such structures or equipment is also debris which is going to be land disposed, which could often be the case, an issue arises regarding the relationship of the "decontamination" standard in the closure rule and the treatment methods adopted in today's rule.

The Agency believes that the treatment methods in today's rule would always satisfy the decontamination standard in the closure provisions. After all, the purpose of these treatment methods is to decontaminate. EPA also interprets the land disposal and closure rules to require that all hazardous debris be treated to meet the debris treatment standards, even if the debris is generated during closure. (Put another way, the debris standards normally would be appropriate for any debris generated as a result of closure.) If the debris treatment standards appear to be inappropriate for debris (such as contaminated structures or equipment) generated during closure, a site-specific treatability variance pursuant to Sec. 268.44(h) may be available. The Agency believes that such a variance could be processed administratively as part of the closure procedures.

2. Mixing of Hazardous Waste or Contaminated Soil With Debris To Avoid the Waste-Specific Treatment Standards Is Prohibited

Today's rule prohibits the intentional mixing of hazardous waste or contaminated soil with debris to avoid the concentration-based treatment

standards for the waste or soil. The Agency is prohibiting such sham mixing to ensure that hazardous waste and contaminated soil are treated to the existing treatment standards given that the waste /48/ is amenable to treatment to those levels and that the waste and soil are likely to be much more heavily contaminated with hazardous constituents than debris and, thus, should be subject to such concentration-based treatment levels.

NOTE /48/ We note that the Agency is concerned that the waste treatment standards may not be appropriate for soil contaminated with the waste and, consequently is considering proposing in summer 1992 treatment standards for contaminated soil.

The prohibition on mixing applies to debris treated by any technology: Immobilization as well as extraction or destruction. Although the debris treatment standards require separation of the waste or contaminated soil from debris treated by an extraction or destruction technology and that the residue must meet the waste-specific treatment standards for the waste contaminating the debris, the treatment process itself could enable the residue to meet the concentration-based waste treatment standards by virtue of dilution during treatment. An example is water washing of debris intentionally mixed with a prohibited listed waste. The water residue may easily meet the waste-specific treatment standard by virtue of dilution rather than treatment.

We note that this prohibition on sham mixing does not affect implementation of the principle discussed above in section V.B.1 to classifying mixtures of debris with contaminated soil or waste as debris. That principle says that if debris is the primary material in a mixture by volume based on visual observation, the mixture is subject to regulation as debris. Thus, for example, when debris is initially excavated in a mixture of debris and nondebris materials, and debris is the primary material present, the mixture is appropriately regulated as debris and sham mixing has not occurred.

However, if debris is intentionally mixed with contaminated soil or hazardous waste (e.g., after excavation), and the mixture is regulated as debris by the application of the mixture principle and subsequently immobilized, prohibited sham mixing has occurred.

3. Procedures for Demonstrating Equivalency of Alternative Technologies

As discussed at proposal, existing Sec. 268.43(b) provides the generator or treater an opportunity to demonstrate to the Agency than an alternative technology can achieve the equivalent level of performance as that of the specified treatment method. We note that this variance procedure can also be used to demonstrate that one of the technologies specified in today's rule can be designed or operated under conditions other than those established in Table 1, Sec. 268.45, to provide equivalent treatment (i.e., meet the performance standard for the technology) or that a specified technology can treat hazardous contaminants to levels that do not pose a hazard to human health and the environment absent subtitle C control without achieving the performance and design and operating standards established in Table 1.

In addition, the Agency is requiring in the treatment standards of Table 1, Sec. 268.45, that treaters must make an Equivalency Demonstration under

Sec.
268.43(b) in order for certain technologies to be considered BDAT. See discussion above for thermal desorption, biodegradation, and chemical destruction.

VI. Capacity Determinations

This section presents the data sources, methodology, and results of EPA's capacity analysis for today's newly listed wastes. Specifically, section VI summarizes the results of the capacity analysis for petroleum refining wastes and other organic wastes; wastes mixed with radioactive contaminants; and debris contaminated with the newly listed wastes. Soil and debris contaminated with newly listed wastes for which standards are finalized today will be addressed in future proposals.

The capacity analysis for the newly listed wastes for which the Agency is today promulgating treatment standards relied on information obtained from several sources. Primary data sources include the National Survey of Hazardous Waste Treatment, Storage, Disposal, and Recycling Facilities (the TSDR Survey), the National Survey of Hazardous Waste Generators (the Generator Survey), data received in response to the proposed rule (57 FR 957), data received in response to the ANPRM for the Newly Identified and Listed Wastes (56 FR 24444), data received in voluntary data submissions, and information requests authorized under section 3007 of RCRA.

EPA conducted the TSDR Survey during 1987 and 1988 to obtain comprehensive data on the nation's capacity for managing hazardous waste and on the quantities of hazardous waste being land disposed. For the capacity analysis, EPA used the TSDR Survey information on the quantities of waste streams managed in land-disposal units and requiring alternative treatment/recovery due to the land disposal restrictions and on available capacity of hazardous waste management technologies.

EPA conducted the Generator Survey in 1987. This survey requested information on waste quantities and waste characteristics of hazardous waste generated, and provided capacity information for facilities not included in the TSDR Survey.

A. Capacity Analysis Results Summary

Table VI.A.1 lists each waste code for which EPA is finalizing LDR standards today. For each code, this table indicates whether EPA is granting a national capacity variance for surface-disposed or deepwell disposed wastes. As indicated in this table, the Agency is granting two-year national capacity variances only for petroleum refining wastes generated as a result of cleanouts or closures of surface impoundments, debris contaminated with newly listed wastes, and mixed radioactive wastes. EPA is granting a one-year national capacity variance for routinely-generated petroleum refining wastes.

EPA is also granting a 3-month national capacity variance, extending the effective date to November 9, 1992, for compliance with the treatment standards for all newly regulated waste codes, F001-F005 revised treatment standards, converted wastewater standards that had been based on scrubber water, and the HTMR generic exclusion standards. This extension would not apply to wastes with a specified longer national capacity variance. EPA is delaying the effective date for all newly regulated waste codes because the

Agency realizes that even where data indicate that sufficient treatment capacity exists, it is not immediately available. Additional time may be required to determine what compliance entails, redesign tracking documents, possibly adjust facility operations, and possibly segregate wastestreams which heretofore had been centrally treated. EPA believes these legitimate delays are encompassable within a short-term capacity variance because part of the notion of available capacity is the ability to get wastes to the treatment capacity in a lawful manner. The Agency is dating this capacity extension from November 9, 1992, rather than date of signature due to unanticipated delays in the publication of this rule in the Federal Register.

Table VI.A.1.--Summary of Capacity Variance Decisions for Newly Listed Wastes

Waste code	Variance for surface-disposed wastes?	Variance for deepwell-disposed wastes?
F037--removed from S.I.a	2-year	No.
F038--removed from S.I.a	2-year	No.
F037--managed in S.I.b	2-year	No.
F038--managed in S.I.b	2-year	No.
F037--Routine	1-year	No.

8. Available Capacity

The analysis of commercial capacity for newly listed wastes is based primarily on data from the TSDR Survey capacity data set, data received in response to previous LDR notices and regulations, and data received in voluntary data submissions. Analysis of data from these sources indicates that sufficient commercial capacity is currently available for newly identified wastes requiring wastewater treatment, stabilization, and

combustion of liquids with exception of deepwell injected K117, K118, K131 and K132. However, commercial capacity for combustion of sludges, solids, and debris is limited for some newly identified wastes. The analysis of commercial combustion capacity discussed in this section focuses on F037 and F038 sludges and solids because these wastes represent the majority of the waste volumes affected by today's rule. Specific capacity issues for the newly listed K and U wastes being regulated today are discussed in section VI.C.2 of this preamble. Debris is amenable to some, but not all types of sludge and solid combustion capacity, and is discussed in greater detail in section VI.E. Table VI.B.1 summarizes available commercial treatment capacity for newly listed wastes.

EPA's analysis of commercial combustion capacity for sludges and solids has historically focused on the broad capacity categories of liquids, sludges, and solids. Several commenters felt that these capacity categories do not adequately represent the diversity of combustion systems included in each category. Therefore, to improve the precision of its combustion capacity analysis, EPA has divided sludge/solid combustion capacity into seven categories. EPA's capacity analysis for fixed site commercial hazardous waste incinerators separately addresses capacity from pumpable sludge, nonpumpable sludge, containerized solid, and bulk solid feed systems. EPA's capacity analysis for cement kilns that burn hazardous wastes as fuel separately addresses capacity from sludge, containerized solid, and dry solid feed systems.

EPA recognizes that this type of categorization is increasingly important as the commercial combustion industry matures and firms employ different combustion and fuel substitution technologies (i.e., cement kilns) to accommodate different types of wastes entering the commercial market. EPA also recognizes that individual feed system capacity constraints must also be consistent with overall system capacity constraints, such as heat release from a kiln. The relationship between overall system constraints and individual feed system constraints is complicated by the fact that, within the overall system limits, limits for one type of feed system (e.g., containerized solids) may be raised by reducing the amount of another type of feed (e.g., bulk solids). EPA emphasizes that its capacity analysis is conducted on a national level, and that though the Agency speaks generally about which systems are more likely to be used for newly identified petroleum refining wastes, this rule does not preclude these wastes from going through other systems.

Table VI.B.1.--Available Commercial Treatment Capacity for Newly Listed Wastes

Technology	Available capacity (Tons/year)
Biological Treatment	188,000
Chemical Precipitation	813,000
Combustion of Liquids	526,000
Combustion of Sludges and Solids	
Cement Kilns: Sludges	14,000
Cement Kilns: Containerized Solids	83,000
Cement Kilns: Dry Solids	24,000
Incineration: Pumpable Sludges	51,000
Incineration: Nonpumpable Sludges	1,000
Incineration: Containerized Solids	41,000
Incineration: Bulk Solids	23,000

Stabilization	1,204,000

This section discusses EPA's assessment of capacity in each of the seven categories, the waste characteristics that affect whether a waste is generally amenable to the category, and pretreatment processing that is generally required. A comparison of available and required capacity for F037 and F038 sludges and solids can be found in section VI.C.

I. Incineration Capacity

In response to the proposed rule, EPA received comments relating to the high demand for incineration capacity and a general shortage of incineration capacity. However, EPA's analysis of detailed data from specific incinerators revealed that there is some commercial incineration capacity available. One commenter remarked that incinerators have less capacity for high BTU wastes.

EPA recognizes that the heating value of a waste affects an incinerator's throughput capacity for the waste when the incinerator is constrained by its heat input to the unit (e.g., if an incinerator is limited to 10 million BTU/ hr, it could either feed 10,000 lb/hr of waste with a heating value of 1,000 BTU per pound or 5,000 pounds per hour of a waste with a heating value of 2,000 BTU per pound). EPA believes that wastes with heating values above about 5,000 BTU per pound will increasingly be sent to cement kilns for use as fuel. This issue is particularly important for bulk solid systems that are designed for soils, which have very low heating values. To the extent that mass throughput limits are based on the incinerators heat release limits, using mass throughput estimates (e.g., for bulk solids) based on large amounts of soil in the feed mix, could overestimate the mass throughput capacity for wastes with higher heating values than soil, such as F037 and F038. For this reason, EPA has revised its capacity estimate for certain incinerators whose estimates in the proposed rule were based on a waste feed blend with a very low heating value. EPA believes that a significant portion of routinely generated F037 and F038, and an even larger portion of F037 and F038 from surface impoundment cleanouts, will require incineration (as opposed to cement kiln) capacity.

EPA has identified 51,000 tons per year of pumpable sludge capacity available at incinerators. Pumpable sludge systems rely on wastes with sufficient liquid content to facilitate the flow of materials. Pumpable sludge systems use direct injection, sludge lances, positive displacement pumps and cement pumps to feed sludges to the incinerator. EPA is aware of at least one facility processing K048-K052 in this manner. In general, F037 and F038 would have to be reslurried, or would have to bypass dewatering at the point of generation to be handled through pumpable sludge systems. The primary constraints on use of this capacity for F037 and F038 are the viscosity, particle size, ash content, and abrasiveness of the sludges.

Therefore, EPA does not believe that pumpable sludge systems will receive a large portion of the nation's F037 and F038 waste streams, because of the problems discussed above. Additional technical developments and operational experience are needed to allow these systems to routinely handle F037 and F038 wastes. Based on EPA's experience observing the progress at commercial combustion facilities, EPA believes obtaining permit modifications and developing the technical and operational experience to routinely handle new wastes will take six to twelve months.

EPA has identified 1,000 tons per year of nonpumpable sludge capacity available at incinerators. Nonpumpable sludge systems use ram feed systems to feed sludges to the incinerator. Wastes fed in this manner are limited by extremely high or low BTU, tramp object size, and the presence of free liquids. The primary constraints are overall availability, aggravated by generally high maintenance requirements. Again, EPA does not believe that nonpumpable sludge systems will receive a large portion of the nation's F037 and F038 waste streams because there are few of them and they will require time to develop the technical and operational experience needed to handle routinely-generated F037 and F038 petroleum refining wastes.

EPA has identified 34,000 tons per year of containerized solids capacity available at incinerators. Containerized solids systems use ram, elevator or drop feed systems to feed metal drums and fiber packs to incinerators. Metal drum systems generally require shredders. Wastes appropriate for this capacity are limited by water content and high or low BTU extremes.

Utilization of this capacity depends on wastes being packaged into drums, which is technically feasible, but systems for packaging petroleum refining wastes for incinerators are not widely available. Containerization capacity could be added at generators, incinerators or intermediate processors. EPA believes obtaining storage and operating permits, as well as construction and startup of packaging units will take six months to one year. Therefore, EPA believes that containerized solids systems will not receive a large portion of the nation's F037 and F038 waste streams because of the time needed to bring these systems on line and operate them routinely on petroleum refining wastes F037 and F038.

EPA has identified 23,000 tons per year of bulk solids capacity available at incinerators. Bulk solids systems generally use clamshell cranes or drop feed systems (possibly with shredders) to feed bulk solids into incinerators.

EPA is aware of four incinerators currently burning petroleum refining wastes as bulk solids. The primary constraints on the bulk solids system are extremes of high and low BTU, object size, abrasiveness, the presence of free liquids, high system maintenance and limited number of installed systems.

F037 and F038 would have to be dewatered in order to be amenable to this type of capacity. The ability for bulk solids feed systems to process large quantities of wastes directly from roll-off bins makes bulk solids capacity the most suitable for petroleum refining wastes with low to moderate BTU values.

Much of the nation's bulk solids incineration capacity has come on line fairly recently and continues to face some technical and regulatory obstacles. Two of the incinerators that provide bulk solids capacity have entered that market in the past year, and another is still modifying its system to bring its actual throughput capacity closer to its design capacity.

Historical experience with new commercial incineration capacity and the unique technical challenges posed by bulk solids feed systems make commissioning and maintaining new commercial bulk solids incineration capacity highly uncertain. Based on the uncertainty of final permit approval, EPA revised its capacity estimates to exclude an incinerator which has not yet received final approval to continue full operation and needs a permit modification for F037 and F038 wastes. EPA estimates it will take six to twelve months for this facility to be fully operational for handling F037 and F038 wastes. EPA also considered the uncertainty in its

estimates of current capacity in its variance decision for F037 and F038 wastes.

2. Cement Kiln Capacity

Several commenters were concerned about EPA's intention to consider cement kiln combustion capacity, citing the low BTU content of F037 and F038. Cement kilns generally require that their solid wastes contain more than 5,000 or 6,000 BTU per pound. Based on available information, EPA estimates that roughly half of the routinely generated F037 and F038 sent off site will have a BTU value sufficient for combustion in cement kilns. On the other hand, EPA believes that F037 and F038 generated from the removal of hazardous wastes from surface impoundments will have a lower BTU value and are more likely to be treated in incinerators.

EPA has identified 14,000 tons of sludge capacity available per year at two cement kilns. One commenter reported that no cement kilns are accepting sludges, but EPA is aware of these two. Cement kiln sludge systems rely on slurrying wastes and feeding them through primary fuel ports. F037 and F038 would have to be reslurried, or bypass dewatering. The primary constraint on the use of this capacity for petroleum refining wastes is the difficulty of suspending large amounts of solids in liquid while maintaining high BTU. However, EPA recognizes the limitations of this capacity for petroleum refining sludges, and believes that cement kiln sludge capacity will not receive a large portion of the national F037 and F038 waste streams.
Additional technical developments and operational experience are needed to allow these systems to routinely handle F037 and F038 wastes. EPA believes these changes will take six to twelve months.

EPA has identified 83,000 tons of containerized solids capacity, primarily at four cement kilns. Cement kiln containerized solids systems use drop feed systems to feed pails and bags containing hazardous wastes into the "cold" midsection of the kiln (the calcining zone). Wastes packaged into bags must generally be thermally dried to a water content of 5 to 25 percent. As is generally true for cement kilns, wastes are limited by BTU value. The primary constraints on the use of this capacity appear to be dewatering and packaging capacity. One commenter is concerned that the facilities identified by EPA as having containerized solids capacity are close to 100 percent utilized. After further analysis, EPA stands by the estimates prepared for the proposed rule.
Three of the facilities included in this estimate routinely accept petroleum refining wastes, and as of September 1991, one was pursuing a permit modification to be able to burn K048-K052 and F037 and F038. EPA believes that containerized solids systems at cement kilns will be the preferred route for most routinely generated petroleum refining wastes, and has relied heavily on these systems in its capacity analysis for F037 and F038.

Cement kilns are continuing to increase their capacity to burn hazardous wastes, and technical advancements in feed systems are producing especially significant increases in capacity for solids. Estimated containerized solids capacity has roughly doubled since the Third Third rule. Because much of the available capacity for F037 and F038 wastes is new capacity, EPA is concerned that additional technical developments and operational experience are needed to allow these systems to handle routinely generated F037 and F038 wastes.

Additionally, there is considerable uncertainty whether cement kilns will continue to provide the same capacity as they modify their equipment and operations to meet interim status requirements of the BIF rule (56 FR 7134, February 21, 1991). To comply with BIF rule interim status requirements, cement kilns must meet a 20 ppm hydrocarbon emission limit or establish an alternative limit based on baseline hydrocarbon emission rates when the facility is not burning hazardous wastes. Based on information from the cement industry, EPA believes that some cement kilns will have trouble meeting the 20 ppm limit or establishing a baseline due to variable hydrocarbon levels in their raw materials. If one of the major cement facilities providing containerized solids capacity is forced to cease operations, it would cause a major disruption to the commercial hazardous waste combustion system, by removing as much as 35,000 tons per year of capacity, leaving the net available capacity close to the amount of routinely generated F037 and F038 that are amenable to cement kilns. As discussed in Section VI.C., nearly half the routinely generated F037 and F038 wastestream is not amenable to cement kilns, and there is insufficient bulk solids capacity to handle this quantity. Due to these potential problems, EPA is reluctant to set the LDR effective dates such that large quantities of new wastes would be introduced into the combustion systems immediately.

EPA has identified 24,000 tons of dry solids capacity available primarily at two cement kilns. Dry solids systems use pneumatic systems that convey dried materials to the "hot" end of the kiln. Wastes going through this feed mechanism are generally limited by their BTU value, moisture content, and ability to form freeflowing solid particles. The primary constraint on the use of this capacity for combustion of F037 and F038 is the availability of thermal drying capacity, which is necessary to reduce the moisture content to between 5 and 25 percent water. Commenters on the proposed rule noted that petroleum refining sludges, even if dried, may be too "tacky" for this type of feed system. EPA agrees that some F037 and F038 wastes may not be amenable to dry solids systems, and believes that dry solids systems will not receive a large portion of the nation's F037 and F038 waste streams. EPA is aware of several refineries that are using or planning to use thermal desorption and solvent extraction to meet BDAT standards for F037 and F038 wastes, and has accounted for existing on-site units by decreasing its estimates of demand for commercial treatment technologies. While these technologies are not currently commercially available, EPA is aware of other refineries exploring the possibility of building them on-site. The one-year national capacity variance will allow time for on-site development of these technologies.

C. Petroleum Refining Wastes and Other Organic Wastes

This section presents the capacity analysis for today's newly listed petroleum refining wastes and other organic wastes.

1. Required Capacity for Petroleum Refining Wastes (F037 and F038)

EPA is promulgating concentration levels as the treatment standards for wastewater and nonwastewater forms of F037 and F038. F037 and F038 nonwastewater standards are based on a transfer of the existing performance data for K048-K052 (55 FR 22520, June 1, 1990). Nonwastewater treatment standards for F037 and F038 wastes are based on solvent extraction and incineration for organic constituents, and stabilization for metals. EPA is also promulgating standards for wastewater forms of F037 and F038 based on

the standards for multi-source leachate (F039). That is, for F037 and F038 wastewaters, the standards are based on biological treatment; or, wet air or chemical oxidation followed by carbon adsorption for organics; and chemical precipitation for metals.

The capacity analysis for the F037 and F038 petroleum refining wastes was conducted using information collected from a number of data sources. The primary data sources include data submitted voluntarily from refineries, the F037 and F038 Regulatory Impact Analysis (RIA) for the listing of the F037 and F038 wastes, the Petroleum Refinery Data Base (PRDB), the TSDR Survey, the Generator Survey, and the public comments submitted in response to the proposed rule (57 FR 958, January 9, 1992).

The RIA was prepared by EPA in 1990 in support of the listing rule for F037 and F038 wastes (55 FR 46354). The RIA includes an industry overview and profile of facilities affected by the listings, an analysis of baseline waste management practices, and regulatory compliance scenarios. The PRDB is based on a mail survey conducted by EPA in 1983 and has been updated to contain 1985 refining information. The TSDR Survey and Generator Survey were discussed previously (in the introduction to Section VI). Public comments submitted in response to the proposed rule present an overview of how industries would be affected by the land disposal restriction of newly listed F037 and F038 wastes.

EPA also used several supplemental data sources: two reports prepared by Midwest Research Institute (MRI), which support the F037 and F038 listing and the Toxicity Characteristic (TC) rule and which summarize sampling and analysis data collected by EPA for 16 petroleum refining facilities; no-migration petitions submitted by petroleum refineries for land treatment units; and the California Hazardous Petroleum Waste Data Base, which contains information on wastes that fit the F037 and F038 definition.

Using the available data and the Agency's best engineering judgment, EPA estimated F037 and F038 waste quantities based on current management practices and identified options for alternative management due to the LDR requirements. EPA derived demand estimates for two sources of F037 and F038 wastes: (1) Quantities from routine generation of F037 and F038 wastes, and; (2) quantities from the cleanout or closure of remaining surface impoundments. The Agency also developed estimates of available on-site treatment/recovery capacity and evaluated information submitted by refineries and treatment technology vendors on the viability of constructing on-site treatment/recovery capacity and the time that would be required to make such additions.

In the proposed rule (57 FR 958, January 9, 1992), EPA assumed that all F037 and F038 wastes would be removed from surface impoundments prior to May 1992. Wastes that remain in surface impoundments after May 8, 1992 would not be removed, but would be disposed of in place--that is, the surface impoundment would close as a landfill. Commenters on the proposed rule agreed with estimates of routine generation. However, many commenters provided data that surface impoundments would not be cleaned out by May 1992. Additionally, many comments indicated that many surface impoundments would not close as landfills after May 8, 1992, but would be cleaned out. Upon reassessment, EPA agrees with the commenters that F037 and F038 wastes are still being generated from surface impoundment cleanouts and closures. For today's final rule, therefore, EPA conducted separate capacity analyses for F037 and F038 generated routinely and F037 and F038 wastes from surface

impoundments.

a. Routine Generation. For the purpose of the F037 and F038 capacity analysis, routinely generated F037 and F038 wastes are wastes generated from tanks, including wastes from equalization tanks and oil/water/solids separators (such as CPI separators and IAF units) that are not API separators or DAF units. EPA estimates that approximately 69,000 tons per year of dewatered F037 and F038 wastes (nonwastewaters) from routine treatment of petroleum refinery wastewaters will require alternative treatment due to the LDRs. Based on information from public comments and engineering judgement, EPA estimates that 41,000 tons of per year of this 69,000 tons will be high heat content wastes (i.e., equal to or greater than 5,000 Btu/lb) and would likely be managed at cement kilns as containerized solids, and 28,000 tons per year of low heat content wastes (i.e., less than 5,000 Btu/lb) would be managed in the form of bulk solids at incinerators. For the reasons described in section VI.B., EPA believes that cement kilns and incinerators will not have sufficient capacity to treat the quantity of routinely generated F037 and F038 wastes; therefore, the Agency is granting a one-year national capacity variance to all routinely generated F037 and F038 waste. This variance allows time for cement kilns to comply with interim status requirements of the BIF rule, and for additional bulk solids incineration capacity and capacity of other treatment and recycling technologies (e.g., solvent extraction and thermal desorption) to come online to meet the demand for treatment from routinely generated F037 and F038.

b. Generation from Surface Impoundment Cleanouts and Closures. The Agency also considered the accumulated sludge quantities in surface impoundments. Many of these wastes are generated in unretrofitted impoundments (i.e., impoundments not satisfying the minimum technology requirements specified in sections 3004(o) and 3005(j)(11)), and would thus be land disposed in a prohibited manner. These impoundments can be retrofitted or replaced with tank systems, but according to many commenters, petroleum refineries may not be able to do so by the effective date of this rule, or for some time thereafter. See RCRA section 3005(j)(6), which allows four years from promulgation date of the rule identifying or listing the wastes to retrofit or close impoundments receiving newly identified or listed wastes (and no other hazardous wastes). Since most of these surface impoundments also accumulate organic toxicity characteristic (TC) wastes, identified as hazardous in March 1990, the refineries have to retrofit or close the impoundments by March 1994. Some impoundments may be granted a delay of closure (see 40 CFR 265.113 and 40 CFR 264.113) and thus will be allowed to remain in operation, providing that hazardous wastes (e.g., F037 and F038 wastes) are removed and the impoundment is used for non-hazardous wastes. For surface impoundments that do not close by May 1992, EPA estimates that 173,000 tons of dewatered F037 and F038 wastes will be generated from impoundment closure or cleanout between June 1992 and June 1993, and 99,000 tons between June 1993 and June 1994. These quantities will require alternative treatment to meet the LDR treatment standards.

Commenters indicated that F037 and F038 wastes generated from surface impoundment closures are generally of lower heat content than routinely generated F037 and F038 wastes. EPA agrees with this comment; therefore, a larger proportion of surface impoundment generated wastes would require incineration. Based on a follow-up analysis of public comments and engineering judgement, EPA estimates that of the total 173,000 tons generated between 1992 and 1993, 112,000 tons will be low heat content

waste requiring incineration for nonpumpable sludge or bulk solids. Of the 99,000 tons generated between 1993 and 1994, 64,000 tons will be low heat content wastes requiring incineration for bulk solids. Because incineration capacity for bulk solids that could accommodate these wastes before they are land disposed is not adequate, EPA is granting a two-year national capacity variance for F037 and F038 wastes from surface impoundments.

The lack of alternative storage/treatment capacity raises two issues. The first is that during the period of a national capacity variance, restricted wastes disposed in surface impoundments can only be placed in impoundments meeting the minimum technology requirements of section 3004(o). See Sec. 268.5(h), RCRA section 3004(h)(4) and Mobil Oil v. EPA, 871 F. 2d 149 (D.C. Cir. 1989). The second issue is that section 3005(j)(6) states that impoundments receiving newly identified or listed hazardous wastes have up to four years from the date of promulgation of the rule to retrofit or close the impoundment. As was described in section IV.H. of today's preamble, EPA believes that these provisions are in irreconcilable conflict, and, accordingly, EPA has significant discretion in determining how best to interpret them. The Agency is promulgating that in the case of wastes subject to a national capacity variance, that impoundments managing such wastes (and no other wastes subject to an earlier prohibition) have four years from the date of the identification or listing (i.e., the date identifying or listing of the wastes is promulgated, not the effective date of the rule, see section 3005(j)(11)) to retrofit or close.

Although land disposal in impoundments remains necessary during the four-year period allowed by statute for retrofitting, the Agency proposed that these surface impoundment wastes be removed and sent for the mandated treatment if adequate treatment capacity existed (section 3005(j)(5)). Some comments received in response to this proposal indicate that some refineries may not be able to remove waste from surface impoundments without first removing the impoundment from service, which would interrupt refinery operations and possibly affect oil and solids loading on the wastewater treatment system, potentially exceeding NPDES permit limits. EPA agrees with these comments and is therefore not requiring such annual cleaning of surface impoundments.

In addition, EPA proposed that impoundments must be clean closed. EPA's intent was to mandate removal of prohibited wastes at closure to be consistent with the statutory intent to treat wastes where capacity is available and not to dispose of untreated wastes in surface impoundments. (Where there is available treatment capacity, the strong statutory policy is to treat hazardous wastes rather than allow them to be land disposed. See RCRA sections 1002(7) and 1003 (4), (5), and (6).) EPA received comments opposing the requirement of clean closure, citing acceptable alternative to clean closure, such as closure in place (40 CFR 265.228(a)(2) and 40 CFR 264.228(a) (2)), delay of closure (40 CFR 265.113(d)(e) and 40 CFR 264.113(d)(e)), and other closure options. EPA has considered these alternative closure practices and is allowing owners and operators of petroleum refineries the same flexibility available to other surface impoundment owners and operators. Therefore, EPA is not requiring that owners and operators of surface impoundments remove wastes when they close. If owners or operators remove wastes from surface impoundments after the expiration of the two-year national capacity variance, and they are unable to identify adequate treatment capacity, they may seek a case-by-case extension to the effective date of the LDR prohibition as

stipulated under 40 CFR 268.5.

One commenter disagreed with EPA's proposal to allow owners and operators to generate F037 and F038 in unretrofitted impoundments. This commenter mentioned that their member companies had received a large number of inquiries concerning the closure and replacement of leaking surface impoundments, but that this interest declined as it became clearer that EPA was likely to allow them the maximum amount of time to retrofit. The commenter believes that owners and operators will take as much time as they are given to comply with the minimum technology requirements. The commenter therefore believes that no capacity shortfall exists, just a perceived "difficult" burden exists for closing surface impoundments. EPA disagrees with this comment. As indicated in today's preamble, EPA believes that four years from the date of promulgation of the listing or characteristic is a reasonable period within which owners and operators can come into compliance with the minimum technology requirements.

c. Capacity Analysis Summary for F037 and F038 Wastes. As stated earlier in this section, the capacity analysis was conducted separately for F037 and F038 wastes routinely generated and for F037 and F038 wastes from surface impoundments. The estimate for routinely generated F037 and F038 waste generation requiring alternative treatment is 69,000 tons per year (nonwastewaters). EPA has no data indicating that any land-disposed wastewaters will require alternative treatment, and therefore EPA assumed this quantity to be zero. Based on the estimate that 69,000 tons per year of dewatered routinely generated F037 and F038 wastes will require alternative treatment, and the determination that insufficient capacity exists to treat these wastes in the next year, EPA is granting routinely generated F037 and F038 wastes a one-year national capacity variance. This variance expires on June 30, 1993, one year from promulgation of the LDR prohibition for these wastes (RCRA 3004(h) (1) and (2)). (EPA notes that it is dating the national capacity variance for these wastes from the date the prohibition took effect, rather than the date of publication, since the record does not support any longer extension).

EPA has estimated that cleanouts and closures of surface impoundments will generate 100,000 tons of low heat content wastes generated between 1992 and 1993 and 91,000 tons generated between 1993 and 1994. Because existing capacity at bulk solid incineration systems is insufficient to treat F037 and F038 wastes from surface impoundments, EPA is granting a two-year national capacity variance for these wastes. This variance expires on June 30, 1994, two years from promulgation of the LDR prohibition, the maximum extent allowed by law (RCRA 3004(h)(2)).

2. Required Capacity for Other Newly Listed Organic Wastes

This section presents EPA's analysis of required capacity for other newly listed organic wastes (surface disposed) including organic U waste, unsymmetrical dimethylhydrazine (UDMH) wastes, toluene diisocyanate (TDI) wastes, ethylene dibromide (EDB) wastes, ethylenebisdithiocarbamic (EBDC) wastes, and methyl bromide wastes.

a. Unsymmetrical Dimethylhydrazine (UDMH) Production Wastes (K107, K108, K109, K110).

K107--Column bottoms from product separation from the production of 1,1-

dimethylhydrazine from carboxylic acid hydrazides
K108--Condensed column overheads from product separation and condensed reactor vent gases from the production of UDMH from carboxylic acid hydrazines
K109--Spent filter cartridges from product-purification from the production of UDMH from carboxylic acid hydrazines
K110--Condensed column overheads from intermediate separation from product purification from the production of UDMH for carboxylic acid hydrazines

For UDMH wastes, EPA is promulgating incineration as the method of treatment for nonwastewaters, and incineration, or chemical oxidation or biodegradation followed by carbon adsorption as methods of treatment for the wastewaters.

EPA listed four UDMH wastes (K107, K108, K109, K110) that are generated from the production of UDMH (unsymmetrical dimethylhydrazine, or 1,1-dimethylhydrazine) from carboxylic acid hydrazides. Also, some of these wastes are ignitable or corrosive and as such are currently subject to LDR standards.
Generation and management information concerning the UDMH wastes was collected by EPA during 1990 and early 1991 under the authority of section 3007 in RCRA. This capacity analysis incorporates data from that section 3007 information request.

The response to the section 3007 request noted that the only manufacturer who used the proprietary process generating UDMH wastes has ceased UDMH production. Therefore, the Agency assumes that no UDMH will require treatment prior to land disposal.

Based on available data, EPA believes that sufficient capacity exists for treatment of the UDMH wastes; therefore, EPA is not granting a national capacity variance for K107, K108, K109, and K110 wastewaters and nonwastewaters.

b. 2-Ethoxyethanol (U359). For U359, EPA is promulgating incineration or fuel substitution as methods of treatment standards for the nonwastewaters, and incineration, or chemical oxidation followed by biological treatment, carbon absorption, or biodegradation followed by carbon adsorption for the wastewaters.

Generation and management information concerning the U359 wastes was collected by EPA during 1990 and early 1991 under the authority of section 3007 in RCRA. This capacity analysis incorporates data from that section 3007 information request.

The Agency estimates that less than 500 tons of U359 wastewaters are being land disposed and will require further treatment as a result of the LDRs.
Most of the U359 waste generated in 1989 was incinerated on-site, and the remainder (less than one percent) was incinerated off-site. In addition, unspecified and variable quantities of untreated wastewater contaminated with U359 are reportedly generated on occasion at one generator's facility; however, this wastewater undergoes biological treatment on site. Because these wastes are rejected products, and the product has a market value, the Agency believes these wastes would be generated in small quantities.

Based on the available data (see Section VI.B), EPA believes that sufficient capacity exists for treatment of U359 wastes; therefore, EPA is

not granting a national capacity variance for U359 wastewaters or nonwastewaters.

c. Dinitrotoluene and Toluenediamine Production Wastes (K111-K112, U328 and U353).

K111--Product washwaters from the production of dinitrotoluene via nitration of toluene
K112--Reaction by-product water from the drying column in the production of toluenediamine via hydrogenation of dinitrotoluene
U328--Ortho-toluidine
U353--Para-toluidine

For K111 wastewaters and nonwastewaters, EPA is promulgating concentration- based standards based on a transfer of the standards for F039 wastes. EPA is promulgating incineration as the method of treatment for K112 nonwastewaters; and incineration, or chemical oxidation followed by carbon adsorption, or biodegradation followed by carbon adsorption as methods of treatment for K112 wastewaters. For U328 and U353 wastes, EPA is promulgating incineration as the method of treatment for nonwastewaters; and incineration, or chemical oxidation followed by carbon adsorption, or biodegradation followed by carbon adsorption as methods of treatment for wastewaters.

During 1990 and early 1991, EPA collected generation and management information concerning these wastes under the authority of section 3007 in RCRA. This capacity analysis incorporates data from that section 3007 information request. In addition, the Agency has contacted other facilities in order to obtain further information concerning K111 and K112 waste generation, management practices, and residuals. Finally, the Agency reviewed information provided in response to the proposed rule (57 FR 957, January 9, 1992).

The Agency has identified approximately 3,500 tons of K111 nonwastewaters and no K112 nonwastewaters and no K111 or K112 wastewaters requiring alternative treatment. The majority of the K111 and K112 wastes generated are currently treated using a variety of alternative treatment or recovery methods and discharged through NPDES. The data indicate that the residuals from treatment of K111 and K112 were further treated before being land disposed.

The Agency estimates that less than 500 tons of U328 and U353 nonwastewaters are being land disposed and will require further treatment as a result of the LDRs. EPA identified no U328 and U353 wastewaters requiring alternative treatment.

Based on the available data (see section VI.B), EPA believes that sufficient capacity exists for treatment of these wastes. Therefore, EPA is not granting a national capacity variance for K111, K112, U328, and U353 wastewaters or nonwastewaters.

d. Ethylene Dibromide (EDB) Production Wastes (K117-Kl18, K136) and Methyl Bromide Production Wastes (K131 and K132).

K117--Wastewaters from the reactor vent gas scrubber in the production of ethylene dibromide via the bromination of ethylene

K118--Spent adsorbent solids from the purification of EDB produced by bromination of ethylene
K136--Still bottoms from the purification of EDB
K131--Wastewater from the reactor and acid dryer from the production of methyl bromide
K132--Spent adsorbent and wastewater separator solids from the production of methyl bromide

For K117, K118, K136, K131, and K132 wastes, EPA is promulgating concentration-based standards based on a transfer of data used to calculate the U029 (bromomethane), U030 (4-bromophenyl phenyl ether), U066 (1,2-dibromo-3-chloropropane), U067 (ethylene dibromide, EDB), U068 (dibromomethane) and U225 (bromoform) Third Rule standards for nonwastewaters; and multisource leachate (F039) performance for wastewaters.
EPA is promulgating standards based on incineration for nonwastewaters; and incineration, or chemical or wet air oxidation followed by carbon adsorption, or biological treatment, or steam or air stripping for wastewaters.

During 1990 and early 1991, EPA collected generation and management information concerning these wastes under the authority of section 3007 in RCRA. This capacity analysis incorporates data from that section 3007 information request. In addition, the Agency reviewed information provided in response to the ANPRM (56 FR 24444) and the proposed rule.

Based on new information received in response to the proposed rule, EPA estimates that less than 100 tons of currently land-disposed K118 nonwastewaters will require alternative treatment. EPA has identified no K117 or K136 waste generation and no K118 wastewaters currently being surface disposed.

EPA has identified no K131 or K132 wastes currently being land disposed and requiring alternative treatment or recovery. All identified K131 wastes currently generated are sent off site for acid reclamation.
Based on available data and using incineration as the treatment technology (see Section VI.B), the Agency believes that sufficient treatment capacity exists for treatment of these wastes; therefore, EPA is not granting a national capacity variance for K117, K118, K136, K131 and K132 wastewaters or nonwastewaters. EPA is granting a two-year national capacity variance to underground injected K117, K118, K131, and K132 wastes (see Section VI.F).

e. Ethylenebisdithiocarbamic (EBDC) Production Wastes (K123, K124, K125, and K126).

K123--Process wastewater (including supernates, filtrates, and washwaters) from the production of ethylenebisdithiocarbamic acid (EBDC) and its salts
K124--Reactor vent scrubber water from the production of EBDC and its salts
K125--Purification solids (including filtration, evaporation, and centrifugation solids) from the production of EBDC and its salts
K126--Baghouse dust and floor sweepings in milling and packaging operations from the production or formulation of EBDC and its salts

For EBDC wastes, EPA is promulgating incineration as the method of treatment for nonwastewaters; and incineration, or chemical oxidation

followed by biological treatment or carbon absorption as methods of treatment for wastewaters.

During 1990 and early 1991, EPA collected generation and management information concerning the EBDC wastes under the authority of section 3007 in RCRA. This capacity analysis incorporates data from that section 3007 information request.

The Agency has identified less than 100 tons of K125 nonwastewaters that are currently land disposed and will require alternative treatment, and has identified no quantities of K123, K124, or K126 wastes that are currently being land disposed. No generation of K125 wastewaters, K124 wastes, or K126 wastes has been identified.

Based on available data, EPA believes sufficient capacity exists for treatment of the EBDC wastes; therefore, EPA is not granting a national capacity variance for K123, K124, K125, and K126 wastewaters or nonwastewaters.

D. Required and Available Capacity for Newly Listed Wastes Mixed With Radioactive Contaminants

EPA has defined a mixed RCRA/radioactive waste as any matrix containing a RCRA hazardous waste and a radioactive waste subject to the Atomic Energy Act (53 FR 37045, 37046, September 23, 1988). Regardless of the type of radioactive constituents that these wastes contain (e.g., high-level, low-level, or transuranic), they are subject to the RCRA hazardous waste regulations, including the land disposal restrictions.

Radioactive wastes that are mixed with spent solvents, dioxins, California list wastes, or First Third, Second Third, and Third wastes are subject to the land disposal restrictions already promulgated for those hazardous wastes. EPA granted two-year national capacity variances for all of these wastes because of a lack of national treatment capacity. Today's rule addresses the radioactive wastes that contain newly listed hazardous wastes being restricted in today's rulemaking.

The Department of Energy (DOE) is the primary generator of mixed RCRA/ radioactive wastes. A variety of non-DOE facilities also generate mixed RCRA/ radioactive wastes, including nuclear power plants, academic and medical institutions, and industrial facilities. Based upon a review of the available data, including data submitted by DOE under several rulemakings, the quantities of mixed RCRA/radioactive wastes containing newly listed wastes regulated by this rulemaking appear to be small.

Although DOE is in the process of increasing its capacity to manage mixed RCRA/radioactive wastes, information supplied by DOE under other rulemakings indicates that a significant capacity shortfall currently exists for the treatment of mixed RCRA/radioactive wastes, much of which is in storage facilities awaiting treatment. EPA's review of non-DOE data sources also showed a significant lack of commercial treatment capacity as well.

Any new commercial capacity for mixed RCRA/radioactive wastes that becomes available will be needed for mixed wastes that were regulated in previous land disposal restriction rulemakings and whose variances have already

expired (i.e., radioactive wastes mixed with solvents, dioxins, California list wastes, or First Third, Second Third, or Third wastes). In addition, DOE has indicated that it will generally give treatment priority to mixed wastes that are already restricted under previous LDR rules. Thus, EPA has determined that sufficient alternative treatment capacity is not available and is granting a two-year national capacity variance for mixed RCRA/ radioactive wastewaters and nonwastewaters contaminated with newly listed wastes whose standards are being promulgated today.

One commenter on the proposed rule suggested that EPA not rely on DOE to develop the capacity needed to manage the largest quantities of mixed RCRA/ radioactive wastes because of DOE's reportedly poor record of handling radioactive materials. EPA disagrees with this comment. DOE is responsible for managing many radioactive wastes and has a Federal statutory obligation to develop needed capacity. In addition, DOE is subject to regulations designed to ensure that its mixed RCRA/radioactive wastes are properly managed. EPA and authorized states regulate the hazardous components of these wastes under RCRA and the Nuclear Regulatory Commission (NRC) and agreement states regulate the radioactive components under the Atomic Energy Act and other statutes. DOE is generally self-regulating with respect to the radioactive component and is generally exempt from NRC regulations, except for DOE facilities that accept commercial high level wastes which are to be licensed by NRC.

The same commenter also suggested that EPA require that all non-DOE mixed RCRA/radioactive wastes be stored and managed under "emergency permits" at known commercial and on-site facilities, rather than allowing them to be generated, managed, and disposed "at an unknown number of unidentified generator sites." This commenter appears to be confused about the RCRA regulatory program. Mixed RCRA/radioactive wastes are not generated, managed, and disposed at "unidentified generator sites." All generators of more than 100 kilograms/month of RCRA hazardous wastes, including mixed wastes, must obtain an EPA identification number. Mixed RCRA/radioactive wastes, like other RCRA wastes, can be stored at the site of generation for greater than 90 days only if the generator has a permitted or interim status storage facility that is specifically allowed to handle mixed wastes. (In the case of generators of 100-1000 kilograms per month, the limit is 180 days, or 270 days in certain cases.) Furthermore, treatment or disposal of mixed RCRA/ radioactive wastes is allowed only at permitted or interim status treatment or disposal facilities specifically authorized to handle mixed wastes. EPA believes that the current RCRA regulatory program is adequate to ensure proper management of the hazardous component of mixed waste and that "emergency permits" are unnecessary.

E. Required and Available Capacity for Debris Contaminated With Newly Listed Wastes

This capacity analysis focuses on debris contaminated with wastes whose treatment standards are being promulgated in this rule./49/ An estimated 80 percent of all debris contaminated with previously regulated wastes is presently disposed in hazardous waste landfills without prior treatment./50/ In today's rule, EPA is specifying that hazardous debris be treated prior to land disposal using one or more of the following families of debris treatment: extraction, destruction, or immobilization. (The availability of each of these treatments is discussed in greater detail in another section of this preamble.)

NOTE /49/ UDMH (K107-K110), dinitrotoluene (K111), toluene diamine (K112), ortho and para toluidine, ethylene dibromide, methyl bromide, 2-ethoxy ethanol (U359), ethylene bis-dithiocarbamic acid, and F037 and F038 petroleum refining wastes.

NOTE /50/ Previously regulated wastes include solvents and dioxin wastes, California list wastes, and First Third, Second Third, and Third Third wastes. EPA has granted national capacity variances to soil and debris contaminated with First Third, Second Third, and Third Third wastes. The national capacity variances for debris contaminated with Third Third wastes expired on May 8, 1992. However, the Agency has extended this variance for one year (see section VI. of the preamble).

EPA used several data sources to estimate the total quantity of land-disposed hazardous debris. These sources include: comments received in response to the proposed rule (57 FR 958); responses to the ANPRM for the newly listed and identified wastes (56 FR 24444); information provided during a series of roundtable meetings held by the Agency in May and June of 1991 with representatives of companies involved in the management and disposal of hazardous debris; Records of Decision (RODs) of Superfund sites; the National Survey of Treatment, Storage, Disposal and Recycling Facilities (TSDR Survey); and the National Survey of Hazardous Waste Generators (Generator Survey)./51/

NOTE /51/ EPA conducted the surveys during 1987 and 1988 to obtain comprehensive data on the nation's capacity for managing hazardous waste and the volumes of hazardous waste being land disposed as well as data on waste generation, waste characterization, and hazardous waste treatment capacity in units exempt from RCRA permitting.

In general, EPA found severe limitations in estimating the total quantity of hazardous debris because the available data are incomplete and poorly defined. The reason for this lack of comprehensive data is several-fold: First, the regulated community reported that their data generally are not classified by debris but rather by waste code and waste description; second, the data from the TSDR and Generator Surveys were not collected and categorized specifically for debris; and debris were often mixed with soils,/52/ and were frequently contaminated with more than one waste, thereby making the hazardous debris matrix and quantity determinations difficult; third, TSDR and Generator Surveys do not include data on debris contaminated with newly listed and identified wastes because they were not considered hazardous wastes in 1986; and fourth, debris that have been cleaned (decontaminated) are generally not reported as hazardous wastes because they are no longer considered hazardous debris. Commenters to the proposed rule agreed with the Agency's assessment of data limitations.

NOTE /52/ Data submitted by TSDFs in roundtable meetings sometimes combine hazardous debris with soil. Furthermore, TSDFs have stated that historical waste data are generally not kept by debris classifications.

1. Waste Generation

The capacity analysis in today's rule is based on the data sources described above. For the total of currently land-disposed debris contaminated with RCRA hazardous wastes, EPA estimates that approximately one million tons are generated per year based on the reported percentage of the total of all hazardous waste land disposed. EPA also has estimated lower and upper bounds of 700,000 to 2.8 million tons per year, respectively, based on adjustment factors to the TSDR survey data. Some commenters to the proposed rule suggested that the Agency's estimate of the quantities of debris requiring treatment is low. However, no commenter provided national estimates of land- disposed hazardous debris.

The largest quantity of routinely generated debris contaminated with newly listed wastes is debris contaminated with F037 and F038 petroleum refining wastes. EPA's estimate for this quantity is 8,000 tons per year. In addition, EPA received information indicating that additional quantities of debris contaminated with F037 and F038 wastes may be generated from modernization of petroleum refinery sewer and wastewater systems. EPA's estimate for debris contaminated with the remainder of wastes covered by today's rulemaking is less than 2,000 tons per year.

One commenter indicated that EPA's estimate of the quantity of debris contaminated with F037 and F038 wastes was low. However, this commenter provided no data that could serve as a basis for updating EPA's estimate. In the proposed rule, EPA acknowledged that decommissioning of large chemical plants and increasing remediation activities can significantly increase the estimated quantity of hazardous debris.

2. Current Management Practices

Waste generators and TSDFs report that most hazardous debris is currently landfilled without prior treatment. Stabilization or incineration are the reported treatment technologies for the small amounts of hazardous debris that are treated prior to landfilling. However, EPA has received information that materials-handling problems may limit the quantity of hazardous debris that currently can be treated by stabilization and incineration.

Specifically, the size of many types of debris must be reduced before they can be treated (e.g., by shredding or grinding). Heavy duty equipment such as shredders and grinders are generally not part of the treatment process at hazardous waste treatment facilities and are not generally available.

Consequently, the available capacity to treat hazardous debris is currently limited. In addition, large quantities of materials that are currently cleaned (decontaminated) and then managed as nonhazardous wastes may require additional management as hazardous debris. Commenters to the proposed rule agreed with EPA's assessment that there are materials-handling limitations in managing hazardous debris.

3. Available Capacity and Capacity Implications

EPA is promulgating that hazardous debris be treated prior to land disposal using one or more of the following families of debris treatment: Extraction, destruction, or immobilization. While materials-handling problems may limit the available destruction (e.g., incineration) and immobilization (e.g., stabilization) capacities, inadequate capacity exists for many of the promulgated technologies in the extraction family. Much of the capacity of extraction technologies currently used to decontaminate

hazardous debris, such as water washing and steam cleaning, is not currently permitted, although EPA is proposing to expedite the permitting of these technologies.

In conclusion, EPA believes that the current capacity available to treat hazardous debris is limited.

Therefore, EPA is today granting a two-year national capacity variance for debris contaminated with newly listed wastes covered in this rule. This variance would allow sufficient time for the installation and permitting of the treatment systems necessary to handle the quantities of hazardous debris affected by this rule. Existing commercial capacity and any new commercial capacity for debris that becomes available will be needed for debris contaminated with wastes listed in previous land disposal restriction rulemakings and not granted a capacity variance (i.e., debris contaminated with solvents, dioxins, or California list wastes). Commenters to the proposed rule generally agreed with EPA's analysis and the need for a national capacity variance for debris contaminated with newly listed wastes covered in this rule.

F. Capacity Determination for Underground Injected Wastes

As explained in previous rules concerning land disposal restrictions (see, e.g. 52 FR 32450, August 27, 1987; 53 FR 30912, August 16, 1988; 55 FR 22520, June 1, 1990), EPA is allocating available capacity first to those wastes disposed in surface units, next to wastes resulting from CERCLA and RCRA clean ups, and finally to underground injected wastes. Based on the continued application of this approach, the Agency is promulgating the following effective dates for injected wastes.

1. Newly Listed Wastes With Treatment Standards Which Current Data Indicate Are Not Being Underground Injected

The wastes K107, K108, K109, K110, K123, K124, K125, K126, K136, U328, U353, and U359 are the newly listed wastes for which numerical standards or specified methods are being promulgated, and which current data indicate are not being underground injected. Therefore, EPA is prohibiting these wastes from underground injection upon the effective date of this rule.

2. Newly Listed Wastes With Treatment Standards Which Current Data Indicate Are Being Underground Injected

The wastes F037, F038, K111, K112, K117, K118, K131, and K132 are the newly listed wastes for which current data indicate are being underground injected by Class I hazardous waste injection wells.

For K111 and K112 waste from the production of dinitrotoluene or toluenediamine, pretreatment includes neutralization and filtration. Only a small amount of this waste is being disposed of in a Class I hazardous waste injection well which has received a no-migration petition.

The treatment standards for F037 and F038, petroleum refining wastes, are based upon transfer of the performance of technologies previously established for K048-K052 wastes. Based on the Hazardous Waste Injection Well Inventory data base, EPA believes that a small volume of F037 and F038 wastes are being underground injected annually by permitted injection

wells. No new data, indicating that larger injected volumes of these wastes, were received by the Agency during the comment period for the proposed rule. Therefore, as adequate alternative treatment capacity appears to be available, the Agency is not granting a two-year national capacity variance for any injected F037, F038, K111, and K112 waste, and is prohibiting these wastes from underground injection upon the effective date of this rule.

The treatment standards for K117, K118, K131, and K132 wastes are based upon liquid incineration. One comment received from the proposed rule indicated that a large volume of these wastes, which are in a mixed non-segregable waste stream exceeding 300 million gallons annually, were being underground injected. The Agency's current data indicate that there is inadequate available commercial treatment capacity for these wastes. Therefore, EPA is granting a two-year national capacity variance for injected K117, K118, K131, and K132 wastes in today's rule.

G. Revisions to Treatment Standards for K061, F006, and K062

In today's rule, the Agency is removing the low and high zinc subcategories for K061 and establishing the same numeric treatment standards based on HTMR for all K061 nonwastewaters. EPA also is establishing alternative treatment standards based on HTMR for K062 and T006. Today's rule does not preclude the use of any treatment technology that can meet these standards nor does it preclude the use of any technology that can meet the previously promulgated treatment standards for K062 and F006. The Agency received several comments questioning the availability of HTMR capacity to treat these wastes. Although commenters also questioned whether stabilization could meet the treatment standards, one commenter submitted information that their stabilization process does meet the numeric treatment standards for K061. Since any technology that can meet the numeric standards for K061 can be used to treat those wastes, the Agency believes that there is sufficient treatment capacity for K061. Similarly, since the treatment standards based on HTMR for K062 and F006 are alternative standards and any technology currently used to treat K062 and F006 to the previously promulgated standards may continue to be used, the Agency believes that there is sufficient treatment capacity for K062 and F006.

VII. Implementation

As described in section VIII. of this preamble, State Authority, today's rule is being promulgated under HSWA authority. Therefore, until states receive authorization to implement today's rule, the Federal procedures and standards will be used for its implementation. The following sections describe some of the relevant generator and permitting procedures that apply to waste handlers as they comply with today's rule.

A. Facilities Qualifying for Interim Status Due to Storage of Prohibited Wastes

As discussed elsewhere in today's preamble, EPA has determined that adequate treatment capacity for hazardous debris will not be available following the expiration of the national capacity variance for these wastes on May 8, 1992, and has therefore granted a one-year national case-by-case

extension to the LDR effective date for hazardous debris, provided certain recordkeeping and other requirements are met. However, even by May 1993 there will likely be generators who will still have difficulty obtaining treatment for these wastes. To a lesser degree, there may also be situations where generators of the newly listed wastes--for which treatment standards are prescribed in today's rule--are unable to initially arrange for appropriate treatment. Therefore, EPA believes that some generators without permits or interim status will need to accumulate wastes restricted from land disposal by today's rule for more than 90 days in order to acquire treatment required by part 268. Although 90 days is the maximum period allowed for accumulation storage at generator sites, if the wastes must remain on-site longer due to unforeseen, temporary, or uncontrollable circumstances, an extension of up to 30 days may be granted at the Regional Administrator's discretion. (See 40 CFR 262.34.) If, despite the best efforts of the generator, waste accumulation will exceed the 90 day limit (or 120 day limit, if an extension is granted), then the generator must obtain interim status for continued storage.

Section 3005(e) of RCRA establishes the criteria for obtaining interim status, and 40 CFR 270.70(a) codifies that provision. This section provides that facilities "in existence on the effective date of statutory or regulatory changes * * * that render the facility subject to the requirement to have a permit" may qualify for interim status if they make the appropriate application. A generator who is accumulating hazardous wastes in tanks or containers before the effective date of today's rule is "in existence" and may qualify for interim status provided that the continued storage is necessary to comply with the land disposal restrictions. Section 3005(e)(1) allows interim status only where new regulatory requirements subject an existing facility to permitting requirements. It is not intended to provide an opportunity for a facility to newly engage in hazardous waste management.

Generators who need to obtain interim status should submit a part A permit application to the Agency as provided in part 270. (Part A application instructions can be found at Sec. 270.13.) In the part A application, the generator must demonstrate that the additional accumulation time is necessary as a result of the land disposal restrictions of part 268.

The part A must be submitted to the Agency by the deadline specified in Sec. 270.10(e). Note that the Sec. 270.10(e) deadline is the earlier of the following two alternative dates: (1) Six months after publication of regulations which first require the facility to comply with part 265, or (2) thirty days after the date they first become subject to the standards in part 265. It is expected that the deadline for most, if not all, of the large quantity generators will be established by the second alternative. By operation of 40 CFR 270.10(e)(ii), the generator first becomes subject to the permitting requirements when he exceeds the generator accumulation time limit. For example, after the 90-day accumulation period ends, the generator would be required to submit the part A within 30 days. Therefore, it is critical that any generator who will be newly subject to the interim status requirements become familiar with the part 270 requirements and submit the part A application on time.

Generators applying for interim status must comply with the applicable requirements of part 265. These new interim status facilities are also subject to corrective action orders under section 3008(h) of RCRA.
Furthermore, if requested by the Administrator, the facility will be

required to submit its part B permit application.

EPA anticipates that some of these new interim status facilities managing debris may find containment buildings more suitable for the storage or treatment of their restricted wastes than their existing tanks or containers.
These facilities may request certain changes during interim status by following the procedures described below.

B. Containment Buildings at Generator Sites

As explained in section IV.G.3. of this preamble, generators who want to add a containment building for accumulation (including treatment) of waste for less than 90 days, can do so without obtaining a RCRA permit, provided the conditions in Sec. 262.34 are met. These conditions include compliance with the containment building standards in subpart DD of part 265 and certain recordkeeping and reporting requirements. Such containment buildings can be used indefinitely, provided the generator ensures that each volume of waste remains in the unit for 90 days or less. When the generator has no further need to manage hazardous waste in the unit, then the building must be closed in accordance with Sec. 265.1102.

C. Addition of Waste Management Capacity at Permitted and Interim Status Facilities

1. Permitted Facilities

Permitted treatment, storage, and disposal facilities may add new treatment processes and additional capacity pursuant to today's rule by applying for a permit modification under the Federal regulations at Sec. 270.42 (see 53 FR 37912, September 28, 1988, for a full explanation of the permit modification procedures). Although the regulations at Sec. 270.42 were promulgated under pre-HSWA authority, EPA may use these regulations in authorized States when necessary to implement HSWA provisions such as the land disposal restrictions (see 53 FR 37933).

The types of modifications needed to add new capacity or processes would likely require the submittal of a Class 2 or 3 modification. For containment buildings the permit modification type can be determined by consulting new section M in appendix I of Sec. 270.42. The Class 2 modification process requires Agency action on the request within 120 days. This action would consist of approval or denial, reclassification as a Class 3 modification, or authorization to conduct the activities for up to 180 days pending Agency action. Furthermore, for Class 2 modifications, construction to implement the requested facility change may commence 60 days after submission of the request. There is no deadline for Agency action for Class 3 modifications, which apply to more substantial facility changes.

Permitted facilities may also apply for a temporary authorization to initiate necessary activities while a Class 2 or 3 permit modification request is undergoing review, or to undertake a treatment or storage activity which will be of short duration. EPA may grant a temporary authorization for a term of up to 180 days. Any request for a temporary authorization must demonstrate compliance with the part 264 standards and

also meet the criteria of Sec. 270.42(e) for approval. Today's rule amends Sec. 270.42(e)(3)(ii)(B) to allow temporary authorizations for containment buildings where necessary to treat or store restricted waste, including hazardous debris, in accordance with part 268. Interested members of the public (i.e., those that have previously expressed interest in any permitting action for the facility) will receive notice by mail of a facility's request for a temporary authorization, and another mail notice if EPA approves the request. The temporary authorization may be renewed once if the additional procedures of Sec.
270.42(e) are followed, including the submission of appropriate permit modification information and the initiation of public meetings and public comment period. (See 53 FR 37919, September 28, 1988 for additional discussion of temporary authorizations.)

2. Interim Status Facilities

Treatment, storage, and disposal facilities managing hazardous waste under interim status may add new treatment processes or additional treatment or storage capacity by using the existing procedures for changes during interim status in Sec. 270.72. Under these procedures, a facility must submit to EPA a revised part A permit application and justification explaining the need for the change. The change may then be approved by EPA.

In order for the change to be approved by EPA, it must meet one of several criteria, such as being necessary to comply with a Federal, State, or local requirement. Note that changes may not be made if they amount to reconstruction of the facility. This occurs when the capital investment for the changes to facility exceed 50 percent of the capital cost of a comparable entirely new facility. However, Sec. 270.72(b)(6) in today's rule lifts the reconstruction limit for changes to treat or store in containment buildings hazardous waste subject to land disposal restrictions imposed by part 268, provided that the changes are made solely for the purpose of complying with part 268.

D. Conversion of Enclosed Waste Piles to Containment Buildings at Permitted and Interim Status Facilities

EPA expects that many permitted and interim status facilities will make changes to existing enclosed waste piles to meet the technical standards for containment buildings. These facilities may either continue the operation of the containment building under its permit or interim status, or may wish to operate the containment building in accordance with the 90-day generator accumulation provision in Sec. 262.34.

I. Conversion of Enclosed Waste Piles to Interim Status or Permitted Containment Buildings

Permitted facilities may convert their enclosed waste piles to containment buildings by submitting a Class 2 permit modification, as provided in Item I.6. in appendix I to Sec. 270.42. Facilities under interim status may amend their part A permit applications to convert an enclosed waste pile to a containment building under Sec. 270.72(a)(3) as a change in process. Interim status facilities must submit a revised part A permit application and a justification explaining the need for the change to the Agency. The Agency must then approve the change before it can be implemented. After the conversion, the containment building standards of part 265 subpart DD would

apply to the unit instead of the waste pile standards of subpart L. Closure of the enclosed waste pile is not triggered by the conversion process since hazardous waste will continue to be managed in the unit and the unit remains fully subject to the requirements of the permit or interim status.

2. Conversion of Permitted or Interim Status Enclosed Waste Piles to Accumulation Units Under Section 262.34

Section 262.34 allows generators to accumulate wastes on-site in certain units for 90 days or less without having a permit or interim status provided that they meet the requirements of that section. Today's rule extends the applicability of Sec. 262.34 to accumulation in containment building units.

Owners and operators of new containment buildings that have not operated under interim status or a permit can accumulate wastes under Sec. 262.34 provided they meet the requirements of that section. Owners and operators of enclosed waste piles that are permitted or operating under interim status can convert those units to generator status and continue accumulating wastes under the provisions of Sec. 262.34 if they first meet the requirements for closure of the unit under Sec. 264.1102 or Sec. 265.1102.

In the case of tanks, the Agency has encountered many owners and operators that have sought conversion from permitted or interim status to generator status but have been unable to satisfy the closure requirements of Sec. 264.197 or 265.197 without ceasing operation of the unit. While the Agency does not seek to require owners and operators to take these units out of operation as part of the conversion to generator status, the Agency does not allow conversion to generator status to serve to exempt permitted and interim status units from the applicable closure and financial responsibility requirements. The Agency seeks to assure that all units that have operated under the requirements of part 264 or 265 satisfy the applicable closure requirements of those parts, and that funds be available to do so. Thus, permitted or interim status tanks that convert to 90-day generator status must undergo full closure before they are released from financial assurance requirements. However, closure requirements are triggered by the final receipt of hazardous waste--not by conversion to 90-day generator status. Therefore, the tank may defer RCRA closure until it is taken out of hazardous waste service.

Similarly, where owners and operators of interim status or permitted containment buildings seek to convert to 90-day generator status but cannot close the unit without taking it out of operation, the owner or operator may accumulate waste as a generator under the provisions of Sec. 262.34 (without a permit requirement) and close the unit at a later date. However, it should be noted that unless the owner or operator satisfies all applicable closure requirements prior to conversion, the unit remains subject to the requirements of subparts G (closure) and H (financial responsibility) until closure of the unit is complete. Furthermore, if the facility is in interim status, it retains interim status until a permit application is denied or interim status is lost. Permitted facilities would retain any corrective action requirements, but could seek permit amendments to eliminate 40 CFR part 264 standards to which they were no longer subject (e.g., waste analysis plan).

VIII. State Authority

A. Applicability of Rules in Authorized States

Under section 3006 of RCRA, EPA may authorize qualified States to administer and enforce the RCRA program within the State. Following authorization, EPA retains enforcement authority under sections 3008, 3013, and 7003 of RCRA, although authorized States have primary enforcement responsibility. The standards and requirements for authorization are found in 40 CFR part 271.

Prior to the Hazardous and Solid Waste Amendments of 1984 (HSWA), a State with final authorization administered its hazardous waste program in lieu of EPA administering the Federal program in that State. The Federal requirements no longer applied in the authorized State, and EPA could not issue permits for any facilities that the State was authorized to permit. When new, more stringent Federal requirements were promulgated or enacted, the State was obliged to enact equivalent authority within specified time frames. New Federal requirements did not take effect in an authorized State until the State adopted the requirements as State law.

In contrast, under RCRA section 3006(g) (42 U.S.C. 6926(g)), new requirements and prohibitions imposed by HSWA take effect in authorized States at the same time that they take effect in nonauthorized States. EPA is directed to carry out these requirements and prohibitions in authorized States, including the issuance of permits, until the State is granted authorization to do so. While States must still adopt HSWA-related provisions as State law to retain final authorization, HSWA applies in authorized States in the interim.

Today's rule is being promulgated pursuant to sections 3004(d) through (k), and (m), of RCRA (42 U.S.C. 6924(d) through (k), and (m)). It is added to Table 1 in 40 CFR 271.1(j), which identifies the Federal program requirements that are promulgated pursuant to HSWA and that take effect in all States, regardless of their authorization status. States may apply for either interim or final authorization for the HSWA provisions in Table 1, as discussed in the following section of this preamble. Table 2 in 40 CFR 271.1(j) is also modified to indicate that this rule is a self-implementing provision of HSWA.

EPA is also finalizing a new management unit, containment buildings, which involves redefinition of the term "pile," pursuant to HSWA. This provision assures an adequate means of implementing the treatment standards, either by providing a means that treatment can occur without constituting impermissible land disposal, or by providing a safe staging area that would not constitute land disposal before best treatment. Cf. 56 FR 41175 (August 19, 1991) (portion of rule assuring availability of capacity adopted pursuant to HSWA).

Thus, this portion of the rule is adopted pursuant to HSWA and takes effect immediately in authorized States.

B. Effect on State Authorization

As noted above, EPA is today finalizing a rule that will be implemented in

authorized States until their programs are modified to adopt these rules and the modification is approved by EPA. Because the rule is pursuant to HSWA, a State submitting a program modification may apply to receive either interim or final authorization under RCRA section 3006(g)(2) or 3006(b), respectively, on the basis of requirements that are substantially equivalent or equivalent to EPA's. The procedures and schedule for State program modifications for either interim or final authorization are described in 40 CFR 271.21. It should be noted that HSWA interim authorization will expire on January 1, 1993 (see 40 CFR 271.24(c)).

Section 271.21(e)(2) requires that States with final authorization must modify their programs to reflect Federal program changes and to subsequently submit the modification to EPA for approval. The deadline by which the State would have to modify its program to adopt these regulations is specified in Sec. 271.21(e). The deadline is July 1, 1993 if this rulemaking is finalized on or before June 30, 1992. This deadline can be extended in certain cases (see Sec. 271.21(e)(3)). Once EPA approves the modification, the State requirements become subtitle C RCRA requirements.

States with authorized RCRA programs may already have requirements similar to those in today's final rule. These State regulations have not been assessed against the Federal regulations being finalized today to determine whether they meet the tests for authorization. Thus, a State is not authorized to implement these requirements in lieu of EPA until the State program modifications are approved. Of course, States with existing standards could continue to administer and enforce their standards as a matter of State law. In implementing the Federal program, EPA will work with States under agreements to minimize duplication of efforts. In many cases, EPA will be able to defer to the States in their efforts to implement their programs rather than take separate actions under Federal authority.

States that submit official applications for final authorization less than 12 months after the effective date of these regulations are not required to include standards equivalent to these regulations in their application. However, the State must modify its program by the deadline set forth in Sec. 271.21(e). States that submit official applications for final authorization 12 months after the effective date of these regulations must include standards equivalent to these regulations in their application. The requirements a state must meet when submitting its final authorization application are set forth in 40 CFR 271.3.

The regulations being finalized today need not affect the State's Underground Injection Control (UIC) primacy status. A State currently authorized to administer the UIC program under the Safe Drinking Water Act (SDWA) could continue to do so without seeking authority to administer the amendments that will be promulgated at a future date. However, a State which wished to implement part 148 and receive authorization to grant exemptions from the land disposal restrictions would have to demonstrate that it had the requisite authority to administer sections 3004 (f) and (g) of RCRA. The conditions under which such an authorization may take place are discussed in a July 15, 1985 final rule (50 FR 28728).

IX. Regulatory Requirements

A. Economic Impact Screening Analysis Pursuant to Executive Order 12291

Executive Order No. 12291 requires that a regulatory agency determine whether a new regulation will be "major" and, if so, that a Regulatory Impact Analysis (RIA) be conducted. A major rule is defined as a regulation likely to result in an annual effect to the economy of $100 million or more; a major increase in costs or prices for consumers, individuals, industries, Federal, State, and local government agencies, or geographic regions; or significant adverse effects on competition, employment, investment, productivity, innovation, or the ability of United States-based enterprises to compete with foreign-based enterprises in domestic or export markets. An RIA is a quantification of the potential benefits, costs, and economic impacts of a rule.

The Agency estimated the costs of today's rule to determine if it is a major regulation as defined by Executive Order 12291. The Agency expects today's rule to have an incremental annual cost below $100 million. Also, the Agency does not believe the rule will significantly increase costs for consumers, individuals, industries, Federal, State and local government agencies, or geographic regions, or have significant adverse effects on competition, employment, investment, innovation, or international trade.

The Agency has performed an Economic Impact Screening Analysis for this rule. The Agency has not assessed benefits but has rather focused its analyses on the costs and economic impacts attributable to today's rule.

1. Cost Methodology

To assess the cost of today's rule, EPA developed a cost methodology with four major analytical concerns: (a) Petroleum refining wastes, (b) remaining wastes affected by the rule, (c) hazardous debris, and (d) storage and treatment in containment buildings. In this section, the Agency summarizes the methodology it adopted for each of these concerns. In addition, at the end of the cost methodology section, EPA also lists several wastes included in today's rule which are not expected to be associated with any regulatory impacts.

a. Approach for Petroleum Refining Wastes (F037 and F038). In the analysis of the compliance costs for the treatment standards being set for petroleum refining wastes, the Agency first reviewed the work completed for the listing of F037 and F038, which EPA promulgated in October 1990 (see 55 FR 46386, subsequently referred to as the Listing Rule or Listing RIA)./53/ EPA estimated in the Listing RIA that 470,000 tons of F037 and F038 nonwastewaters (with an average water content of 55 percent) were generated annually. The Agency assessed compliance costs for this volume under a compliance scenario that included LDR treatment before land disposal because it believed that the realistic post-regulatory management practice after listing will include treatment. The LDR treatment scenario consisted of dewatering of the waste followed by either incineration (on-site or off-site) or solvent extraction (on-site).

NOTE /53/ Regulatory Impact Analysis for the Listing of Primary and Secondary Oil/Water/Solids Separation Sludges from the Treatment of Petroleum Refinery Wastewaters, prepared for U.S. EPA, Office of Solid Waste, Economic Analysis Staff, by DPRA, October 1990.

For today's rule, the Agency updated the F037 and F038 volume estimates used in the Listing RIA based on additional generation information obtained as part of the capacity determination (see section VI.C for the capacity analysis of F037 and F038). Based on this updated information, the Agency estimated that 223,000 tons of F037 and F038 nonwastewaters are generated annually (with an average water content of 30 percent). EPA estimated that 56,000 tons per year of F037 and F038 wastes were treated to meet the treatment standards in the baseline and that the industry will incur incremental costs in treating the remaining 167,000 tons.

Of the 167,000 tons of land disposed F037 and F038 requiring treatment, EPA estimated that roughly 17,000 tons (i.e., 10 percent) is land disposed in California. California has its own LDR program, under which F037 and F038 waste are restricted from land disposal as of May 8, 1992. The California land ban standards are substantively equivalent to those standards in today's rule. Thus, even if the Federal regulations are not promulgated, F037 and F038 waste will be restricted in this State. Therefore, EPA estimated that only 150,000 tons annually of F037 and F038 will require additional treatment prior to land disposal as a result of today's rule. For its cost analysis, EPA is ignoring the effect of the one-year national capacity variance being granted for this volume and rather estimates the expected annualized cost several years after the listing decision.

For the baseline scenario, the Agency estimated that 96,000 tons per year (i.e., 64 percent) of the F037 and F038 waste requiring additional treatment is managed on-site, and the remaining 54,000 tons (i.e., 36 percent) is sent off-site. Of the waste managed on-site, the Agency estimated that 91,000 tons per year (i.e., 95 percent) is managed using land treatment, and 5,000 tons per year (i.e., 5 percent) is landfilled. All wastes disposed off-site were assumed to go to landfills.

For the post-regulatory scenario, the Agency assumed that 130,000 tons (i.e., 87 percent) of the 150,O00 tons requiring additional treatment will be treated on-site. Although the Listing RIA did not project any volume of waste going to on-site cokers, information indicates that in the post-regulatory scenario 34,000 tons per year (i.e., 26 percent) of the F037 and F038 volume managed on-site will be disposed of in such a manner, at a cost of $200 per ton. The remainder of the F037 and F038 volume managed on-site was assumed to be split evenly between solvent extraction (48,000 tons per year, or 37 percent, at a cost of $500 per ton) and incineration (48,000 tons per year, or 37 percent, at a cost of $400 per ton). The post-regulatory scenario assumed disposal of residuals in subtitle C landfills.

The Agency assumed that 20,000 tons per year (i.e., 13 percent) of the 150,000 tons requiring additional treatment will be treated off-site. The Agency estimated that 2,000 tons per year (i.e., 10 percent) of this volume will go to incineration, at a cost of $1,600 per ton, and the remaining 18,000 tons per year (i.e., 90 percent) will go to cement kilns, at a cost ranging from $700 per ton to $1,200 per ton. Although the Agency doesn't expect large increases in cement kiln capacity, there is uncertainty about future prices charged by cement kilns for hazardous waste.

b. Approach for Remaining Wastes. To determine the cost and economic impacts of the rule for newly listed wastes other than F037 and F038, EPA

first identified the industries that will be affected. The Agency analyzed these industries to determine the amounts of the affected wastes that they generate, how these wastes are currently managed, and how these wastes will have to be managed to comply with LDR treatment standards.

The incremental cost of today's rule for each waste was estimated by comparing post-regulatory costs with the costs of current, or baseline, conditions. EPA lacked site-specific waste generation data for this screening analysis. Accordingly, the Agency developed costs for the baseline and post- regulatory scenarios assuming off-site commercial treatment for all wastes included in the cost analysis, even though off-site treatment may not be used by all generators since it generally is more expensive than on-site treatment.

The following paragraphs explain the approach used to evaluate costs for wastes besides F037 and F038 affected by today's rule.

(i) Newly Listed Organic Wastes. All newly listed organic chemical wastes affected by today's rule--unsymmetrical dimethylhydrazine production wastes, 2-ethoxyethanol, dinitrotoluene and toluenediamine production wastes, ethylene dibromide production wastes and methyl bromide production wastes, and ethylenebisdithiocarbamic acid production wastes--are land disposed in relatively small quantities. The baseline for all newly listed wastes was defined as continued land disposal in units meeting minimum technological requirements.

(ii) K061, F006, K062. Today's rule eliminates the low zinc subcategory for K061 wastes and establishes numeric treatment standards for all K061 based on high temperature metals recovery (HTMR). Wastes previously included in the high zinc subcategory of K061 already had to meet treatment standards based on HTMR; they are unaffected by this change. Wastes previously included in the low zinc subcategory of K061 had to meet numeric treatment standards based on stabilization, although in some cases HTMR was being used.

EPA's cost analysis for the regulatory changes to K061 considered only the low zinc subcategory since wastes in the high zinc subcategory are not affected by the rule. The Agency assumed the baseline for wastes previously included in the low zinc subcategory K061 is stabilization. The Agency assumed that in the post-regulatory scenario managers of these wastes will use HTMR.

Today's rule establishes numeric treatment standards based on HTMR as an alternative treatment standard for K062 and F006. The Agency did not quantify the cost impact of the rule for these two wastes; it believed that any operator using HTMR for K062 and F006 will be using the technology only because it is more cost-effective than current management practices.

c. Approach for Hazardous Debris. (i) Previously Regulated Hazardous Debris. The majority of hazardous debris is already regulated under the Solvents and Dioxins, California list, and the First Third, Second Third, and Third Third LDR rules due to the waste code-carry-through principle. The waste code-carry-through principle, or mixture rule, states that a solid waste mixed with a listed hazardous waste bears the waste code of the listed hazardous waste.

For this hazardous debris, which is already restricted under the LDR

program, the standards in today's rule are expected to be easier to implement and less costly than the previous standards. As one commenter stated, by specifying multiple acceptable BDAT technologies for a given hazardous contaminant category and debris class, EPA has given the generators and treaters a number of options to allow more cost-effective and efficient treatment of hazardous debris. In addition, the Agency is allowing hazardous debris to be treated to meet the existing LDR standards established for the listed wastes if the managers of hazardous debris so desire.

To estimate the incremental annual cost of treating previously regulated hazardous debris, EPA constructed probabilistic distributions of both the volume of previously regulated hazardous debris and the unit costs of treating various subsets of this volume before and after the rule takes effect. EPA relied on the expert judgment of its technical staff to collect the data necessary for this step. EPA considered three sources of generation of previously regulated hazardous debris: routinely generated debris (approximately 20 percent of all previously regulated hazardous debris), debris generated at remedial actions required by Federal and State regulations (approximately 30 percent), and debris generated at demolition and construction sites (approximately 50 percent). The volumes associated with each of these sources were further divided based on other considerations that would determine the type and cost of the technology used to treat the debris.

EPA's approach for previously regulated hazardous debris did not focus on volume and cost estimates for specific wastes or facilities. For this set of debris, estimates of total volume and costs were apportioned to sets of facilities with different debris generation characteristics and different treatment patterns. EPA assumed that in the baseline, incineration would always be used for debris contaminated with organic wastes (estimated to be 20 percent of previously regulated hazardous debris, on average, for all sets of facilities); immobilization always would be used for debris contaminated with organic wastes (estimated to be 20 percent of previously regulated hazardous debris, on average, for all sets of facilities); and incineration followed by immobilization always would be used for debris contaminated with both organic and inorganic wastes (estimated to be 60 percent of previously regulated hazardous debris, on average, for all sets of facilities). In the post-regulatory scenarios, EPA assumed that debris contaminated with organics would be treated using incineration 20 percent of the time and washing the remaining 80 percent of the time, debris contaminated with inorganics always would be treated using immobilization (i.e., no change from the baseline treatment), and debris contaminated with both organics and inorganics would be treated using incineration followed by immobilization 20 percent of the time and washing followed by immobilization 80 percent of the time. Cost information, presented in appendix C of the EIA was gathered for the Phase I analysis based on industry contacts and professional judgment. The ranges used for the costs of incineration and washing reflected that some debris treated with the technologies in the post-regulatory scenario would be exempted from subtitle C management.

(ii) Newly Regulated Hazardous Debris. To gather information for its cost estimate of treating debris contaminated with wastes newly restricted under today's rule, EPA used an approach involving structured interviews with recognized experts in the area of hazardous debris volumes and treatment technologies. An integral part of these interviews was identifying the

uncertainties associated with estimates of future hazardous debris generation rates and treatment costs.

EPA first identified individuals with expert knowledge of the industries generating and managing newly regulated hazardous debris. EPA identified nine experts. Four of these experts were senior environmental managers associated with several of the 14 organic chemical facilities that potentially could generate debris contaminated with organic chemical production wastes regulated by today's rule. The remaining five experts were senior environmental managers associated with several of the over 190 petroleum refineries that could potentially generate debris contaminated with F037 and F038.

The Agency then developed protocols for structured interviews with the experts who had been identified. The Agency's protocol was similar in structure to those used by Stanford/SRI /54/ and Morgan and Henrion,/55/ although it was substantially abbreviated due to time constraints. The protocol involved five basic stages. These stages could be described as: (1) Motivating, (2) structuring, (3) debasing, (4) encoding, and (5) verifying.

NOTE /54/ See: Spetzler, C.S. and Stael Von Holstein, C.-A.S., "Probability Encoding in Decision Analysis", Management Science, Vol. 22, No. 3. and Stael Von Holstein, C.-A.S. and Matheson, J.E., A Manual for Encoding Probability Distributions, SRI International, Palo Alto, CA., 1979.

NOTE /55/ Morgan, M.G. and Henrion, M., Uncertainty: A Guide to Dealing with Uncertainty in Quantitative Risk and Policy Analysis, Cambridge: Cambridge University Press, 1990.

Two individuals conducted each interview, one a professional facilitator and the other an engineer with expertise in the industry being regulated. Interviews typically lasted one hour, during which time information on hazardous debris volumes and incremental treatment costs was solicited. Interviewers stressed that ranges should be supplied rather than point estimates, and they requested that experts provide percentile probabilities for these ranges.

After the Agency had collected information from experts, it aggregated data and generated cost results in terms of ranges that reflected the uncertainty of the analysis. EPA used a probabilistic model to develop volume and cost estimates. The Agency produced overall volume and cost estimates for the newly regulated debris treatment standards based on the medians of data; it also generated ranges of volumes and costs that have a 98 percent likelihood of containing the true values. EPA analyzed volumes and costs separately for the petroleum refining industry, which will generate debris contaminated with F037 and F038, and the organic chemicals industry, which will generate the remainder of debris effected by the rule.

d. Methodology for Assessing Regulatory Impact Due to Storage and Treatment in Containment Buildings. As a result of today's rule, containment buildings could be used as a method of waste management. They potentially could provide regulatory relief to the regulated community. Accordingly, the Agency assessed the potential cost implications of using

these units. In its assessment, EPA considered industries that will use containment buildings for storage of bulk wastes and treatment of contaminated debris.

(i) Industries and Wastes Potentially Using Containment Buildings for Storage of Bulk Wastes. EPA believes that two primary categories of facilities currently use structures very similar to containment buildings for storage and are likely to convert to use of containment buildings in the future: mineral processing and metal recycling facilities. Within the mineral processing category, the Agency believes that generators of aluminum potliners will be particularly affected by the provision. Within the metal recycling category, the Agency believes that brokers of batteries, battery recyclers (i.e., lead smelters), and generators and recyclers of dust and ash from primary steel producers will be particularly affected. The Agency bases these beliefs on a review of the waste volumes these industries generate and comments that it has received on industrial practices. In addition, the Agency received extensive public comment from representatives of the three industries, thus enabling the Agency to perform a more detailed analysis of these industries than of other industries.

In the case of aluminum potliners, EPA is assuming that aluminum facilities already have Subtitle C storage permits, since potliners are currently being stored on-site in waste piles pending bulk shipment off-site. Because waste piles are a form of land disposal, if there was no containment building provision, in order to comply with the LDRs EPA believes that large facilities will have revert to sending potliners off-site at the time of generation. This change in practices would result in higher transportation and disposal costs, given the increased frequency of shipments. Today's containment building provision will allow large generators of spent aluminum potliners to continue their present management methods even after treatment standards are set for K088.

In the case of the lead acid battery recovery industry, the Agency believes that brokers of lead acid batteries and recyclers of lead acid batteries will be the primary parties affected by the containment building provision.

Attempts to handle furnace feed materials differently have proven unsuccessful and to date remain infeasible. Because EPA considers the staging of furnace feed materials in the furnace feed areas as land disposal under the LDRs, bulk storage would be prohibited unless the materials are first treated. Thus, if containment buildings were not excluded from LDR regulation, generators would have to seek treatment alternatives, such as off-site stabilization, that might be more expensive than lead recycling and that do not promote resource recovery. Today's provision will allow brokers and secondary smelting facilities to accumulate sufficient quantities to allow for more efficient shipment and processing.

Lastly, with regard to the primary steel production industry, steel facilities store, and sometimes treat, production dust, primarily K061, in order to lower the cost of waste management through waste accumulation. As in the lead smelting industry, attempts to handle furnace feed materials differently are infeasible. If generators are not able to store waste to facilitate transportation and treatment, they would have to seek management alternatives, such as off-site stabilization, that would remain feasible if waste had to be sent off-site immediately after generation. These

alternatives might be more expensive than HTMR. The Agency believes that both generators of K061 and HTMR facilities could take advantage of the containment building provision and continue to store wastes in the present manner.

The Agency recognizes the possibility that small generators and recyclers of bulk hazardous waste may not recognize as significant regulatory relief from the containment buildings provision as larger generators. Small generators are less likely than larger generators to have existing structures which are similar in design to containment buildings, and small generators may not generate enough waste to fully capitalize a containment building. The Agency believes that many small generators and recyclers of all types of bulk hazardous waste presently use concrete storage bins that are regulated under RCRA as tanks (and thus are granted a 90-day storage exclusion from the LDRs). Storage in concrete bins is possible for small generators and recyclers because they do not need the large areas to store and monitor their hazardous waste. For example, a small generator of aluminum smelting waste may store its spent potliners, each weighing about 10 tons, in a tank-like concrete bin. Because of this use of concrete bins, the Agency believes that many small generators already enjoy the exclusion from the LDRs that use of containment buildings would provide.

On the other hand, the industrial practices of large generators and recyclers often necessitate the use of large containment buildings. Large aluminum smelting facilities are likely to generate spent potliners weighing an order of magnitude more than those of small generators (e.g., 150 tons versus 10 tons) and thus they could take advantage of the increased storage capabilities of large containment buildings. Large recyclers often require large areas for proper monitoring and preparation of waste, and also could benefit from the containment building provision. For example, large recyclers of lead smelting require substantial staging areas to achieve time-efficient and proper draining of lead waste from "cracked" batteries. Large facilities are the primary facilities likely to gain economies of scale in the transportation, treatment, and disposal costs from the containment building provision. As a result, the Agency believes that large volume managers of wastes, such as those found in the three industries being analyzed, will realize significant benefits from the provision, while small volume managers will not.

For this reason, as well as the fact that the scarcity of data on smaller facilities does not permit a meaningful analysis, the Agency has focused its analysis on large generators. The Agency acknowledges that other industries besides the three being considered could profit from the containment building provision. The Agency, however, is using the analysis of these three industries to gain an understanding of the economic implications of containment buildings in use for storage of wastes.

(ii) Facilities Potentially Using Containment Buildings for Treatment of Hazardous Debris. In addition to analyzing the use of containment buildings in the aluminum smelting, secondary lead smelting, and steel production industries, the Agency assessed the effects of the provision on facilities generating hazardous debris. To analyze the potential cost savings associated with treatment in containment buildings, EPA assumed in lieu of the today's rule, that facilities would treat hazardous debris off-site; the Agency assumed that under the containment building provision in today's rule, facilities will treat debris on-site inside containment buildings. The Agency used a weighted average of commercial on-site and off-site

extraction and immobilization costs for its cost comparison and took into account the cost of constructing and operating a containment building.

e. Wastes Not Considered. The costs associated with two groups of wastes--F001 through F005 spent solvents and 24 K- and U-wastes with wastewater standards based on scrubber waters--were not quantified by the Agency in this screening analysis. The Agency has regulated these wastes previously and is revisiting them in the rule only to modify the basis for concentration standards. The modifications are for the purpose of standardization in testing procedures and in the basis for treatment standards and for the purpose of clarification to ensure appropriate placement in the Code of Federal Regulations. These modifications will not change the required management practices for any of these wastes significantly. Thus, the Agency expects such changes to have no significant cost impacts.

2. Cost Estimates

a. Total Cost Estimate. The estimate for the incremental annual cost of the standards promulgated in today's rule is $57 million to $65 million per year./56/ Table IX-1 presents quantities of the wastes affected by today's rule. The estimated cost of compliance with the rule for each waste is presented in Table IX-2. Neither table includes F001 through F005 spent solvents or the 24 K- and U-wastes covered by today's rule because the effect of the rule on these wastes is negligible, as explained in Section IX.1.e.

NOTE /56/ Wastewaters account for none of the cost of today's rule. No compliance costs are expected for treatment of wastewaters because wastewaters are typically discharged to publicly owned treatment works (POTWs) or to coastal and inland waterways under National Pollution Discharge Elimination System (NPDES) permit provisions. When wastewaters are discharged in this manner, they are not subject to the treatment standards required by the LDRs under RCRA.

b. Waste Code Cost Estimates. (i) Petroleum Refining Wastes (F037 and F038). The Agency estimates the total incremental annual cost for treatment of F037 and F038 nonwastewaters to range between $40 million and $47 million.

This figure is based on an annual F037 and F038 land disposed volume of 130,000 tons per year in States other than California. In the upper bound of the cost range shown for F037 and F038, 35 percent of the post-regulatory cost are from off-site treatment. The high cement kiln price used in this analysis, $1,200 per ton, is expected to be an overestimate of the long-term price for treatment in cement kilns. Presently, cement kilns appear to be charging rates slightly below those charged by incinerators; as more cement kilns are able to handle wastes their prices should decrease. Because of the high prices charged by cement kilns, the Agency has analyzed the costs for F037 and F038 in a range, as shown above.

Table IX-1.--Summary of Annual Quantities of Wastes Affected by the LDRs

Line No.	Waste	Annual land disposal rate	Form of waste affected

1. Petroleum refining sludges (F037 and F038)	130,000 tons of routinely generated waste currently land disposed, excluding waste generated in California	Dewatered sludge	
2. Unsymmetrical dimethylhydrazine production wastes (K107-K110)	No longer produced		
3. 2-Ethoxyethanol (U359)	<500 tons	Nonwastewater	
4. Dinitrotoluene and toluenediamine production wastes (K111 and K112, U328 and U353)	3,500 tons--K111, 0 tons--K112, <500 tons of U328 and U353	Nonwastewater	
5. Ethylene dibromide (EDB) production wastes (K117, K118, and K136) and methyl bromide production wastes (K131 and K132)	<100 tons--K118, <100 tons--K132	Nonwastewater	
6. Ethylenebisdithiocarbamic acid (EBDC) production wastes (K123, K124, K125, and K126)	<100 tons--K125	Nonwastewater	
7. Electric arc furnace dust (K061)	67,000 tons of low zinc K061 a	Solid	
8. Debris contaminated with newly listed wastes b	XXX tons	Solid	
9. Previously regulated debris	1,000,000 tons	Solid	

(...Table continues...)

Line No.	Generation type	Assumed management method
1.	Routine	Solvent extraction; incineration; cement kilns.
2.		
3.	Routine	Incineration or fuel substitution.
4.	Routine	Incineration.
5.	Routine	Incineration.
6.	Routine	Incineration.
7.	Routine	High temperature metals recovery.
8.	Routine and intermittent	Destruction; immobilization; extraction.
9.	Routine and intermittent	Destruction; immobilization; extraction.

a Of the set of wastes potentially affected by a new BDAT for wastes with high chromium and high nickel content (including K061, K062, and F006), the Agency is considering K061 only. The quantity given for K061 is based on the generation quantity instead of on the quantity that is land disposed.

b The quantity presented here for newly regulated debris is an estimate pending completion of the Agency's analysis for hazardous debris.

Table IX-2.--Summary of Annual Costs of LDR Phase I Wastes
(In millions of dollars per year)

Waste	Post regulatory costs a	Baseline costs	Incremental costs
Wastes with Positive Incremental Cost:			

Petroleum refining sludges (F037 and F038) b 58 to 66 b 18 40 to 47
Unsymmetrical dimethylhydrazine production wastes (K107-K110) 0 0 0
2-Ethoxyethanol (U359) 0.4 0.1 0.3
Dinitrotoluene and toluenediamine production wastes (K111 and K112, U328 and U353) 7 1 6
Ethylene dibromide (EDB) production wastes (K117, K118, and K136) and methyl bromide production wastes (K131 and K132) 0.3 <0.1 0.3
Ethylenebisdithiocarbamic acid (EBDC) production wastes (K123, K124, K125, and K126) 0.2 0.1 0.2
Debris contaminated with newly listed wastes 15 5 10
Total for newly listed wastes 81 to 89 24 57 to 65
Wastes with Negative Incremental Cost:
Electric arc furnace dust (K061) 19 30 (11)
Previously regulated debris 970 1,600 (560)

a Baseline assumes all waste is landfilled, except for previously regulated debris.

b The range of costs shown represents a unit price for cement kilns of between $700 per ton and $1200 per ton. This range is reflected in the total costs shown for each column as well.

(ii) Wastes from the Production of Unsymmetrical Dimethylhydrazine (K107-K110). The Agency did not calculate costs of treatment standards for wastes from the production of unsymmetrical dimethylhydrazine (UDMH) (K107, K108, K109, and K110). This decision was made based on information that these wastes are no longer generated.

(iii) 2-Ethoxyethanol Wastes (U359). The Agency estimated an incremental annual cost of $700,000 for the standards developed for these wastes. This cost is based on an upper bound assumption of incineration of 500 tons annually.

(iv) Wastes from Production of Dinitrotoluene and Toluenediamine (K111 and K112, U328 and U353). The Agency estimated an incremental annual cost of $6.1 million for the standards developed for these wastes. This figure is based on an annual land disposal estimate of 3,500 tons of K111 nonwastewater, an upper bound assumption of 100 tons of K112 nonwastewater, and an upper bound assumption of 500 tons of U328 and U353 combined.

(v) Wastes from Production of Ethylene Dibromide (EDB) (K117, K118, and K136). The standards for these wastes have an estimated incremental annual cost of $300,000. This figure is based on upper bound assumptions of 100 tons of K118 nonwastewater and 100 tons of K132 nonwastewater requiring incineration.

(vi) Wastes from Production of Ethylenebisdithiocarbamic Acid (EBDC) (K123- K126). The incremental annual cost estimated for these wastes is $150,000.
This figure is based on an upper bound assumption of 100 tons of K125

nonwastewater requiring incineration.

(vii) K061, F006, K062. The only previously regulated wastes revisited in today's rule for which the Agency developed cost estimates are K061 low-zinc wastes. (As discussed above, the standards for F006 and K062 are expected to have no incremental costs associated with them.) The standards for K061 wastes are based on high temperature metals recovery (HTMR). These standards, as applied to K061, could save industry up to approximately $11 million annually (i.e., The standards in today's rule are potentially less costly than the existing standards.). This figure is based on an annual generation estimate of 67,000 tons. The Agency has used a generation estimate rather than a land disposal estimate for this waste because of the high level of uncertainty regarding the quantity of low zinc K061 that is currently treated using HTMR. The effect of using a generation estimate of the K061 volume is that the cost savings presented is likely to be an over-estimate of the true cost savings for these standards.

c. Results for Hazardous Debris. There are two groups of hazardous debris in this rule. The first group includes all previously regulated hazardous debris: Debris contaminated with wastes regulated under the previous HSWA land disposal restriction rules (i.e., Solvents and Dioxins, California List, First Third, Second Third, Third Third rules). The second group of hazardous debris includes debris contaminated with wastes newly regulated under today's rule (e.g., F037).

(i) Previously Regulated Hazardous Debris. As of May 8, 1992, all of the national capacity variances for the debris regulated in the HSWA land disposal restriction scheduled waste rules will expire. (If the Agency proceeds with the planned national case-by-case variance, this date would be extended to May 8, 1993.) All previously regulated hazardous debris would then be required to meet the existing standards for debris established in the scheduled waste rules. Since the Agency is interested in long-term treatment costs, its analysis does not take into account the effect of the national capacity variance on treatment of hazardous debris.

Standards for debris established in today's rule allow considerably more flexibility in debris treatment than did the standards established in the LDR scheduled waste rules. In addition, today's standards provide for the use of many more extraction technologies for treatment then the HSWA standards; extraction technologies often can be cheaper to use than the destruction and immobilization technologies that are required under current regulations.

Furthermore, today's treatment standards allow debris treated by destruction and extraction technologies to be excluded from subtitle C disposal.

Therefore, EPA estimates that today's standards for previously regulated debris will result in a potential regulatory relief to industry. The Agency estimates baseline costs, costs of debris treatment and the prior land disposal restrictions rules after all variances are expired to be $1,600 million per year; under this rule the costs would be reduced by $560 million per year to $970 million. It should be noted that if there is a portion of the previously regulated debris volume which would be generated and managed only during the period of the national capacity variance, to the degree that this portion is reflected in the cost savings presented, these savings would be over-estimated.

One issue should be noted, however, regarding the baseline for previously regulated debris. The standard baseline in cost analysis is formulated as

the scenario of existing management requirements in the absence of a new rule. In today's rule, the volume of previously regulated debris is currently under a capacity variance. In the absence of today's rule, once the variance expires, treatment according to existing standards is required. Therefore, the baseline used in the cost analysis is the existing standards./57/ However, since most hazardous debris is currently under the national capacity variance, treatment of hazardous debris is not generally occurring.

Therefore, the baseline being used does not reflect current debris management practices. Yet, in keeping with standard regulatory analysis procedures, the Agency believes it to be appropriate to analyze costs for the volume of previously regulated debris based on a baseline of compliance with existing standards.

NOTE /57/ It should be noted that due to the limited data available for the cost analysis for the previous LDR rules, the hazardous debris volumes estimated by the Agency were small in comparison to the previously regulated contaminated debris volume estimated for today's rule. EPA believes that it underestimated compliance costs for hazardous debris treatment under the previous LDR rules due to this lack of data.

(ii) Newly Regulated Hazardous Debris. The results of EPA's analysis indicate that the volume of hazardous debris newly regulated by today's rule has a 98 percent likelihood of falling between 18,000 and 119,000 tons per year and the corresponding incremental cost of managing this waste has a 98 percent likelihood of falling between $3.8 million and $120 million per year.

The median annual incremental cost for treating newly regulated debris was $10 million. For purposes of determining whether today's rule is a major rule as defined by Executive Order 12291, EPA has used the median volume and cost results from its analysis.

The volume of debris contaminated with F037 and F038 has a 98 percent likelihood of falling between 13,000 tons per year and 24 million tons per year in the long term future (i.e., more than five years after promulgation of today's rule). The incremental annual cost of treating this debris has a 98 percent likelihood of falling between $1.2 million and $5.8 million. The median incremental cost of treating F037 and F038-contaminated debris in EPA's analysis was $3.1 million. EPA acknowledges that in the short-term future (i.e., in the first five years after promulgation), the compliance costs of treating debris contaminated with F037 and F038 will be much higher.

The volume of debris contaminated with newly regulated organic chemical wastes has a 98 percent likelihood of falling between 3,400 tons and 98,000 tons per year in the long term future. The incremental annual cost of treating this debris has a 98 percent likelihood of falling between $1.4 million and $120 million. The median incremental cost of treating debris contaminated with newly regulated organic waste was $7.1 million.

d. Cost Savings From Storage and Treatment in Containment Buildings. The Agency lacked information with which to infer the typical dimensions of a containment building used to treat contaminated debris; therefore, the same size containment buildings were used for the analysis of treatment containment buildings as were used for the storage containment building

analysis. The calculations indicate that use of containment buildings designed to store the typical waste quantities associated with the three industries considered and to treat contaminated debris could result in significant cost savings. Please see the EIA for complete results from the Agency's analysis.

To arrive at the estimates of cost savings, the Agency calculated the annualized costs of containment buildings. All costs were estimated as the present value of the capital and recurring costs incurred by facilities over an assumed 20-year operating life. The present value costs was then annualized over 20 years to arrive at equal annual payments. Implicit in this approach is the assumption that facilities will be able to smooth out anticipated costs with some form of financing over a 20-year period. Three and seven percent social discount rates, assumed constant for 20 years, were used to calculate the annualized costs.

In addition to estimating the overall incremental cost savings of the containment building provision, the Agency addressed three other issues associated with containment buildings: the costs of retaining corrective action authority of the containment buildings, costs of recordkeeping, and costs of engineered barriers required for liquids and dust.

Under today's rule, corrective action authority will be extended to permitted containment buildings; corrective action authority will not be extended to unpermitted containment buildings (i.e., those buildings under the 90-day generator exemption from permitting). The Agency assumes that only facilities that already have RCRA permits will choose to construct permitted containment buildings and that all containment buildings constructed at facilities without existing RCRA permits will be unpermitted (i.e., they will not be affected by the corrective action provisions in today's rule). Based on these assumptions, the Agency does not believe that today's provision will produce any incremental costs or benefits with regard to corrective action authority.

The Agency believes the recordkeeping requirements of today's provision will have little impact on industries choosing to use containment buildings.
The Agency assumed that annual recordkeeping costs range from $1100 to $33,000/facility, depending on the volume of waste managed.

In addition to quantitative estimates of recordkeeping costs, the Agency qualitatively assessed the benefits of recordkeeping requirements for containment buildings. The Agency believes the costs are justified given the potential benefits that the public may incur.

Recordkeeping establishes adequate inspection plans to ensure that the unit is operating as designated. This goal is achieved through the establishment of an inspection program that ensures the structural integrity of the unit and prompt detection of any leaks or releases. As discussed in section IV.G, the Agency is requiring an inspection schedule for these units whereby, at least once each week, monitoring and leak detection equipment, the containment building, and the area surrounding the containment building is checked to ensure the unit is being properly operated and that no leaks or releases have occurred.
The Agency believes such controls are key to providing simple, yet adequate, maintenance of facilities to prevent detrimental releases of hazardous waste. In addition, monitoring buildings and wastes releases

facilitates the Agency's enforcement actions.

The Agency does not believe that facilities will be significantly affected by these requirements. It is the Agency's understanding that the majority of facilities already have, or could easily, modify their existing operations to add these recordkeeping measures. The Agency notes that large facilities are the most likely to use containment buildings and believes that these facilities will be able to incorporate additional recordkeeping into their present operations with relatively little cost.

The final issue the Agency analyzed with regard to containment buildings was costs associated with engineered barriers and fugitive dust emission controls. The annualized cost (i.e., assuming social discount rate of three percent and cost annualized over 20 years) for secondary containment ranged from $7,000 to $23,000 per year for systems for 50' x 30' containment building and 340' x 200' buildings, respectively. Fugitive dust control ranged from approximately $3,000 for a 50' x 30' building to $30,000 per year for a 340' x 200' structure. (The building dimensions are representative of possible containment structures for all of the three industries.)

Given the results of the analysis presented in this section, the Agency believes that the containment building provision will provide regulatory relief to large facilities, while having little to no impact on small facilities. The Agency believes that facilities in the mineral processing and recycling industries are particularly likely to benefit from this provision.

3. Economic Impacts

A full economic impacts analysis was not performed because of a lack of data in many areas. The Agency, however, qualitatively assessed the economic impacts attributable to today's rule.

a. Petroleum Refining Wastes (F037 and F038). The Listing RIA considered the economic impact of the F037 and F038 listing in light of anticipated land disposal restrictions on these wastes. The impacts estimated in the Listing RIA were driven by facility costs and the economic viability of facility owners. The results of the Listing RIA's economic impacts analysis are summarized below.

In the Listing RIA, two to five percent of the refineries (depending on the cost scenario) had cost impacts greater than one percent of sales. (Cost impacts exceeding one percent of sales can be viewed as an indicator of potentially significant economic impact.) Slightly under two percent of the refineries had cost impacts that exceeded two percent of sales under the high-cost scenario, indicating more severe economic impacts. Nine out of ten affected refineries in the high-cost scenario had costs below 0.5 percent of sales, and over three-quarters of the refineries fell below 0.25 percent, indicating no significant impacts.

The analysis of small entities presented in the Listing RIA indicated that there were potentially seven non-integrated refineries (i.e., refineries that did not produce their own crude and market their own products) with cost-to- sales ratios greater than one percent under the high-cost scenario. A further analysis of employment effects and potential closures was not possible because of insufficient financial data for individual refineries.

EPA compared the incremental compliance cost for the F037 and F038 standards in today's rule with that of the Listing Rule. The Agency found that today's rule will have an incremental compliance cost for F037 and F038 waste, including both nonwastewater and hazardous debris, of between $49 million and $58 million, while the Listing RIA estimated an incremental annual compliance cost of $53 million to $102 million. Based on its qualitative analysis, EPA believes that the economic impacts of today's rule will be less than the impacts estimated by the Listing RIA.

b. Remaining Wastes. Considering the economic impacts of LDRs for the newly listed organic wastes other than F037 and F038, the Agency estimated the costs associated with all wastes to be insignificant, with the possible exception of dinitrotoluene and toluenediamine production wastes. The Agency, however, did not have the data to examine these economic impacts.

A quantitative assessment of the economic impacts associated with the hazardous debris standards was not possible because of data limitations. The Agency does not have comprehensive site-specific information on the volumes of previously regulated or newly listed hazardous debris.

The Agency expects that the impacts for previously regulated debris will not be significant since the revised standards are likely to be no more costly, and in some cases less costly, than the standards which currently exist. The impacts of the rule on newly regulated hazardous debris are uncertain. The estimated incremental cost for these standards is expected to range between $3.8 million and $120 million annually. If a relatively large number of facilities bear the burden of this cost, it is likely that these standards will not have a significant impact.

B. Regulatory Flexibility Analysis

Pursuant to the Regulatory Flexibility Act of 1980, 5 U.S.C. 601 et seq., whenever an agency publishes a notice of rulemaking, it must prepare and make available for public comment a Regulatory Flexibility Analysis (RFA) that describes the effect of the rule on small entities (i.e., small businesses, small organizations, and small governmental jurisdictions). This analysis is unnecessary, however, if the rule is estimated not to have a significant economic effect on a substantial number of small entities.

According to EPA's guidelines for conducting an RFA, if over 20 percent of the population of small entities is likely to experience financial distress based on the costs of the rule, then the Agency considers that the rule will have a significant impact on a substantial number of small entities, and must perform an RFA. The Agency has virtually no data on small entities affected by today's rule. Because of the low incremental costs incurred for the newly listed waste standards, the Agency believes that the only area of potential importance is the hazardous debris treatment standards. The previously regulated debris standards, being potentially a regulatory relief, are, for this analysis, considered to not have an effect on small entities. For the debris contaminated with newly listed wastes, the impacts to small facilities are uncertain, although may be significant. Therefore, although insufficient data was available to make a determination, the Agency estimates that there are not significant impacts on over 20 percent of the population of small entities based on the costs of the rule, so the Agency has not conducted an RFA for today's rule.

C. Paperwork Reduction Act

The information collection requirements for newly listed wastes were promulgated in previous land disposal restriction rulemakings and approved by the Office of Management and Budget (OMB) under the Paperwork Reduction Act (PRA), 44 U.S.C. 3501 et seq. and have been assigned OMB control number 2050- 0085. A copy of the Information Collection Request (ICR) document (ICR
1442.03) may be obtained from Sandy Farmer, Information Policy Branch, EPA, 401 M Street SW. (PM-223Y), Washington, DC 20460 or by calling (202) 260-2740.
The new information collection requirements and revisions to existing requirements in this rule will be submitted for approval to OMB under the PRA. These requirements are not effective until OMB approves them and a technical amendment to that effect is published in the Federal Register.

Send comments regarding the burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden, to Chief, Information Policy Branch, PM-223Y, U.S. Environmental Protection Agency, 401 M Street SW., Washington, DC 20460; and to the Office of Information and Regulatory Affairs, Office of Management and Budget, Washington, DC 20503, marked "Attention: Jonathan Gledhill."

Dated: June 30, 1992.

William K. Reilly,
Administrator.

For the reasons set out in the preamble, title 40, chapter I, of the Code of Federal Regulations is amended as follows:

PART 148--HAZARDOUS WASTE INJECTION RESTRICTIONS

1. The authority citation for part 148 continues to read as follows:

Authority: Section 3004, Resource Conservation and Recovery Act, 42 U.S.C. 6901 et. seq.

2. Section 148.17 is added to subpart B of part 148 to read as follows:

Sec. 148.17 Waste specific prohibitions; newly listed wastes.

(a) Effective November 9, 1992, the wastes specified in 40 CFR part 261 as EPA hazardous waste numbers F037, F038, K107, K108, K109, K110, K111, K112, K117, K118, K123, K124, K125, K126, K131, K136, U328, U353, and U359 are prohibited from underground injection.

(b) Effective June 30, 1995, the wastes specified in 40 CFR part 261 as EPA Hazardous waste numbers K117, K118, K131, and K132 are prohibited from underground injection.

(c) The requirements of paragraphs (a) and (b) of this section do not apply:
(1) If the wastes meet or are treated to meet the applicable standards specified in subpart D of part 268; or
(2) If an exemption from a prohibition has been granted in response to a petition under subpart C of this part; or
(3) During the period of extension of the applicable effective date, if an extension has been granted under Sec. 148.4 of this part.

PART 260--HAZARDOUS WASTE MANAGEMENT SYSTEM: GENERAL

3. The authority citation for part 260 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6921-6927, 6930, 6934, 6935, 6937, 6938, 6939, and 6974.

4. In Sec. 260.10, a definition for "containment building" is added in alphabetical order and the definitions of "miscellaneous unit" and "pile" are revised to read as follows:

Sec. 260.10 Definitions.

* * * * *

Containment building means a hazardous waste management unit that is used to store or treat hazardous waste under the provisions of subpart DD of parts 264 or 265 of this chapter.

* * * * *

Miscellaneous unit means a hazardous waste management unit where hazardous waste is treated, stored, or disposed of and that is not a container, tank, surface impoundment, pile, land treatment unit, landfill, incinerator, boiler, industrial furnace, underground injection well with appropriate technical standards under 40 CFR part 146, containment building, or unit eligible for a research, development, and demonstration permit under Sec. 270.65 of this chapter.

* * * * *

Pile means any non-containerized accumulation of solid, nonflowing hazardous waste that is used for treatment or storage and that is not a containment building.

* * * * *

PART 261--IDENTIFICATION AND LISTING OF HAZARDOUS WASTE

5. The authority citation for part 261 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6921, 6922, and 6938.

6. In Sec. 261.3 paragraphs (a)(2)(iii) and (c)(2)(ii)(C) are revised and paragraph (f) is added to read as follows:

Sec. 261.3 Definition of hazardous waste.

(a) * * *
(2) * * *
(iii) It is a mixture of a solid waste and a hazardous waste that is listed in subpart D of this part solely because it exhibits one or more of the characteristics of hazardous waste identified in subpart C of this part, unless the resultant mixture no longer exhibits any characteristic of hazardous waste identified in subpart C of this part, or unless the solid waste is excluded from regulation under Sec. 261.4(b)(7) and the resultant mixture no longer exhibits any characteristic of hazardous waste identified in subpart C of this part for which the hazardous waste listed in subpart D of this part was listed. (However, nonwastewater mixtures are still subject to the requirements of part 268 of this chapter, even if they no longer exhibit a characteristic at the point of land disposal).

* * * * *

(c) * * *
(2) * * *
(ii) * * *
(C)(1) Nonwastewater residues, such as slag, resulting from high temperature metals recovery (HTMR) processing of K061, K062 or F006 waste, in units identified as rotary kilns, flame reactors, electric furnaces, plasma arc furnaces, slag reactors, rotary hearth furnace/electric furnace combinations or industrial furnaces (as defined in paragraphs (6), (7), and (13) of the definition for "Industrial furnace" in 40 CFR 260.10), that are disposed in subtitle D units, provided that these residues meet the generic exclusion levels identified in the tables in this paragraph for all constituents, and exhibit no characteristics of hazardous waste. Testing requirements must be incorporated in a facility's waste analysis plan or a generator's self-implementing waste analysis plan; at a minimum, composite samples of residues must be collected and analyzed quarterly and/or when the process or operation generating the waste changes. Persons claiming this exclusion in an enforcement action will have the burden of proving by clear and convincing evidence that the material meets all of the exclusion requirements.

Constituent	Maximum for any single composite sample--TCLP (mg/l)
Generic exclusion levels for K061 and K062 nonwastewater HTMR residues	
Antimony	0.10
Arsenic	0.50
Barium	7.6
Beryllium	0.010
Cadmium	0.050
Chromium (total)	0.33
Lead	0.15
Mercury	0.009
Nickel	1.0
Selenium	0.16
Silver	0.30

Thallium	0.020
Zinc	70

Generic exclusion levels for F006 nonwastewater HTMR residues

Antimony	0.10
Arsenic	0.50
Barium	7.6
Beryllium	0.010
Cadmium	0.050
Chromium (total)	0.33
Cyanide (total) (mg/kg)	1.8
Lead	0.15
Mercury	0.009
Nickel	1.0
Selenium	0.16
Silver	0.30
Thallium	0.020
Zinc	70

(2) A one-time notification and certification must be placed in the facility's files and sent to the EPA region or authorized state for K061, K062 or F006 HTMR residues that meet the generic exclusion levels for all constituents and do not exhibit any characteristics that are sent to subtitle D units. The notification and certification that is placed in the generators or treaters files must be updated if the process or operation generating the waste changes and/or if the subtitle D unit receiving the waste changes.

However, the generator or treater need only notify the EPA region or an authorized state on an annual basis if such changes occur. Such notification and certification should be sent to the EPA region or authorized state by the end of the calendar year, but no later than December 31. The notification must include the following information: The name and address of the subtitle D unit receiving the waste shipments; the EPA Hazardous Waste Number(s) and treatability group(s) at the initial point of generation; and, the treatment standards applicable to the waste at the initial point of generation. The certification must be signed by an authorized representative and must state as follows: "I certify under penalty of law that the generic exclusion levels for all constituents have been met without impermissible dilution and that no characteristic of hazardous waste is exhibited. I am aware that there are significant penalties for submitting a false certification, including the possibility of fine and imprisonment."

* * * * *

(f) Notwithstanding paragraphs (a) through (d) of this section and provided the debris as defined in part 268 of this chapter does not exhibit a characteristic identified at subpart C of this part, the following materials are not subject to regulation under 40 CFR parts 260, 261 to 266, 268, or 270:

(1) Hazardous debris as defined in part 268 of this chapter that has been treated using one of the required extraction or destruction technologies specified in Table 1 of Sec. 268.45 of this chapter; persons claiming this exclusion in an enforcement action will have the burden of proving by clear and convincing evidence that the material meets all of the exclusion requirements; or

(2) Debris as defined in part 268 of this chapter that the Regional Administrator, considering the extent of contamination, has determined is

no longer contaminated with hazardous waste.

PART 262--STANDARDS APPLICABLE TO GENERATORS OF HAZARDOUS WASTE

8. The authority citation for part 262 continues to read as follows:

Authority: 42 U.S.C. 6906, 6912, 6922, 6923, 6924, 6925, and 6937.

9. In Sec. 262.34, paragraph (a)(1)(iii) introductory text is amended by removing the semicolon at the end and replacing it with a colon, paragraph (a)(1)(iii)(B) and the concluding text of paragraph (a)(1) are revised, and paragraph (a)(1)(iv) is added to read as follows:

Sec. 262.34 Accumulation time.

(a) * * *
(1) * * *
(iii) * * *
(B) Documentation of each waste removal, including the quantity of waste removed from the drip pad and the sump or collection system and the date and time of removal; and/or
(iv) The waste is placed in containment buildings and the generator complies with subpart DD of 40 CFR part 265, has placed its professional engineer certification that the building complies with the design standards specified in 40 CFR 265.1101 in the facility's operating record no later than 60 days after the date of initial operation of the unit. After February 18, 1993, PE certification will be required prior to operation of the unit. The owner or operator shall maintain the following records at the facility:
(A) A written description of procedures to ensure that each waste volume remains in the unit for no more than 90 days, a written description of the waste generation and management practices for the facility showing that they are consistent with respecting the 90 day limit, and documentation that the procedures are complied with; or
(B) Documentation that the unit is emptied at least once every 90 days.

In addition, such a generator is exempt from all the requirements in subparts G and H of 40 CFR part 265, except for Secs. 265.111 and 265.114.

* * * * *

10. In Sec. 262.34(a), the first paragraph designated (a)(2) and the undesignated paragraph following (a)(2)(ii) are removed.

PART 264--STANDARDS FOR OWNER AND OPERATORS OF HAZARDOUS WASTE TREATMENT, STORAGE, AND DISPOSAL FACILITIES

11. The authority citation for part 264 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6924, and 6925.

12. Section 264.110 is amended by removing the word "and" from the end of

paragraph (b)(1), by adding a semicolon in place of the period at the end of paragraph (b)(2), by adding "; and" in place of the period at the end of paragraph (b)(3), and by adding a new paragraph (b)(4) to read as follows:

Sec. 264.110 Applicability.

* * * * *

(b) * * *
(4) Containment buildings that are required under Sec. 264.1102 to meet the requirement for landfills.

13. Section 264.111 is amended by revising paragraph (c) to read as follows:

Sec. 264.111 Closure performance standard.
* * * * *

(c) Complies with the closure requirements of this subpart, including, but not limited to, the requirements of Secs. 264.178, 264.197, 264.228, 264.258, 264.280, 264.310, 264.351, 264.601 through 264.603, and 264.1102.

14. Section 264.112 is amended by revising paragraph (a)(2) to read as follows:

Sec. 264.112 Closure plan; amendment of plan.

(a) * * *
(2) The Director's approval of the plan must ensure that the approved closure plan is consistent with Secs. 264.111 through 264.115 and the applicable requirements of subpart F of this part, Secs. 264.178, 264.197, 264.228, 264.258, 264.280, 264.310, 264.351, 264.601, and 264.1102. Until final closure is completed and certified in accordance with Sec. 264.115, a copy of the approved plan and all approved revisions must be furnished to the Director upon request, including requests by mail.

* * * * *

15. Section 264.140 is amended by adding a semicolon in place of ", and" at the end of paragraph (b)(1), by adding a semicolon in place of the period at the end of paragraph (b)(2), by adding "; and" in place of the period at the end of paragraph (b)(3), and by adding a new paragraph (b)(4) to read as follows:

Sec. 264.140 Applicability.

* * * * *

(b) * * *
(4) Containment buildings that are required under Sec. 264.1102 to meet the requirements for landfills.

* * * * *

16. Section 264.142 is amended by revising the introductory text of paragraph (a) to read as follows:

Sec. 264.142 Cost estimate for closure.

(a) The owner or operator must have a detailed written estimate, in current dollars, of the cost of closing the facility in accordance with the requirements in Secs. 264.111 through 264.115 and applicable closure requirements in Secs. 264.178, 264.197, 264.228, 264.258, 264.280, 264.310, 264.351, 264.601 through 264.603, and 264.1102.

* * * * *

17. Subpart DD is added to part 264 to read as follows:

Subpart DD--Containment Buildings

Sec.
264.1100 Applicability.
264.1101 Design and operating standards.
264.1102 Closure and post-closure care.
264.1103-264.1110 (Reserved)

Subpart DD--Containment Buildings

Sec. 264.1100 Applicability.

The requirements of this subpart apply to owners or operators who store or treat hazardous waste in units designed and operated under Sec. 264.1101 of this subpart. These provisions will become effective on February 18, 1993, although owner or operator may notify the Regional Administrator of his intent to be bound by this subpart at an earlier time. The owner or operator is not subject to the definition of land disposal in RCRA section 3004(k) provided that the unit:

(a) Is a completely enclosed, self-supporting structure that is designed and constructed of manmade materials of sufficient strength and thickness to support themselves, the waste contents, and any personnel and heavy equipment that operate within the unit, and to prevent failure due to pressure gradients, settlement, compression, or uplift, physical contact with the hazardous wastes to which they are exposed; climatic conditions; and the stresses of daily operation, including the movement of heavy equipment within the unit and contact of such equipment with containment walls;

(b) Has a primary barrier that is designed to be sufficiently durable to withstand the movement of personnel, wastes, and handling equipment within the unit;

(c) If the unit is used to manage liquids, has:

(1) A primary barrier designed and constructed of materials to prevent migration of hazardous constituents into the barrier;

(2) A liquid collection system designed and constructed of materials to minimize the accumulation of liquid on the primary barrier; and

(3) A secondary containment system designed and constructed of materials to prevent migration of hazardous constituents into the barrier, with a leak detection and liquid collection system capable of detecting, collecting, and removing leaks of hazardous constituents at the earliest practicable time, unless the unit has been granted a variance from the secondary containment system requirements under Sec. 264.1101(b)(4);

(d) Has controls sufficient to prevent fugitive dust emissions to meet the

no visible emission standard in Sec. 264.1101(c)(1)(iv); and
(e) Is designed and operated to ensure containment and prevent the tracking of materials from the unit by personnel or equipment.

Sec. 264.1101 Design and operating standards.

(a) All containment buildings must comply with the following design standards:
(1) The containment building must be completely enclosed with a floor, walls, and a roof to prevent exposure to the elements, (e.g., precipitation, wind, run-on), and to assure containment of managed wastes.

(2) The floor and containment walls of the unit, including the secondary containment system if required under paragraph (b) of this section, must be designed and constructed of materials of sufficient strength and thickness to support themselves, the waste contents, and any personnel and heavy equipment that operate within the unit, and to prevent failure due to pressure gradients, settlement, compression, or uplift, physical contact with the hazardous wastes to which they are exposed; climatic conditions; and the stresses of daily operation, including the movement of heavy equipment within the unit and contact of such equipment with containment walls. The unit must be designed so that it has sufficient structural strength to prevent collapse or other failure. All surfaces to be in contact with hazardous wastes must be chemically compatible with those wastes. EPA will consider standards established by professional organizations generally recognized by the industry such as the American Concrete Institute (ACI) and the American Society of Testing Materials (ASTM) in judging the structural integrity requirements of this paragraph. If appropriate to the nature of the waste management operation to take place in the unit, an exception to the structural strength requirement may be made for light-weight doors and windows that meet these criteria:
(i) They provide an effective barrier against fugitive dust emissions under paragraph (c)(1)(iv); and
(ii) The unit is designed and operated in a fashion that assures that wastes will not actually come in contact with these openings.

(3) Incompatible hazardous wastes or treatment reagents must not be placed in the unit or its secondary containment system if they could cause the unit or secondary containment system to leak, corrode, or otherwise fail.

(4) A containment building must have a primary barrier designed to withstand the movement of personnel, waste, and handling equipment in the unit during the operating life of the unit and appropriate for the physical and chemical characteristics of the waste to be managed.

(b) For a containment building used to manage hazardous wastes containing free liquids or treated with free liquids (the presence of which is determined by the paint filter test, a visual examination, or other appropriate means), the owner or operator must include:
(1) A primary barrier designed and constructed of materials to prevent the migration of hazardous constituents into the barrier (e.g., a geomembrane covered by a concrete wear surface).
(2) A liquid collection and removal system to minimize the accumulation of liquid on the primary barrier of the containment building:
(i) The primary barrier must be sloped to drain liquids to the associated

collection system; and

(ii) Liquids and waste must be collected and removed to minimize hydraulic head on the containment system at the earliest practicable time.

(3) A secondary containment system including a secondary barrier designed and constructed to prevent migration of hazardous constituents into the barrier, and a leak detection system that is capable of detecting failure of the primary barrier and collecting accumulated hazardous wastes and liquids at the earliest practicable time.

(i) The requirements of the leak detection component of the secondary containment system are satisfied by installation of a system that is, at a minimum:

(A) Constructed with a bottom slope of 1 percent or more; and

(B) Constructed of a granular drainage material with a hydraulic conductivity of 1x10-2 cm/sec or more and a thickness of 12 inches (30.5 cm) or more, or constructed of synthetic or geonet drainage materials with a transmissivity of 3x10-5 m/2//sec or more.

(ii) If treatment is to be conducted in the building, an area in which such treatment will be conducted must be designed to prevent the release of liquids, wet materials, or liquid aerosols to other portions of the building.

(iii) The secondary containment system must be constructed of materials that are chemically resistant to the waste and liquids managed in the containment building and of sufficient strength and thickness to prevent collapse under the pressure exerted by overlaying materials and by any equipment used in the containment building. (Containment buildings can serve as secondary containment systems for tanks placed within the building under certain conditions. A containment building can serve as an external liner system for a tank, provided it meets the requirements of Sec. 264.193(d)(1).

In addition, the containment building must meet the requirements of Sec. 264.193(b) and Secs. 264.193(c) (1) and (2) to be considered an acceptable secondary containment system for a tank.)

(4) For existing units other than 90-day generator units, the Regional Administrator may delay the secondary containment requirement for up to two years, based on a demonstration by the owner or operator that the unit substantially meets the standards of this subpart. In making this demonstration, the owner or operator must:

(i) Provide written notice to the Regional Administrator of their request by November 16, 1992. This notification must describe the unit and its operating practices with specific reference to the performance of existing containment systems, and specific plans for retrofitting the unit with secondary containment;

(ii) Respond to any comments from the Regional Administrator on these plans within 30 days; and

(iii) Fulfill the terms of the revised plans, if such plans are approved by the Regional Administrator.

(c) Owners or operators of all containment buildings must:

(1) Use controls and practices to ensure containment of the hazardous waste within the unit; and, at a minimum:

(i) Maintain the primary barrier to be free of significant cracks, gaps, corrosion, or other deterioration that could cause hazardous waste to be released from the primary barrier;

(ii) Maintain the level of the stored/treated hazardous waste within the

containment walls of the unit so that the height of any containment wall is not exceeded;

(iii) Take measures to prevent the tracking of hazardous waste out of the unit by personnel or by equipment used in handling the waste. An area must be designated to decontaminate equipment and any rinsate must be collected and properly managed; and

(iv) Take measures to control fugitive dust emissions such that any openings (doors, windows, vents, cracks, etc.) exhibit no visible emissions (see 40 CFR part 60, appendix A, Method 22--Visual Determination of Fugitive Emissions from Material Sources and Smoke Emissions from Flares). In addition, all associated particulate collection devices (e.g., fabric filter, electrostatic precipitator) must be operated and maintained with sound air pollution control practices (see 40 CFR part 60 subpart 292 for guidance).

This state of no visible emissions must be maintained effectively at all times during routine operating and maintenance conditions, including when vehicles and personnel are entering and exiting the unit.

(2) Obtain certification by a qualified registered professional engineer that the containment building design meets the requirements of paragraphs (a) through (c) of this section. For units placed into operation prior to February 18, 1993, this certification must be placed in the facility's operating record (on-site files for generators who are not formally required to have operating records) no later than 60 days after the date of initial operation of the unit. After February 18, 1993, PE certification will be required prior to operation of the unit.

(3) Throughout the active life of the containment building, if the owner or operator detects a condition that could lead to or has caused a release of hazardous waste, must repair the condition promptly, in accordance with the following procedures.

(i) Upon detection of a condition that has lead to a release of hazardous waste (e.g., upon detection of leakage from the primary barrier) the owner or operator must:

(A) Enter a record of the discovery in the facility operating record;

(B) Immediately remove the portion of the containment building affected by the condition from service;

(C) Determine what steps must be taken to repair the containment building, remove any leakage from the secondary collection system, and establish a schedule for accomplishing the cleanup and repairs; and

(D) Within 7 days after the discovery of the condition, notify the Regional Administrator of the condition, and within 14 working days, provide a written notice to the Regional Administrator with a description of the steps taken to repair the containment building, and the schedule for accomplishing the work.

(ii) The Regional Administrator will review the information submitted, make a determination regarding whether the containment building must be removed from service completely or partially until repairs and cleanup are complete, and notify the owner or operator of the determination and the underlying rationale in writing.

(iii) Upon completing all repairs and cleanup the owner or operator must notify the Regional Administrator in writing and provide a verification, signed by a qualified, registered professional engineer, that the repairs and cleanup have been completed according to the written plan submitted in accordance with paragraph (c)(3)(i)(D) of this section.

(4) Inspect and record in the facility's operating record, at least once every seven days, data gathered from monitoring equipment and leak detection equipment as well as the containment building and the area immediately surrounding the containment building to detect signs of releases of hazardous waste.

(d) For containment buildings that contain areas both with and without secondary containment, the owner or operator must:
(1) Design and operate each area in accordance with the requirements enumerated in paragraphs (a) through (c) of this section;
(2) Take measures to prevent the release of liquids or wet materials into areas without secondary containment; and
(3) Maintain in the facility's operating log a written description of the operating procedures used to maintain the integrity of areas without secondary containment.

(e) Notwithstanding any other provision of this subpart the Regional Administrator may waive requirements for secondary containment for a permitted containment building where the owner operator demonstrates that the only free liquids in the unit are limited amounts of dust suppression liquids required to meet occupational health and safety requirements, and where containment of managed wastes and liquids can be assured without a secondary containment system.

Sec. 264.1102 Closure and post-closure care.

(a) At closure of a containment building, the owner or operator must remove or decontaminate all waste residues, contaminated containment system components (liners, etc.,) contaminated subsoils, and structures and equipment contaminated with waste and leachate, and manage them as hazardous waste unless Sec. 261.3(d) of this chapter applies. The closure plan, closure activities, cost estimates for closure, and financial responsibility for containment buildings must meet all of the requirements specified in subparts G and H of this part.

(b) If, after removing or decontaminating all residues and making all reasonable efforts to effect removal or decontamination of contaminated components, subsoils, structures, and equipment as required in paragraph (a) of this section, the owner or operator finds that not all contaminated subsoils can be practicably removed or decontaminated, he must close the facility and perform post-closure care in accordance with the closure and post-closure requirements that apply to landfills (Sec. 264.310). In addition, for the purposes of closure, post-closure, and financial responsibility, such a containment building is then considered to be a landfill, and the owner or operator must meet all of the requirements for landfills specified in subparts G and H of this part.

Sec. 264.1103-264.1110 (Reserved)

PART 265--INTERIM STATUS STANDARDS FOR OWNERS AND OPERATORS OF HAZARDOUS WASTE TREATMENT, STORAGE, AND DISPOSAL FACILITIES

18. The authority citation for part 265 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6924, 6925, 6935, and 6936.

19. Section 265.110 is amended by removing the word "and" from the end of paragraphs (b)(1) and (b)(2), by adding "; and" in place of the period at the end of paragraph (b)(3), and by adding a new paragraph (b)(4) to read as follows:

Sec. 265.110 Applicability.

* * * * *

(b) * * *
(4) Containment building that are required under Sec. 265.1102 to meet the requirement for landfills.

20. Section 265.111 is amended by revising paragraph (c) to read as follows:

Sec. 265.111 Closure performance standard.
* * * * *

(c) Complies with the closure requirements of this subpart, including, but not limited to, the requirements of Secs. 265.197, 265.228, 265.258, 265.280, 265.310, 265.351, 265.381, 265.404, and 264.1102.

21. In Sec. 265.112 (d)(4), the last two sentences are revised to read as follows:

Sec. 265.112 Closure plan; amendment of plan.

* * * * *

(d) * * *
(4) * * * The Regional Administrator must assure that the approved plan is consistent with Secs. with 265.111 through 265.115 and the applicable requirements of subpart F of this part, Secs. 265.197, 265.228, 265.258, 265.280, 265.310, 265.351, 265.381, 265.404, and 264.1102. A copy of the modified plan with a detailed statement of reasons for the modifications must be mailed to the owner or operator.

* * * * *

22. Section 265.140 is amended by revising paragraph (b) to read as follows:

Sec. 265.140 Applicability.

(b) The requirements of Secs. 265.144 and 265.146 apply only to owners and operators of:
(1) Disposal facilities;
(2) Tank systems that are required under Sec. 264.197 of this chapter to meet the requirements for landfills; and
(3) Containment buildings that are required under Sec. 265.1102 to meet the requirements for landfills.

* * * * *

23. Section 265.142 is amended by revising the introductory text of paragraph (a) to read as follows:

Sec. 265.142 Cost estimate for closure.

(a) The owner or operator must have a detailed written estimate, in current dollars, of the cost of closing the facility in accordance with the requirements in Secs. 265.111 through 265.115 and applicable closure requirements in Secs. 265.178, 265.197, 265.228, 265.258, 265.280, 265.310, 265.351, 265.381, 265.404, and 265.1102

* * * * *

24. In Sec. 265.221, a new paragraph (h) is added to read as follows:

Sec. 265.221 Design and operating requirements.

* * * * *

(h) Surface impoundments that are newly subject to RCRA section 3005(j)(1) due to the promulgation of additional listings or characteristics for the identification of hazardous waste must be in compliance with paragraphs (a), (c) and (d) of this section not later than 48 months after the promulgation of the additional listing or characteristic. This compliance period shall not be cut short as the result of the promulgation of land disposal prohibitions under part 268 of this chapter or the granting of an extension to the effective date of a prohibition pursuant to Sec. 268.5 of this chapter, within this 48-month period.

25. Subpart CC is added and reserved and subpart DD is added to part 265 to read as follows:

Subpart DD--Containment Buildings

Sec.
265.1100 Applicability.
265.1101 Design and operating standards.
265.1102 Closure and post-closure care.
265.1103 -265.1110 (Reserved)

Subpart DD--Containment Buildings

Sec. 265.1100 Applicability.

The requirements of this subpart apply to owners or operators who store or treat hazardous waste in units designed and operated under Sec. 265.1101 of this subpart. These provisions will become effective on February 18, 1993, although the owner or operator may notify the Regional Administrator of his intent to be bound by this subpart at an earlier time. The owner or operator is not subject to the definition of land disposal in RCRA section 3004(k) provided that the unit:

(a) Is a completely enclosed, self-supporting structure that is designed and constructed of manmade materials of sufficient strength and thickness to support themselves, the waste contents, and any personnel and heavy

equipment that operate within the units, and to prevent failure due to pressure gradients, settlement, compression, or uplift, physical contact with the hazardous wastes to which they are exposed; climatic conditions; and the stresses of daily operation, including the movement of heavy equipment within the unit and contact of such equipment with containment walls;

(b) Has a primary barrier that is designed to be sufficiently durable to withstand the movement of personnel and handling equipment within the unit;

(c) If the unit is used to manage liquids, has:

(1) A primary barrier designed and constructed of materials to prevent migration of hazardous constituents into the barrier;

(2) A liquid collection system designed and constructed of materials to minimize the accumulation of liquid on the primary barrier; and

(3) A secondary containment system designed and constructed of materials to prevent migration of hazardous constituents into the barrier, with a leak detection and liquid collection system capable of detecting, collecting, and removing leaks of hazardous constituents at the earliest possible time, unless the unit has been granted a variance from the secondary containment system requirements under Sec. 265.1101(b)(4);

(d) Has controls as needed to permit fugitive dust emissions; and

(e) Is designed and operated to ensure containment and prevent the tracking of materials from the unit by personnel or equipment.

Sec. 265.1101 Design and operating standards.

(a) All containment buildings must comply with the following design standards:

(1) The containment building must be completely enclosed with a floor, walls, and a roof to prevent exposure to the elements, (e.g., precipitation, wind, run-on), and to assure containment of managed wastes.

(2) The floor and containment walls of the unit, including the secondary containment system if required under paragraph (b) of this section, must be designed and constructed of materials of sufficient strength and thickness to support themselves, the waste contents, and any personnel and heavy equipment that operate within the unit, and to prevent failure due to pressure gradients, settlement, compression, or uplift, physical contact with the hazardous wastes to which they are exposed; climatic conditions; and the stresses of daily operation, including the movement of heavy equipment within the unit and contact of such equipment with containment walls. The unit must be designed so that it has sufficient structural strength to prevent collapse or other failure. All surfaces to be in contact with hazardous wastes must be chemically compatible with those wastes. EPA will consider standards established by professional organizations generally recognized by the industry such as the American Concrete Institute (ACI) and the American Society of Testing Materials (ASTM) in judging the structural integrity requirements of this paragraph. If appropriate to the nature of the waste management operation to take place in the unit, an exception to the structural strength requirement may be made for light-weight doors and windows that meet these criteria:

(i) They provide an effective barrier against fugitive dust emissions under paragraph (c)(1)(iv); and

(ii) The unit is designed and operated in a fashion that assures that wastes will not actually come in contact with these openings.

(3) Incompatible hazardous wastes or treatment reagents must not be placed in the unit or its secondary containment system if they could cause the unit or secondary containment system to leak, corrode, or otherwise fail.

(4) A containment building must have a primary barrier designed to withstand the movement of personnel, waste, and handling equipment in the unit during the operating life of the unit and appropriate for the physical and chemical characteristics of the waste to be managed.

(b) For a containment building used to manage hazardous wastes containing free liquids or treated with free liquids (the presence of which is determined by the paint filter test, a visual examination, or other appropriate means), the owner or operator must include:
(1) A primary barrier designed and constructed of materials to prevent the migration of hazardous constituents into the barrier (e.g. a geomembrane covered by a concrete wear surface).

(2) A liquid collection and removal system to prevent the accumulation of liquid on the primary barrier of the containment building:
(i) The primary barrier must be sloped to drain liquids to the associated collection system; and
(ii) Liquids and waste must be collected and removed to minimize hydraulic head on the containment system at the earliest practicable time that protects human health and the environment.
(3) A secondary containment system including a secondary barrier designed and constructed to prevent migration of hazardous constituents into the barrier, and a leak detection system that is capable of detecting failure of the primary barrier and collecting accumulated hazardous wastes and liquids at the earliest practicable time.

(i) The requirements of the leak detection component of the secondary containment system are satisfied by installation of a system that is, at a minimum:
(A) Constructed with a bottom slope of 1 percent or more; and
(B) Constructed of a granular drainage material with a hydraulic conductivity of 1 x 10-/2/ cm/sec or more and a thickness of 12 inches (30.5 cm) or more, or constructed of synthetic or geonet drainage materials with a trasmissivity of 3 x 10-/5/ m /2//sec or more.

(ii) If treatment is to be conducted in the building, an area in which such treatment will be conducted must be designed to prevent the release of liquids, wet materials, or liquid aerosols to other portions of the building.

(iii) The secondary containment system must be constructed of materials that are chemically resistant to the waste and liquids managed in the containment building and of sufficient strength and thickness to prevent collapse under the pressure exerted by overlaying materials and by any equipment used in the containment building. (Containment buildings can serve as secondary containment systems for tanks placed within the building under certain conditions. A containment building can serve as an external liner system for a tank, provided it meets the requirements of Sec. 265.193(d)(1).
In addition, the containment building must meet the requirements of Sec.
265.193 (b) and (c) to be considered an acceptable secondary containment system for a tank.)
(4) For existing units other than 90-day generator units, the Regional

Administrator may delay the secondary containment requirement for up to two years, based on a demonstration by the owner or operator that the unit substantially meets the standards of this Subpart. In making this demonstration, the owner or operator must:

(i) Provide written notice to the Regional Administrator of their request by February 18, 1993. This notification must describe the unit and its operating practices with specific reference to the performance of existing containment systems, and specific plans for retrofitting the unit with secondary containment;

(ii) Respond to any comments from the Regional Administrator on these plans within 30 days; and

(iii) Fulfill the terms of the revised plans, if such plans are approved by the Regional Administrator.

(c) Owners or operators of all containment buildings must:

(1) Use controls and practices to ensure containment of the hazardous waste within the unit; and, at a minimum:

(i) Maintain the primary barrier to be free of significant cracks, gaps, corrosion, or other deterioration that could cause hazardous waste to be released from the primary barrier;

(ii) Maintain the level of the stored/treated hazardous waste within the containment walls of the unit so that the height of any containment wall is not exceeded;

(iii) Take measures to prevent the tracking of hazardous waste out of the unit by personnel or by equipment used in handling the waste. An area must be designated to decontaminate equipment and any rinsate must be collected and properly managed; and

(iv) Take measures to control fugitive dust emissions such that any openings (doors, windows, vents, cracks, etc.) exhibit no visible emissions.

In addition, all associated particulate collection devices (e.g., fabric filter, electrostatic precipitator) must be operated and maintained with sound air pollution control practices. This state of no visible emissions must be maintained effectively at all times during normal operating conditions, including when vehicles and personnel are entering and exiting the unit.

(2) Obtain certification by a qualified registered professional engineer that the containment building design meets the requirements of paragraphs (a) through (c) of this section. For units placed into operation prior to February 18, 1993, this certification must be placed in the facility's operating record (on-site files for generators who are not formally required to have operating records) no later than 60 days after the date of initial operation of the unit. After February 18, 1993, PE certification will be required prior to operation of the unit.

(3) Throughout the active life of the containment building, if the owner or operator detects a condition that could lead to or has caused a release of hazardous waste, must repair the condition promptly, in accordance with the following procedures.

(i) Upon detection of a condition that has led to a release of hazardous waste (e.g., upon detection of leakage from the primary barrier) the owner or operator must:

(A) Enter a record of the discovery in the facility operating record;

(B) Immediately remove the portion of the containment building affected by the condition from service;

(C) Determine what steps must be taken to repair the containment building, remove any leakage from the secondary collection system, and establish a schedule for accomplishing the cleanup and repairs; and
(D) Within 7 days after the discovery of the condition, notify the Regional Administrator of the condition, and within 14 working days, provide a written notice to the Regional Administrator with a description of the steps taken to repair the containment building, and the schedule for accomplishing the work.

(ii) The Regional Administrator will review the information submitted, make a determination regarding whether the containment building must be removed from service completely or partially until repairs and cleanup are complete, and notify the owner or operator of the determination and the underlying rationale in writing.

(iii) Upon completing all repairs and cleanup the owner or operator must notify the Regional Administrator in writing and provide a verification, signed by a qualified, registered professional engineer, that the repairs and cleanup have been completed according to the written plan submitted in accordance with paragraph (c)(3)(i)(D) of this section.

(4) Inspect and record in the facility's operating record, at least once every seven days, data gathered from monitoring equipment and leak detection equipment as well as the containment building and the area immediately surrounding the containment building to detect signs of releases of hazardous waste.

(d) For containment building that contains both areas with and without secondary containment, the owner or operator must:
(1) Design and operate each area in accordance with the requirements enumerated in paragraphs (a) through (c) of this section;
(2) Take measures to prevent the release of liquids or wet materials into areas without secondary containment; and
(3) Maintain in the facility's operating log a written description of the operating procedures used to maintain the integrity of areas without secondary containment.

(e) Notwithstanding any other provision of this subpart, the Regional Administrator may waive requirements for secondary containment for a permitted containment building where the owner or operator demonstrates that the only free liquids in the unit are limited amounts of dust suppression liquids required to meet occupational health and safety requirements, and where containment of managed wastes and liquids can be assured without a secondary containment system.

Sec. 265.1102 Closure and post-closure care.

(a) At closure of a containment building, the owner or operator must remove or decontaminate all waste residues, contaminated containment system components (liners, etc.), contaminated subsoils, and structures and equipment contaminated with waste and leachate, and manage them as hazardous waste unless Sec. 261.3(d) of this chapter applies. The closure plan, closure activities, cost estimates for closure, and financial responsibility for containment buildings must meet all of the requirements specified in subparts G and H of this part.

(b) If, after removing or decontaminating all residues and making all reasonable efforts to effect removal or decontamination of contaminated components, subsoils, structures, and equipment as required in paragraph (a) of this section, the owner or operator finds that not all contaminated subsoils can be practicably removed or decontaminated, he must close the facility and perform post-closure care in accordance with the closure and post-closure requirements that apply to landfills (Sec. 265.310). In addition, for the purposes of closure, post-closure, and financial responsibility, such a containment building is then considered to be a landfill, and the owner or operator must meet all of the requirements for landfills specified in subparts G and H of this part.

Secs. 265.1103--265.1110 (Reserved)

PART 268--LAND DISPOSAL RESTRICTIONS

26. The authority citation for part 268 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6921, and 6924.

27. In Sec. 268.2 paragraph (g) is revised and paragraph (h) added to read as follows:

Sec. 268.2 Definitions applicable in this part.

* * * * *

(g) Debris means solid material exceeding a 60 mm particle size that is intended for disposal and that is: A manufactured object; or plant or animal matter; or natural geologic material. However, the following materials are not debris: Any material for which a specific treatment standard is provided in subpart D, part 268; Process residuals such as smelter slag and residues from the treatment of waste, wastewater, sludges, or air emission residues; and Intact containers of hazardous waste that are not ruptured and that retain at least 75% of their original volume. A mixture of debris that has not been treated to the standards provided by Sec. 268.45 and other material is subject to regulation as debris if the mixture is comprised primarily of debris, by volume, based on visual inspection.

(h) Hazardous debris means debris that contains a hazardous waste listed in subpart D of part 261 of this chapter, or that exhibits a characteristic of hazardous waste identified in subpart C of part 261 of this chapter.

28. Section 268.5 is amended by adding "; or" in place of the semicolon at the end of paragraph (h)(2)(ii), by redesignating paragraph (h)(2)(v) as paragraph (h)(2)(vi), by revising paragraph (h)(2)(iv) and by adding new paragraph (h)(2)(v) to read as follows:

Sec. 268.5 Procedures for case-by-case extensions to an effective date.

* * * * *

(h) * * *

(2) * * *
(iv) The surface impoundment, if permitted, is in compliance with the requirements of subpart F of part 264 and Sec. 264.221 (c), (d) and (e) of this chapter; or
(v) The surface impoundment, if newly subject to RCRA section 3005(j)(1) due to the promulgation of additional listings or characteristics for the identification of hazardous waste, is in compliance with the requirements of subpart F of part 265 of this chapter within 12 months after the promulgation of additional listings or characteristics of hazardous waste, and with the requirements of Sec. 265.221 (a), (c) and (d) of this chapter within 48 months after the promulgation of additional listings or characteristics of hazardous waste. If a national capacity variance is granted, during the period the variance is in effect, the surface impoundment, if newly subject to RCRA section 3005(j)(1) due to the promulgation of additional listings or characteristics of hazardous waste, is in compliance with the requirements of subpart F of part 265 of this chapter within 12 months after the promulgation of additional listings or characteristics of hazardous waste, and with the requirements of Sec. 265.221 (a), (c) and (d) of this chapter within 48 months after the promulgation of additional listings or characteristics of hazardous waste; or
* * * * *

29. Section 268.7 is amended by revising paragraphs (a)(1)(iii), (a)(1)(iv), (a)(2) introductory text, (a)(3)(iv), (a)(3)(v), (a)(4) introductory text, (b)(4) introductory text, and (b)(5) introductory text, and by adding paragraphs (a)(1)(v), (a)(3)(vi), and (d) to read as follows:

Sec. 268.7 Waste analysis and recordkeeping.

(a) * * *
(1) * * *
(iii) The manifest number associated with the shipment of waste;
(iv) For hazardous debris, the contaminants subject to treatment as provided by Sec. 268.45(b) and the following statement: "This hazardous debris is subject to the alternative treatment standards of 40 CFR 268.45"; and
(v) Waste analysis data, where available.

(2) If a generator determines that he is managing a restricted waste under this Part, and determines that the waste can be land disposed without further treatment, with each shipment of waste he must submit, to the treatment, storage, or land disposal facility, a notice and a certification stating that the waste meets the applicable treatment standards set forth in subpart D of this part and the applicable prohibition levels set forth in Sec. 268.32 or RCRA section 3004(d). Generators of hazardous debris that is excluded from the definition of hazardous waste under Sec. 261.3(e)(2) of this chapter (i.e., debris that the Director has determined does not contain hazardous waste), however, are not subject to these notification and certification requirements.

* * * * *

(3) * * *
(iv) Waste analysis data, where available;
(v) For hazardous debris, the contaminants subject to treatment as

provided by Sec. 268.45(b) and the following statement: "This hazardous debris is subject to the alternative treatment standards of 40 CFR 268.45"; and

(vi) The date the waste is subject to the prohibitions.

(4) If a generator is managing prohibited waste in tanks, containers, or containment buildings regulated under 40 CFR 262.34, and is treating such waste in such tanks, containers, or containment buildings to meet applicable treatment standards under subpart D of this part, the generator must develop and follow a written waste analysis plan which describes the procedures the generator will carry out to comply with the treatment standards. (Generators treating hazardous debris under the alternative treatment standards of Table 1, Sec. 268.45, however, are not subject to these waste analysis requirements.) The plan must be kept on site in the generator's records, and the following requirements must be met:

* * * * *

(b) * * *

(4) A notice must be sent with each waste shipment to the land disposal facility which includes the following information, except that debris excluded from the definition of hazardous waste under Sec. 261.3(e) of this chapter (i.e., debris treated by an extraction or destruction technology provided by Table 1, Sec. 268.45, and debris that the Director has determined does not contain hazardous waste) is subject to the notification and certification requirements of paragraph (d) of this section rather than these notification requirements:

* * * * *

(5) The treatment facility must submit a certification with each shipment of waste or treatment residue of a restricted waste to the land disposal facility stating that the waste or treatment residue has been treated in compliance with the applicable performance standards specified in subpart D of this part and the applicable prohibitions set forth in Sec. 268.32 or RCRA section 3004(d). Debris excluded from the definition of hazardous waste under Sec. 261.3(e) of this chapter (i.e., debris treated by an extraction or destruction technology provided by Table 1, Sec. 268.45, and debris that the Director has determined does not contain hazardous waste), however, is subject to the notification and certification requirements of paragraph (d) of this section rather than the certification requirements of this paragraph (b)(5).

* * * * *

(d) Generators or treaters who first claim that hazardous debris is excluded from the definition of hazardous waste under Sec. 261.3(e) of this chapter (i.e., debris treated by an extraction or destruction technology provided by Table 1, Sec. 268.45, and debris that the Director has determined does not contain hazardous waste) are subject to the following notification and certification requirements:

(1) A one-time notification must be submitted to the Director or authorized State including the following information:

(i) The name and address of the Subtitle D facility receiving the treated debris;

(ii) A description of the hazardous debris as initially generated, including the applicable EPA Hazardous Waste Number(s); and

(iii) For debris excluded under Sec. 261.3(e)(1) of this chapter, the technology from Table 1, Sec. 268.45, used to treat the debris.

(2) The notification must be updated if the debris is shipped to a different facility, and, for debris excluded under Sec. 261.2(e)(1) of this chapter, if a different type of debris is treated or if a different technology is used to treat the debris.

(3) For debris excluded under Sec. 261.3(e)(1) of this chapter, the owner or operator of the treatment facility must document and certify compliance with the treatment standards of Table 1, Sec. 268.45, as follows:
(i) Records must be kept of all inspections, evaluations, and analyses of treated debris that are made to determine compliance with the treatment standards;
(ii) Records must be kept of any data or information the treater obtains during treatment of the debris that identifies key operating parameters of the treatment unit; and
(iii) For each shipment of treated debris, a certification of compliance with the treatment standards must be signed by an authorized representative and placed in the facility's files. The certification must state the following: "I certify under penalty of law that the debris has been treated in accordance with the requirements of 40 CFR 268.45. I am aware that there are significant penalties for making a false certification, including the possibility of fine and imprisonment."
* * * * *

30. In Sec. 268.9, paragraph (d) is revised to read as follows:

Sec. 268.9 Special rules regarding wastes that exhibit a characteristic.

* * * * *

(d) Wastes that exhibit a characteristic are also subject to Sec. 268.7 requirements, except that once the waste is no longer hazardous, a one-time notification and certification must be placed in the generators or treaters files and sent to the EPA region or authorized state. The notification and certification that is placed in the generators or treaters files must be updated if the process or operation generating the waste changes and/or if the subtitle D facility receiving the waste changes. However, the generator or treater need only notify the EPA region or an authorized state on an annual basis if such changes occur. Such notification and certification should be sent to the EPA region or authorized state by the end of the calendar year, but no later that December 31.

(1) The notification must include the following information:
(i) Name and address of the Subtitle D facility receiving the waste shipment;
(ii) A description of the waste as initially generated, including the applicable EPA Hazardous Waste Number(s) and treatability group(s);
(iii) The treatment standards applicable to the waste at the point of generation.

(2) The certification must be signed by an authorized representative and must state the language found in Sec. 268.7(b)(5).

31. Section 268.14 is added to subpart B of part 268 to read as follows:

Sec. 268.14 Surface impoundment exemptions.

(a) This section defines additional circumstances under which an otherwise prohibited waste may continue to be placed in a surface impoundment.

(b) Wastes which are newly identified or listed under section 3001 after November 8, 1984, and stored in a surface impoundment that is newly subject to subtitle C of RCRA as a result of the additional identification or listing, may continue to be stored in the surface impoundment for 48 months after the promulgation of the additional listing or characteristic, not withstanding that the waste is otherwise prohibited from land disposal, provided that the surface impoundment is in compliance with the requirements of subpart F of part 265 of this chapter within 12 months after promulgation of the new listing or characteristic.

(c) Wastes which are newly identified or listed under section 3001 after November 8, 1984, and treated in a surface impoundment that is newly subject to subtitle C of RCRA as a result of the additional identification or listing, may continue to be treated in that surface impoundment, not withstanding that the waste is otherwise prohibited from land disposal, provided that surface impoundment is in compliance with the requirements of subpart F of part 265 of this chapter within 12 months after the promulgation of the new listing or characteristic. In addition, if the surface impoundment continues to treat hazardous waste after 48 months from promulgation of the additional listing or characteristic, it must then be in compliance with Sec.
268.4.

32. Section 268.36 is added to subpart C of part 268 to read as follows:

Sec. 268.36 Waste specific prohibitions--newly listed wastes.

(a) Effective November 9, 1992, the wastes specified in 40 CFR 261.32 as EPA Hazardous Waste Numbers K107, K108, K109, K110, K111, K112, K117, K118, K123, K124, K125, K126, K131, K132, and K136; and the wastes specified in 40 CFR 261.33(f) as EPA Hazardous Waste numbers U328, U353, and U359 are prohibited from land disposal.

(b) Effective June 30, 1993, the wastes specified in 40 CFR 261.31 as EPA Hazardous Waste Numbers F037 and F038 that are not generated from surface impoundment cleanouts or closures are prohibited from land disposal.

(c) Effective June 30, 1994, the wastes specified in 40 CFR 261.31 as EPA Hazardous Waste Numbers F037 and F038 that are generated from surface impoundment cleanouts or closures are prohibited from land disposal.

(d) Effective June 30, 1994, radioactive wastes that are mixed with hazardous wastes specified in 40 CFR 261.31 as EPA Hazardous Waste Numbers F037 and F038; the wastes specified in 40 CFR 261.32 as EPA Hazardous Waste Numbers K107, K108, K109, K110, K111, K112, K117, K118, K123, K124, K125, K126 K131, K132, and K136; or the wastes specified in 40 CFR 261.33(f) as EPA Hazardous Waste Numbers U328, U353, and U359 are prohibited from land disposal.

(e) Effective June 30, 1994, debris contaminated with hazardous wastes specified in 40 CFR 261.31 as EPA Hazardous Waste Numbers F037 and F038; the wastes specified in 40 CFR 261.32 as EPA Hazardous Waste Numbers K107,

K108, K109, K110, K111, K112, K117, K118, K123, K124, K125, K126 K131, K132, and K136; or the wastes specified in 40 CFR 261.33(f) as EPA Hazardous Waste Numbers U328, U353, and U359; and which is not contaminated with any other waste already subject to a prohibition are prohibited from land disposal.

(f) Between June 30, 1992 and June 30, 1993, the wastes included in paragraph (b) of this section may be disposed of in a landfill, only if such unit is in compliance with the requirements specified in Sec. 268.5(h)(2), and may be generated in and disposed of in a surface impoundment only if such unit is in compliance with either Sec. 268.5(h)(2) or Sec. 268.14.

(g) Between June 30, 1992 and June 30, 1994, the wastes included in paragraphs (d) and (e) of this section may be disposed of in a landfill only if such unit is in compliance with the requirements specified in Sec. 268.5(h)(2), and may be generated in and disposed of in a surface impoundment only if such unit is in compliance with either Sec. 268.5(h)(2) or Sec. 268.14.

(h) The requirements of paragraphs (a), (b), (c), (d), and (e) of this section do not apply if:
(1) The wastes meet the applicable standards specified in subpart D of this part;
(2) Persons have been granted an exemption from a prohibition pursuant to a petition under Sec. 268.6, with respect to those wastes and units covered by the petition;
(3) The wastes meet the applicable alternate standards established pursuant to a petition granted under Sec. 268.44;
(4) Persons have been granted an extension to the effective date of a prohibition pursuant to Sec. 268.5, with respect to the wastes covered by the extension.

(i) To determine whether a hazardous waste identified in this section exceeds the applicable treatment standards specified in Secs. 268.41 and 268.43, the initial generator must test a representative sample of the waste extract or the entire waste, depending on whether the treatment standards are expressed as concentrations in the waste extract or the waste, or the generator may use knowledge of the waste. If the waste contains constituents in excess of the applicable levels in subpart D of this part, the waste is prohibited from land disposal, and all requirements of part 268 are applicable, except as otherwise specified.

33. In Sec. 268.40, paragraph (b) is revised and paragraph (d) is added to read as follows:

Sec. 268.40 Applicability of treatment standards.

* * * * *

(b) A restricted waste for which a treatment technology is specified under Sec. 268.42(a) or hazardous debris for which a treatment technology is specified under Sec. 268.45 may be land disposed after it is treated using that specified technology or an equivalent treatment method approved by the Administrator under the procedures set forth in Sec. 268.42(b).

* * * * *

(d) If a treatment standard has been established in Secs. 268.41 through 268.43 for a hazardous waste that is itself hazardous debris, the waste is subject to those standards rather than the standards for hazardous debris under Sec. 268.45.

34. In Sec. 268.41, paragraph (a) text preceding table is revised, and Table CCWE is amended by revising the entry for "F001-F005 spent solvents," by removing the entries for "K061 (Low Zinc Subcategory--less than 15% Total Zinc)" and "K061 (High Zinc Subcategory--greater than 15% Total Zinc)-- Effective until August 7, 1991, by adding entries for "F037", "F038", and "K061", and by adding paragraph (c) to read as follows:

Sec. 268.41 Treatment standards expressed as concentrations in waste extract.

(a) Table CCWE identifies the restricted wastes and the concentrations of their associated constituents which may not be exceeded in the extract of a waste or waste treatment residual extracted using the test method in appendix I of this part for the allowable land disposal of such wastes. Compliance with these concentrations is required based upon grab samples.

(b) Any person may submit an application to the Administrator demonstrating that an alternative treatment method can achieve a measure of performance equivalent to that achieved by methods specified in paragraphs (a), (c), and (d) of this section for wastes or specified in Table 1 of Sec. 268.45 for hazardous debris. The applicant must submit information demonstrating that his treatment method is in compliance with federal, state, and local requirements and is protective of human health and the environment. On the basis of such information and any other available information, the Administrator may approve the use of the alternative treatment method if he finds that the alternative treatment method provides a measure of performance equivalent to that achieved by methods specified in paragraphs (a), (c), and (d) of this section for wastes or in Table 1 of Sec. 268.45 for hazardous debris. Any approval must be stated in writing and may contain such provisions and conditions as the Administrator deems appropriate. The person to whom such approval is issued must comply with all limitations contained in such a determination.

* * * * *

(d) Radioactive hazardous mixed wastes with treatment standards specified in Table 3 of this section are not subject to any treatment standards specified in Secs. 268.41 or 268.43, or Table 2 of this section. Radioactive hazardous mixed wastes not subject to treatment standards in Table 3 of this section remain subject to all applicable treatment standards specified in Secs. 268.41, 268.43, and Table 2 of this section. Hazardous debris containing radioactive waste is not subject to the treatment standards specified in Table 3 of this section but is subject to the treatment standards specified in Sec. 268.45.

37. In Sec. 268.43(a) Table CCW is amended by revising the entries for F001-F005 spent solvents, K015, K016, K018, K019, K020, K023, K024, K028, K030, K043, K048, K049, K050, K051, K052, K087, K093, K094, U028, U069, U088, U102, U107, and U190, by removing the entry for U042, and by adding the entries for F037, F038, K117, K118, K131, K132, and K136 in alphanumerical order to read as follows:

Sec. 268.43 Treatment standards expressed as waste concentrations.

/1/ Treatment standards for this organic constituent were

established based upon incineration in units operated in accordance with the technical requirements of 40 CFR 264 Subpart O or Part 265 Subpart O, or based upon combustion in fuel substitution units operating in accordance with applicable technical requirements. A facility may certify compliance with these treatment standards according to provisions in 40 CFR Section 268.7.

/2/ Based on analysis of composite samples.

* * * * * * *

Note: NA means Not Applicable.

38. In subpart D, Sec. 268.45 with Table 1 is added to read as follows:

Sec.268.45 Treatment standards for hazardous debris.

(a) Treatment standards. Hazardous debris must be treated prior to land disposal as follows unless EPA determines under Sec. 261.3(e)(2) of this chapter that the debris is no longer contaminated with hazardous waste or the debris is treated to the waste-specific treatment standard provided in this subpart for the waste contaminating the debris:

(1) General. Hazardous debris must be treated for each "contaminant subject to treatment" defined by paragraph (b) of this section using the technology or technologies identified in Table 1 of this section.

(2) Characteristic debris. Hazardous debris that exhibits the characteristic of ignitability, corrosivity, or reactivity identified under Secs. 261.21, 261.22, and 261.23 of this chapter, respectively, must be deactivated by treatment using one of the technologies identified in Table 1 of this section.

(3) Mixtures of debris types. The treatment standards of Table 1 in this section must be achieved for each type of debris contained in a mixture of debris types. If an immobilization technology is used in a treatment train, it must be the last treatment technology used.

(4) Mixtures of contaminant types. Debris that is contaminated with two or more contaminants subject to treatment identified under paragraph (b) of this section must be treated for each contaminant using one or more treatment technologies identified in Table 1 of this section. If an immobilization technology is used in a treatment train, it must be the last treatment technology used.

(5) Waste PCBs. Hazardous debris that is also a waste PCB under 40 CFR part 761 is subject to the requirements of either 40 CFR part 761 or the requirements of this section, whichever are more stringent.

(b) Contaminants subject to treatment. Hazardous debris must be treated for each "contaminant subject to treatment." The contaminants subject to treatment must be determined as follows:

(1) Toxicity characteristic debris. The contaminants subject to treatment for debris that exhibits the Toxicity Characteristic (TC) by Sec. 261.24 of this chapter are those EP constituents for which the debris exhibits the TC toxicity characteristic.

(2) Debris contaminated with listed waste. The contaminants subject to treatment for debris that is contaminated with a prohibited listed

hazardous waste are those constituents for which BDAT standards are established for the waste under Secs. 268.41 and 268.43.

(3) Cyanide reactive debris. Hazardous debris that is reactive because of cyanide must be treated for cyanide.

(c) Conditioned exclusion of treated debris. Hazardous debris that has been treated using one of the specified extraction or destruction technologies in Table 1 of this section and that does not exhibit a characteristic of hazardous waste identified under subpart C, part 261, of this chapter after treatment is not a hazardous waste and need not be managed in a subtitle C facility. Hazardous debris contaminated with a listed waste that is treated by an immobilization technology specified in Table 1 is a hazardous waste and must be managed in a subtitle C facility.

(d) Treatment residuals--(1) General requirements. Except as provided by paragraphs (d)(2) and (d)(4) of this section:
(i) Residue from the treatment of hazardous debris must be separated from the treated debris using simple physical or mechanical means; and
(ii) Residue from the treatment of hazardous debris is subject to the waste-specific treatment standards provided by subpart D of this part for the waste contaminating the debris.

(2) Nontoxic debris. Residue from the deactivation of ignitable, corrosive, or reactive characteristic hazardous debris (other than cyanide-reactive) that is not contaminated with a contaminant subject to treatment defined by paragraph (b) of this section, must be deactivated prior to land disposal and is not subject to the waste-specific treatment standards of subpart D of this part.

(3) Cyanide-reactive debris. Residue from the treatment of debris that is reactive because of cyanide must meet the standards for D003 under Sec. 268.43.

(4) Ignitable nonwastewater residue. Ignitable nonwastewater residue containing equal to or greater than 10% total organic carbon is subject to the technology-based standards for D001: "Ignitable Liquids based on Sec. 261.21(a)(1)" under Sec. 268.42.

(5) Residue from spalling. Layers of debris removed by spalling are hazardous debris that remain subject to the treatment standards of this section.

Table 1.--Alternative Treatment Standards For Hazardous Debris

Technology description	Performance and/or design and operating standard /1/	Contaminant restrictions /2/
A. Extraction Technologies:		
1. Physical Extraction		
a. Abrasive Blasting: Removal of contaminated debris surface layers using water and/or air pressure to propel a	Glass, Metal, Plastic, Rubber: Treatment to a clean debris surface./3/	All Debris: None.

solid media (e.g., steel shot, aluminum oxide grit, plastic beads)		
	Brick, Cloth, Concrete, Paper, Pavement, Rock, Wood: Removal of at least 0.6 cm of the surface layer; treatment to a clean debris surface./3/	
b. Scarification, Grinding, and Planing: Process utilizing striking piston heads, saws, or rotating grinding wheels such that contaminated debris surface layers are removed	Same as above	Same as above.
c. Spalling: Drilling or chipping holes at appropriate locations and depth in the contaminated debris surface and applying a tool which exerts a force on the sides of those holes such that the surface layer is removed. The surface layer removed remains hazardous debris subject to the debris treatment standards	Same as above	Same as above.
d. Vibratory Finishing: Process utilizing scrubbing media, flushing fluid, and oscillating energy such that hazardous contaminants or contaminated debris surface layers are removed./4/	Same as above	Same as above.
e. High Pressure Steam and Water Sprays: Application of water or steam sprays of sufficient temperature, pressure, residence time, agitation, surfactants, and detergents to remove hazardous contaminants from debris surfaces	Same as above	Same as above.

or to remove contaminated debris surface layers		
2. Chemical Extraction		
a. Water Washing and Spraying: Application of water sprays or water baths of sufficient temperature, pressure, residence time, agitation, surfactants, acids, bases, and detergents to remove hazardous contaminants from debris surfaces and surface pores or to remove contaminated debris surface layers	All Debris: Treatment to a clean debris surface /3/; Contaminant must be soluble to at least 5% by weight in water solution or 5% by weight in emulsion; if debris is contaminated with a dioxin-listed waste,/6/ an "Equivalent Technology" approval under Sec. 268.42(b) must be obtained./8/	
	Brick, Cloth, Concrete, Paper, Pavement, Rock, Wood: Debris must be no more than 1.2 cm (1/2 inch) in one dimension (i.e., thickness limit,/5/ except that this thickness limit may be waived under an "Equivalent Technology" approval under Sec. 268.42(b);/8/ debris surfaces must be in contact with water solution for at least 15 minutes	
b. Liquid Phase Solvent Extraction: Removal of hazardous contaminants from debris surfaces and surface pores by applying a nonaqueous liquid or liquid solution which causes the hazardous contaminants to enter the liquid phase and be flushed away from the debris along with the liquid or liquid solution while using appropriate agitation, temperature, and residence time./4/	Same as above	Brick, Cloth, Concrete, Paper, Pavement, Rock, Wood: Same as above, except that contaminant must be soluble to at least 5% by weight in the solvent.
c. Vapor Phase Solvent Extraction: Application of an	Same as above, except that brick, cloth, concrete, paper,	Same as above.

organic vapor using sufficient agitation, residence time, and temperature to cause hazardous contaminants on contaminated debris surfaces and surface pores to enter the vapor phase and be flushed away with the organic vapor./4/	pavement, rock and wood surfaces must be in contact with the organic vapor for at least 60 minutes	
3. Thermal Extraction		
a. High Temperature Metals Recovery: Application of sufficient heat, residence time, mixing, fluxing agents, and/or carbon in a smelting, melting, or refining furnace to separate metals from debris	For refining furnaces, treated debris must be separated from treatment residuals "Equivalent Technology" using simple physical or mechanical means,/9/ and, prior to further treatment, such residuals must meet the waste-specific treatment standards for organic compounds in the waste contaminating the debris	Debris contaminated with a dioxin-listed waste:/5/ Obtain an "Equivalent Technology" approval under Sec. 268.42(b)./8/
b. Thermal Desorption: Heating in an enclosed chamber under either oxidizing or nonoxidizing atmospheres at sufficient temperature and residence time to vaporize hazardous contaminants from contaminated surfaces and surface pores and to remove the contaminants from the heating chamber in a gaseous exhaust gas./7/	All Debris: Obtain an "Equivalent Technology" approval under Sec. 268.42(b);/8/ treated debris must be separated from treatment residuals using simple physical or mechanical means,/9/ and, prior to further treatment, such residue must meet the waste-specific treatment standards for organic compounds in the waste contaminating the debris Brick, Cloth, Concrete, Paper, Pavement, Rock, Wood: Debris must be no more than 10 cm (4 inches) in one dimension (i.e., thickness limit),/5/ except that this thickness limit may be waived under the "Equivalent Technology" approval	All Debris: Metals other than mercury.
B. Destruction Technologies:		

1. Biological Destruction (Biodegradation): Removal of hazardous contaminants from debris surfaces and surface pores in an aqueous solution and biodegration of organic or nonmetallic inorganic compounds (i.e., inorganics that contain phosphorus, nitrogen, or sulfur) in units operated under either aerobic or anaerobic conditions	All Debris: Obtain an "Equivalent Technology" approval under Sec. 268.42(b);/8/ treated debris must be separated from treatment residuals using simple physical or mechanical means,/9/ and, prior to further treatment, such residue must meet the waste-specific treatment standards for organic compounds in the waste contaminating the debris Brick, Cloth, Concrete, Paper, Pavement, Rock, Wood: Debris must be no more than 1.2 cm (1/2 inch) in one dimension (i.e., thickness limit),/5/ except that this thickness limit may be waived under the "Equivalent Technology" approval	All Debris: Metal contaminants.
2. Chemical Destruction a. Chemical Oxidation: Chemical or electolytic oxidation utilizing the following oxidation reagents (or waste reagents) or combination of reagents--(1) hypochlorite (e.g., bleach); (2) chlorine; (3) chlorine dioxide; (4) ozone or UV (ultraviolet light) assisted ozone; (5) peroxides; (6) persulfates; (7) perchlorates; (8) perman-ganates; and/or (9) other oxidizing reagents of equivalent destruction efficiency./4/ Chemical oxidation specifically includes what is referred to as alkaline chlorination	All Debris: Obtain an "Equivalent Technology" approval under Sec. 268.42(b);/8/ treated debris must be separated from treatment residuals using simple physical or mechanical means,/9/ and, prior to further treatment, such residue must meet the waste-specific treatment standards for organic compounds in the waste contaminating the debris	All Debris: Metal contaminants.

	Brick, Cloth, Concrete, Paper, Pavement, Rock, Wood: Debris must be no more than 1.2 cm (1/2 inch) in one dimension (i.e., thickness limit),/5/ except that this thickness limit may be waived under the "Equivalent Technology" approval	
b. Chemical Reduction: Chemical reaction utilizing the following reducing reagents (or waste reagents) or combination of reagents: (1) sulfur dioxide; (2) sodium, potassium, or alkali salts of sulfites, bisulfites, and metabisulfites, and polyethylene glycols (e.g., NaPEG and KPEG); (3) sodium hydrosulfide; (4) ferrous salts; and/or (5) other reducing reagents of equivalent efficiency./4/	Same as above	Same as above.
3. Thermal Destruction: Treatment in an incinerator operating in accordance with Subpart O of Parts 264 or 265 of this chapter; a boiler or industrial furnace operating in accordance with Subpart H of Part 266 of this chapter, or other thermal treatment unit operated in accordance with Subpart X, Part 264 of this chapter, or Subpart P, Part 265 of this chapter, but excluding for purposes of these debris treatment standards Thermal Desorption units	Treated debris must be separated from treatment residuals using simple physical or mechanical means,/9/ and, prior to further treatment, such residue must meet the waste-specific treatment standards for organic compounds in the waste contaminating the debris	Brick, Concrete, Glass, Metal, Pavement, Rock, Metal: Metals other than mercury, except that there are no metal restrictions for vitrification.
		Debris contaminated

with		a dioxin-listed waste./6/ Obtain an "Equivalent Technology" approval under Sec. 268.42(b),/8/ except that this requirement does not apply to vitrification.
C. Immobilization Technologies:		
1. Macroencapsulation: Application of surface coating materials such as polymeric organics (e.g., resins and plastics) or use of a jacket of inert inorganic materials to substantially reduce surface exposure to potential leaching media	Encapsulating material must completely encapsulate debris and be resistant to degradation by the debris and its contaminants and materials into which it may come into contact after placement (leachate, other waste, microbes)	None.
2. Microencapsulation: Stabilization of the debris with the following reagents (or waste reagents) such that the leachability of the hazardous contaminants is reduced: (1) Portland cement; or (2) lime/pozzolans (e.g., fly ash and cement kiln dust). Reagents (e.g., iron salts, silicates, and clays) may be added to enhance the set/cure time and/or compressive strength, or to reduce the leachability of the hazardous constituents./5/	Leachability of the hazardous contaminants must be reduced	None.
3. Sealing: Application of an appropriate material which adheres tightly to the debris surface to avoid exposure of the surface to potential leaching media. When necessary to	Sealing must avoid exposure of the debris surface to potential leaching media and sealant must be resistent to degradation by the debris and its contaminants and	None.

	effectively seal the surface, sealing entails pretreatment of the debris surface to remove foreign matter and to clean and roughen the surface. Sealing materials include epoxy, silicone, and urethane compounds, but paint may not be used as a sealant	materials into which it may come into contact after placement (leachate, other waste, microbes)

/1/ Hazardous debris must be treated by either these standards or the waste-specific treatment standards for the waste contaminating the debris. The treatment standards must be met for each type of debris contained in a mixture of debris types, unless the debris is converted into treatment residue as a result of the treatment process. Debris treatment residuals are subject to the waste-specific treatment standards for the waste contaminating the debris.

/2/ Contaminant restriction means that the technology is not BDAT for that contaminant. If debris containing a restricted contaminant is treated by the technology, the contaminant must be subsequently treated by a technology for which it is not restricted in order to be land disposed (and excluded from Subtitle C regulation).

/3/ "Clean debris surface" means the surface, when viewed without magnification, shall be free of all visible contaminated soil and hazardous waste except that residual staining from soil and waste consisting of light shadows, slight streaks, or minor discolorations, and soil and waste in cracks, crevices, and pits may be present provided that such staining and waste and soil in cracks, crevices, and pits shall be limited to no more than 5% of each square inch of surface area.

/4/ Acids, solvents, and chemical reagents may react with some debris and contaminants to form hazardous compounds. For example, acid washing of cyanide-contaminated debris could result in the formation of hydrogen cyanide. Some acids may also react violently with some debris and contaminants, depending on the concentration of the acid and the type of debris and contaminants. Debris treaters should refer to the safety precautions specified in Material Safety Data Sheets for various acids to avoid applying an incompatible acid to a particular debris/contaminant combination. For example, concentrated sulfuric acid may react violently with certain organic compounds, such as acrylonitrile.

/5/ If reducing the particle size of debris to meet the treatment standards results in material that no longer meets the 60 mm minimum particle size limit for debris, such material is subject to the waste-specific

treatment
standards for the waste contaminating the material, unless the debris has
been cleaned and separated from contaminated soil and waste prior to size
reduction. At a minimum, simple physical or mechanical means must be used to
provide such cleaning and separation of nondebris materials to ensure that
the debris surface is free of caked soil, waste, or other nondebris
material.
/6/ Dioxin-listed wastes are EPA Hazardous Waste numbers FO20, FO21, FO22,
FO23, FO26, and FO27.
/7/ Thermal desorption is distinguished from Thermal Destruction in that the
primary purpose of Thermal Desorption is to volatilize contaminants and to
remove them from the treatment chamber for subsequent destruction or other
treatment.
/8/ The demonstration "Equivalent Technology" under Sec. 268.42(b) must
document that the technology treats contaminants subject to treatment to a
level equivalent to that required by the performance and design and
operating standards for other technologies in this table such that residual
levels of hazardous contaminants will not pose a hazard to human health and
the environment absent management controls.
/9/ Any soil, waste, and other nondebris material that remains on the debris
surface (or remains mixed with the debris) after treatment is considered a
treatment residual that must be separated from the debris using, at a
minimum, simple physical or mechanical means. Examples of simple physical or
mechanical means are vibratory or trommel screening or water washing. The
debris surface need not be cleaned to a "clean debris surface" as defined in
note 3 when separating treated debris from residue; rather, the surface must
be free of caked soil, waste, or other nondebris material. Treatment
residuals are subject to the waste-specific treatment standards for the
waste contaminating the debris.

39. In subpart D, Sec. 268.46 is added to read as follows:

Sec. 268.46 Alternative treatment standards based on HTMR.

Table 1 identifies alternative treatment standards for F006 and K062 nonwastewaters.

Table 1.--Alternative Treatment Standards

	CAS No. for regulated Nonwastewaters

Waste code	Regulated hazardous constituent	hazardous constituent	CAS number	concentration (mg/1) TCLP
F006	See also Table CCWE in 268.41 and Table CCW in 268.43	Antiomony	7440-36-0	2.1

		Cadmium	7440-43-9	0.19
		Chromium (total)	7440-47-32	0.33
		Lean	7439-92-1	0.37
		Mercury	7439-97-6	0.009
		Nickel	7440-02-0	5.0
		Selenium	7782-49-2	0.16
		Silver	7440-22-4	0.30
		Thallium		0.078
		Zinc	7440-66-6	5.3

40. In Sec. 268.50, paragraph (a)(1) and the introductory text of paragraph (a)(2) are revised to read as follows:

Sec. 268.50 Prohibitions on storage of restricted wastes.

(a) * * *

(1) A generator stores such wastes in tanks, containers, or containment buildings on-site solely for the purpose of the accumulation of such quantities of hazardous waste as necessary to facilitate proper recovery, treatment, or disposal and the generator complies with the requirements in Sec. 262.34 and parts 264 and 265 of this chapter.

(2) An owner/operator of a hazardous waste treatment, storage, or disposal facility stores such wastes in tanks, containers, or containment buildings solely for the purpose of the accumulation of such quantities of hazardous waste as necessary to facilitate proper recovery, treatment, or disposal and:

* * * * *

41. In Part 268, appendix II is revised to read as follows:

Appendix II--Treatment Standards (As Concentrations in the Treatment

Residual Extract)

Note: The treatment standards for F001-F005 Spent Solvent Wastes appear in Secs. 268.41, 268.42, 268.43.

PART 270--EPA ADMINISTERED PERMIT PROGRAMS: THE HAZARDOUS WASTE PERMIT PROGRAM

42. The authority citation for part 270 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912, 6924, 6925, 6927, 6939, and 6974.

43. In Sec. 270.13, paragraph (n) is added to read as follows:

Sec. 270.13 Contents of Part A of the permit application.

* * * * *

(n) For hazardous debris, a description of the debris category(ies) and contaminant category(ies) to be treated, stored, or disposed of at the facility.

44. In Sec. 270.14, paragraph (b)(2) is revised to read as follows:

Sec. 270.14 Contents of Part B: General requirements.

* * * * *

(b) * * *
(2) Chemical and physical analyses of the hazardous waste and hazardous debris to be handled at the facility. At a minimum, these analyses shall contain all the information which must be known to treat, store, or dispose of the wastes properly in accordance with part 264 of this chapter.

* * * * *

45. In Sec. 270.42, paragraph (e)(3)(ii)(B) is revised to read as follows:

Sec. 270.42 Permit modification at the request of the permittee.

* * * * *

(e) * * *
(ii) * * *
(B) To allow treatment or storage in tanks or containers, or in containment buildings in accordance with 40 CFR part 268;
* * * * *

46. In Sec. 270.42, appendix I is amended by adding entry 6 to section I., and by adding new section M. to read as follows:

Appendix I to Sec. 270.42--Classification of Permit Modification

Modifications	Class
* * * * *	
I. Enclosed Waste Piles. * * *	

* * * * *

6. Conversion of an enclosed waste pile to a containment building unit 2

* * * * *

M. Containment Buildings.

1. Modification or addition of containment building units:

a. Resulting in greater than 25% increase in the facility's containment building storage or treatment capacity 3

b. Resulting in up to 25% increase in the facility's containment building storage or treatment capacity 2

2. Modification of a containment building unit or secondary containment system without increasing the capacity of the unit 2

3. Replacement of a containment building with a containment building that meets the same design standards provided:

a. The unit capacity is not increased 1

b. The replacement containment building meets the same conditions in the permit 1

4. Modification of a containment building management practice 2

5. Storage or treatment of different wastes in containment buildings:

a. That require additional or different management practices 3

b. That do not require additional or different management practices 2

47. In Sec. 270.72, paragraph (b)(6) is revised to read as follows:

Sec. 270.72 Changes during interim status.

* * * * *

(b) * * *

(6) Changes to treat or store, in tanks, containers, or containment buildings, hazardous wastes subject to land disposal restrictions imposed by part 268 of this chapter or RCRA section 3004, provided that such changes are made solely for the purpose of complying with part 268 of this chapter or RCRA section 3004.

* * * * *

PART 271--REQUIREMENTS FOR AUTHORIZATION OF STATE HAZARDOUS WASTE PROGRAMS

48. The authority citation for part 271 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), and 6926.

Subpart A--Requirements for Final Authorization

49. Section 271.1(j) is amended by adding the following entries to Table 1 in chronological order by date of publication in the Federal Register, and by adding the following entries to Table 2 in chronological order by effective date to read as follows:

Sec. 271.1 Purpose and scope.

ACTION: Final rule
INTERNAL DATA: (FR Doc. 92-19347 Filed 8-17-92, 8:45 am)
Word Count: 19919
SUMMARY: The Environmental Protection Agency is today amending its regulations under the Resource Conservation and Recovery Act (RCRA) by listing as hazardous seven wastes generated during the production, recovery, and refining of coke by-products produced from coal. EPA is adding seven wastes to the list of hazardous wastes from specific sources. EPA is also amending appendix VII of 40 CFR part 261 to add the constituents for which these wastes are being listed. In addition, the Agency is finalizing the proposed determination not to list as hazardous wastes wastewaters from coking and tar refining operations.

The effect of listing K141 through K145, K147 and K148 will be to subject these materials to the hazardous waste regulations of 40 CFR parts 124, 262 through 266, 268, 270 and 271, the notification requirements of RCRA 3010, and the notification requirements under section 103 of CERCLA.

In addition to the listings, the Agency is today amending and clarifying an exclusion from the definition of solid waste for wastes from the coke by- products process that exhibit the TC and are recycled by being returned to coke ovens or mixed with coal tar. (57 FR 27880).

TEXT:

ENVIRONMENTAL PROTECTION AGENCY
40 CFR Parts 261, 271, and 302

(FRL-4134-2)

RIN 2050-AC85

Identification and Listing of Hazardous Waste; CERCLA Hazardous Substance Designation; Reportable Quantity Adjustment; Coke By-Products Wastes

AGENCY: Environmental Protection Agency.

ACTION: Final rule.

SUMMARY: The Environmental Protection Agency is today amending its regulations under the Resource Conservation and Recovery Act (RCRA) by listing as hazardous seven wastes generated during the production, recovery, and refining of coke by-products produced from coal. EPA is adding seven wastes to the list of hazardous wastes from specific sources. EPA is also amending appendix VII of 40 CFR part 261 to add the constituents for which these wastes are being listed. In addition, the Agency is finalizing the proposed determination not to list as hazardous wastes wastewaters from coking and tar refining operations.

The effect of listing K141 through K145, K147 and K148 will be to subject these materials to the hazardous waste regulations of 40 CFR parts 124, 262 through 266, 268, 270 and 271, the notification requirements of RCRA 3010, and the notification requirements under section 103 of CERCLA.

In addition to the listings, the Agency is today amending and clarifying an exclusion from the definition of solid waste for wastes from the coke by- products process that exhibit the TC and are recycled by being returned to coke ovens or mixed with coal tar. (57 FR 27880).

EFFECTIVE DATE: Today's final rule will become effective on February 18, 1993.

ADDRESSES: The official record for this rulemaking is identified as Docket Number F-92-CBPF-FFFFF and is located in the EPA RCRA Docket, room M2427, 401 M Street, SW., Washington, DC 20460. The public must make an appointment in order to review docket materials by calling (202) 260-9327 for the RCRA portion of the docket, or (202) 260-3046 for the CERCLA portion of the docket. Both dockets are available for inspection from 9 a.m. to 4 p.m., Monday through Friday, excluding holidays. The public may copy up to 100 pages from the docket at no charge. Additional copies cost $0.15 per page.

FOR FURTHER INFORMATION CONTACT: The RCRA/Superfund Hotline toll-free at (800) 424-9346 (voice) or (800) 553-7672 (TDD), or, in the Washington, DC metropolitan area, (703) 920-9810 (voice) or (703) 486-3323 (TDD). For technical information on the RCRA portion of the rule, contact Mr. Ron Josephson of the Office of Solid Waste (OS-333) at (202) 260-4770. For technical information on the CERCLA portion of the rule, contact Ms. Gerain Perry, Office of Emergency and Remedial Response (OS-210) at (202) 260-2190.

SUPPLEMENTARY INFORMATION: The contents of today's preamble are listed in the following outline:

I. Background

Section 3001 of Subtitle C of RCRA mandates that EPA make a determination whether to list as hazardous certain wastes generated during the production, recovery, and refining of coke by-products produced from coal. EPA proposed to list a number of these wastes from the coke by-products process as hazardous in a notice published in the Federal Register on July 26, 1991 (56 FR 35758). Certain other wastes from the coke by-products industry are already listed as hazardous under RCRA. An overview of past regulatory actions taken by the Agency that affect this industry was provided in the preamble to the proposed rule (see 56 FR 35759).

On July 26, 1991, EPA proposed to add seven wastes from the coke by-products process to the list of wastes from specific sources. Today's notice promulgates these seven "K-listings."

In a separate Federal Register notice (57 FR 27880), EPA promulgated an exclusion from the definition of solid waste for Hazardous Waste No. K087, and other wastes from the coke by-products process that are hazardous only because they exhibit the Toxicity Characteristic (TC) specified in Sec. 261.24, when they are recycled by being returned to coke ovens as a feedstock to produce coke, added to the tar recovery process to produce coal tar, or mixed with coal tar prior to its sale or refining. This exclusion was conditioned on no land disposal of wastes. Today, the Agency is amending this exclusion to include the wastes being listed in this notice.

II. Summary of the Regulation

A. Overview of the Proposed Rule

The notice published on July 26, 1991 (56 FR 35758) proposed to amend the regulations for hazardous waste listing under RCRA by adding the following seven wastes generated during the production, recovery, and refining of coke by-products produced from coal to the list of hazardous wastes from specific sources under 40 CFR 261.32.

K141--Process residues from the recovery of coal tar, including, but not listed to, tar collecting sump residues from the production of coke from coal or the recovery of coke by-products produced from coal. This listing does not include K087 (decanter tank tar sludge from coking operations).

K142--Tar storage tank residues from the production of coke from coal or from the recovery of coke by-products produced from coal.

K143--Process residues from the recovery of light oil, including, but not limited to, those generated in stills, decanters, and wash oil recovery

units from the recovery of coke by-products produced from coal.
K144--Wastewater treatment sludges from light oil refining, including, but not limited to, intercepting or contamination sump sludges from the recovery of coke by-products produced from coal.
K145--Residues from naphthalene collection and recovery operations from the recovery of coke by-products produced from coal.
K147--Tar storage tank residues from coal tar refining.
K148--Residues from coal tar distillation, including, but not limited to, still bottoms.

The Agency also proposed to amend appendix VII of 40 CFR part 261 to add the following constituents for which these wastes were proposed for listing: Benzene and polynuclear aromatic hydrocarbons (PAHs), including benz(a)anthracene, benzo(a)pyrene, benzo(b and k)fluoranthene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene, and naphthalene.

Lastly, the Agency proposed to amend the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) regulations in 40 CFR part 302 by designating all of the proposed listed wastes as hazardous substances under CERCLA. Pursuant to section 102(b) of CERCLA, the reportable quantities (RQs) applicable to each of these wastes is one pound.
The proposed listings included process residues and storage tank residues other than those residuals already listed as EPA Hazardous Waste Nos. K035, K060, and K087. Several industry commenters requested clarification on the scope of the proposed listings. Details on the scope of the listings finalized in today's rule as well as descriptions of the modifications made to the proposed listings are discussed below under Wastes Included in Today's Listing. The proposed listings did not include wastewaters or wastewater treatment sludges from coke by-products recovery and tar refining.

Because a number of the wastes that were proposed for listing are recycled by members of the coke by-products industry, EPA supported the environmentally beneficial recycling of these wastes by proposing to exclude the listed wastes from the definition of solid waste when they are recycled in certain ways. This exclusion is conditioned on no land disposal of the wastes. These wastes are generally recycled using one of the two following methods: (1) Combining the residue with coal feedstock prior to or just after charging the coal into the coke oven, and (2) mixing the residue with coal tar prior to its being sold as a product. In order to maintain hazardous waste control over the listed wastes in the event of mismanagement, the Agency proposed that the exclusions apply at the point of reinsertion of the wastes into the coke ovens or the point at which they are mixed with coal tar. The exclusions were intended to encourage waste minimization while maintaining RCRA control over the wastes prior to the recycling step (i.e., during interim storage and transportation) and when using management practices other than recycling.

EPA proposed the listings of K141-K145 and K147-K148 in response to the Hazardous and Solid Waste Amendments (HSWA) of 1984. Section 3001(e)(2) of RCRA, added by HSWA, requires EPA to make a listing determination for wastes generated from the coke by-products industry.

B. Overview of the Final Rule

1. Hazardous Waste Listings

Today's rule adds to the list of wastes from specific sources the seven listings proposed on July 26, 1991. These are as follows:

K141--Process residues from the recovery of coal tar, including, but not limited to, tar collecting sump residues from the production of coke from coal or the recovery of coke by-products produced from coal. This listing does not include K087 (decanter tank tar sludge from coking operations).

K142--Tar storage tank residues from the production of coke from coal or from the recovery of coke by-products produced from coal.

K143--Process residues from the recovery of light oil, including, but not limited to, those generated in stills, decanters, and wash oil recovery units from the recovery of coke by-products produced from coal.

K144--Wastewater sump residues from light oil refining, including, but not limited to, intercepting or contamination sump sludges from the recovery of coke by-products produced from coal.

K145--Residues from naphthalene collection and recovery operations from the recovery of coke by-products produced from coal.

K147--Tar storage tank residues from coal tar refining.

K148--Residues from coal tar distillation, including, but not limited to, still bottoms.

Today's rule also amends appendix VII of part 261 to include the constituents for which these wastes are listed.

2. Recycling Exclusion

Several recycling exclusions were proposed on July 26, 1991 as 40 CFR 261.4 (a)(10-(12). Public comments on these exclusions were requested separately from comments on the rest of the listing proposal. For a brief summary of these public comments and EPA's response to them, see the Summary of Public Comments and Responses section later in this preamble. The public comments concerning the recycling exclusion are addressed fully in the exclusion rule promulgated on June 22, 1992 (57 FR 27880).

This rule excluded from the definition of solid waste Hazardous Waste No. K087, and any other wastes from the coke by-products process that are hazardous only because they exhibit the TC, when they are recycled to coke ovens as a feedstock to produce coke, to the tar recovery process to produce coal tar, or mixed with coal tar prior to its sale or refining. This exclusion for recycling is conditioned on there being no land disposal for the materials up to the point of recycling (see 40 CFR 261.4(a)(10); 57 FR 27888). Today, EPA is amending this exclusion to include the wastes being listed in this notice within the scope of the exclusion. The extension of the exclusion to the wastes being listed in today's rule is logical given the fact that many, if not all of the wastes listed here qualify for the existing exclusion under Sec. 261.4(a)(10). In addition, all commenters to the proposed rule who commented on recycling issues supported this action.

As indicated in the proposal, the Agency is including the following additional materials in the recycling exclusion under 40 CFR 261.4(a)(10): K060, K087, K141, K142, K143, K144, K145, K147, K148, and wastes from the coke by-products industry that are hazardous only because they exhibit the TC. The exclusion does not apply if other hazardous wastes (e.g., spent solvents, TC hazardous wastes from other industries, etc.) are mixed with the above-mentioned residues or charged to a coke oven. If the "no land

disposal" condition of the exclusion is met, the wastes listed above are not solid wastes and, thus, not hazardous wastes, when they are recycled to coke ovens or tar recovery processes, or mixed with coal tar. The effect of this exclusion from the definition of solid waste is to remove these coke by- product wastes from RCRA control when they are recycled within the coking and tar refining industries. In other words, as long as coke by-product wastes are being recycled within the terms of the exclusion at 40 CFR 261.4(a)(10), no permit is needed for the storage or management of these wastes, no manifest is required for transport of these wastes, and so on. It is important to note, however, that certain recordkeeping requirements under the Land Disposal Restrictions program still attach to wastes that have been excluded from RCRA regulation. These requirements are discussed later in this preamble in the section entitled Interaction with Other Regulations.

C. Industry Overview

In the preamble to the proposed rule, EPA presented a description of the coking and tar refining industries, along with descriptions and quantities of wastes generated and descriptions of waste management practices employed for the wastes. This information remains the most recent and accurate information on the industry available to EPA and was relied upon in developing the final rule. The industry statistics are based on 1987 data which indicate that 21 domestic companies produced approximately 28 million metric tons of coke at 34 plants. Updated information provided by an industry trade association indicates that there are currently 32 active plants which are divided into two segments: Captive coke producers (22 plants) and merchant coke producers (10 plants). The 22 captive coke plants are operated by major iron and steel companies and produce blast furnace coke that is generally used on-sit or within the same company at integrated iron and steel plants to produce steel.

The 10 merchant coke plants generally produce blast furnace coke for sale to iron and steel companies, and metallurgical coke for sale to iron and steel foundries and to other metallurgical and chemical industries. A list of active plants is provided in the Background Document for today's rule.

In 1985, about 1,200 million liters of coal tar, 3.7 billion liters of sodium phenolate, 7,000 metric tons of naphthalene, and 580 million liters of light oil were produced as coke by-products. The crude coal tar is sold to independent tar refiners for the production of other coal tar by-products.

The 1985 production of these coal tar by-products was approximately 45 million liters of light oil, 500 million liters of creosote oil, 550 million liters of refined tar (excluding tar used as road tar), and 470,000 metric tons of coal tar pitch. More recent data indicate that domestic coke plants produced 256,823,533 gallons of crude coal tar in 1991.

Table 1 presents estimates, based on data collected from 1985 to 1987, of the quantities of waste generated from the production of coke and coke by-products, recovery of coke by-products, and coal tar refining. The assumptions and data used to generate these estimates are provided in the Background Document for this rule. Tables containing the waste management practices used for these wastes and the percentage of facilities employing each waste management practice are also presented in the Background Document.

Overall, at least 40 percent of the facilities who reported waste

management practices in the 1985 RCRA 3007 questionnaire recycle the wastes and products addressed in today's rule.

Table 1.--Estimated Nationwide Waste Quantities (Mt/Yr)

	Waste Quantity
K141--Process residues from the recovery of coal tar, including, but not limited to, collecting sump residues from the production of coke from coal or the recovery of coke by-products produced from coal. This listing does not include K087 (decanter tank tar sludges from coking operations)	3,100
K142--Tar storage tank residues from the production of coke from coal or from the recovery of coke by-products produced from coal	10,000
K143--Process residues from the recovery of light oil, including, but not limited to, those generated in stills, decanters, and wash oil recovery units from the recovery of coke by-products produced from coal	4,500
K144--Wastewater sump residues from light oil refining, including, but not limited to, intercepting or contamination sump sludges from the recovery of coke by-products produced from coal	900
K145--Residues from naphthalene collection and recovery operations from the recovery of coke by-products produced from coal.	450
K147--Tar storage tank residues from coal tar refining	2,800
K148--Residues from coal tar distillation, including, but not limited to, still bottoms	270

D. Process and Waste Descriptions

1. The Coking Process

Coke is manufactured by anaerobic carbonization of coal in high temperature (900-1200 deg.C) coke ovens. Coke is the main product and is used as a reductant in the blast furnaces used in iron manufacturing. The coke oven gas (COG) is processed through recovery units to separate other such saleable by- products as coal tar, light oil, and ammonia liquor from the gas stream and the remainder of the gas stream is then used as fuel.

Figure 1 is a general process flow diagram that indicates the sources of by-product residues that are the subject of this rule. During the recovery of coal tar from the coke oven gas, tar residue accumulates in the tar decanter tank (K087), the tar collection sump (K141) and at the bottom of tar storage tanks (K147). The light oil recovery process generates wash and light oil residues (K143) in the scrubber tower, the stripping still, and in a decanter or centrifuge used to separate a polymerized resin referred to as wash oil muck from the recycled wash oil. A wastewater collecting sump, used to separate the oil and water in wastewaters from the light oil recovery area, generates wastewater sump residues (K144). Naphthalene recovery residues (K145) are generated in the final cooling tower, naphthalene separator and collection sumps. Facilities may also use an ammonia still, in which a "lime sludge" accumulates (K060).

BILLING CODE 6560-50-M

BILLING CODE 6560-50-C

2. The Tar Refining Process

Coal tar is typically refined to produce commercial and industrial products including pitch, creosote oil, refined tar, naphthalene, and commercial materials such as bitumen. Coal tar is refined by either batch

or continuous distillation. The heavy liquid components such as pitch and creosote are sent to a distillation column for further refining. The pitch, which is generated at the softening point of tar, is discharged from the still, cooled, extruded, and poured into barrels or other containers for storage.

The coal tar refining plant may produce two process residuals that will be added to the list of wastes from specific sources. The first process residual is generated at the bottom of the coal tar storage tanks (K147). Based on the information provided to the Agency during the industry study and public comment periods, this residual is generated infrequently. Large volumes of tar storage tank bottoms were recently generated during the tank clean-outs required for compliance with the benzene NESHAPs rule. However, mechanical mixers or air agitators were installed at several plants to prevent future formation of this residual. The same residual is generated in coal tar storage tanks at coking facilities.

The second process waste from the refining plant, identified as K148, is high boiling-point residue, which accumulates on the fire tubes and at the bottom of the batch still and must be removed periodically. These tar refining residuals are either recycled to coke ovens at the same or adjacent facilities, or sold to other coking facilities as products. Tar distillation residues may also be recycled to the distillation tank along with crude coal tar.

In addition to the above, a sludge is often formed from the treatment of tar refining wastewaters. This sludge carries the K035 listing.

E. Wastes Included in Today's Listing

Today's rule adds seven wastes to the list of hazardous wastes from specific sources (40 CFR 261.32). These listings encompass all of the same materials described and proposed for listing in the proposed rule. The seven wastes added to Sec. 261.32, K141, K142, K143, K144, K145, K147, and K148, retain the same scope as the corresponding proposed listed wastes. The listing descriptions also remain the same as those proposed, with the exception of the description of K144 wastes, which are now more accurately called "wastewater sump residues" rather than "wastewater treatment sludges." (For further explanation, see Footnote 1 to Table 6 below.) This change is based on information and comments received from the coke by-products industry. K144 wastes include the same materials as those originally proposed.

Descriptions of the manufacturing process and sources of the wastes are provided earlier in this preamble and are presented in greater detail in the Background Document for today's rule and in the preamble to the July 1991 proposed rule. EPA also provides data describing the composition of the wastes being listed in each of these documents.

Two commenters requested that more specific language be used to describe the listed wastes. The commenters requested that terms such as "including but not limited to" be deleted from the waste descriptions. These terms, however, are necessary in describing these wastes because the manufacturing processes generating the wastes are not always identical. If the Agency limited the scope of the listings to residues generated only by the specific unit operations shown in the generic process flow diagram, then

residues of similar chemical composition that are generated from the same stage of the coke by-product recovery operation may not be encompassed by the listing. For example, wash oil circulation sludge generally has the same chemical composition as residues from wash oil recovery units when used to wash light oil and, therefore, would be listed as K143. However, in certain instances, wash oil may be used to wash other by-products such as naphthalene, and the wash oil circulation sludge would then be listed as K145. This preamble further clarifies the scope of the listings by providing a table that contains each of the coke by-product wastes specified in the proposed Consent Decree which resolves issues raised in EDF vs. Reilly, Civ. No. 89-0598 (D.D.C.) along with the appropriate hazardous waste listing numbers (see Summary of Public Comments and Responses section).

As proposed, EPA is finalizing the determination not to list wastewaters from coking and tar refining operations. One commenter believed that these wastes should be listed as hazardous wastes because certain hazardous constituents were found at concentrations exceeding the health-based levels by over six orders of magnitude. As stated in the preamble to the proposed rule, EPA has found that these constituents are not typically and frequently found in the wastewaters at quantifiable levels. For example, constituents other than benzene that were identified as concerns by the commenter were either detected below the detection limit or not detected in at least 75% of the coking and tar refining wastewater samples collected by EPA. Since benzene is the only constituent of concern that is typically and frequently present at concentrations of regulatory concern and is a contaminant that is regulated by both the Toxicity Characteristic, EPA believes that wastewaters will be adequately regulated by both the TC rule and Effluent Guidelines for Industrial Point Source Discharges under the Clean Water Act. Any wastewater that exhibits the TC and is land disposed prior to receiving adequate treatment (or release through the Clean Water Act programs) must comply with all RCRA requirements.

Raw wastewater releases are unlikely for several reasons. First, a statutory ban exists on the disposal of liquids in landfills. Also, all facilities in this industry have closed their surface impoundments and lagoons in favor of more modern treatment plants. While problems existed in the past with wastewaters being mixed with other process wastes and causing environmental problems, such releases are less likely to happen, and, if they did, would cause the released materials to be a hazardous waste mixture (as described on page 35780 of the July 26, 1991 proposal). Lastly, the wastewater treatment plants at the coke by-products facilities have been or are being upgraded in compliance with the Clean Water Act and other EPA regulatory programs. Many of the upgraded plants use biological treatment process that may degrade both benzene and PAHs of concern below levels of regulatory concern.

One commenter stated that EPA is required to list a waste as hazardous if it exhibits any of the hazardous waste characteristics and cited 40 CFR 261.11(a) (1). EPA would like to clarify here that when considering a solid waste for listing, the Administrator may list a waste on the basis that it exhibits a hazardous waste characteristic but this is not a requirement. Indeed, a policy that required all wastes exhibiting a characteristic to be listed would render subpart C of part 261 meaningless. Section 261.11 reads, "The Administrator shall list a solid waste as a hazardous waste only upon determining that the solid waste meets one of the following criteria: (1) It exhibits any of the characteristics of hazardous waste

identified in Subpart C * * * while the Agency has the authority to list a waste based solely on this criterion, the language of this section does not mean that the Agency is required to list upon determining that a waste exhibits a characteristic.

F. Basis for Listing

As stated in the preamble to the proposed rule, the Agency has based today's listing determination on the criteria set forth in 40 CFR 261.11(a)(3). In the preamble to the July 1991 proposed rule, EPA provided a detailed discussion of the basis for listing K141-L145, K147 and K148. The discussion included quantitative data on the concentrations of constituents of concern found in the wastes, summaries of the known health effects of the constituents of concern, data describing the relative persistence and mobility of the constituents of concern, mismanagement case studies, and an analysis of the relative hazards posed by the wastes. In general, the information presented in the preamble to the proposed rule remains the most current available to EPA and serves as the basis for today's listings for K141 through K145, K147, and K148.

In the preamble to the proposed rule, EPA provided a list of constituents found to be present in the wastes that were not selected as constituents of concern at the time of proposal, and stated that additional constituents may be added upon promulgation based upon the consideration of comments and/or additional data (56 FR 35772). After reviewing the analytical data presented in the Background Document to the proposed rule and the current health effects information on the constituents present in the wastes, one additional constituent that appeared on that list, chrysene, has been selected as a constituent of concern. As stated in the preamble to the proposed rule, the addition of chrysene to the list of constituents of concern has no effect on the Agency's ultimate decision to list these wastes as hazardous. Tables 2 and 3 are revised versions of Tables 5, 6, and 7 from the preamble to the proposed rule; they present the selected constituents of concerns in each of the newly listed wastes, and the range of measured concentrations of constituents in coke by-products and tar refining products.

In addition, the health effects information for many of the constituents of concern has been revised. Indeno (1, 2, 3-cd)pyrene has been raised from a possible human carcinogen (Class C) to a probable human carcinogen (Class B), and the qualitative information upon which this change was based is provided on EPA's Integrated Risk Information System (IRIS). Because the health- effects information on IRIS is peer reviewed by inter-Agency workgroups that reach consensus decisions regarding the data, the new carcinogen classification is considered scientifically sound. (More information regarding this change and IRIS is included in the background document to today's rule.)

Also, the health-based limits have been revised slightly for benzo(a)pyrene, benzo(b and k)fluoranthene, indeno(1, 2, 3-cd)pyrene, benz(a)anthracene, and naphthalene. In all cases, the change is two orders of magnitude or less and does not affect the results of the listing analyses which indicate that the wastes listed in today's rulemaking should be listed as hazardous. The specific changes are as follows:

Table 2.--Constituents of Concern

Constituents	K141	K142	K143	K144	K145	K147	K148
Benzene	X	X	X	X	X	X	
Benz(a)anthracene	X	X	X	X	X	X	X
Benzo(a)pyrene	X	X	X	X	X	X	X
Benzo(b and k)fluoranthene	X	X	X	X	X	X	X
Chrysene	X	X	X	X	X	X	X
Dibenz(a,h)anthracene	X	X		X	X	X	X
Indeno(1,2,3-cd)pyrene	X	X		X		X	X
Naphthalene	X	X	X	X	X	X	

Note: X indicates that the constituent has been found to be present at levels of regulatory concern in the individual waste stream.

Table 3.--Coke and Coke by-Product Wastes: Constituents of Concern and Range of Measured Concentrations
(All Values in PPM)

		K141 Process residues from coal tar recoverya	K142 Tar Storage Tank Residues	
Line No.	Constituent		Range	Avg.
1.	Benzene	3,850	230-290	260

a GC peak resolution was not adequate to provide quantitation of the two isomers individually. The results shown are the sum of the two isomers.
NA--Constituent not analyzed (volatiles were not anticipated in still bottoms that have been heated to high temperatures).
Source: Background.

On July 17, 1992, (57 FR 31776) the Agency promulgated an MCL of 2x10-4 mg/L for benzo(a)pyrene. As indicated in the preamble to the proposed rule, EPA uses promulgated Maximum Contamination Limits (MCLs) when available.
Therefore, the newly finalized MCL is being used in today's rule.

In addition, in April 1992, the Agency verified a risk specific dose (RSD) of 1.7x10-7 mg/kg/day for benzo(a)pyrene. This RSD was then used to determine health-based numbers for benzo (b and k) fluoranthene, chrysene, and indeno(1,2,3-cd)pyrene, which are calculated relative to the potency of benzo(a)pyrene. More information regarding these calculations and the reasons for the adjustments to them is provided in the background document to today's rule.

The same study used as the basis for the proposed level of concern for naphthalene is used for the level of concern used in today's rule. However, the revised provisional oral RfD for naphthalene was raised one order of magnitude (from 0.004 to 0.04) when the uncertainty factor was decreased from 10,000 to 1,000 (since the proposal). The revised provisional RfD is listed in the Annual 1992 Health Effects Assessment Summary Tables (HEAST). For more information on the changes in the health-based numbers for naphthalene, see the Background Document to today's rule.

A 1986 reference was the source for the proposed RSD of 3.2x10-7 mg/kg/day for benz(a)anthracene. However, a new 1988 source was identified which indicates a proposed RSD of 4.7x10-8 mg/kg/day. All of these new references are included in the docket to today's rule.

The Agency believes that these changes have no effect on the conclusion that the constituents of concern in the wastes being listed today are systemic toxicants and/or carcinogens present in concentrations capable of causing adverse health effects and therefore have no effect on today's ultimate listing decision. The constituents of concern are present at high enough concentrations to exceed both the proposed levels of concern, most of which were higher than the concentrations of concern used in today's

rule, and those used in today's rule.

One commenter requested that the Agency base the health-based concentration limits on proposed MCLs, instead of RSDs, when available. Historically, final listing determinations have not been based on proposed health-based numbers.

The Agency has recently proposed, in another rulemaking, the use of proposed MCLs to establish jurisdictional boundaries of RCRA subtitle C. (See 57 FR 21450-21522, May 20, 1992.) Since that issue remains unresolved, the Agency chooses not to use proposed MCLs for this rulemaking. Moreover, the adoption of proposed MCLs for the applicable constituents of concerns in today's rule would not change the overall conclusion regarding the hazard posed by the wastes due to the extremely high concentrations of the constituents of concern in the wastes. Thus, as shown in Tables 4-4F and 5, the health-based limits for the constituents of concern continue to rely on Reference Doses (RfDs), Risk-Specific Doses (RSDs), and final MCLs. For more information on the adoption of MCLs for benzo(a)pyrene and not other PAHs, see the Phase V drinking water rule, published July 17, 1992 (57 FR 31776).

Tables 4 through 4F are revised versions of Tables 8 through 8F of the proposed rule. They summarize the Agency's analysis of the hazards posed by the constituents of concern present in the listed wastes and products by presenting the average concentrations of the previous and additional hazardous constituents in the wastes, the updated health-based water concentration limits and updated hypothetical environmental exposure factors.

In this analysis, EPA projected ground-water concentrations for the constituents of concern based on average waste concentrations (rather than maximum concentrations) and assuming three dilution and attenuation factors: 100, 1,000, and 10,000. These three levels encompass a broad range of dilution/attenuation factors (DAFs). The drinking water well concentrations calculated for dilution/attenuation levels of 100, 1,000, and 10,000 make the assumption that the concentration of each constituent of concern in the well water would be 1 percent, 0.1 percent, and 0.01 percent, respectively, of its average concentration in the waste. The calculated ratios of estimated drinking water concentration values to health-based water concentration-limit values presented in these tables serve to illustrate that, under the assumptions used here, even if only 0.01 percent of the average constituent levels in the wastes (i.e., HEEF of 10,000) reaches environmental receptors, the exposure concentrations could exceed the health-based levels of concern by up to five orders of magnitude.

Table 5 is a revised version of Table 9 from the preamble to the proposed rule. It presents updated data on the water solubilities and partition coefficients (log Kow and log Koc) which, as explained in the proposed rule, provide an indication of the mobility and persistence of the constituents of concern. Several comments were submitted regarding the mobility and persistence of the constituents of concern; these comments are addressed below in the Summary of Public Comments and Responses section of this preamble.

As stated in the preamble to the proposed rule, the Agency considered the use of leachability models and subsurface fate and transport models to estimate concentrations of these constituents in drinking water. Several commenters believed that these models should have been used to determine the potential hazards posed by these wastes and products, while other commenters support the Agency's decision not to use models. This issue is addressed further in the Summary of Public Comments and Responses section of this preamble. However, as stated in the preamble, EPA continues to believe that the limitations of the available models, when applied to wastes or products generated from coking and tar refining processes, underestimate the hazard posed by the wastes.

aKow=Octanol-water partition coefficient.
bKoc=Soil sorption coefficient.
cThe health-based limit for benzo(b)fluoranthene was also applied to benzo(k)fluoranthene because the GC peak resolution was not adequate to provide quantitation of the isomers individually, and

therefore, the results are the sum of the two isomers.

III. Summary of Public Comments and Responses

A. Hazardous Waste Listings

Several comments were submitted regarding the technical basis used by the Agency in making the listing determinations on wastes generated from the coking and tar refining industries. Five commenters expressed concerns over leachability and mobility, ground-water fate and transport models, dilution and attenuation assumptions, carcinogenicity risk levels, persistence, and mismanagement case studies. The substance of these comments is explained in more detail below.

As explained in the preamble to the proposed rule, the Agency believes that the use of available leaching and subsurface fate and transport models is not appropriate for evaluating wastes and products generated during the production, recovery, and refining of coke by-products (see FR 35769). Three commenters disagree that these models (i.e., the Toxicity Characteristic Leaching Procedure (TCLP), the EPA Composite Model for Landfills (EPACML), and the Organic Leachate Model (OLM)) would underestimate the migration and transport of hazardous constituents to a drinking water source, as stated by the Agency.

Three commenters believe that the TCLP data should be considered as a basis for listing wastes generated from the coking and tar refining industries.
They believe that the leaching procedure results in higher leached concentrations of constituents than would occur in an actual environmental setting due to the method's particle size reduction step. One commenter supports the Agency's decision not to rely on TCLP data as a basis for listing because of the belief that the TCLP results in lower concentrations of constituents than would occur in the environment.

The Agency notes that the TCLP was developed by evaluating various laboratory methods that use different extraction media, extraction procedures, and liquid: solid ratios, and by determining the method which best obtained the concentrations of inorganic and organic constituents found in leachate from a simulated co-disposal landfill scenario. The simulated leachate was generated from large-scale columns, called lysimeters, packed with municipal waste and using this municipal waste leachate as a leaching fluid in studies on industrial wastes. Particle size reduction is used to simulate both the size reduction caused by the action of heavy landfill equipment and the degradation of structural integrity caused by repeated wet/ dry and freeze/thaw cycles. The laboratory conditions selected for the TCLP were those which best simulated the concentrations of inorganic and organic constituents in leachate from wastes co-disposed with municipal wastes in landfills.

The TCLP is a reasonable worst-case mismanagement scenario which the Agency has historically used to determine whether a waste should be classified as hazardous. However, for wastes that clog the glass fiber filter utilized in the TCLP, it has been shown that portions of wastes that are mobile in soil columns are often classified as solids by TCLP standards (RTI, 1988). As stated in July's proposed rule, the tarry samples analyzed in support of today's rulemaking were found to pose problems with sample

homogenization, filtration, and dispersion of solids in the leaching medium due to the varying amounts of tar in the wastes. Due to these analytical problems, the Agency maintains its belief that the TCLP results may underestimate the concentrations of constituents in leachates generated from the proposed wastes and should not be used as a basis for listing these wastes.

Three commenters also requested that EPA reconsider the use of the OLM and the EPACML. One commenter stated that the Agency is freely disregarding the TCLP and OLM results for this listing decision and that the models are not serving their mandated purpose. This commenter also stated that even though the EPACML may not account for immiscible flow conditions, the constituent concentrations at drinking water wells would not be underestimated. Another commenter stated that the OLM and EPACML apply more realistic environmental exposure factors (than the HEEFs) and that these models actually overestimate rather than underestimate constituent mobility because they do not account for biodegradation.

As described in the proposed rule, the EPACML estimates the dilution and attenuation of specific constituents during migration from leachate at the bottom of an unlined landfill (see U.S. EPA, "Background Document for EPA's Composite Landfill Model (EPACML)", 1990). If the Agency had applied the EPACML as it has in past rulemakings, leachate would have been diluted by a factor of 135 (at the 85th percentile of the probability distribution). (See 55 FR 11798, March 29, 1990). If hazardous constituent levels were to be reduced by that factor, the calculated constituent levels at the receptor sites would still exceed the health-based numbers by several orders of magnitude. However, the Agency notes that problems still exist in applying this model to these wastes. Due to the physical and chemical nature of the proposed listed wastes, immiscible flow may occur. Migration of constituents in the immiscible layer may be underestimated by a model that considers only homogenous flow. The underestimation occurs because the EPACML model does not account for the increased constituent concentrations that reach the receptor well in spiked patterns. The effect could be pronounced with wastes containing constituents in high concentrations. Because of these concerns, the Agency did not apply the EPACML to the proposed listed wastes.

The OLM is an empirical equation which was developed through application of modeling techniques to a data base of waste constituent concentrations and experimentally measured leachate concentrations (see 51 FR 41082 and 50 FR 48886). The OLM takes into account the concentrations of organic constituents and their aqueous solubility. EPA believes that, with the possible exception of tar distillation residues, the wastes proposed for listing may be subject to significant cosolvency effects. However, the OLM does not consider cosolvency effects and therefore tends to underestimate pollutant mobility in waste matrices where cosolvency may be significant. The Agency's response to the issue of biodegradation is discussed below.

Fate and transport models serve their intended purpose when applied to appropriate situations. Although the Agency prefers to use specific case studies and/or general modeling results to estimate potential risks from the mismanagement of wastes, the Agency is not required to use a particular model in evaluating the hazards posed by certain wastes. In this situation, however, due to the physical and chemical nature of the coke by-product wastes, the Agency selected an alternative approach to evaluate the potential hazard posed by these wastes. The Agency selected the use of

Hypothetical Environmental Exposure Factors (HEEFs), applied to average constituent concentrations found in the wastes, as an alternative approach to estimating the mobility of constituents from the waste under a wide range of environmental conditions. Using this approach, the Agency concludes that under a range of possible environmental conditions, these wastes would pose a substantial hazard to human health and the environment if mismanaged.

The Agency recognizes that the basis for listing wastes as hazardous since 1980 has not always explicitly included the use of models to predict concentrations of hazardous constituents at receptor sites. Rather, EPA has relied on a weight-of-evidence approach including such factors as damage incidents and probability of mismanagement. The recently proposed Hazardous Waste Identification Rule (HWIR, 57 FR 21450--21522, May 20, 1992) contains several options that, depending on which is promulgated, may change the Agency's procedure for the identification and listing of hazardous wastes in the future.

Two commenters claimed that the Agency did not consider biodegradation in its risk analysis and therefore, overestimated the concentration of constituents at the receptor well. The commenters provided general examples of successful biodegradation under aerobic conditions but did not provide data to support these claims or examples under anaerobic conditions. As stated in the proposed rule, the Agency believes that benzene and PAHs are not expected to biodegrade in ground water due to the relatively low biological activity present in the ground-water system. In addition, the persistence of the contaminants of concern is demonstrated by their presence in soil, ground water and surface water at the mismanagement sites described in the proposed rule.

One commenter submitted a journal article that describes a testing program of wells serving water-supply systems in California in which benzene is either undetected or detected in small concentrations at the majority of wells. The article suggests that, due to the large number of leaking underground storage tanks existing throughout the state, the absence of benzene near water-supply wells implies that biodegradation is occurring in the ground water.

The Agency agrees with the commenter only in that benzene generally biodegrades in ground waters with environments that are conducive to high biological activity (i.e., with high dissolved oxygen levels or acclimated microorganisms). The Agency notes benzene has been found to be present in the ground water at receptor wells of several contaminated sites described in the preamble of the proposed rule. For example, at a steel manufacturing plant operating in New York from 1920 through 1983 on Lake Erie, benzene was detected at concentrations up to 340 ppm at ground-water monitoring wells installed near two waste management areas, a pit and a landfill, which received coking wastes almost exclusively. Thus, the Agency maintains that benzene is a persistent and mobile constituent of concern and that wastes containing benzene in sufficiently high concentrations may pose a hazard when improperly managed.

Several commenters questioned the Agency's concern over cosolvency effects relative to the use of the OLM in evaluating the proposed wastes. The commenters believed that use of the OLM should be reconsidered because the Land Disposal Restrictions for solvents prevent the disposal of solvents in landfills. Therefore, the commenters believed that cosolvency effects should not be considered and that the proposed wastes should be evaluated

using the OLM. The Agency's concern over cosolvency effects is not directed at the commingling of the proposed listed wastes with listed solvents which must be treated prior to land disposal. The mobility of constituents may also be enhanced by the presence of organic phases that behave as solvents, such as benzene, from these and other codisposed hazardous wastes, or carboxylic acids from municipal waste leachates.

Two commenters criticized the use of and values for the Hypothetical Environmental Exposure Factors (HEEFs) because they believed the factor to be unrealistic as compared to the dilution and attenuation that occurs in actual environmental conditions. One commenter compared leaching and mobility factors generated by using the OLM and a dilution and attenuation factor (DAF) of 12 (which was generated by the EPACML) to the HEEFs used to support this listing determination and stated that the OLM factors are more realistic than the HEEFs because they are higher. Another commenter believed that the use of HEEFs is unrealistic because the estimated drinking well concentrations exceed the water solubilities for some constituents in some wastes and therefore, the constituents cannot be present in ground water at these concentrations. The commenters also stated that the Agency did not provide a scientific or sound basis for the HEEFs.

HEEFs are meant to be benchmarks of projected dilution and attenuation, and, as such, allow EPA to project potential exposure scenarios to see if health-based criteria can be exceeded under mismanagement conditions. The Agency believes these comparisons add to the weight-of-evidence approach used to determine whether or not a waste is potentially hazardous. In this case, several constituents exceed health-based criteria by several orders of magnitude at HEEFs used in this rulemaking to project dilution. (See discussion in "Basis for Listing," section II.F. above.) In addition, the Agency believes that the HEEFs should not be compared to values generated by the OLM since, as explained earlier, the OLM may significantly underestimate the constituent concentrations leached from these wastes due to the oily/ tarry nature of the wastes and the possibility of immiscible flow of migrating constituents. Although other methodologies (i.e., TCLP) tend to underestimate hazardous constituent concentrations in these wastes, they still may show unacceptably high constituent concentrations.

The Agency selected the use of HEEFs to evaluate the potential hazards associated with mismanagement of the proposed listed wastes because, as explained above, the models generally used to evaluate potential release, and fate and transport of hazardous constituents from landfills may not be appropriate for evaluating wastes from the coking and tar refining industries. As stated in the preamble to the proposed rule (56 FR 35769), "(t)he concentrations and toxicities of hazardous constituents in the wastes are of such a magnitude that, even under conservative assumptions regarding the potential for release of the constituents to the environment (use of HEEFs) and their subsequent transport in the subsurface environment, improper management of the wastes poses an unacceptable health risk."

This same range of 1.0 to 0.01 percent of the waste disposed reaching the point of exposure was also used as a basis for listing three categories of wastes from wood preserving operations that use chlorophenolic, creosote, and/or inorganic (arsenical and chromium) preservatives (see 55 FR 50450; December 6, 1990). The Agency has used a Dilution Attenuation Factor (DAF) of 100 for evaluating the mobility of constituents. The TCLP only uses a dilution and attenuation factor of 20. The Agency believes that a HEEF of 20 times 100 (or 2,000) would represent a way of projecting a benchmark of

the leachability and mobility of constituents from a waste. Therefore, a HEEF of 10,000, in comparison, could represent a conservative basis for evaluating the hazard posed by a waste considering the uncertainty associated with estimating dilution and attenuation. The Agency notes that each of the constituents of concern have waste concentrations that equal or exceed their health-based limits assuming a HEEF of 10,000.

The Agency relies on information regarding the solubility of a pure substance in water as one of several indicators of the mobility of a constituent in ground water. The Agency does not believe that water solubilities should be quantitatively compared to the solubility of the substance in ground water that has been contaminated by a mismanaged waste because this does not represent a pure substance in water. Solubilities are dependent on many factors, including the presence of an organic or oily phase. The phenomenon of constituents occurring in ground water at concentrations exceeding their water solubilities is not completely understood; however, it has been demonstrated at a number of contaminated sites, as presented in the mismanagement case studies of the proposed rule. In addition, even if the concentrations of these constituents in ground-water systems were limited to the solubility of the pure substance in water, the estimated drinking well concentrations would exceed the health-based water concentration limits by several orders of magnitude. Several commenters supported the Agency's position of evaluating constituent solubilities based on mismanagement cases at a site.

Based on the information in Tables 4-4F of todays's rule, the concentrations of hazardous constituents in the proposed listed wastes indicate that the wastes will have an adverse impact on human health and the environment. For example, even with an estimated leaching and mobility factor as high as 10,000, the exposure concentrations for each of the wastes are at least equal to the health-based level for at least one constituent of concern, and up to five orders of magnitude greater for another constituent of concern. This approach demonstrates that these wastes pose significant hazards to human health and the environment over a wide range of potential mobility and transport scenarios.

One commenter questioned the 10-5 and 10-6 risk levels used for carcinogens, stating that the National Contingency Plan under CERCLA uses 10- 4 to 10-6 risk levels as a basis for cleanup standards at Superfund sites.

When developing its preliminary remediation goals at Superfund sites, EPA uses 10-6 as a point of departure, which is considered the most desirable risk level, all things being equal, in establishing remediation goals (55 FR 8717; March 8, 1990). Site-specific factors that determine the overall risk to human health and the environment, remedy-specific factors that are based on the treatment technology, and potential future uses for the site and wastes are all factors used in determining the point within the range of 10-4 to 10-6 that defines the final cleanup standard. The Listing Program under RCRA, however, must evaluate certain wastes to determine if they are hazardous under all plausible mismanagement scenarios. The Agency does not rely on future use and site-specific information in its evaluation.

Therefore, the Agency believes that there is no basis to depart from the more protective risk factor of 10-6. The Agency notes, however, that even if the lower risk factor of 10-4 was used, the highly concentrate coke by-product wastes would still exceed the health-based limits (albeit for fewer constituents) and would still be listed today as hazardous wastes.

Another commenter claimed that the RfDs and RSDs used to develop the health-based concentration limits do not have a regulatory basis because they are not promulgated standards. The Agency does not "propose" health-based limits for promulgation as rules when listing wastes, as suggested by the commenter, because unlike Agency rules, these numbers do not prescribe behavior. Comparison of the health-based limits to the waste concentrations is only used in the initial listing process as a tool for demonstrating "(t)he nature of the toxicity presented by the constituent" in the waste, one of the criteria the Agency uses to make the listing determination (See 40 CFR 261.11(a)(3)(i)). These numbers serve as scientific guidance to the Agency in making its listing determinations. The RfDs and RSDs were presented in the proposed rule and made available for comment. The public had the opportunity to comment on the Agency's choice to use specific limits, the soundness of those limits and their underlying assumptions, and, most importantly, the Agency's overall assessment that those wastes possess toxic constituents in levels capable of causing harm to human health and the environment. However, only the waste listings are finalized; the health-based limits are used to support the listing decision. Additional information regarding the health- based limits and assumptions is provided in the background document to this rule.

Several comments were submitted regarding specific proposed listed wastes. Four commenters stated that K148, residues from coal tar distillation, does not exhibit leachability. Two commenters substantiated this claim with TCLP data and two other commenters related the leachability of K148 to that of asphalt because it has a higher melting point and asphalt binders decrease the leachability of arsenic wastes. As explained earlier in this section, the Agency does not believe that the TCLP can be used to determine the leachability of wastes such as K148 that are difficult to filter. In addition, the Agency did not receive any data to substantiate reduced leachability of K148, as compared to asphalt, particularly in the presence of other coking and/or tar refining wastes.

Several commenters questioned the relationship of the mismanagement case histories in the proposed rule (56 FR 35775) to the proposed listed wastes and believed that the Agency has not demonstrated that the wastes are capable of posing human health and environmental damage. One commenter believed that the Agency must cite actual human exposure in order to demonstrate that the wastes are capable of posing substantial harm. The Agency believes that, from the nature of the activities performed at these sites (i.e., primarily coking and tar refining operations), it is reasonable to conclude that the resulting environmental contamination was caused primarily by wastes generated from these operations. Due to the extent of contamination found at these sites relative to the health-based levels, the data are sufficient to demonstrate that potential exposure and harm exist, which is all that is required by 40 CFR 261.11(a)(3).

One commenter submitted detailed analytical concerns on one of the 13 analytical data reports used to support these listings. Overall, many of the comments addressed specific quality assurance/quality control steps in the analytical process. The Agency agrees with some of the quality concerns which address constituents that were not used to support the listing. However, most of the comments were either misinterpretations of the requirements of methods from "Test Methods for Evaluating Solid Waste: Physical/Chemical Methods" (SW-846), or they addressed requirements of the Contract Laboratory Program (CLP) instead of the SW-846 methods. These

concerns are each addressed in detail and are available in the background document for today's rule. The Agency further notes that the data presented in the particular analytical data report in question support the listing of only one waste, and in addition, represent the lowest end of the concentration ranges found for the constituents of concern for this waste. EPA does not believe that any of the analytical comments affect the conclusions presented in today's rulemaking.

One commenter requested that the Agency clarify whether the K148 listing includes tar plant wastewater collection sump sludges. The Agency reviewed the specific waste streams that were originally grouped under the heading of tar plant wastewater collection sump sludges from the RCRA 3007 Questionnaires completed in 1985 and determined that these waste streams were incorrectly described as tar plant wastewater collection sludges and are already addressed in today's listings. Specifically, these waste streams were generated during coke by-product recovery operations rather than tar refining operations. Most of these waste streams are actually residues from sumps that collect wastewaters (i.e., from tar dewatering) generated from the tar recovery process and are encompassed by K141, process residues from the recovery of coal tar. One of the waste streams formerly grouped under the tar plant wastewater collection sump sludges heading is actually the tar product stream that is fed directly to the tar dehydrator.

The same commenter also requested that EPA discuss the final listing determination for each of the coke by-product wastes specified in the proposed Consent Decree which resolves issues raised in EDF vs. Reilly, Civ.
No. 89-0598 (D.D.C.). The Agency has reviewed the RCRA 3007 Questionnaires and accompanying process flow diagrams which were the original sources for the waste categories specified in the consent decree and has determined that each of these wastes is addressed fully in today's rule. Table 6 presents the listing determination for each of these wastes:

Table 6.--Listing Determinations on Wastes in Proposed Consent Decree

Waste stream proposed in consent decree	Listing determination
Process residues from coal tar recovery operations including tar collection sump residue	K141.
Tar storage tank residues	K147.
Residues from light oil plant processing units	K143.
Wastewater treatment sludges from light oil refining, including interceptor sump sludge	K144./1/
Residues from naphthalene collection and recovery	K145.
Wastewaters from coking and coke by-product operations	No listing.
Tar storage tank residues, still bottoms, and residues from coal tar distillation	K148.
Wastewaters from coal tar refining	No listing.
Benzol scrubber sludge	K143.
Oil/water separator effluent	No listing (wastewater).
Tar plant wastewater collection sump	

sludge K141 (see explanation in text above).

Naphthalene skimmer sludge	K145.
Wash oil circulation sludge and still residue	K143, or K145./2/
Primary light oil rectifier bottoms	K143.

/1/ This waste stream is referred to at some facilities as wastewater sump residues rather than wastewater treatment sludges. To avoid confusion with the wastewater treatment sludges produced after combined wastewater treatment (see Figure 1), the Agency has decided to adopt the former description. The proposed language describing the waste has, therefore, been revised accordingly.

/2/ When wash oil is used in light oil recovery, it is classified as K143, whereas when it is used in naphthalene recovery, it is classified as K145.

One commenter believed that the wastewater treatment sludge from coke by-product recovery wastewater should be listed as a hazardous waste. The commenter compared the data generated from tar refinery wastewaters in support of this rulemaking to data from the Best Demonstrated Available Technology (BDAT) Background Document for wastewater treatment sludges generated in the production of creosote, K035. The commenter concluded that the constituents of concern may be present at low or non-detected levels in tar refining wastewaters and still be found at high concentrations in the wastewater treatment sludges due to partitioning from the wastewaters.

The Agency does not believe it has enough information to make a listing determination at this time for these wastewater treatment sludges. As stated in the preamble to the proposed rule, EPA does not have analytical data on the concentrations of constituents of concern in these sludges. The Agency also does not believe that the data presented by the commenter justify investigation of these sludges. The sludge sample referred to by the commenter, which contained high concentrations of PAHs, was from the bottom oil layer of the oil/water separator, which precedes the wastewater treatment unit in the creosote wastewater treatment plant. The other K035 samples presented in the Background Document represent sludges generated following either biological treatment or solar evaporation and contain these constituents at concentrations two to three orders of magnitude lower than the bottom oil layer.

As stated earlier in this section, the constituents of concern were not typically and frequently found at levels of regulatory concern in the coke byproduct wastewaters and therefore, the Agency does not believe that they would be typically and frequently found at levels of regulatory concern in the wastewater treatment sludges. In addition, since a significant number of facilities use biological treatment to treat these wastewaters before discharging them to a POTW or through their NPDEs permitted outfall, even low concentrations of organics would be biologically consumed in the treatment process. Lastly, the PAHSs found in the tar refining wastewaters were generally found at concentrations an order of magnitude lower in the coke by- products wastewaters than in the creosote wastewaters. The Agency expects that concentrations of PAHs would, therefore, be lower in the coke by- products treatment sludges. This probably occurs because the heavier organic layers are removed prior to wastewater treatment in the coke

by-products recovery process.

B. Recycling Exclusion

The Agency received comments from several industry groups concerning the recycling exclusions proposed on July 26, 1991 (56 FR 35787) as Sec. 261.4(a)(10)-(12). All the commenters supported the general concept of an exclusion from the definition of solid waste for coke by-product residues that are recycled by being returned to coke ovens as a feedstock to produce coke.

Two commenters made reference to the September 14, 1991 effective date of the benzene by-product NESHAP rule as a major reason for the immediate promulgation of an exclusion at the point of generation. This compliance date forced coke oven operators to either retrofit or replace the storage vessels used for coke by-product residues. This action generated large amounts of residues that would have to be sent off-site for disposal if they were not excluded at the point they were generated. The large amounts generated would cause the facilities to exceed the 90-day accumulation limit and, thus, become subject to permitting standards. In addition to the NESHAP deadline, the effective date of the permitting standards for boilers and industrial furnaces (BIF rule; 56 FR 7134) was August 21, 1991. Absent some regulatory relief by that date, commenters asserted that coke oven operators would be forced to stop recycling coke by-product residues due to the technical infeasibility of meeting the destruction and removal standards imposed by the BIF rule.

In response to commenter concerns over the effective date of the BIF rule, because the Agency did not want to disrupt the legitimate recycling of coke by-product residues, and because large amounts of residues were being generated as a result of the NESHAPs rule, EPA issued an Administrative Stay on September 5, 1991 (56 FR 43874). The effect of this action was to stay the permitting standard of the BIF rule as they apply to coke ovens that process TC hazardous residues in the production of coke. In a later Federal Register notice (57 FR 27880), EPA nullified the stay by promulgating an exclusion from the definition of solid waste for coke by-product residues that exhibit the Toxicity Characteristic when they are recycled by being returned to coke ovens or mixed with coal tar. The Agency also clarified the scope of the exclusion by placing certain conditions on it (i.e., no land disposal).

One commenter (an industry trade association) requested that the exclusion for coke by-product residues be expanded to encompass materials burned as fuel in blast furnaces in iron and steelmaking operations. Because the residues contain the same constituents as the final coke product, the commenter contended that burning of coke by-product residues in blast furnaces along with coke would not have a significant effect on the composition of the steel product. EPA disagrees with the commenter. Blast furnaces normally are charged with coal tar product that contains the coke by-products covered by this rule, as opposed to the actual coke by-product wastes themselves. Due to this distinction, the Agency believes that the introduction of raw by-product wastes into the blast furnace may have an adverse effect on emissions from the blast furnace. In addition, the use of by-product wastes in blast furnaces may cause other engineering problems not posed by the processing of coal tar product. (Nor have any other interested members of the public had any opportunity to comment on this issue.) The Agency has insufficient information on the use of coke

by-product wastes in blast furnaces and may evaluate this practice further in the future. Until such time, this issue is outside the scope of today's rulemaking. See also 50 FR at 49171-72, 49174 (November 29, 1985) (general discussion of use of secondary materials in blast furnaces).

Before publication of the exclusion rule on June 22, 1992, coke by-product residues that exhibited the TC as generated were solid and hazardous wastes, and had to be managed as such. If these residues were stored on-site for a period exceeding 90 days, they had to be stored in accordance with RCRA Subtitle C controls on storage, including permitting standards. If hazardous residues were shipped off-site for recycling or disposal, they were required to be shipped with a manifest. Facilities that received hazardous waste residues for recycling were required to have a RCRA permit if the residues were stored at the facility prior to recycling. Coking industry representatives indicated that this strict regulatory regime for coke by- product residues served as a disincentive for waste minimization and recycling efforts in the coke by-products industry. Over 50 percent of the commenters to the proposed rule stated that coke by-products facilities that currently do not have RCRA permits would not obtain a RCRA permit to manage the residues prior to recycling, due to the corrective action implications of a permit and the associated costs. Consequently, absent some regulatory relief, the residues would be sent off-site for incineration or disposal.

This was not the Agency's intent. As discussed in the Administrative Stay under rules existing at that time, EPA views the required pretreatment steps as part of the recycling process. The Agency recognizes that prior processing of the residues is necessary to obtain a homogeneous material suitable for charging to a coke oven with coal or mixing with coal tar. Therefore, this processing is considered an integral part of the recycling process itself and, as such, is exempt from regulation under 40 CFR 261.6(c)(1). The exemption encompasses all the units associated with the recycling operation, in this case, the process units and ball mills used to process the residues prior to reinsertion to coke ovens.

In any case, this issue is now moot because the materials are excluded from being solid waste. As long as the terms of the exclusion are met (i.e., no land disposal from the point of generation to the time the wastes are recycled and proper documentation is kept), no RCRA regulations apply. However, generators of these wastes must be aware of the prohibition on speculative accumulation of wastes intended for recycling. A material is not accumulated speculatively if the person accumulating it can show that the material is potentially recyclable and has a feasible means of being recycled; and that, during the calendar year (commencing on January 1), the amount of material recycled or transferred to a different site for recycling equals at least 75 percent by weight or volume of the amount of that material accumulated at the beginning of the period. (See 40 CFR 261.1(c)(8).) Therefore, the burden of proof rests with the person accumulating materials for recycling. EPA believes that speculative accumulation will not be a problem for most generators of coke by-product residues due to the ongoing use/reuse of these materials in their processes.

Three commenters requested a clarification in the final rule that today's rule does not apply to closing or historic sites. The commenters are incorrect. Since inception of the RCRA program, hazardous waste listings apply to the material being disposed, not when it is disposed of. A listed

coke by-product waste disposed in 1970 is still that same listed waste. (Chem. Waste Management v. EPA, 869 F.2d 1526 (D.C. Cir. 1989)) Hazardous waste listings thus apply retroactively to wastes disposed in units that ceased operation prior to the effective date of the listings. This does not mean that such wastes must be exhumed for proper treatment; they are subject to subtitle C controls only when they are actively managed. EPA has interpreted "active management" as physically disturbing accumulated wastes within a management unit or disposing of additional hazardous wastes in existing units containing previously disposed wastes (September 1, 1989; 54 FR 36597). Therefore, the listings promulgated today do apply to wastes disposed before the effective date of this rule, when such wastes are actively managed. For example, if an abandoned site is being remediated and wastes or contaminated media are being removed from the site, any wastes meeting the listing descriptions finalized today must be managed in accordance with all applicable requirements.

One commenter was concerned about environmental media contaminated with the wastes being listed today. The commenter believed that recycling of such media should be treated the same as the recycling of the listed wastes. EPA clarifies here that the recycling of materials extracted from media that are contaminated with the wastes being listed today will fall within the exclusion for recycling as long as the recycling practice meets the terms of the exclusion (i.e., no land disposal). If extracted material from contaminated media can be safely and effectively recycled, EPA sees no reason to regulate such recycling more stringently than the recycling of the process wastes themselves. Recycling of the listed materials is acceptable as long as they are not land disposed again. Extraction of recyclable materials from contaminated media remains subject to all applicable requirements of RCRA and CERCLA. In addition, the residues from this process (i.e., leftover media that is unrecyclable, or other treatment residues) not only will be hazardous waste but, once EPA prohibits these wastes from land disposal, would have to meet the treatment standard for these wastes before they could be land disposed.

Several commenters made reference to the similarity between the coke by-products recovery process and the recycling practice addressed in the AMC I decision, involving in-process recycled materials in the petroleum refining industry (AMC v. EPA, 824 F.2d, D.C. Cir. 1987). The commenters believe that the similarities between the two situations provide a sound basis for an exclusion for coke by-product residues, conditioned on no land disposal of materials.

EPA agrees that it is possible to craft a reasonable exclusion that allows these materials to be recycled so as not to become part of the waste management problem. EPA does not agree with the commenters' characterization of the AMC I decision, an opinion now substantially repudiated by the D.C. Circuit.

Upon promulgation of the exclusion, the recycling of coke by-product plant residues, by reinsertion to coke ovens, the tar recovery or refining process, or mixing with coal tar, was excluded from regulation, provided the condition of the exclusion at 40 CFR 261.4(a)(10) is met (i.e., no land disposal up to point of recycling). Consequently, if the terms of the exclusion are satisfied, coke by-product plant residues shipped off-site for recycling need not be accompanied by a manifest because they are not solid wastes and, therefore, not hazardous wastes. Of course, management of

coke by-product residues that involves land disposal carries the provision that those residues must be managed in accordance with all applicable RCRA requirements.

It is important to note that, although manifesting is not required for coke by-product wastes being shipped for recycling within the terms of the exclusion, generators of theses wastes remain subject to LDR notification requirements under Sec. 268.7(a)(6). This provision requires generators of restricted wastes that have been excluded from the definition of solid or hazardous waste or otherwise exempted from Subtitle C regulation to place a one-time notice in the facility's operating record. The requirements of the LDR program as they relate to this rulemaking are discussed more fully in the section of this preamble entitled Interaction with Other Regulations.

Four commenters objected to EPA's reliance on the "used to produce a fuel" rationale in 40 CFR 261.2(c)(2) for classifying coke by-product residues as solid wastes. Two commenters stated that the recycling of coke by-product residues into coke ovens falls under 40 CFR 261.2(e)(1) and, therefore, an exclusion at Sec. 261.4(a) is unnecessary because the residues are already excluded from the definition of solid waste since they are used as ingredients in an industrial process to make a product (coke). EPA's rationale in classifying coke by-product residues as solid wastes in the July 26, 1991 proposal is also the reasons why 40 CFR 261.2(e)(1) does not exclude coke by-product residues from classification as a solid waste. 40 CFR 261.2(e)(2) provides that materials burned for energy recovery, used to produce a fuel, or otherwise contained in fuels are solid wastes, even if the recycling involves use, reuse, or return to the original process, as described in Sec. 261.2(e)(1). The fact that coke has been recognized in the iron and steel industry for a long time not only for its physical and chemical value but also for its heating value in driving the iron reduction process in the blast furnace causes the "fuel" classification for coke.

The regulations classify secondary materials burned for energy recovery, used to produce a fuel, or otherwise contained in a fuel, as solid wastes because EPA believes that Congress intended the Agency to read its authority over waste-derived fuels expansively. EPA believes its authority over recycling is broadest when the recycling practice resembles a classic waste management activity, in this case, incineration. However, in the case involving recycling of coke by-product residues, the process is unlike waste management since the residues are similar to the coke and coal tar products, are amenable to use in the same process, and have no significant effect on the chemical composition of the products.

One commenter requested that the exclusion be expanded to include the recycling of coal tar materials generated by electric utilities during the remediation of historic manufactured gas plant (MGP) sites, specifically, the burning of coal tar wastes as fuels in high efficiency boilers. EPA wishes to clarify that the process of coal gasification is distinct from the coking process, from both a technical and a regulatory standpoint. The wastes from abandoned coal gasification plants are, therefore, not a part of this listing. The process referred to by the commenter is outside the scope of the recycling exclusion promulgated on June 22, 1992. The commenter may petition the Agency under 40 CFR 260.20 for a regulatory determination concerning the recycling activities at remediated MGP sites under a separate rulemaking.

One commenter proposed expanded approaches for dealing with the recycling of coke oven wastes. First, they recommended that EPA exempt these wastes

from regulation as a hazardous waste when they are used as part of a CERCLA cleanup or RCRA corrective action. Secondly, the commenter urged the Agency to adopt a generic recycling exemption (i.e., from regulation as a hazardous waste) for recycling of these wastes and MGP wastes by any type of process if a person submits a petition and EPA approves such petition. This petitioning process would be similar to the existing process for delisting petitions.

Regarding the first suggestion, at a CERCLA site, treatment of a waste does not need a RCRA permit as long as the work is being done on-site and as long as Applicable and Relevant and Appropriate Requirements (ARARs) are observed.

In these cases, where the wastes are removed from a remediated site, the material extracted can still be recycled to a coke oven if it meets the description of a waste in today's rule and if a coke by-products facility is willing to accept it. (Subsequent land disposal of the material again would void the exclusion.) Further, the issue of a national policy regarding recycling at remedial sites outside the scope of this rulemaking, which deals only with listing determinations regarding coke by-product wastes (RCRA 3001(e)). The Agency has recently raised the issue of cleanups at RCRA or CERCLA sites in the Hazardous Waste Identification Rule proposed on May 20, 1992 (57 FR 21450--21522). The Agency will resolve issues related to recycling at these sites as it decides which option in the HWIR rule to promulgate, in response to public comments.

With regard to the second point, under the exclusion to the definition of solid waste in Sec. 261.4(a)(10), the materials can be excluded if they are returned to an excluded process (e.g., coke oven). The materials in question must have enough coke by-products material to meet the requirements of 261.4(a)(10). Given the demonstrated ability of several recyclers to accomplish extracting, reprocessing, and recycling of these materials without land disposal, the Agency feels that the current regulatory structure is sufficient to encourage not only the recycling of coke by-products wastes at operational facilities but also the remediation of these materials where they have been found in sufficient quantities in the environment (e.g., abandoned sites).

Finally, one commenter requested that a Regulatory Flexibility Analysis be conducted. The Regulatory Flexibility Act (5 U.S.C. 601 et seq.) requires that whenever an agency publishes a notice of rulemaking, it must prepare a Regulatory Flexibility Analysis (RFA) that describes the effect of the rule on small entities. An RFA is unnecessary, however, if the Agency's administrator certifies that the rule will not have a significant economic effect on a substantial number of small entities. The commenter contended that the proposed rule would have a significant economic impact on their business because it proposed to exclude only processes that occur subsequent to the company's recycling activities. The Agency reiterates that any processing of coke by-products that occurs prior to recycling is considered part of the recycling process and is, therefore, excluded from regulation, provided that the terms of the exclusion are met. As a result, small entities are not significantly affected and a Regulatory Flexibility Analysis is unnecessary.

Additional detail and responses to additional comments are available in the Background Document to today's rule.

IV. Interaction With Other Regulations

A. Land Disposal Restrictions

The 1984 amendments to RCRA (HSWA) mandate that the Agency promulgate land disposal prohibition determinations under a specific schedule for wastes identified and listed prior to enactment of HSWA (RCRA sections 3004 (d), (e), and (g)(4); 42 U.S.C. 6924 (d), (e), and (g)(4)). If the Agency failed to promulgate land disposal restrictions by the dates specified in section 3004(g)(4), the wastes were absolutely prohibited from land disposal after May 8, 1990. The statute also requires the Agency to make a land disposal prohibition determination for any hazardous waste that is newly listed or identified after November 8, 1984, within six months of the date of promulgation of the listing or identification (RCRA 3004(g)(4)). However, the statute does not provide for automatic prohibition of the land disposal of such wastes if EPA fails to meet this deadline.

The Agency is in the process of completing treatability and capacity analyses for the wastes covered by today's rule. For this reason, the Agency will address land disposal restrictions for these wastes in the near future.

It should be noted that because the statute does not provide for automatic restriction or prohibition of land disposal for newly listed and identified wastes until such restrictions are promulgated, land disposal of these wastes will not be restricted or prohibited until the Agency promulgates land disposal restrictions for these wastes. However, these wastes may exhibit one of the prohibited hazardous characteristics or be subject to other regulatory or statutory restrictions such as the prohibition on disposing liquids in landfills. Wastes that exhibit the Toxicity Characteristic are considered newly identified and are not covered by the LDR, unless they also exhibit the EP Toxicity Characteristic (see the Third Third LDR Rule, June 1, 1990; 55 FR 22520). EPA expects to propose prohibitions and treatment standards for TC wastes, as well as for the wastes newly listed today, during the summer of 1992.

EPA wishes to point out that generators of restricted hazardous wastes that have been excluded or exempted from regulation are subject to a notification requirement under the Land Disposal Restrictions program in accordance with Sec. 268.7(a)(6) (see 55 FR 3878; January 31, 1991). This subparagraph requires generators of restricted wastes that are excluded from the definition of solid or hazardous waste or otherwise exempt from Subtitle C regulation to place a one-time notice in the facility's files. This notice must contain information on the generation, subsequent exclusion or exemption from RCRA regulation, and the disposition of the waste. This recordkeeping requirement is similar to the provision in Sec. 261.2(f) requiring documentation of claims that a material is not a solid waste. The information on the disposition of the waste must indicate that the waste is not land disposed or placed in any type of land-based unit and, therefore, remains eligible for the exclusion. The existing listed wastes covered by the exclusion at Sec. 261.4(a)(10) (i.e., K060 and K087) are already prohibited from land disposal and have BDAT treatment standards associated with them and are therefore already subject to this recordkeeping requirement. The wastes being listed today will be addressed by the Agency in a future LDR rulemaking and will therefore become subject to the notification requirement once the prohibition for these wastes takes effect. As discussed above, these prohibitions and treatment standards for the TC wastes are expected to be proposed this summer.

V. State Authority

A. Applicability of Final Rule in Authorized States

Under Section 3006 of RCRA, EPA may authorize qualified States to administer and enforce RCRA programs within the State. (See 40 CFR part 271 for the standards and requirements for authorization.) Following authorization, EPA retains enforcement authority under sections 3008, 7003, and 3013 of RCRA, although authorized States have primary enforcement responsibility.

Prior to the Hazardous and Solid Waste Amendments of 1984 (HSWA), a State with final RCRA authorization administered its authorized hazardous waste program entirely in lieu of EPA. The Federal requirements no longer applied in the authorized State, and EPA could not issue permits for any facilities in the State which the State was authorized to permit. When new, more stringent Federal requirements were promulgated or enacted, the State was obliged to enact equivalent authority within specified time frames. New Federal requirements did not take effect in an authorized State until the State adopted the requirements as State law.

In contrast, under section 3006(g) of RCRA (42 U.S.C. 6926(g)), new requirements and prohibitions imposed by the HSWA take effect in authorize States at the same time that they take effect in nonauthorized States. EPA is directed to implement these requirements and prohibitions in authorized States, including the issuance of permits, until the State modifies its program to reflect the Federal standards, and applies for and is granted authorization. While States must still adopt HSWA-related provisions as State law to retain final authorization, HSWA applies in authorized States in the interim.

Today's rule is promulgated pursuant to section 3001(e)(2) of RCRA, a provision added by HSWA. Therefore, the Agency is adding these requirements to Table 1 in 40 CFR 271.1(j), which identifies the Federal program requirements that are promulgated pursuant to HSWA and that take effect in all States, regardless of their authorization status. States may apply for either interim or final authorization for the HSWA provisions identified in 40 CFR 271.1(j) Table 1, as discussed in the following section of the preamble.

B. Effect on State Authorization

As noted previously, today's rule is promulgated pursuant to provisions added by HSWA. The addition of K141 through K145 and K147 and K148 to the list of hazardous wastes from specific sources is promulgated pursuant to section 3001(e)(2) of RCRA, a provision added by HSWA.

As noted above, EPA will implement the HSWA portions of today's rule in authorized States until they modify their programs to adopt these rules and such modifications are approved by EPA. Because this rule is promulgated pursuant to HSWA, a State submitting a program modification may apply to receive either interim or final RCRA authorization under section 3006 (g)(2) or 3006(b), respectively, on the basis that State regulations are substantially equivalent or fully equivalent to EPA's regulations. The

procedures and schedules for State program modifications for either interim or final authorization are described in 40 CFR 271.21. It should be noted that all HSWA interim authorizations will expire on January 1, 1993 (see 40 CFR 271.24(c)).

It should also be noted that 40 CFR 271.21(e) requires that States having final RCRA authorization must modify their programs to reflect Federal program changes and must subsequently submit the modifications to EPA for approval. The deadline by which States must modify their programs to reflect this rule is July 1, 1994 (or July 1, 1995, if statutory changes are required). Once EPA approves the modification, the State requirements become RCRA subtitle C requirements.

States with authorized RCRA programs may already have regulations similar to those promulgated in today's rule. Such State regulations have not been assessed against the Federal regulations being finalized today to determine whether they meet the tests for authorization. Thus, a State is not authorized to implement its regulations as RCRA requirements until the State program modification is submitted to EPA and approved. Of course, States with existing regulations may continue to administer and enforce those regulations as a matter of State law. In addition, in implementing the Federal program, EPA will work with the States under cooperative agreements to minimize duplication of efforts; in many cases, EPA will be able to defer to the States in their efforts to implement their programs, rather than take separate actions under Federal authority.

States that submit their official applications for final authorization less than 12 months after the effective date of EPA's regulations are not required to include regulations equivalent to the EPA regulations in their application. However, States must modify their programs by the deadlines set forth in 40 CFR 271.21(e)(2). States that submit official applications for final authorization 12 months after the effective date of these standards must include standards equivalent to these standards in their application.

The requirements States must meet when submitting final authorization applications are set forth in 40 CFR 271.3.

VI. CERCLA Designation and Reportable Quantities

All hazardous wastes listed in 40 CFR 261.31 through 261.33, as well as any solid waste that exhibits one or more of the hazardous waste characteristics, also are hazardous substances under section 101(14) of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) of 1980, as amended. Therefore, the seven wastes being listed today are CERCLA hazardous substances. Hazardous substances are listed in Table 302.4 at 40 CFR 302.4 along with their respective reportable quantities (RQs); thus, EPA is today adding entries for K141, K142, K143, K144, K145, K147, and K148 to Table 302.4.

Under CERCLA 103(a), the person in charge of a vessel or facility from which a hazardous substance has been released in a quantity that equals or exceeds its RQ must immediately notify the National Response Center of the release as soon as that person has knowledge of the release. In addition to this reporting requirement under CERCLA, section 304 of the Emergency Planning and Community Right-to-Know Act (EPCRA) requires owners or operators of certain facilities to report the release of a hazardous

substance to State and local authorities. EPCRA section 304 notification must be given to the community emergency coordinator of the local emergency planning committee for each area likely to be affected by the release, and to the State emergency planning commission of any State likely to be affected by the release.

Under section 102(b) of CERCLA, all hazardous wastes are assigned a statutory RQ of one pound unless and until adjusted by regulation. The Agency's methodology for adjusting RQs of individual hazardous substances begins with an evaluation of the intrinsic physical, chemical, and toxicological properties of each hazardous substance. The intrinsic properties examined, called "primary criteria," are aquatic toxicity, mammalian toxicity (oral, dermal, and inhalation), ignitability, reactivity, chronic toxicity, and potential carcinogenicity. Generally, for each intrinsic property, the Agency ranks hazardous substances on a scale, associating a specific range of values on each scale with an RQ of 1, 10, 100, 1,000, or 5,000 pounds. The data for each hazardous substance are evaluated using various primary criteria; each hazardous substance may receive several tentative RQ values based on its particular intrinsic properties. The lowest of the tentative RQs becomes the "primary criteria RQ" for that substance.

After the primary criteria RQs are assigned, substances are further evaluated for their susceptibility to certain degradative processes, which are used as secondary adjustment criteria. These natural degradative processes are biodegradation, hydrolysis, and photolysis (BHP). If a hazardous substance, when released into the environment, degrades relatively rapidly to a less hazardous form by one or more of the BHP processes, its RQ, as determined by the primary RQ adjustment criteria, is generally raised one level. This adjustment is made because the relative potential for harm to public health or welfare or the environment posed by the release of such a substance is reduced by these degradative processes. Conversely, if a hazardous substance degrades to a more hazardous form after its release, the original substance is assigned an RQ equal to the RQ for the reaction product. The downward adjustment is appropriate because the hazard posed by the release of the original substance is increased if it degrades to a more hazardous form.

The methodology summarized above is applied to adjust the RQs of individual hazardous substances. An additional process applies to RCRA waste streams that contain individual hazardous substances as constituents. As the Agency has stated (54 FR 33440, August 14, 1989), to assign an RQ to a waste stream, the Agency determines the RQ for each waste stream constituent and then assigns the lowest of these constituent RQs to the waste stream itself.

Waste streams K141, K142, K143, K144, K145, K147, and K148 each contain at least one constituent with an RQ of one pound (the lowest RQ). In order to coordinate RCRA and CERCLA rulemakings, the Agency included regulatory RQs of one pound for each waste stream in the July 26, 1991 proposed rule (56 FR 35758). EPA received no comments on these proposed RQ adjustments. The Agency is, therefore, promulgating these RQ adjustments by including final RQs of one pound for waste streams K141, K142, K143, K144, K145, K147, and K148 in Table 302.4 (40 CFR 302.4).

VII. Cost and Economic Analysis

Executive Order No. 12291 requires that a regulatory agency determine whether a new regulation will be "major" and, if so, that a Regulatory Impact Analysis (RIA) be conducted. An RIA is a quantification of the potential benefits, costs, and economic impacts of the rule. A "major" rule is defined as a regulation likely to: (1) Result in an annual effect on the economy of $100 million or more; (2) increase costs or prices for consumers, individuals, industries, Federal, State, and local government agencies, or geographic regions; or (3) significant adverse effects on competition, employment, investment, productivity, innovation, or on the ability of United States-based enterprises to compete with foreign-based enterprises in domestic or export markets.

The Agency estimated the costs of today's final rule to determine if it is a major regulation as defined by Executive Order 12291. Today's final rule is not a major rule, having costs below $100 million annually. Additionally, the Agency's cost analysis concluded that these costs would not result in significant price increases or significant adverse effects on competition, trade, employment, or investment. Because impacts of this rule do not meet the criteria set forth by Executive Order 12291, the Agency has determined that today's rule is not a major one. An effect and economic impact analysis has been performed, estimating the costs and economic impact incurred as a result of today's rule. This section of the preamble discusses the results of this analysis. The full Cost and Economic Impact Analysis document is available in the public docket.

A. Cost Analysis

The Agency developed costs for today's final rule on a facility-specific basis for the coking industry (30 active coke facilities) and the tar refining industry (eight active tar refining facilities). Baseline management practice costs and post-regulatory management practice costs were developed at each facility; the incremental compliance cost of today's rule is determined as the post-regulatory cost minus the baseline cost.

The baseline management options include practices such as recycling to the coke oven or tar decanter, on-site landfilling, off-site reclamation, and burning in a boiler or blast furnace. The compliance management options include recycling to the coke oven or cement kiln for all waste streams, no generation-circulation for tar storage tank residues for coking merchant plants and tar refining plants, and off-site reclamation for K143 wash oil purifier residue and decanter muck.

Tables 7 and 8 summarize the annualized after-tax costs by waste code for baseline, least costly compliance option (recycle to the oven and no generation-circulation for tar storage tank residues from tar refining) and most costly compliance option (cement kiln). Tables 9 and 10 summarize the annualized after-tax costs by facility, including the part 262 costs. The total incremental annual after-tax compliance cost of today's rule is estimated to be between $380,000 (not including a $200,000 estimated savings for the tar refining industry) and $6.6 million. The Economic Impact Screening Analysis, available in the docket, provides a complete description of the cost analysis.

Table 7--Summary of Coking Industry Impacts Following Compliance for Hazardous Waste Listings K141-K145
(After tax private cost)

Line No.	Waste stream	Coke production (tons/ product year)a	Residual (tons/ year)	Current management practice	Baseline Annualized cost ($/yr)
1.	K141	24,924,631	3,102	Baseline	54,980
2.	K142	24,637,897	10,023	Baseline	497,012
3.	K143		22,860,399		
4.	(a) Scrubber residue	452		Baseline	11,873
5.	(b) Wash oil residue	3,617		Baseline	30,862
6.	K144	16,297,707	870	Baseline	23,480
7.	K145	15,251,593	453	Baseline	14,994
8.	Total				633,201

(...Table continues...)

Line No.	Least costly compliance option: Compliance management practice	Annualized cost ($/yr)	Incremental annualized cost ($/yr)
1.	Recycle to oven	234,732	149,752

B. Economic Impact Analysis

The Agency assessed the economic impacts incurred due to today's final rule for the coke industry and the tar refining industry. The economic impacts for both industries were estimated by calculating the ratio derived from dividing the annual incremental after-tax compliance costs by the value of production on a facility-specific basis. A ratio greater than one percent of sales (value of production) indicates potentially significant adverse effects.

1. Coking Industry

EPA estimated costs for the 30 active coke facilities for which data was available. However, the economic impact analysis was conducted for all 32 coking facilities. Economic impacts for the two facilities for which the Agency did not possess data were estimated using the average production and incremental compliance costs for the 30 active coke facilities. Table 9 summarizes the impacts by facility and industry total for coking. Except for those facilities that claimed confidentiality (CBI facilities), Table 9 shows for each facility in the industry the estimated annual value of production, least costly and most costly incremental annualized compliance costs, and costs of compliance as a percent of value of production.

Assuming facilities adopt the least costly management options, costs of compliance are insignificant for all facilities. For the least costly management options, the industry aggregate costs of compliance to value of production ratios is estimated at 0.009 percent (compared to the proposed rule industry aggregate of -0.001 percent). There are no adverse economic impacts associated with the least costly option. The increase in the industry aggregate cost to value of production ratio from the proposed rule is attributable to a contract recycler recycling the waste at the coking plant at $100/ton. The price of $100/ton includes capital expenditures for storage and processing equipment, removal of waste, and processing. The proposed rule costs included only facility labor for removal of waste, except for K143 which also included storage tanks.

Assuming that facilities adopt the most costly compliance option, cement kiln in all cases, there are no adverse economic impacts. For the most costly management option, the industry aggregate costs of compliance to

value of production ratios is estimated at 0.13 percent (compared to the proposed rule industry aggregate of 0.36 percent).

Table 9.--Summary of Coking Facility and Industry Impacts Following Compliance With Proposed Hazardous Waste Listings (K141-K145)

27	262,956,386	16,782	0.006		353,208	0.13
7	464,034,330	16,457	0.004		385,011	0.08
50 /1/	138,629,820	21,625	0.016		235,075	0.17
52 /1/	172,462,500	31,264	0.018		348,351	0.20
CBI /2/	474,025,289	(8,794)	-0.002		640,133	0.14
Other /3/	276,596,538	23,894	0.009		350,782	0.13
Total industry	4,425,544,613	382,299	0.009		5,612,515	0.13

/1/ The estimated value of production for this firm is based strictly on their production of coke. No information is available on the rest of their production line. Thus, the value of production is likely underestimated and the impacts on these facilities overestimated.

/2/ Information for CBI facilities is aggregated to protect the confidentiality of each individual facility.

/3/ There are two active coking facilities for which no production or waste generation data are available. The average values for all other coking facilities are used as proxies for these two facilities, so that industry impacts are not underestimated. Thus, the average value of production is assumed for each of these facilities, as is the average incremental annualized compliance costs for both the least costly options and the most

costly options.
Source: DPRA Incorporated.

2. Tar Refining Industry

There are 14 active tar refining facilities. Of these 14 facilities, three facilities do not generate K147 and K148. In addition, for three of the facilities no production or waste generation data are available. Incremental compliance costs were estimated for the eight active tar refining facilities for which the Agency has data. However, the Agency conducted an economic impact analysis for 11 tar refining plants (the three facilities that do not generate K147 and K148 were omitted). Economic impact for the three facilities for which there are no data were estimated using the average production and incremental compliance costs for the eight active tar refining facilities. Table 10 summarizes the impacts by industry total for tar refining. Nearly all the tar refiners requested confidentiality on the data they submitted on the RCRA 3007 questionnaire; therefore, Table 10 presents only aggregated information.

Assuming facilities adopt the least costly management options, costs of compliance are insignificant for all facilities. For the least costly management options, the industry aggregate costs of compliance to value of production ratios is estimated to be too small to be measurable as a cost or savings (compared to the proposed rule industry aggregate of -0.04 percent).
There are no adverse economic impacts associated with the least costly option.

Assuming the facilities adopt the most costly compliance option, cement kiln in all cases, there are no adverse economic impacts. For the most costly management option, the industry aggregate costs of compliance to value of production ratios is estimated at 0.26 percent (compared to the proposed rule industry aggregate of 0.97 percent). Under the proposed rule, five tar refining facilities were adversely affected, with costs to sales ratios exceeding one percent.

Table 10.-- Summary of Tar Refining Industry Effects Following Compliance With Proposed Hazardous Waste Listings (K 147 and K 148)

		Least costly option /2/		Most costly option /3/	
Facility name /1/	Estimated value of production	Incremental annualized costs ($/yr)	Costs of compliance as a percent of value of production (%)	Incremental annualized compliance costs ($/yr)	Costs of compliance as a percent of value of production (%)
Aggregated facilities	$384,801,384 /4/	0	0	1,011,248	0.26

/1/ Because most tar refining facilities requested confidentiality, individual facility names are not shown. Rather, data from all facilities are presented in aggregate figures.
/2/ Least costly option: No generation/circulation for tar storage tank residues (K147). Recycle to oven for still bottoms (K148).
/3/ Most costly option: Cement kiln for both K147 and K148.
/4/ Incremental annualized compliance costs were determined to be

insignificant, either as a cost or a savings.
Source: Prepared for the U.S. EPA by DPRA Incorporated.

VIII. Regulatory Flexibility Analysis

Pursuant to the Regulatory Flexibility Act of 1980 (RFA), 5 U.S.C. 601 et seq., whenever an agency is required to publish a notice of rulemaking for any proposed or final rule, it must prepare and make available for public comment a regulatory flexibility analysis that describes the effect of the rule on small entities (i.e., small businesses, small organizations, and small governmental jurisdictions). This analysis is unnecessary, however, if the agency's administrator certifies that the rule will not have a significant economic effect on a substantial number of small entities.

EPA has examined the rule's potential effects on small entities as required by the Regulatory Flexibility Act. I certify that today's proposed rule will not have a significant economic effect on a substantial number of small entities.

IX. Paperwork Reduction Act

This rule does not contain any new information collection requirements under RCRA that are subject to OMB review under the Paperwork Reduction Act of 1990, 44 U.S.C. 3501 et seq. Release reporting required as a result of proposing the listed wastes as hazardous substances under CERCLA and adjusting the reportable quantities (RQs) has been approved under the provisions of the Paperwork Reduction Act, 44 U.S.C. 3501 et seq., and has been assigned OMB control number 2050-0046.

X. Compliance and Implementation

A. Section 3010 Notification

Generally, when new hazardous wastes are listed, all persons who generate, transport, treat, store, or dispose of the newly listed waste(s) are required to notify either EPA, or a State authorized by EPA to implement the hazardous waste program, of their activities pursuant to Section 3010 of RCRA. However, under the Solid Waste Disposal Amendments of 1980 (Pub. L. 96-482), EPA was given the option of waiving the notification requirements under Section 3010 of RCRA following revision of the Section 3001 regulations, at the discretion of the Administrator. EPA is proposed to waive this notification requirement for persons who handle wastes that are covered by today's rule and have already notified EPA that they manage other hazardous wastes and have received an EPA identification number. EPA is waiving the notification requirement because of the likelihood that persons managing today's newly listed wastes already are managing one or more hazardous wastes that generally are associated with the generation of K141-K145, K147, and K148 and have, therefore, previously notified EPA and received an EPA identification number. In the event that any person who generates, transports, treats, stores, or disposes these wastes has not previously notified and received an identification number, that person must obtain an identification number pursuant to 40 CFR 262.12 before that person can generate, transport, treat, store, or dispose of these wastes.

B. Compliance Dates for Facilities

Today's hazardous wastes listings are promulgated pursuant to HSWA. HSWA requirements are applicable in authorized States at the same time as in unauthorized States. Therefore, EPA will regulate the wastes listed today until States are authorized to regulate these wastes. The Agency will apply these Federal regulations to these wastes and to their management in both authorized and unauthorized States.

Newly regulated facilities (i.e., facilities at which the only hazardous wastes that are managed are today's newly listed wastes in units subject to permit requirements) must qualify for interim status within six months of publication of the rule in order to continue managing these wastes in such units. To retain interim status, a newly-regulated land disposal facility must, within eighteen months after publication of the rule, submit a part B permit application and certify that the facility is in compliance with all applicable ground-water monitoring and financial responsibility requirements (see RCRA section 3005(e)(3)).

Interim status facilities that manage the wastes listed today must file an amended part A permit application within six months of publication of today's rule (the effective date of the rule) if they are to continue managing these wastes in units that require a permit. The facilities must file the necessary amendments by the effective date of the rule, or they will not obtain interim status with respect to these wastes.

Currently permitted facilities that manage today's newly listed wastes must request permit modifications if they are to continue managing these wastes in units that require a permit. Since EPA will initially be responsible for processing these permit modifications, the Federal procedures for permit modifications to add newly listed or identified wastes will be followed. (See Sec. 270.42(g).) This provision generally requires that a permitted facility that is "in existence" for the newly listed or identified waste on the effective date of the waste listing must submit a Class 1 modification by that date. Essentially, this modification notifies the Agency and the public that the facility is handling the waste and identifies the units involved. By submitting this notice, the facility is temporarily allowed to continue management of the newly listed wastes until the Agency can make a final modification to the permit. Next, within 180 days of the effective date the permittees must submit a more detailed permit modification request (i.e., a Class 2 or 3 modification). This information will be used by the Agency to develop a final permit modification.

List of Subjects

40 CFR Part 261

Hazardous waste, Recycling, Reporting and recordkeeping requirements.

40 CFR Part 271

Administrative practice and procedure, Confidential business information, Hazardous materials transportation, Hazardous waste, Indians-lands, Intergovernmental relations, Penalties, Reporting and recordkeeping

requirements, Water pollution control, Water supply.

40 CFR Part 302

Air pollution control, Chemicals, Hazardous substances, Hazardous materials, Hazardous wastes, Intergovernmental relations, Natural resources, Reporting and recordkeeping requirements, Superfund, Water pollution control, Water supply.

Dated: July 31, 1992.

William K. Reilly,
Administrator.

For the reasons set out in the preamble, chapter I of title 40 of the Code of Federal Regulations is amended as follows:

PART 261--IDENTIFICATION AND LISTING OF HAZARDOUS WASTE

1. The authority citation for part 261 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6921, 6922, and 6938.

2. In Sec. 261.4, paragraph (a)(10) is revised to read as follows:

Sec. 261.4 Exclusions.

(a) * * *

(10) EPA Hazardous Waste Nos. K060, K087, K141, K142, K143, K144, K145, K147, and K148, and any wastes from the coke by-products processes that are hazardous only because they exhibit the Toxicity Characteristic (TC) specified in section 261.24 of this part when, subsequent to generation, these materials are recycled to coke ovens, to the tar recovery process as a feedstock to produce coal tar, or mixed with coal tar prior to the tar's sale or refining. This exclusion is conditioned on there being no land disposal of the wastes from the point they are generated to the point they are recycled to coke ovens or tar recovery or refining processes, or mixed with coal tar.

* * * * *

3. Section 261.32 is amended by adding the following hazardous waste listings in alphanumeric order to the subgroup Coking to read as follows:

Sec. 261.32 Hazardous wastes from specific sources.

* * * * *

Industry and EPA hazardous waste No.	Hazard	Hazardous waste code

* * * * * * *

Coking:

* * * * * * *

K141 Process residues from the recovery of coal tar, (T) including, but not limited to, collecting sump residues from the production of coke from coal or the recovery of coke by-products produced from coal. This listing does not include K087 (decanter tank tar sludges from coking operations).

K142 Tar storage tank residues from the production of coke (T) from coal or from the recovery of coke by-products produced from coal.

K143 Process residues from the recovery of light oil, (T) including, but not limited to, those generated in stills, decanters, and wash oil recovery units from the recovery of coke by-products produced from coal.

K144 Wastewater sump residues from light oil refining, (T) including, but not limited to, intercepting or contamination sump sludges from the recovery of coke by-products produced from coal.

K145 Residues from naphthalene collection and recovery (T) operations from the recovery of coke by-products produced from coal.

K147 Tar storage tank residues from coal tar refining. (T)

K148 Residues from coal tar distillation, including but not (T) limited to, still bottoms.

4. In part 261, Appendix VII is amended to add the following waste streams in alphanumeric order to read as follows:

Appendix VII--Basis for Listing Hazardous Waste

EPA hazardous waste No.	Hazardous constituents for which listed
* * * * * * *	
K141	Benzene, benz(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene.
K142	Benzene, benz(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene.
K143	Benzene, benz(a)anthracene, benzo(b)fluoranthene, benzo(k)fluoranthene.
K144	Benzene, benz(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, dibenz(a,h)anthracene.
K145	Benzene, benz(a)anthracene, benzo(a)pyrene, dibenz(a,h)anthracene, naphthalene.
K147	Benzene, benz(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene.
K148	Benz(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene.

* * * * * * *

PART 271--REQUIREMENTS FOR AUTHORIZATION OF STATE HAZARDOUS WASTE PROGRAMS

1. The authority citation for Part 271 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), and 6926.

2. Section 271.1(j) is amended by adding the following entry to Table 1 in chronological order by date of publication:

Sec. 271.1 Purpose and scope.

* * * * *

(j) * * *

Table 1.--Regulations Implementing the Hazardous and Solid Waste Amendments of 1984

Promulgation date	Title of regulation	Federal Register reference	Effective date
* * * * * * *			
August 18, 1992.	The listing of wastes from the production, recovery, and refining of coke by-products produced from coal	(Insert FR page numbers)	February 18, 1993.

* * * * *

PART 302--DESIGNATION, REPORTABLE QUANTITIES, AND NOTIFICATION

1. The authority citation for part 302 continues to read as follows:

Authority: 42 U.S.C. 9602, 9603, and 9604; 33 U.S.C. 1321 and 1361.

2. Section 302.4 is amended by adding the waste streams K141 through K145, K147, and K148 to Table 302.4 in alphanumeric order. The appropriate footnotes to Table 302.4 are republished without change.

SUMMARY: The Environmental Protection Agency (EPA) is amending its financial assurance requirements under subtitle C of the Resource Conservation and Recovery Act (RCRA). On July 1, 1991 (56 FR 30201), the Agency proposed several amendments to the regulations related to third-party liability coverage, namely, the claims reporting provision and the provisions for obtaining a letter of credit. The Agency proposed to expand the use of the non-parent corporate guarantee to owners and operators of hazardous waste facilities for demonstrating financial responsibility for closure and post- closure care. In this action the Agency is promulgating those changes.

TEXT:

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Parts 264 and 265

(FRL-4106-2)

RIN 2050-AC71

Standards Applicable to Owners and Operators of Hazardous Waste Treatment, Storage, and Disposal Facilities; Financial Responsibility for Third-Party Liability, Closure, and Post-Closure

AGENCY: Environmental Protection Agency.

ACTION: Final rule.

SUMMARY: The Environmental Protection Agency (EPA) is amending its financial assurance requirements under subtitle C of the Resource Conservation and Recovery Act (RCRA). On July 1, 1991 (56 FR 30201), the Agency proposed several amendments to the regulations related to third-party liability coverage, namely, the claims reporting provision and the provisions for obtaining a letter of credit. The Agency proposed to

expand the use of the non-parent corporate guarantee to owners and operators of hazardous waste facilities for demonstrating financial responsibility for closure and post- closure care. In this action the Agency is promulgating those changes.

EFFECTIVE DATE: September 16, 1992.

SUPPLEMENTARY INFORMATION:

Preamble Outline

I. Authority

This proposed rule is issued under the authority of section 3004 of the Resource Conservation and Recovery Act (RCRA), as amended, 42 U.S.C. 6924.

II. Amendments to the September 1, 1988 Rule Regarding Third Party Liability Coverage

A. Background

On September 1, 1988, the Agency issued a final rule that expanded the instruments available to owners and operators to demonstrate financial responsibility for third party liability. (see 53 FR 33938). Prior to the September 1, 1988 rule, the RCRA regulations at 40 CFR 264.147 allowed the use of a financial test, a parent corporate guarantee, or insurance for third party liability assurance. In the September 1, 1988 rulemaking, the Agency expanded the options to include the letter of credit, surety bond, trust fund, and non-parent corporate guarantee. The September 1, 1988 rulemaking also established in Secs. 264.147 and 265.145 a claims reporting requirement for third-party claims.

Chemical Waste Management, Inc. (CWM) challenged several provisions of the September 1, 1988 rulemaking, in particular, several provisions related to the letter of credit and the claims reporting requirement. On February 23, 1990 the parties entered into a Joint Stipulation of Settlement in which the Agency agreed to: (1) Revise the claims reporting requirement of Secs.

264.147 and 265.147 to clarify the type of claims that must be reported; (2) amend Sec. 264.151(k) to authorize the creation of a standby trust fund for owners and operators who obtain letters of credit to demonstrate liability coverage; and (3) issue a correction to Secs. 264.147(a)(2) and 265.147(a)(2) to insert a reference to the financial test. In accordance with the February 23 settlement agreement, the Agency proposed changes to the claims reporting requirement of Secs. 264.147 and 265.147 and the use of a standby trust fund under Sec. 264.151(k) on July 1, 1991 (56 FR 30201). The technical correction to Secs. 264.147(a)(2) and 265.147(a)(2) was also published on that date.

Today's notice promulgates the changes pertaining to claims reporting and the standby trust proposed on July 1, 1991.

In addition to the changes resulting from the settlement agreement, today's notice also promulgates a conforming change to Secs. 264.147(f)(6) and 265.147(f)(6) to expand the instruments available to owners and operators that no longer meet the requirements of the financial test for liability coverage. This change was proposed in the July 1, 1991 notice.

The July 1, 1991 notice also proposed provisions not promulgated today. First, that notice proposed modifications to the financial tests for closure, post-closure and third-party liability. In addition, it proposed amendments to the post-closure deed requirement at Secs. 264.119(b)(2), 264.143(i), 265.119(b)(2), and 265.143(h). EPA is continuing to evaluate comments received on the proposed revisions to the financial tests and has decided not to proceed with those revisions and the revisions to the post-closure deed requirements at this time. EPA believes deferring action on the amendments promulgated today until such time as revisions to the financial tests and all other issues arising from the July 1, 1991 notice are resolved is not necessary to protect human health and the environment and would unduly burden the regulated community. Because the July 1, 1991 notice would have amended the financial tests and other provisions that the Agency is continuing to evaluate, the notice included proposed changes to the wording of the financial assurance instruments in Sec. 264.151 that differ from the language in today's rule. Today's rule amends the language of the financial assurance instruments only to the extent necessary to reflect amendments to Secs.
264.143, 264.145, and 264.147, and Secs. 265.143, 265.145, 265.147.

B. Claims Reporting Requirement

As is discussed above, the September 1, 1988 rule established in Secs. 264.147 and 265.147 a requirement that owners and operators report, in writing, to the Regional Administrator whenever: (1) A claim for bodily injury or property damages caused by the operation of a hazardous waste management facility is made against the owner, operator, or instrument providing financial assurance for liability coverage; and (2) the amount of financial assurance for liability coverage is reduced. In its complaint filed in response to the September 1, 1988 rulemaking, CWM asserted that the claims reporting requirement, as worded, was overly broad and thereby unduly burdensome. CWM argued that it required reporting of every claim filed against the owner or operator, no matter how valid.

This reporting requirement was intended to provide the Agency with early warning of potential instrument failure due to pending claims and to

provide the Agency with data concerning the incidence of third party claims. EPA certainly did not intend the interpretation of this provision suggested by CWM. Instead, in a memorandum, from Sylvia K. Lowrance to the RCRA Branch Chiefs, of January 25, 1990, EPA clarified that it expected reporting of valid claims only. Today's rule revises Secs. 264.147(a)(2), 264.147(b)(2), 265.147(a)(2), and 265.147(b)(2) to clarify that intent and require reporting of third party claims only when: (1) a claim results in reduction of the amount of an instrument; (2) a Certification of Valid Claim is entered between the owner or operator and third party claimant; or (3) a final court order establishing a judgment is issued.

In general, comments generally favored the revised claims reporting requirement. Commentors felt that the revised reporting requirement would clarify the types of claims that need to be reported to the Regional Administrator. However, one commentor felt that "Certification of Valid Claim" was not defined clearly enough. This commentor should note the regulatory language of Sec. 264.151 (h)(2), (k), (l), (m), and (n). In those sections, the Agency has established precise language for a Certification of Valid Claim. This language is not modified by today's rule. In light of the precise language in Sec. 264.151, the Agency disagrees that further clarification of the term, "Certification of Valid Claim", is required.

Another commentor expressed concern that States that have adopted the September 1, 1988 reporting requirement will not adopt the revised reporting requirement contained in this rule. The Agency understands this commentor's concern. However, as was discussed in the preamble of the July 1, 1992 proposal, the revised rule language promulgated today is not more stringent than the claims reporting requirement of the September 1, 1988 rule. Because authorized States can have requirements that are more stringent than the Federal program, States are free to interpret the September 1, 1988 language more broadly than EPA does. This is explained in more detail in the Effect of Rule on State Authorization section found later in this notice. However, the Agency urges States to accept the interpretation of EPA's January 25, 1990 memorandum and adopt the specific language promulgated today.

C. Standby Trust for Owners and Operators Who Use a Letter of Credit to Demonstrate Liability Coverage

The September 1, 1988 rule, discussed above, required that: (1) owners or operators using letters of credit to demonstrate liability coverage designate third-party claimants as beneficiaries in the event of a valid claim, and (2) the issuer of the letter of credit determine whether a claim against the instrument is valid and should be paid. In the February 23, 1990 settlement agreement with CWM, the Agency agreed to amend the letter of credit requirements (Secs. 264.147(h) and 265.147(h)) and the language of the letter of credit mechanism (Sec. 264.151(k)) to allow for the creation of a standby trust fund and the designation of an independent trustee as beneficiary.
Thus, the trustee, rather than the issuer of the letter of credit, is responsible for distributing funds to the claimants when a claim for damages is filed against the owner or operator.

This rule promulgates those changes to the letter of credit instrument by adding new Secs. 264.147(1), 265.147(1) and 264.151(n) relating

specifically to the requirements and instrument language of the standby trust. The Agency believes that these revisions make the letter of credit more available to owners and operators without reducing its integrity.

Commentors generally favored the addition of this financial instrument to those currently available for use by owners and operators to demonstrate financial responsibility.

One commentor expressed concern that the letter of credit with standby trust mechanism would replace the letter of credit mechanism that is currently allowed for use by owners and operators. The Agency reiterates that the letter of credit mechanism with a standby trust is an additional mechanism that owners and operators can use to demonstrate financial responsibility.

One commentor suggested several modifications to the wording of the letter of credit with standby trust instrument that were unrelated to creation of the standby trust. The Agency did not, in proposing this rule, contemplate modification to its existing financial assurance mechanisms, and did not, therefore, solicit comment on those types of changes. Other wording changes were made that were minor and not addressed by this commentor. Therefore the suggestions received from the commentor are outside the scope of this rule, but the Agency does note these suggested wording changes and may address them at a later date. The wording changes suggested by this commentor are potentially major and need to be fully assessed by the Agency before it can consider proposing them.

D. Instruments Available to Owners and Operators that no Longer Meet the Requirements of the Financial Test

The Agency is also promulgating, as proposed, conforming changes to Secs. 264.147(f)(6) and 265.147(f)(6). Before these changes, those sections required owners or operators that have been using the financial test to assure for third party liability, but no longer meet the requirements of the test, to obtain insurance. Today's rule expands the available instruments to allow those owners and operators to obtain insurance or a letter of credit, surety bond, trust fund, or a guarantee. EPA received no comments on this issue. These conforming changes implement the intent of the September 1, 1988 rule expanding the allowable instruments for third party liability coverage.

III. The Expanded Guarantee for Demonstrating Financial Assurance for Closure and Post-Closure Care

The use of a parent corporate guarantee for liability coverage was authorized in the interim final rule on July 11, 1986 (51 FR 25350) and promulgated as a final regulation on November 18, 1987 (52 FR 44314). Several commentors on the interim final rule urged EPA to allow non-parent firms to provide guarantees. After analyzing the validity and enforceability of guarantee contracts by non-parent firms, the Agency in the September 1, 1988 rulemaking discussed earlier in this preamble, authorized guarantees for third-party liability coverage provided by: (1) Corporate grandparents, (2) corporate "sibling" firms, and (3) firms with a "substantial business relationship" with the owner or operator. Further discussion of the parent guarantee can be found in the September 1, 1988 rule (53 FR 33938).

Since authorizing the non-parent guarantee as an allowable mechanism for third-party liability coverage, the Agency has received many requests to extend its use to closure and post-closure care financial responsibility requirements. This rule revises Secs. 264.143, 264.145, 265.143 and 265.145 to allow the same non-parent guarantee for closure and post-closure as is currently allowed for third-party liability.

In general, commentors generally favored expanding the use of the non-parent guarantee mechanism to owners and operators who wish to demonstrate financial responsibility for closure and post-closure care.

One commentor felt that the expanded non-parent guarantee should be classified as more stringent than the current rule. The Agency disagrees. A program that allows an additional instrument for compliance is less stringent than a program that does not allow the use of that instrument. Thus, though this rule expands the allowable instruments under the Federal program, the States can choose whether or not to adopt it. This is explained in more detail in the Effect of Rule on State Authorization section found later in this notice.

IV. Effective Date

Today's rule is effective immediately. Section 3010(b) of RCRA provides that regulations respecting permits for the treatment, storage, or disposal of hazardous waste shall take effect six months after the date of promulgation. However, section 3010(b)(1) of the RCRA allows EPA to shorten the time to the effective date if the Agency finds that the regulated community does not need six months to come into compliance with the new regulation.

The provisions of this rule either reduce the regulatory burden or provide additional flexibility in complying with the regulations for owners and operators.

As a result, the Agency finds that the regulated community does not need six months to come into compliance. Hence, today's rule is immediately effective under section 553(d) of the Administrative Procedure Act.

V. State Authorization

A. Applicability of Rules in Authorized States

Under section 3006 of RCRA, EPA may authorize qualified States to administer and enforce the RCRA program within the State (See 40 CFR part 271 for the standards and requirements for authorization). Following authorization, the Agency retains enforcement authority under sections 3008, 7003, and 3013 of RCRA, although authorized States have primary enforcement responsibility.

Prior to the Hazardous and Solid Waste Amendments of 1984 (HSWA), a State with final authorization administered its hazardous waste program entirely in lieu of the Federal program. The Federal requirements no longer applied in the authorized State, and EPA could not issue permits for any facilities in a State where the State was authorized to permit. When new, more

stringent Federal requirements were promulgated or enacted, the State was obligated to enact equivalent authority within specified time frames. New Federal requirements did not take effect in an authorized States until the State adopted the requirements as state law.

In contrast, under section 3006(g) of RCRA, 42 U.S.C. 6926(g), new requirements and prohibitions imposed by HSWA take effect in authorized States at the same time that they take effect in nonauthorized States. EPA is directed to carry out those requirements and prohibitions in authorized States, including the issuance of permits, until the State is granted authorization to do so. While States must still adopt HSWA-related provisions as state law to retain final authorization, the HSWA requirements and prohibitions apply in authorized States in the interim.

B. Effect of Rule on State Authorization

Today's rule proposes standards that are not effective in authorized States because the requirements are not imposed pursuant to HSWA. Thus, the requirements are applicable only in those States that do not have final authorization. In authorized States, the requirements will not be applicable until the State revises its program to adopt equivalent requirements under state law.

In general, 40 CFR 271.21(e)(2) requires States that have final authorization to modify their programs to reflect Federal program changes and to subsequently submit the modifications to EPA for approval. It should be noted, however, that authorized States are only required to modify their programs when EPA promulgates Federal standards that are more stringent or broader in scope than the existing Federal standards. Section 3009 of RCRA allows States to impose standards more stringent than those in the Federal program. For those Federal program changes that are less stringent or reduce the scope of the Federal program, States are not required to modify their programs (See 40 CFR 271.1(i)).

The provisions of today's rule that expand the allowable instruments for demonstrating financial assurance are less stringent than the current program. Those provisions are: (1) Revisions to Sec. 264.147(h) (4) and (5), Secs. 265.147(h) (4) and (5), and 264.151(k), and addition of new Sec. 264.151(n), which provide for the use of a stand-by trust with the letter of credit to demonstrate financial assurance for liability coverage requirements; and (2) revisions to Secs. 264.147(f)(6) and 265.147(f)(6), which expand the mechanisms available to owners and operators that no longer meet the requirements of the financial test for liability coverage; and (3) revisions to Secs. 264.143(f)(10), 264.145(f)(11), 265.143(e)(11), and 265.145(e)(11), which expand the use of the non-parent guarantee to owners or operators demonstrating financial assurance for closure and post-closure care. For these Federal program changes that are less stringent or reduce the scope of the Federal program, an authorized State is not required to modify its authorized program. If the State does modify its program, EPA must approve the modification for the state requirements to become Subtitle C RCRA requirements.

The September 1, 1988 rule related to liability coverage established a claims reporting requirement at Secs. 264.147(a)(7) and (b)(7) and 265.147(a)(7) and (b)(7). The preamble characterized all provisions of that rule as less stringent and, therefore, authorized States were not required

to adopt the new provisions, including the claims reporting requirement. However, upon further consideration the Agency has determined that this claims reporting requirement was, in fact, more stringent than the Federal program in effect before that time because there was no reporting requirement before that time.

Because the claims reporting requirement of Secs. 264.147(a)(7), 264.147(b)(7), 265.147(a)(7), and 265.147(b)(7) was more stringent than the Federal Program in place prior to the September 1, 1988 rule, States should have been required to modify their programs to include it in order to maintain an equivalent program. In accordance with Sec. 271.21(e)(2), the deadline for States to modify their program to reflect changes adopted on September 1, 1988 was July 1, 1990. However, the States were not notified of this obligation since the rule was originally classified as less stringent.

Because of the confusion related to the stringency characterization of the claims reporting requirement and the fact that the Agency is in the process of clarifying that requirement, the Agency will, for purposes of determining applicable deadlines under Sec. 271.21(e)(2), treat the claims reporting requirement of the September 1, 1988 rule as if it were promulgated and amended today. This means that the deadline for adopting the provision is the applicable deadline under Sec. 271.21(e)(2) for today's final rule. States that have not yet adopted the reporting requirement of the September 1, 1988 rule should not do so but should adopt the clarified version promulgated today. In addition, States whose programs have been modified to adopt the current claims reporting requirement but wish to adopt the clarified reporting requirement should follow the deadlines of 40 CFR 271.21(e)(2) for today's final rule.

The revisions to the claims reporting requirement that are promulgated today, however, are not more stringent than the current claims reporting requirement at Secs. 264.147(a)(7) and (b)(7) and 265.147(a)(7) and (b)(7) promulgated in the September 1, 1988 rule. Therefore, States that have already adopted the current claims reporting requirement are not required to adopt the clarified reporting requirement, though EPA urges them to do so.

A commentor suggested that the Agency's treatment of the revised claims notification language as not being more stringent than the language promulgated on September 1, 1988 imposed an arbitrary and unreasonable burden on the regulated community. The commentor believed that EPA's determination that the proposed language was not more stringent than the September 1, 1988 language would require the regulated community to challenge 50 state rules in litigation in 50 States. In the commentor's view, the Agency should vacate the claims reporting provisions of the September 1, 1988 rule, vacate approvals of state program revisions that adopted the September 1, 1988 language, and require States to change their rules to conform to the newly promulgated language.

EPA carefully considered commentor's views and concerns about the state authorization aspects of today's final rule and has determined that it does not have the authority to grant the relief that commentor suggests. Under RCRA section 3009, the Agency cannot require a State to adopt today's language if the State has a claims reporting provisions that is broader (or that the State interprets as being broader) than that required by the RCRA program. However, EPA has taken several steps that it believes will be effective in minimizing the likelihood of and need for the excessive

litigation suggested by the commentor. First, on January 25, 1990, EPA issued a memorandum from Sylvia K. Lowrance to the RCRA Branch Chiefs entitled "Clarification of 40 CFR 264.147(a)(7), (b)(7), and Sec. 265.147(a)(7), (b)(7)" in which EPA interpreted the September 1, 1988 language (see Docket Number 91-RCFP-FFFFF). This guidance on implementing the 1988 reporting requirement directs States and Regions to require reporting of only valid claims, that is, those required by today's revised reporting requirement.

Thus, in States, that have adopted the 1988 reporting requirement and are following the guidance set forth in the January 25, 1990 memorandum, a failure to revise the state program to adopt today's provisions would have no practical effect on owners and operators (though for purposes of clarity the Agency encourages those States to adopt today's provision).

There are other factors that should reduce the problem cited by the commentor. First, many States have not yet adopted the language of the September 1, 1988 rule; these States will be able to obtain approval by submitting today's language and need not submit the September 1, 1988 language. Second, many States that adopted the September 1, 1988 claims reporting provision automatically conform their regulations and statutes to the provisions of the Federal program; therefore, these States will adopt today's clarified language in due course without litigation. Third, many of the States that adopted the September 1, 1988 language, obtained authorization, and do not automatically use the Federal regulatory language, will want to adopt today's clarification. Therefore, EPA believes the regulated community will not need to challenge these state rules as applied.

For the few States that have adopted the September 1, 1988 provision, that interpret the language more expansively than EPA, and that wish to retain that language, EPA lacks a legal and practical mechanism for requiring these States to adopt today's language. EPA cannot require States to modify their programs to comply with less stringent Federal program changes. However, for the reasons discussed above, EPA anticipates that there will be far fewer States in this position than the commentor suggests.

VI. Regulatory Analysis

A. Regulatory Impact Analysis

Under Executive Order 12291, EPA must determine whether a regulation is "major" and thus whether it must prepare and consider a Regulatory Impact Analysis in connection with the rule. Today's rule is not major because it will not result in an annual effect on the economy of $100 million or more, nor will it result in an increase in costs or prices to industry. There will be no adverse impact on the ability of U.S.-based enterprises to compete with foreign-based enterprises in domestic or export markets. Therefore the Agency has not prepared a Regulatory Impact Analysis for today's rule. This rule has been reviewed by the Office of Management and Budget in accordance with Executive Order 12291.

B. Regulatory Flexibility Act

Under the Regulatory Flexibility Act, 5 U.S.C. 601 et seq. at the time an Agency publishes a proposed or final rule, it must prepare a Regulatory

Flexibility Analysis that describes the impact of the rule on small entities, unless the Administrator certifies that the rule will not have a significant economic impact on a substantial number of small entities. Today's rule expands the instruments available for owner or operator to demonstrate financial responsibility. Therefore, pursuant to 5 U.S.C. 601b, I certify that this regulation will not have a significant economic impact on a substantial number of small entities.

Dated: September 4, 1992.

F. Henry Habicht II,
Acting Administrator.

List of Subjects

40 CFR Part 264

Air pollution control, Hazardous waste, Insurance, Packaging and containers, Reporting and recordkeeping requirements, Security measures, Surety bonds.

40 CFR Part 265

Air pollution control, Hazardous waste, Insurance, Packaging and containers, Reporting and recordkeeping requirements, Security measures, Surety bonds, Water supply.

40 CFR part 264 is amended as follows:

PART 264--STANDARDS FOR OWNERS OR OPERATORS OF HAZARDOUS WASTE TREATMENT, STORAGE, AND DISPOSAL FACILITIES

1. The authority citation for part 264 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6924 and 6925.

2. Section 264.143 is amended by revising the introductory text of paragraph (f)(10) to read as follows:

264.143 Financial assurance for closure.

* * * * *

(f) * * *
(10) An owner or operator may meet the requirements of this section by obtaining a written guarantee. The guarantor must be the direct or higher-tier parent corporation of the owner or operator, a firm whose parent corporation is also the parent corporation of the owner or operator, or a firm with a "substantial business relationship" with the owner or operator. The guarantor must meet the requirements for owners or operators in paragraphs (f)(1) through (8) of this section and must comply with the terms of the guarantee. The wording of the guarantee must be identical to the wording specified in Sec. 264.151(h). The certified copy of the

guarantee must accompany the items sent to the Regional Administrator as specified in paragraph (f)(3) of this section. One of these items must be the letter from the guarantor's chief financial officer. If the guarantor's parent corporation is also the parent corporation of the owner or operator, the letter must describe the value received in consideration of the guarantee. If the guarantor is a firm with a "substantial business relationship" with the owner or operator, this letter must describe this "substantial business relationship" and the value received in consideration of the guarantee. The terms of the guarantee must provide that:

* * * * *

3. Section 264.145 is amended by revising the introductory text of paragraph (f)(11) to read as follows:

Sec. 264.145 Financial assurance for post-closure care.

* * * * *

(f) * * *

(11) An owner or operator may meet the requirements for this section by obtaining a written guarantee. The guarantor must be the direct of higher-tier parent corporation of the owner or operator, a firm whose parent corporation is also the parent corporation of the owner or operator, or a firm with a "substantial business relationship" with the owner or operator. The guarantor must meet the requirements for owners or operators in paragraphs (f)(1) through (9) of this section and must comply with the terms of the guarantee. The wording of the guarantee must be identical to the wording specified in Sec. 264.151(h). A certified copy of the guarantee must accompany the items sent to the Regional Administrator as specified in paragraph (f)(3) of this section. One of these items must be the letter from the guarantor's chief financial officer. If the guarantor's parent corporation is also the parent corporation of the owner or operator, the letter must describe the value received in consideration of the guarantee. If the guarantor is a firm with a "substantial business relationship" with the owner or operator, this letter must describe this "substantial business relationship" and the value received in consideration of the guarantee. The terms of the guarantee must provide that:

* * * * *

4. Section 264.147 is amended by revising paragraphs (a)(7), (b)(7), and (f)(6) and by adding new paragraphs (h)(4) and (h)(5) to read as follows:

Sec. 264.147 Liability requirements.

(a) * * *

(7) An owner or operator shall notify the Regional Administrator in writing within 30 days whenever:

(i) A claim results in a reduction in the amount of financial assurance for liability coverage provided by a financial instrument authorized in paragraphs (a)(1) through (a)(6) of this section; or

(ii) A Certification of Valid Claim for bodily injury or property damages caused by a sudden or non-sudden accidental occurrence arising from the operation of a hazardous waste treatment, storage, or disposal facility is entered between the owner or operator and third-party claimant for liability coverage under paragraphs (a)(1) through (a)(6) of this section; or

(iii) A final court order establishing a judgment for bodily injury or

property damage caused by a sudden or non-sudden accidental occurrence arising from the operation of a hazardous waste treatment, storage, or disposal facility is issued against the owner or operator or an instrument that is providing financial assurance for liability coverage under paragraphs (a)(1) through (a)(6) of this section.

(b) * * *

(7) An owner or operator shall notify the Regional Administrator in writing within 30 days whenever:

(i) A Claim results in a reduction in the amount of financial assurance for liability coverage provided by a financial instrument authorized in paragraphs (b)(1) through (b)(6) of this section; or

(ii) A Certification of Valid Claim for bodily injury or property damages caused by a sudden or non-sudden accidental occurrence arising from the operation of a hazardous waste treatment, storage, or disposal facility is entered between the owner or operator and third-party claimant for liability coverage under paragraphs (b)(1) through (b)(6) of this section; or

(iii) A final court order establishing a judgment for bodily injury or property damage caused by a sudden or non-sudden accidental occurrence arising from the operation of a hazardous waste treatment, storage, or disposal facility is issued against the owner or operator or an instrument that is providing financial assurance for liability coverage under paragraphs (b)(1) through (b)(6) of this section.

* * * * *

(f) * * *

(6) If the owner or operator no longer meets the requirements of paragraph (f)(1) of this section, he must obtain insurance, a letter of credit, a surety bond, a trust fund, or a guarantee for the entire amount of required liability coverage as specified in this section. Evidence of liability coverage must be submitted to the Regional Administrator within 90 days after the end of the fiscal year for which the year-end financial data show that the owner or operator no longer meets the test requirements.

* * * * *

(h) * * *

(4) An owner or operator who uses a letter of credit to satisfy the requirements of this section may also establish a standby trust fund. Under the terms of such a letter of credit, all amounts paid pursuant to a draft by the trustee of the standby trust will be deposited by the issuing institution into the standby trust in accordance with instructions from the trustee. The trustee of the standby trust fund must be an entity which has the authority to act as a trustee and whose trust operations are regulated and examined by a Federal or State agency.

(5) The wording of the standby trust fund must be identical to the wording specified in Sec. 264.151(n).

* * * * *

5. Section 264.151 is amended by revising paragraphs (f), (g), (h), and (k) and adding a new paragraph (n) to read as follows:

Sec. 264.151 Wording of the instruments.

* * * * *

(f) A letter from the chief financial officer, as specified in Sec. 264.143(f) or 264.145(f), or Sec. 265.143(e) or 265.143(e) of this chapter, must be worded as follows, except that instructions in brackets are to be replaced with the relevant information and the brackets deleted:

Letter From Chief Financial Officer

(Address to Regional Administrator of every Region in which facilities for which financial responsibility is to be demonstrated through the financial test are located).

I am the chief financial officer of (name and address of firm). This letter is in support of this firm's use of the financial test to demonstrate financial assurance for closure and/or post-closure costs, as specified in subpart H of 40 CFR parts 264 and 265.

(Fill out the following five paragraphs regarding facilities and associated cost estimates. If your firm has no facilities that belong in a particular paragraph, write "None" in the space indicated. For each facility, include its EPA Identification Number, name, address, and current closure and/or post-closure cost estimates. Identify each cost estimate as to whether it is for closure or post-closure care).

1. This firm is the owner or operator of the following facilities for which financial assurance for closure or post-closure care is demonstrated through the financial test specified in subpart H of 40 CFR parts 264 and 265. The current closure and/or post-closure cost estimates covered by the test are shown for each facility: .

2. This firm guarantees, through the guarantee specified in subpart H of 40 CFR parts 264 and 265, the closure or post-closure care of the following facilities owned or operated by the guaranteed party. The current cost estimates for the closure or post-closure care so guaranteed are shown for each facility: . The firm identified above is (insert one or more: (1) The direct or higher-tier parent corporation of the owner or operator; (2) owned by the same parent corporation as the parent corporation of the owner or operator, and receiving the following value in consideration of this guarantee ; or (3) engaged in the following substantial business relationship with the owner or operator , and receiving the following value in consideration of this guarantee). (Attach a written description of the business relationship or a copy of the contract establishing such relationship to this letter).

3. In States where EPA is not administering the financial requirements of subpart H of 40 CFR part 264 or 265, this firm, as owner or operator or guarantor, is demonstrating financial assurance for the closure or post-closure care of the following facilities through the use of a test equivalent or substantially equivalent to the financial test specified in subpart H of 40 CFR parts 264 and 265. The current closure and/or post-closure cost estimates covered by such a test are shown for each facility: .

4. This firm is the owner or operator of the following hazardous waste management facilities for which financial assurance for closure or, if a disposal facility, post-closure care, is not demonstrated either to EPA or a State through the financial test or any other financial assurance mechanism specified in subpart H of 40 CFR parts 264 and 265 or equivalent or substantially equivalent State mechanisms. The current closure and/or post- closure cost estimates not covered by such financial assurance are shown for each facility: .

5. This firm is the owner or operator of the following UIC facilities for which financial assurance for plugging and abandonment is required under part 144. The current closure cost estimates as required by 40 CFR 144.62 are shown for each facility: .

This firm (insert "is required" or "is not required") to file a Form 10K with the Securities and Exchange Commission (SEC) for the latest fiscal year.

The fiscal year of this firm ends on (month, day). The figures for the following items marked with an asterisk are derived from this firm's independently audited, year-end financial statements for the latest completed fiscal year, ended (date).

(Fill in Alternative I if the criteria of paragraph (f)(1)(i) of Sec. 264.143 or Sec. 264.145, or of paragraph (e)(1)(i) of Sec. 265.143 or Sec. 265.145 of this chapter are used. Fill in Alternative II if the criteria of paragraph (f)(1)(ii) of Sec. 264.143 or Sec. 264.145, or of paragraph (e)(1)(ii) of Sec. 265.143 or Sec. 265.145 of this chapter are used.)

Alternative I

1. Sum of current closure and post-closure cost estimate (total of all cost estimates shown in the five paragraphs above) $
* 2. Total liabilities (if any portion of the closure or post-closure cost estimates is included in total liabilities, you may deduct the amount of that portion from this line and add that amount to lines 3 and 4)$
*3. Tangible net worth $
*4. Net worth $
*5. Current assets $
*6. Current liabilities $
7. Net working capital (line 5 minus line 6) $
*8. The sum of net income plus depreciation, depletion, and amortization $

*9. Total assets in U.S. (required only if less than 90% of firm's assets are located in the U.S.) $
10. Is line 3 at least $10 million? (Yes/No)
11. Is line 3 at least 6 times line 1? (Yes/No)
12. Is line 7 at least 6 times line 1? (Yes/No)
*13. Are at least 90% of firm's assets located in the U.S.? If not, complete line 14 (Yes/No)
14. Is line 9 at least 6 times line 1? (Yes/No)
15. Is line 2 divided by line 4 less than 2.0? (Yes/No)
16. Is line 8 divided by line 2 greater than 0.1? (Yes/No)
17. Is line 5 divided by line 6 greater than 1.5? (Yes/No)

Alternative II

1. Sum of current closure and post-closure cost estimates (total of all cost estimates shown in the five paragraphs above) $
2. Current bond rating of most recent issuance of this firm and name of rating service
3. Date of issuance of bond
4. Date of maturity of bond
*5. Tangible net worth (if any portion of the closure and post-closure cost estimates is included in "total liabilities" on your firm's financial statements, you may add the amount of that portion to this line) $
*6. Total assets in U.S. (required only if less than 90% of firm's assets are located in the U.S.) $
7. Is line 5 at least $10 million ? (Yes/No)
8. Is line 5 at least 6 times line 1? (Yes/No)
*9. Are at least 90% of firm's assets located in the U.S.? If not, complete line 10 (Yes/No)
10. Is line 6 at least 6 times line 1? (Yes/No)
I hereby certify that the wording of this letter is identical to the wording specified in 40 CFR 264.151(f) as such regulations were constituted on the date shown immediately below.

(Signature)----------

(g) A letter from the chief financial officer, as specified in Sec. 264.147(f) or Sec. 265.147(f) of this chapter, must be worded as follows, except that instructions in brackets are to be replaced with the relevant information and the brackets deleted.

Letter From Chief Financial Officer

(Address to Regional Administrator of every Region in which facilities for which financial responsibility is to be demonstrated through the financial test are located).

I am the chief financial officer of (firm's name and address). This letter is in support of the use of the financial test to demonstrate financial responsibility for liability coverage (insert "and closure and/or post-closure care" if applicable) as specified in subpart H of 40 CFR parts 264 and 265.

(Fill out the following paragraphs regarding facilities and liability coverage. If there are no facilities that belong in a particular paragraph, write "None" in the space indicated. For each facility, include its EPA Identification Number, name, and address).

The firm identified above is the owner or operator of the following facilities for which liability coverage for (insert "sudden" or "nonsudden" or "both sudden and nonsudden") accidental occurrences is being demonstrated through the financial test specified in subpart H of 40 CFR parts 264 and 265:

The firm identified above guarantees, through the guarantee specified in subpart H of 40 CFR parts 264 and 265, liability coverage for (insert "sudden" or "nonsudden" of "both sudden and nonsudden") accidental occurrences at the following facilities owned or operated by the following:

. The firm identified above is (insert one or more: (1) The direct or higher-tier parent corporation of the owner or operator; (2) owned by the same parent corporation as the parent corporation of the owner or operator, and receiving the following value in consideration of this guarantee ; or (3) engaged in the following substantial business relationship with the owner or operator , and receiving the following value in consideration of this guarantee). (Attach a written description of the business relationship or a copy of the contract establishing such relationship to this letter.)

(If you are using the financial test to demonstrate coverage of both liability and closure and post-closure care, fill in the following five paragraphs regarding facilities and associated closure and post-closure cost estimates. If there are no facilities that belong in a particular paragraph, write "None" in the space indicated. For each facility, include its EPA identification number, name, address, and current closure and/or post-closure cost estimates. Identify each cost estimate as to whether it is for closure or post-closure care.)

1. The firm identified above owns or operates the following facilities for which financial assurance for closure or post-closure care or liability coverage is demonstrated through the financial test specified in subpart H of 40 CFR parts 264 and 265. The current closure and/or post-closure cost estimate covered by the test are shown for each facility: .

2. The firm identified above guarantees, through the guarantee specified in subpart H of 40 CFR parts 264 and 265, the closure and post-closure care or liability coverage of the following facilities owned or operated by the guaranteed party. The current cost estimates for closure or post-closure care so guaranteed are shown for each facility: .

3. In States where EPA is not administering the financial requirements of subpart H of 40 CFR parts 264 and 265, this firm is demonstrating financial assurance for the closure or post-closure care of the following facilities through the use of a test equivalent or substantially equivalent to the financial test specified in subpart H or 40 CFR parts 264 and 265. The current closure or post-closure cost estimates covered by such a test are shown for each facility: .

4. The firm identified above owns or operates the following hazardous waste management facilities for which financial assurance for closure or, if a disposal facility, post-closure care, is not demonstrated either to EPA or a State through the financial test or any other financial assurance mechanisms specified in subpart H of 40 CFR parts 264 and 265 or equivalent or substantially equivalent State mechanisms. The current closure and/or post- closure cost estimates not covered by such financial assurance are shown for each facility: .

5. This firm is the owner or operator or guarantor of the following UIC facilities for which financial assurance for plugging and abandonment is required under part 144 and is assured through a financial test. The current closure cost estimates as required by 40 CFR 144.62 are shown for each facility: .

This firm (insert "is required" or "is not required") to file a Form 10K with the Securities and Exchange Commission (SEC) for the latest fiscal year.

The fiscal year of this firm ends on (month, day). The figures for the following items marked with an asterisk are derived from this firm's independently audited, year-end financial statements for the latest completed fiscal year, ended (date).

Part A. Liability Coverage for Accidental Occurrences

(Fill in Alternative I if the criteria of paragraph (f)(1)(i) of Sec. 264.147 or Sec. 265.147 are used. Fill in Alternative II if the criteria of paragraph (f)(1)(ii) of Sec. 264.147 or Sec. 265.147 are used.)

Alternative I

1. Amount of annual aggregate liability coverage to be demonstrated $.

*2. Current assets $.

*3. Current $.

4. Net working capital (line 2 minus line 3) $.

*5. Tangible net worth $.

*6. If less than 90% of assets are located in the U.S., give total U.S. assets $.

7. Is line 5 at least $10 million? (Yes/No) .

8. Is line 4 at least 6 times line 1? (Yes/No) .

9. Is line 5 at least 6 times line 1? (Yes/No) .

*10. Are at least 90% of assets located in the U.S.? (Yes/No) . If not, complete line 11.

11. Is line 6 at least 6 times line 1? (Yes/No) .

Alternative II

1. Amount of annual aggregate liability coverage to be demonstrated $.

2. Current bond rating of most recent issuance and name of rating service .

3. Date of issuance of bond .

4. Date of maturity of bond .

*5. Tangible net worth $.

*6. Total assets in U.S. (required only if less than 90% of assets are located in the U.S.) $.

7. Is line 5 at least $10 million? (Yes/No) .

8. Is line 5 at least 6 times line 1? .

9. Are at least 90% of assets located in the U.S.? If not, complete line 10. (Yes/No) .

10. Is line 6 at least 6 times line 1? .

(Fill in part B if you are using the financial test to demonstrate assurance of both liability coverage and closure or post-closure care.)

Part B. Closure or Post-Closure Care and Liability Coverage

(Fill in Alternative I if the criteria of paragraphs (f)(1)(i) of Sec. 264.143 or Sec. 264.145 and (f)(1)(i) of Sec. 264.147 are used or if the criteria of paragraphs (e)(1)(i) of Sec. 265.143 or Sec. 265.145 and (f)(1)(i) of Sec. 265.147 are used. Fill in Alternative II if the criteria of paragraphs (f)(1)(ii) of Sec. 264.143 or Sec. 264.145 and (f)(1)(ii) of Sec. 264.147 are used or if the criteria of paragraphs (e)(1)(i) of Sec. 265.143 or Sec. 265.145 and (f)(1)(ii) of Sec. 265.147 are used.)

Alternative I

1. Sum of current closure and post-closure cost estimates (total of all cost estimates listed above) $
2. Amount of annual aggregate liability coverage to be demonstrated $
3. Sum of lines 1 and 2 $
*4. Total liabilities (if any portion of your closure or post-closure cost estimates is included in your total liabilities, you may deduct that portion from this line and add that amount to lines 5 and 6) $
*5. Tangible net worth $
*6. Net worth $
*7. Current assets $
*8. Current liabilities $
9. Net working capital (line 7 minus line 8) $
10. The sum of net income plus depreciation, depletion, and amortization $

*11. Total assets in U.S. (required only if less than 90% of assets are located in the U.S.) $
12. Is line 5 at least $10 million? (Yes/No)
13. Is line 5 at least 6 times line 3? (Yes/No)
14. Is line 9 at least 6 times line 3? (Yes/No)
*15. Are at least 90% of assets located in the U.S.? (Yes/No) If, not, complete line 16.

16. Is line 11 at least 6 times line 3? (Yes/No)
17. Is line 4 divided by line 6 less than 2.0? (Yes/No)
18. Is line 10 divided by line 4 greater than 0.1? (Yes/No)
19. Is line 7 divided by line 8 greater than 1.5? (Yes/No)

Alternative II

1. Sum of current closure and post-closure cost estimates (total of all cost estimates listed above) $
2. Amount of annual aggregate liability coverage to be demonstrated $
3. Sum of lines 1 and 2 $
4. Current bond rating of most recent issuance and name of rating service

5. Date of issuance of bond
6. Date of maturity of bond
*7. Tangible net worth (if any portion of the closure or post-closure cost

estimates is included in "total liabilities" on your financial statements you may add that portion to this line) $

*8. Total assets in the U.S. (required only if less than 90% of assets are located in the U.S.) $

9. Is line 7 at least $10 million? (Yes/No)

10. Is line 7 at least 6 times line 3? (Yes/No)

*11. Are at least 90% of assets located in the U.S.? (Yes/No) If not complete line 12.

12. Is line 8 at least 6 times line 3? (Yes/No)

I hereby certify that the wording of this letter is identical to the wording specified in 40 CFR 264.151(g) as such regulations were constituted on the date shown immediately below.

(Signature)----------

(h)(1) A corporate guarantee, as specified in Sec. 264.143(f) or Sec. 264.145(f), or Sec. 265.143(e) or Sec. 265.145(e) of this chapter, must be worded as follows, except that instructions in brackets are to be replaced with the relevant information and the brackets deleted:

Corporate Guarantee for Closure or Post-Closure Care

Guarantee made this (date) by (name of guaranteeing entity), a business corporation organized under the laws of the State of (insert name of State), herein referred to as guarantor. This guarantee is made on behalf of the (owner or operator) of (business address), which is (one of the following: "our subsidiary"; "a subsidiary of (name and address of common parent corporation), of which guarantor is a subsidiary"; or "an entity with which guarantor has a substantial business relationship, as defined in 40 CFR (either 264.141(h) or 265.141(h))" to the United States Environmental Protection Agency (EPA).

Recitals

1. Guarantor meets or exceeds the financial test criteria and agrees to comply with the reporting requirements for guarantors as specified in 40 CFR 264.143(f), 264.145(f), 265.143(e), and 265.145(e).

2. (Owner or operator) owns or operates the following hazardous waste management facility(ies) covered by this guarantee: (List for each facility: EPA Identification Number, name, and address. Indicate for each whether guarantee is for closure, post-closure care, or both.)

3. "Closure plans" and "post-closure plans" as used below refer to the plans maintained as required by subpart G of 40 CFR parts 264 and 265 for the closure and post-closure care of facilities as identified above.

4. For value received from (owner or operator), guarantor guarantees to EPA that in the event that (owner or operator) fails to perform (insert "closure," "post-closure care" or "closure and post-closure care") of the above facility(ies) in accordance with the closure or post-closure plans and other permit or interim status requirements whenever required to do so, the guarantor shall do so or establish a trust fund as specified in subpart H of 40 CFR part 264 or 265, as applicable, in the name of (owner or operator) in the amount of the current closure or post-closure cost estimates as specified in subpart H of 40 CFR parts 264 and 265.

5. Guarantor agrees that if, at the end of any fiscal year before termination of this guarantee, the guarantor fails to meet the financial test criteria, guarantor shall send within 90 days, by certified mail, notice to the EPA Regional Administrator(s) for the Region(s) in which the facility(ies) is(are) located and to (owner or operator) that he intends to provide alternate financial assurance as specified in subpart H of 40 CFR part 264 or 265, as applicable, in the name of (owner or operator). Within 120 days after the end of such fiscal year, the guarantor shall establish such financial assurance unless (owner or operator) has done so.

6. The guarantor agrees to notify the EPA Regional Administrator by certified mail, of a voluntary or involuntary proceeding under Title 11 (Bankruptcy), U.S. Code, naming guarantor as debtor, within 10 days after commencement of the proceeding.

7. Guarantor agrees that within 30 days after being notified by an EPA Regional Administrator of a determination that guarantor no longer meets the financial test criteria or that he is disallowed from continuing as a guarantor of closure or post-closure care, he shall establish alternate financial assurance as specified in subpart H of 40 CFR part 264 or 265, as applicable, in the name of (owner or operator) unless (owner or operator) has done so.

8. Guarantor agrees to remain bound under this guarantee notwithstanding any or all of the following: amendment or modification of the closure or post-closure plan, amendment or modification of the permit, the extension or reduction of the time of performance of closure or post-closure, or any other modification or alteration of an obligation of the owner or operator pursuant to 40 CFR part 264 or 265.

9. Guarantor agrees to remain bound under this guarantee for as long as (owner or operator) must comply with the applicable financial assurance requirements of subpart H of 40 CFR parts 264 and 265 for the above-listed facilities, except as provided in paragraph 10 of this agreement.

10. (Insert the following language if the guarantor is (a) a direct or higher-tier corporate parent, or (b) a firm whose parent corporation is also the parent corporation of the owner or operator):
Guarantor may terminate this guarantee by sending notice by certified mail to the EPA Regional Administrator(s) for the Region(s) in which the facility(ies) is(are) located and to (owner or operator), provided that this guarantee may not be terminated unless and until (the owner or operator) obtains, and the EPA Regional Administrator(s) approve(s), alternate closure and/or post-closure care coverage complying with 40 CFR 264.143, 264.145, 265.143, and/or 265.145.

(Insert the following language if the guarantor is a firm qualifying as a guarantor due to its "substantial business relationship" with its owner or operator)

Guarantor may terminate this guarantee 120 days following the receipt of notification, through certified mail, by the EPA Regional Administrator(s) for the Region(s) in which the facility(ies) is(are) located and by (the owner or operator).

11. Guarantor agrees that if (owner or operator) fails to provide alternate financial assurance as specified in subpart H of 40 CFR part 264 or 265, as applicable, and obtain written approval of such assurance from the EPA Regional Administrator(s) within 90 days after a notice of cancellation by the guarantor is received by an EPA Regional Administrator from guarantor, guarantor shall provide such alternate financial assurance in the name of (owner or operator).

12. Guarantor expressly waives notice of acceptance of this guarantee by the EPA or by (owner or operator). Guarantor also expressly waives notice of amendments or modifications of the closure and/or post-closure plan and of amendments or modifications of the facility permit(s).

I hereby certify that the wording of this guarantee is identical to the wording specified in 40 CFR 264.151(h) as such regulations were constituted on the date first above written.

Effective date:----------

(2) A guarantee, as specified in Sec. 264.147(g) or Sec. 265.147(g) of this chapter, must be worded as follows, except that instructions in brackets are to be replaced with the relevant information and the brackets deleted:

Guarantee for Liability Coverage

Guarantee made this (date) by (name of guaranteeing entity), a business corporation organized under the laws of (if incorporated within the United States insert "the State of " and insert name of State; if incorporated outside the United States insert the name of the country in which incorporated, the principal place of business within the United States, and the name and address of the registered agent in the State of the principal place of business), herein referred to as guarantor. This guarantee is made on behalf of (owner or operator) of (business address), which is one of the following: "our subsidiary;" "a subsidiary of (name and address of common parent corporation), or which guarantor is a subsidiary;" or "an entity with which guarantor has a substantial business relationship, as defined in 40 CFR (either 264.141(h))", to any and all third parties who have sustained or may sustain bodily injury or property damage caused by (sudden and/or nonsudden) accidental occurrences arising from operation of the facility(ies) covered by this guarantee.

Recitals

1. Guarantor meets or exceeds the financial test criteria and agrees to comply with the reporting requirements for guarantors as specified in 40 CFR 264.147(g) and 265.147(g).

2. (Owner or operator) owns or operates the following hazardous waste management facility(ies) covered by this guarantee: (List for each facility: EPA identification number, name, and address; and if guarantor is incorporated outside the United States list the name and address of the guarantor's registered agent in each State.) This corporate guarantee satisfies RCRA third-party liability requirements for (insert "sudden" or "nonsudden" or "both sudden and nonsudden") accidental occurrences in above- named owner or operator facilities for coverage in the amount of (insert dollar amount) for each occurrence and (insert dollar amount) annual aggregate.

3. For value received from (owner or operator), guarantor guarantees to any and all third parties who have sustained or may sustain bodily injury or property damage caused by (sudden and/or nonsudden) accidental occurrences arising from operations of the facility(ies) covered by this guarantee that in the event that (owner or operator) fails to satisfy a judgment or award based on a determination of liability for bodily injury or property damage to third parties caused by (sudden and/or nonsudden) accidental occurrences, arising from the operation of the above-named facilities, or fails to pay an amount agreed to in settlement of a claim arising from or alleged to arise from such injury or damage, the guarantor will satisfy such judgment(s), award(s) or settlement agreement(s) up to the limits of coverage identified above.

4. Such obligation does not apply to any of the following:
(a) Bodily injury or property damage for which (insert owner or operator) is obligated to pay damages by reason of the assumption of liability in a contract or agreement. This exclusion does not apply to liability for damages that (insert owner or operator) would be obligated to pay in the absence of the contract or agreement.

(b) Any obligation of (insert owner or operator) under a workers' compensation, disability benefits, or unemployment compensation law or any similar law.

(c) Bodily injury to:
(1) An employee of (insert owner or operator) arising from, and in the course of, employment by (insert owner or operator); or
(2) The spouse, child, parent, brother, or sister of that employee as a consequence of, or arising from, and in the course of employment by (insert owner or operator). This exclusion applies:
(A) Whether (insert owner or operator) may be liable as an employer or in any other capacity; and
(B) To any obligation to share damages with or repay another person who must pay damages because of the injury to persons identified in paragraphs (1) and (2).

(d) Bodily injury or property damage arising out of the ownership, maintenance, use, or entrustment to others of any aircraft, motor vehicle or watercraft.

(e) Property damage to:
(1) Any property owned, rented, or occupied by (insert owner or operator);
(2) Premises that are sold, given away or abandoned by (insert owner or operator) if the property damage arises out of any part of those premises;
(3) Property loaned to (insert owner or operator);

(4) Personal property in the care, custody or control of (insert owner or operator);
(5) That particular part of real property on which (insert owner or operator) or any contractors or subcontractors working directly or indirectly on behalf of (insert owner or operator) are performing operations, if the property damage arises out of these operations.

5. Guarantor agrees that if, at the end of any fiscal year before termination of this guarantee, the guarantor fails to meet the financial test criteria, guarantor shall send within 90 days, by certified mail, notice to the EPA Regional Administrator(s) for the Region(s) in which the facility(ies) is(are) located and to (owner or operator) that he intends to provide alternate liability coverage as specified in 40 CFR 264.147 and 265.147, as applicable, in the name of (owner or operator). Within 120 days after the end of such fiscal year, the guarantor shall establish such liability coverage unless (owner or operator) has done so.

6. The guarantor agrees to notify the EPA Regional Administrator by certified mail of a voluntary or involuntary proceeding under title 11 (Bankruptcy), U.S. Code, naming guarantor as debtor, within 10 days after commencement of the proceeding.

7. Guarantor agrees that within 30 days after being notified by an EPA Regional Administrator of a determination that guarantor no longer meets the financial test criteria or that he is disallowed from continuing as a guarantor, he shall establish alternate liability coverage as specified in 40 CFR 264.147 or 265.147 in the name of (owner or operator), unless (owner or operator) has done so.

8. Guarantor reserves the right to modify this agreement to take into account amendment or modification of the liability requirements set by 40 CFR 264.147 and 265.147, provided that such modification shall become effective only if a Regional Administrator does not disapprove the modification within 30 days of receipt of notification of the modification.

9. Guarantor agrees to remain bound under this guarantee for so long as (owner or operator) must comply with the applicable requirements of 40 CFR 264.147 and 265.147 for the above-listed facility(ies), except as provided in paragraph 10 of this agreement.

10. (Insert the following language if the guarantor is (a) a direct or higher-tier corporate parent, or (b) a firm whose parent corporation is also the parent corporation of the owner or operator):
Guarantor may terminate this guarantee by sending notice by certified mail to the EPA Regional Administrator(s) for the Region(s) in which the facility(ies) is(are) located and to (owner or operator), provided that this guarantee may not be terminated unless and until (the owner or operator) obtains, and the EPA Regional Administrator(s) approve(s), alternate liability coverage complying with 40 CFR 264.147 and/or 265.147.

(Insert the following language if the guarantor is a firm qualifying as a guarantor due to its "substantial business relationship" with the owner or operator):
Guarantor may terminate this guarantee 120 days following receipt of notification, through certified mail, by the EPA Regional Administrator(s) for the Region(s) in which the facility(ies) is(are) located and by (the owner or operator).

11. Guarantor hereby expressly waives notice of acceptance of this guarantee by any party.

12. Guarantor agrees that this guarantee is in addition to and does not affect any other responsibility or liability of the guarantor with respect to the covered facilities.

13. The Guarantor shall satisfy a third-party liability claim only on receipt of one of the following documents:
(a) Certification from the Principal and the third-party claimant(s) that the liability claim should be paid. The certification must be worded as follows, except that instructions in brackets are to be replaced with the relevant information and the brackets deleted:

Certification of Valid Claim

The undersigned, as parties (insert Principal) and (insert name and address of third-party claimant(s)), hereby certify that the claim of bodily injury and/or property damage caused by a (sudden or nonsudden) accidental occurrence arising from operating (Principal's hazardous waste treatment, storage, or disposal facility should be paid in the amount of $.

(Signatures)----------
Principal----------

(Notary) Date----------
(Signatures)----------
Claimant(s)----------
(Notary) Date----------

(b) A valid final court order establishing a judgment against the Principal for bodily injury or property damage caused by sudden or nonsudden accidental occurrences arising from the operation of the Principal's facility or group of facilities.

14. In the event of combination of this guarantee with another mechanism to meet liability requirements, this guarantee will be considered (insert "primary" or "excess") coverage.

I hereby certify that the wording of the guarantee is identical to the wording specified in 40 CFR 264.151(h)(2) as such regulations were constituted on the date shown immediately below.

Region(s)----------

U.S. Environmental Protection Agency----------

Dear Sir or Madam: We hereby establish our Irrevocable Standby Letter of Credit No. in the favor of ("any and all third-party liability claimants" or insert name of trustee of the standby trust fund), at the request and for the account of (owner or operator's name and address) for third-party liability awards or settlements up to (in words) U.S. dollars $ per occurrence and the annual aggregate amount of (in words) U.S.
dollars $, for sudden accidental occurrences and/or for third-party liability awards or settlements up to the amount of (in words) U.S. dollars $ per occurrence, and the annual aggregate amount of (in words) U.S.
dollars $, for nonsudden accidental occurrences available upon presentation of a sight draft bearing reference to this letter of credit No.
, and (insert the following language if the letter of credit is being used without a standby trust fund: "(1) a signed certificate reading as follows:

Certificate of Valid Claim

The undersigned, as parties (insert principal) and (insert name and address of third party claimant(s)), hereby certify that the claim of bodily injury and/or property damage caused by a (sudden or nonsudden) accidental occurrence arising from operations of (principal's) hazardous waste treatment, storage, or disposal facility should be paid in the amount of $( ). We hereby certify that the claim does not apply to any of the following:
(a) Bodily injury or property damage for which (insert principal) is obligated to pay damages by reason of the assumption of liability in a contract or agreement. This exclusion does not apply to liability for damages that (insert principal) would be obligated to pay in the absence of the contract or agreement.

(b) Any obligation of (insert principal) under a workers' compensation, disability benefits, or unemployment compensation law or any similar law.

(c) Bodily injury to:
(1) An employee of (insert principal) arising from, and in the course of, employment by (insert principal); or
(2) The spouse, child, parent, brother or sister of that employee as a consequence of, or arising from, and in the course of employment by (insert principal).

This exclusion applies:
(A) Whether (insert principal) may be liable as an employer or in any other capacity; and
(B) To any obligation to share damages with or repay another person who must pay damages because of the injury to persons identified in paragraphs (1) and (2).
(d) Bodily injury or property damage arising out of the ownership, maintenance, use, or entrustment to others of any aircraft, motor vehicle or watercraft.

(e) Property damage to:
(1) Any property owned, rented, or occupied by (insert principal);
(2) Premises that are sold, given away or abandoned by (insert principal) if the property damage arises out of any part of those premises;
(3) Property loaned to (insert principal);
(4) Personal property in the care, custody or control of (insert principal);
(5) That particular part of real property on which (insert principal) or any contractors or subcontractors working directly or indirectly on behalf of (insert principal) are performing operations, if the property damage arises out of these operations.

(Signatures)----------
(Signatures)----------

Claimant(s)----------

or (2) a valid final court order establishing a judgment against the Grantor for bodily injury or property damage caused by sudden or nonsudden accidental occurrences arising from the operation of the Grantor's facility or group of facilities.

This letter of credit is effective as of (date) and shall expire on (date) at least one year later), but such expiration date shall be automatically extended for a period of (at least one year) on (date and on each successive expiration date, unless, at least 120 days before the current expiration date, we notify you, the USEPA Regional Administrator for Region (Region
), and (owner's or operator's name) by certified mail that we have decided not to extend this letter of credit beyond the current expiration date.

Whenever this letter of credit is drawn on under and in compliance with the terms of this credit, we shall duly honor such draft upon presentation to us.

(Insert the following language if a standby trust fund is not being used: "In the event that this letter of credit is used in combination with another mechanism for liability coverage, this letter of credit shall be considered (insert "primary" or "excess" coverage)."

We certify that the wording of this letter of credit is identical to the wording specified in 40 CFR 264.151(k) as such regulations were constituted on the date shown immediately below. (Signature(s) and title(s) of official(s) of issuing institution) (Date).

This credit is subject to (insert "the most recent edition of the Uniform Customs and Practice for Documentary Credits published by the International Chamber of Commerce" or "the Uniform Commercial Code").

* * * * *

(n)(1) A standby trust agreement, as specified in Sec. 264.147(h) or 265.147(h) of this chapter, must be worded as follows, except that instructions in brackets are to be replaced with the relevant information and the brackets deleted:

Standby Trust Agreement

Trust Agreement, the "Agreement," entered into as of (date) by and between (name of the owner or operator) a (name of a State) (insert "corporation," "partnership," "association," or "proprietorship"), the "Grantor," and (name of corporate trustee), (insert, "incorporated in the State of " or "a national bank"), the "trustee."

Whereas the United States Environmental Protection Agency, "EPA," an agency of the United States Government, has established certain regulations applicable to the Grantor, requiring that an owner or operator of a hazardous waste management facility or group of facilities must demonstrate financial responsibility for bodily injury and property damage to third parties caused by sudden accidental and/or nonsudden accidental occurrences arising from operations of the facility or group of facilities.

Whereas, the Grantor has elected to establish a standby trust into which the proceeds from a letter of credit may be deposited to assure all or part of such financial responsibility for the facilities identified herein.

Whereas, the Grantor, acting through its duly authorized officers, has selected the Trustee to be the trustee under this agreement, and the Trustee is willing to act as trustee.

Now, therefore, the Grantor and the Trustee agree as follows:

Section 1. Definitions. As used in this Agreement:

(a) The term Grantor means the owner or operator who enters into this Agreement and any successors or assigns of the Grantor.

(b) The term Trustee means the Trustee who enters into this Agreement and any successor Trustee.

Section 2. Identification of Facilities. This agreement pertains to the facilities identified on attached schedule A (on schedule A, for each facility list the EPA Identification Number, name, and address of the facility(ies) and the amount of liability coverage, or portions thereof, if more than one instrument affords combined coverage as demonstrated by this Agreement).

Section 3. Establishment of Fund. The Grantor and the Trustee hereby establish a standby trust fund, hereafter the "Fund," for the benefit of any and all third parties injured or damaged by (sudden and/or nonsudden) accidental occurrences arising from operation of the facility(ies) covered

by this guarantee, in the amounts of (up to $1 million) per occurrence and (up to $2 million) annual aggregate for sudden accidental occurrences and (up to $3 million) per occurrence and (up to $6 million) annual aggregate for nonsudden occurrences, except that the Fund is not established for the benefit of third parties for the following:
(a) Bodily injury or property damage for which (insert Grantor) is obligated to pay damages by reason of the assumption of liability in a contract or agreement. This exclusion does not apply to liability for damages that (insert Grantor) would be obligated to pay in the absence of the contract or agreement.

(b) Any obligation of (insert Grantor) under a workers' compensation, disability benefits, or unemployment compensation law or any similar law.

(c) Bodily injury to:
(1) An employee or (insert Grantor) arising from , and in the course of, employment by (insert Grantor); or
(2) The spouse, child, parent, brother or sister of that employee as a consequence of, or arising from, and in the course of employment by (insert Grantor).

This exclusion applies:
(A) Whether (insert Grantor) may be liable as an employer or in any other capacity; and
(B) To any obligation to share damages with or repay another person who must pay damages because of the injury to persons identified in paragraphs (1) and (2).

(d) Bodily injury or property damage arising out of the ownership, maintenance, use, or entrustment to others of any aircraft, motor vehicle or watercraft.

(e) Property damage to:
(1) Any property owned, rented, or occupied by (insert Grantor);
(2) Premises that are sold, given away or abandoned by (insert Grantor) if the property damage arises out of any part of those premises;
(3) Property loaned (insert Grantor);
(4) Personal property in the care, custody or control of (insert Grantor);
(5) That particular part of real property on which (insert Grantor) or any contractors or subcontractors working directly or indirectly on behalf of (insert Grantor) are performing operations, if the property damage arises out of these operations.

In the event of combination with another mechanism for liability coverage, the fund shall be considered (insert "primary" or "excess") coverage.

The Fund is established initially as consisting of the proceeds of the letter of credit deposited into the Fund. Such proceeds and any other property subsequently transferred to the Trustee is referred to as the Fund, together with all earnings and profits thereon, less any payments or distributions made by the Trustee pursuant to this Agreement. The Fund shall be held by the Trustee, IN TRUST, as hereinafter provided. The Trustee shall not be responsible nor shall it undertake any responsibility for the amount or adequacy of, nor any duty to collect from the Grantor, any payments necessary to discharge any liabilities of the Grantor established by EPA.

Section 4. Payment for Bodily Injury or Property Damage. The Trustee shall satisfy a third party liability claim by drawing on the letter of credit described in Schedule B and by making payments from the Fund only upon receipt of one of the following documents:

(a) Certification from the Grantor and the third party claimant(s) that the liability claim should be paid. The certification must be worded as follows, except that instructions in brackets are to be replaced with the relevant information and the brackets deleted:

Certification of Valid Claim

The undersigned, as parties (insert Grantor) and (insert name and address of third party claimant(s)), hereby certify that the claim of bodily injury and/or property damage caused by a (sudden or nonsudden) accidental occurrence arising from operating (Grantor's) hazardous waste treatment, storage, or disposal facility should be paid in the amount of $( ).

(Signature)----------

(Signatures)----------

Claimant(s)----------

(b) A valid final court order establishing a judgment against the Grantor for bodily injury or property damage caused by sudden or nonsudden accidental occurrences arising from the operation of the Grantor's facility or group of facilities.

Section 5. Payments Comprising the Fund. Payments made to the Trustee for the Fund shall consist of the proceeds from the letter of credit drawn upon by the Trustee in accordance with the requirements of 40 CFR 264.151(k) and Section 4 of this Agreement.

Section 6. Trustee Management. The Trustee shall invest and reinvest the principal and income, in accordance with general investment policies and guidelines which the Grantor may communicate in writing to the Trustee from time to time, subject, however, to the provisions of this Section. In investing, reinvesting, exchanging, selling, and managing the Fund, the Trustee shall discharge his duties with respect to the trust fund solely in the interest of the beneficiary and with the care, skill, prudence, and diligence under the circumstances then prevailing which persons of prudence, acting in a like capacity and familiar with such matters, would use in the conduct of an enterprise of a like character and with like aims; except that:

(i) Securities or other obligations of the Grantor, or any other owner or operator of the facilities, or any of their affiliates as defined in the Investment Company Act of 1940, as amended, 15 U.S.C. 80a-2(a), shall not be acquired or held, unless they are securities or other obligations of the Federal or a State government;

(ii) The Trustee is authorized to invest the Fund in time or demand deposits of the Trustee, to the extent insured by an agency of the Federal or a State government; and

(iii) The Trustee is authorized to hold cash awaiting investment or distribution uninvested for a reasonable time and without liability for the payment of interest thereon.

Section 7. Commingling and Investment. The Trustee is expressly authorized in its discretion:

(a) To transfer from time to time any or all of the assets of the Fund to any common, commingled, or collective trust fund created by the Trustee in which the Fund is eligible to participate, subject to all of the provisions thereof, to be commingled with the assets of other trusts participating therein; and

(b) To purchase shares in any investment company registered under the Investment Company Act of 1940, 15 U.S.C. 80a-1 et seq., including one which may be created, managed, underwritten, or to which investment advice is rendered or the shares of which are sold by the Trustee. The Trustee may vote such shares in its discretion.

Section 8. Express Powers of Trustee. Without in any way limiting the powers and discretions conferred upon the Trustee by the other provisions of this Agreement or by law, the Trustee is expressly authorized and empowered:

(a) To sell, exchange, convey, transfer, or otherwise dispose of any property held by it, by public or private sale. No person dealing with the Trustee shall be bound to see to the application of the purchase money or to inquire into the validity or expediency of any such sale or other disposition;

(b) To make, execute, acknowledge, and deliver any and all documents of transfer and conveyance and any and all other instruments that may be necessary or appropriate to carry out the powers herein granted;

(c) To register any securities held in the Fund in its own name or in the name of a nominee and to hold any security in bearer form or in book entry, or to combine certificates representing such securities with certificates of the same issue held by the Trustee in other fiduciary capacities, or to deposit or arrange for the deposit of such securities in a qualified central depositary even though, when so deposited, such securities may be merged and held in bulk in the name of the nominee of such depositary with other securities deposited therein by another person, or to deposit or arrange for the deposit of any securities issued by the United States Government, or any agency or instrumentality thereof, with a Federal Reserve Bank, but the books and records of the Trustee shall at all times show that all such securities are part of the Fund;

(d) To deposit any cash in the Fund in interest-bearing accounts maintained or savings certificates issued by the Trustee, in its separate corporate capacity, or in any other banking institution affiliated with the Trustee, to the extent insured by an agency of the Federal or State government; and

(e) To compromise or otherwise adjust all claims in favor of or against the Fund.

Section 9. Taxes and Expenses. All taxes of any kind that may be assessed or levied against or in respect of the Fund and all brokerage commissions incurred by the Fund shall be paid from the Fund. All other expenses incurred by the Trustee in connection with the administration of this Trust, including fees for legal services rendered to the Trustee, the compensation of the Trustee to the extent not paid directly by the Grantor, and all other proper charges and disbursements to the Trustee shall be paid from the Fund.

Section 10. Advice of Counsel. The Trustee may from time to time consult with counsel, who may be counsel to the Grantor, with respect to any question arising as to the construction of this Agreement or any action to be taken hereunder. The Trustee shall be fully protected, to the extent permitted by law, in acting upon the advice of counsel.

Section 11. Trustee Compensation. The Trustee shall be entitled to reasonable compensation for its services as agreed upon in writing from time to time with the Grantor.

Section 12. Successor Trustee. The Trustee may resign or the Grantor may replace the Trustee, but such resignation or replacement shall not be effective until the Grantor has appointed a successor trustee and this successor accepts the appointment. The successor trustee shall have the same powers and duties as those conferred upon the Trustee hereunder. Upon the successor trustee's acceptance of the appointment; the Trustee shall assign, transfer, and pay over to the successor trustee the funds and properties then constituting the Fund. If for any reason the Grantor cannot or does not act in the event of the resignation of the Trustee, the Trustee may apply to a court of competent jurisdiction for the appointment of a successor trustee or for instructions. The successor trustee shall specify the date on which it assumes administration of the trust in a writing sent to the Grantor, the EPA Regional Administrator and the present Trustee by certified mail 10 days before such change becomes effective. Any expenses incurred by the Trustee as a result of any of the acts contemplated by this Section shall be paid as provided in Section 9.

Section 13. Instructions to the Trustee. All orders, requests, certifications of valid claims, and instructions to the Trustee shall be in writing, signed by such persons as are designated in the attached Exhibit A or such other designees as the Grantor may designate by amendments to Exhibit A. The Trustee shall be fully protected in acting without inquiry in accordance with the Grantor's orders, requests, and instructions. The Trustee shall have the right to assume, in the absence of written notice to the contrary, that no event constituting a change or a termination of the authority of any person to act on behalf of the Grantor or the EPA Regional Administrator hereunder has occurred. The Trustee shall have no duty to act in the absence of such orders, requests, and instructions from the Grantor and/or EPA, except as provided for herein.

Section 14. Amendment of Agreement. This Agreement may be amended by an instrument in writing executed by the Grantor, the Trustee, and the EPA Regional Administrator, or by the Trustee and the EPA Regional Administrator if the Grantor ceases to exist.

Section 15. Irrevocability and Termination. Subject to the right of the parties to amend this Agreement as provided in Section 14, this Trust shall be irrevocable and shall continue until terminated at the written agreement of the Grantor, the Trustee, and the EPA Regional Administrator, or by the Trustee and the EPA Regional Administrator, if the Grantor ceases to exist. Upon termination of the Trust, all remaining trust property, less final trust administration expenses, shall be paid to the Grantor.

The Regional Administrator will agree to termination of the Trust when the owner or operator substitutes alternative financial assurance as specified in this section.

Section 16. Immunity and indemnification. The Trustee shall not incur personal liability of any nature in connection with any act or omission, made in good faith, in the administration of this Trust, or in carrying out any directions by the Grantor and the EPA Regional Administrator issued in accordance with this Agreement. The Trustee shall be indemnified and saved harmless by the Grantor or from the Trust Fund, or both, from and against any personal liability to which the Trustee may be subjected by reason of any act or conduct in its official capacity, including all expenses reasonable incurred in its defense in the event the Grantor fails to provide such defense.

Section 17. Choice of Law. This Agreement shall be administered, construed, and enforced according to the laws of the State of (enter name of State).

Section 18. Interpretation. As used in this Agreement, words in the singular include the plural and words in the plural include the singular. The descriptive headings for each Section of this Agreement shall not affect the interpretation of the legal efficacy of this Agreement.

In Witness Whereof the parties have caused this Agreement to be executed by their respective officers duly authorized and their corporate seals to be hereunto affixed and attested as of the date first above written. The parties below certify that the wording of this Agreement is identical to the wording specified in 40 CFR 264.151(n) as such regulations were constituted on the date first above written.

(2) The following is an example of the certification of acknowledgement which must accompany the trust agreement for a standby trust fund as specified in section 264.147(h) or 265.147(h) of this chapter. State requirements may differ on the proper content of this acknowledgement.

State of----------

County of----------

On this (date), before me personally came (owner or operator) to me known, who, being by me duly sworn, did depose and say that she/he resides at (address), that she/he is (title) of (corporation), the corporation described in and which executed the above instrument; that she/he knows the seal of said corporation; that the seal affixed to such instrument is such corporate seal; that it was so affixed by order of the Board of Directors of said corporation, and that she/he signed her/his name thereto by like order.

(Signature of Notary Public)

40 CFR part 265 is amended as follows:

PART 265--INTERIM STATUS STANDARDS FOR OWNERS OR OPERATORS OF HAZARDOUS WASTE TREATMENT, STORAGE, AND DISPOSAL FACILITIES

1. The authority citation for part 265 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6924, 6925, and 6935.

2. Section 265.143 is amended by revising the introductory text of paragraph (e)(10) to read as follows:

Sec. 265.143 Financial assurance for closure.

* * * * *

(e) * * *

(10) An owner or operator may meet the requirements of this section by obtaining a written guarantee. The guarantor must be the direct or higher-tier parent corporation of the owner or operator, a firm whose parent corporation is also the parent corporation of the owner or operator, or a firm with a "substantial business relationship" with the owner or operator. The guarantor must meet the requirements for owners or operators in paragraphs (e)(1) through (8) of this section and must comply with the terms of the guarantee. The wording of the guarantee must be identical to the wording specified in Sec. 264.151(h). A certified copy of the guarantee must accompany the items sent to the Regional Administrator as specified in paragraph (e)(3) of this section. One of these items must be the letter from the guarantor's chief financial officer. If the guarantor's parent corporation is also the parent corporation of the owner or operator, the letter must describe the value received in consideration of the guarantee. If the guarantor is a firm with a "substantial business relationship" with the owner or operator, this letter must describe this "substantial business relationship" and the value received in consideration of the guarantee. The terms of the guarantee must provide that:

* * * * *

3. Section 265.145 is amended by revising the introductory text of paragraph (e)(11) to read as follows:

Sec. 265.145 Financial assurance for post-closure care.

* * * * *

(e) * * *

(11) An owner or operator may meet the requirements of this section by obtaining a written guarantee. The guarantor must be the direct or higher-tier parent corporation of the owner or operator, a firm whose parent corporation is also the parent corporation of the owner or operator, or a firm with a "substantial business relationship" with the owner or operator. The guarantor must meet the requirements for owners or operators in paragraphs (e)(1) through (9) of this section and must comply with the terms of the guarantee. The wording of the guarantee must be identical to the wording specified in Sec. 264.151(h). A certified copy of the guarantee must accompany the items sent to the Regional Administrator as specified in

paragraph (e)(3) of this section. One of these items must be the letter from the guarantor's chief financial officer. If the guarantor's parent corporation is also the parent corporation of the owner or operator, the letter must describe the value received in consideration of the guarantee. If the guarantor is a firm with a "substantial business relationship" with the owner or operator, this letter must describe this "substantial business relationship" and the value received in consideration of the guarantee. The terms of the guarantee must provide that:

* * * * *

4. Section 265.147 is amended by revising paragraphs (a)(7), (b)(7), and (f)(6), and by adding new paragraphs (h)(4) and (h)(5) to read as follows:

Sec. 265.147 Liability requirements.

(a) * * *

(7) An owner or operator shall notify the Regional Administrator in writing within 30 days whenever:

(i) A claim results in a reduction in the amount of financial assurance for liability coverage provided by a financial instrument authorized in paragraphs (a)(1) through (a)(6) of this section; or

(ii) A Certification of Valid Claim for bodily injury or property damages caused by a sudden or non-sudden accidental occurrence arising from the operation of a hazardous waste treatment, storage, or disposal facility is entered between the owner or operator and third-party claimant for liability coverage under paragraphs (a)(1) through (a)(6) of this section; or

(iii) A final court order establishing a judgment for bodily injury or property damage caused by a sudden or non-sudden accidental occurrence arising from the operation of a hazardous waste treatment, storage, or disposal facility is issued against the owner or operator or an instrument that is providing financial assurance for liability coverage under paragraphs (a)(1) through (a)(6) of this section.

(b) * * *

(7) An owner or operator shall notify the Regional Administrator in writing within 30 days whenever:

(i) A claim results in a reduction in the amount of financial assurance for liability coverage provided by a financial instrument authorized in paragraphs (b)(1) through (b)(6) of this section; or

(ii) A Certification of Valid Claim for bodily injury or property damages caused by a sudden or non-sudden accidental occurrence arising from the operation of a hazardous waste treatment, storage, or disposal facility is entered between the owner or operator and third-party claimant for liability coverage under paragraphs (b)(1) through (b)(6) of this section; or

(iii) A final court order establishing a judgment for bodily injury or property damage caused by a sudden or non-sudden accidental occurrence arising from the operation of a hazardous waste treatment, storage, or disposal facility is issued against the owner or operator or an instrument that is providing financial assurance for liability coverage under paragraphs (b)(1) through (b)(6) of this section.

(f) * * *

(6) If the owner or operator no longer meets the requirements of paragraph (f)(1) of this section, he must obtain insurance, a letter of credit, a

surety bond, a trust fund, or a guarantee for the entire amount of required liability coverage as specified in this section. Evidence of liability coverage must be submitted to the Regional Administrator within 90 days after the end of the fiscal year for which the year-end financial data show that the owner or operator no longer meets the test requirements.

* * * * *

(h) * * *

(4) An owner or operator who uses a letter of credit to satisfy the requirements of this section may also establish a standby trust fund. Under the terms of such a letter of credit, all amounts paid pursuant to a draft by the trustee of the standby trust will be deposited by the issuing institution into the standby trust in accordance with instructions from the trustee. The trustee of the standby trust fund must be an entity which has the authority to act as a trustee and whose trust operations are regulated and examined by a Federal or State agency.

(5) The wording of the standby trust fund must be identical to the wording specified in Sec. 264.151(n).

SUMMARY: On August 21, 1985, the Environmental Protection Agency (EPA or the Agency) published a Notice of Proposed Rulemaking to amend the financial responsibility requirements concerning liability coverage for owners and operators of hazardous waste treatment, storage, and disposal facilities (TSDFs) permitted under the Resource Conservation and Recovery Act (RCRA) (50 FR 33902). The proposal set forth several regulatory options, including the authorization of additional financial mechanisms for covering third-party liability requirements, under consideration by the Agency to provide relief for owners and operators who encounter difficulties in obtaining liability insurance. On July 11, 1986, EPA published an interim final rule allowing use of a corporate guarantee as an additional financial responsibility mechanism (51 FR 25350). This rule was issued in final form on November 18, 1987 (52 FR 44314).
EPA is toda adopting other financial mechanisms for liability coverage for RCRA TSDFs These mechanisms are letters of credit, surety bonds, trust funds, an guarantees provided by firms that are not the direct parent of the owner o operator. In addition, the Agency is clarifying the liability insuranc requirements to ensure that other firms can purchase insurance for owner and operators of hazardous waste management facilities.

TEXT:

ENVIRONMENTAL PROTECTION AGENCY
40 CFR Parts 264 and 265
(FRL-3361-6)
Standards Applicable to Owners and Operators of Hazardous Waste Treatment,
Storage, and Disposal Facilities; Liability Coverage

AGENCY: Environmental Protection Agency.

ACTION: Final rule.

SUMMARY: On August 21, 1985, the Environmental Protection Agency (EPA or

the Agency) published a Notice of Proposed Rulemaking to amend the financial responsibility requirements concerning liability coverage for owners and operators of hazardous waste treatment, storage, and disposal facilities (TSDFs) permitted under the Resource Conservation and Recovery Act (RCRA) (50 FR 33902). The proposal set forth several regulatory options, including the authorization of additional financial mechanisms for covering third-party liability requirements, under consideration by the Agency to provide relief for owners and operators who encounter difficulties in obtaining liability insurance. On July 11, 1986, EPA published an interim final rule allowing use of a corporate guarantee as an additional financial responsibility mechanism (51 FR 25350). This rule was issued in final form on November 18, 1987 (52 FR 44314).

EPA is today adopting other financial mechanisms for liability coverage for RCRA TSDFs. These mechanisms are letters of credit, surety bonds, trust funds, and guarantees provided by firms that are not the direct parent of the owner or operator. In addition, the Agency is clarifying the liability insurance requirements to ensure that other firms can purchase insurance for owners and operators of hazardous waste management facilities.

EFFECTIVE DATE: October 3, 1988.

ADDRESSES: The regulatory docket for this rulemaking is available for public inspection at Room S-212-E, U.S. EPA, 401 M Street, SW., Washington, DC 20460, from 9:00 a.m. to 4:00 p.m., Monday through Friday, excluding Federal holidays. The docket number is F-88-CGF1-FFFFF. The public must make an appointment to review docket materials by calling (202) 475-9327. The public may copy a maximum of 50 pages from any one regulatory docket at no cost.
Additional copies cost $0.20 per page.

FOR FURTHER INFORMATION CONTACT: The RCRA Hotline, toll free, at (800) 424- 9346 or, in Washington, DC, at (202) 382-3000. For technical information, contact Carlos M. Lago, Office of Solid Waste (WH-563), U.S. Environmental Protection Agency, 401 M Street, SW., Washington, DC 20460, (202) 382-4780.

Date IX. State Authority A. Applicability of Rules in Authorized States B. Effect of Rule on State Authorizations X. Executive Order 12291 XI. Regulatory Flexibility Act XII. Supporting Documents

I. Authority

This regulation is being adopted under the authority of sections 2002(a), 3004, and 3005 of the Solid Waste Disposal Act; as amended by RCRA, as amended (42 U.S.C. 6912(a), 6924, and 6925).

II. Background

A. Current Liability Coverage Requirements

Section 3004(a)(6) of RCRA, as amended, requires EPA to establish financial responsibility standards for owners and operators of hazardous waste management facilities as may be necessary or desirable to protect human health and the environment.

On April 16, 1982, EPA promulgated regulations requiring owners or operators to demonstrate liability coverage during the operating life of the facility for bodily injury and/or property damage to third parties resulting from accidental occurrences arising from facility operations (47 FR 16554).

Under these regulations (40 CFR 264.147 and 265.147), an owner or operator of a hazardous waste treatment, storage, or disposal facility must demonstrate, on a per-firm basis, liability coverage for sudden accidental occurrences in the amount of $1 million per occurrence and $2 million annual aggregate, exclusive of legal defense costs. An owner or operator of a surface impoundment, landfill, or land treatment facility used to manage hazardous waste is also required to demonstrate, on a per-firm basis, liability coverage for nonsudden accidental occurrences in the amount of $3 million per occurrence and $6 million annual aggregate, exclusive of legal defense costs.

(A "nonsudden accidental occurrence," as opposed to a "sudden accidental occurrence," is defined by 40 CFR 264.141 and 265.141 as an occurrence that takes place over time and involves continuous or repeated exposure.) "First- dollar" coverage is required; that is, the amount of any deductible must be covered by the insurer, who may have a right of reimbursement of the deductible amount from the insured.

The requirements for coverage of sudden accidental occurrences became effective on July 15, 1982. The requirements for nonsudden accidental occurrences were phased in gradually according to annual dollar sales or revenue figures of the owner or operator. January 16, 1985, was the final phase-in date.

Financial responsibility for third-party liability currently can be demonstrated by obtaining insurance, by passing a financial test, or by obtaining a corporate guarantee from a parent corporation that passes the financial test. The regulations (40 CFR 264.147(a)(3), 264.147(b)(3), 265.147(a)(3), and 265.147(b)(3)) also allow an owner or operator to meet the liability requirements through a combination of the financial test and insurance, or a combination of the corporate guarantee and insurance.

B. August 21, 1985, Notice of Proposed Rulemaking

In 1984-1985, the availability of pollution liability insurance policies began to decline. A number of insurers who previously had offered coverage ceased to write pollution liability policies. Those still offering coverage raised their premiums substantially while reducing the coverage provided.

As a consequence, some owners and operators of hazardous waste TSDFs began to experience difficulties in obtaining necessary coverage and/or paying the increased cost of such coverage.

In response to this situation, EPA took a number of steps, including issuing on August 21, 1985, a Notice of Proposed Rulemaking (NPRM) (50 FR 33902) requesting comment on five possible regulatory options as responses to the problem of reduced availability and increased cost of pollution liability insurance: (1) Maintain the existing requirements; (2) clarify the required scope of coverage and/or lower the required levels of coverage; (3) authorize other financial responsibility mechanisms; (4) authorize waivers; and (5) suspend or withdraw the liability coverage requirements.

EPA received numerous comments from four major categories of commenters on the August 21, 1985, NPRM: Owners and operators of hazardous waste TSDFs; members of the insurance industry; representatives of State and local governments; and members of the public at large. A majority of commenters encouraged the Agency to retain the existing coverage limits and encouraged the Agency not to suspend or withdraw the liability coverage requirements. Numerous commenters did, however, ask EPA to consider waivers in certain circumstances. Some commenters requested EPA to clarify the scope of coverage required or to lower the required limits of coverage, but many commenters urged EPA to authorize additional financial mechanisms that would provide an alternative to insurance. Commenters specifically mentioned mechanisms such as corporate guarantees, surety bonds, letters of credit, and trust funds for use for liability coverage. The commenters, however, did not discuss in detail any of these mechanisms.

Upon analysis of comments received, studies of the cost and availability of the instruments, analysis of the suitability of proposed financial instruments for liability coverage, and consultation with banks and State insurance commissioners, EPA has decided to maintain the existing coverage requirements, while authorizing additional financial responsibility mechanisms for liability coverage. Sections III and V of this preamble discuss the mechanisms being authorized and existing approaches to waivers. The Agency's summary of and responses to comments urging it to change existing requirements on the scope and levels of coverage are provided in Section V of this preamble. Additionally, more specific discussion and response to comments is found in documents included in the docket for today's rule.

C. Rulemaking Authorizing the Corporate Guarantee

In response to the commenters on the August 21, 1985 NPRM who argued that EPA should authorize other financial instruments for liability coverage, EPA examined several additional mechanisms for liability coverage. Commenters particularly encouraged EPA to authorize a corporate guarantee for liability coverage, noting that such guarantees were already authorized as financial assurance mechanisms for closure and post-closure care (40 CFR 264.143(f), 264.145(f), 265.143(e), and 265.145(e)). In response, on July 11, 1986, the Agency issued an interim final rule revising 40 CFR 264.147, 264.151, and 265.147 to authorize, in addition to insurance and the financial test, the use of a corporate guarantee for liability coverage (51 FR 25350). The Agency subsequently made minor revisions to the rule authorizing the corporate guarantee for liability coverage, and finalized that rule on November 18, 1987 (52 FR 44314). As discussed in Section III of this preamble, today's rule further expands the availability of the

guarantee by allowing firms that are not the direct corporate parent of the owner or operator to be the guarantor.

D. Justification for Today's Rule

The Agency believes that additional mechanisms for liability coverage are desirable in order to provide a broad set of options for owners or operators who must demonstrate liability coverage but who cannot use one of the existing mechanisms. Although commentary concerning the insurance industry in the Insurance Trade Press and in other sources suggests that underwriting losses in property-casualty insurance peaked around the end of 1985 and that the outlook for the future is more favorable,/1/ the market for Environmental Impairment Liability (EIL) insurance has remained constrained./2/ Accordingly, the Agency is seeking to ensure that as many alternative financial assurance mechanisms as possible are available to the regulated community, to reduce the problem created by the constrained insurance market.

NOTE /1/ United States General Accounting Office, Statement by William J. Anderson before the House of Representatives on "Profitability of the Property/Casualty Insurance Industry," March 13, 1986.

NOTE /2/ National Association of Insurance Commissioners, "Report of the NAIC Advisory Committee on Environmental Liability Insurance," September, 1986; and "Business Insurance," April 16, 1987, p. 58; May 4, 1987, p. 22; and May 11, 1987, p. 71.

Section 3010(b) of RCRA provides that regulations promulgated under Subtitle C of the statute and revisions to existing Subtitle C regulations generally take effect six months after promulgation. However, the period prior to the effective date may be shortened if the Administrator finds the regulated community does not need six months to come into compliance or for other good cause. As the regulation does not add any additional compliance requirements and a six-month period prior to implementation would be contrary to the interest of the regulated community and public by delaying the availability of other compliance mechanisms, the regulatory changes are being issued as a final rule effective 30 days after publication.

E. Key Provisions of Today's Rule

In today's rule, EPA authorizes owners or operators of hazardous waste TSDFs to use the following additional financial assurance mechanisms for liability coverage: A letter of credit; a surety bond assuring payment of liability claims; a fully-funded trust fund; and a guarantee provided by a firm that is not the direct parent of the owner or operator. The Agency is generally not revising the scope and levels of coverage required for third-party liabilities. However, today's rule includes amendments clarifying the liability coverage requirements to allow other firms to purchase insurance for owners and operators. Finally, EPA is specifying more clearly the aggregate amount of coverage that must be provided by financial responsibility mechanisms that offer combined coverage for sudden and nonsudden occurrences.

III. Additional Financial Responsibility Mechanisms Being Authorized for Liability Coverage

In determining which additional financial assurance mechanisms to approve for liability coverage, EPA reviewed the other financial assurance programs within EPA, other Federal agencies, and several States. The Agency first

analyzed the financial mechanisms already approved for use for closure or post-closure care financial assurance since the regulated community could be expected to be familiar with them. Many of these mechanisms were mentioned by commenters on the August 21, 1985 NPRM as potentially useful. Other EPA financial assurance requirements or proposed requirements, such as the requirements for underground injection wells and underground storage tanks, were also reviewed to identify the mechanisms, if any, used in those programs for third-party liability coverage.

The Agency considered several characteristics of the mechanisms that could affect their suitability for the coverage of third-party liability claims, including (1) availability; (2) cost; (3) whether they are likely to be valid and enforceable contracts under special provisions of State law, such as laws regulating the business of insurance; and (4) whether they are capable of being set up in ways that do not require EPA to act as a "claims adjuster" or otherwise act to determine the merits of third-party liability claims brought against TSDF owners or operators.

On the basis of these analyses, EPA determined that letters of credit, surety bonds, guarantees, and trust funds provide adequate third-party liability coverage. The rationale for authorization of these instruments is described below in the discussion of each instrument.

Other mechanisms suggested by the commenters on the August 1985 NPRM and analyzed by EPA included security interests, indemnity contracts, reserve funds, captive insurance pools, and government-supplied insurance or loan guarantees. As discussed in Section V of today's preamble, EPA has concluded that these instruments are inappropriate, with the exception of captive insurance pools and risk retention groups. Captive insurance pools and risk retention groups are authorized under the current regulations.

The financial mechanisms authorized in today's rulemaking, with the exception of the guarantee, are currently approved mechanisms for closure or post-closure care under 40 CFR Parts 264 and 265, Subpart H. (Performance bonds, which are authorized for use by owners or operators of permitted facilities for assurance for closure and post-closure care, are not included because they are not adaptable to liability coverage; instead, an analogous mechanism, the payment bond, is allowed.) The requirements for these financial mechanisms parallel the requirements for financial mechanisms authorized for closure or post-closure care. However, some provisions of the mechanisms have been adjusted to address issues that arise only in the context of liability claims. Features of the mechanisms that differ include the designation of the beneficiary, exclusions for categories of damages and obligations, the claims-payment trigger, the certification of validity and enforceability, and cancellation provisions. These features are described more fully in Section IV of today's preamble.

A. Letter of Credit

Today's rule authorizes owners or operators of hazardous waste TSDFs to use letters of credit to satisfy the RCRA third-party liability coverage requirements (40 CFR 264.147(a)(3), 264.147(b)(3), 265.147(a)(3), and 265.147(b)(3)). Letters of credit are commitments by a financial institution (e.g., a bank), whose letter of credit operations are regulated and examined by a State or Federal agency, to provide funds if appropriate documents are presented. In general, letters of credit are instruments that can be adapted for various purposes./3/ Banks contacted by EPA have indicated that they would consider issuing letters of credit for liability claims for their established customers. EPA believes that letters of credit

may be more readily available to owners or operators than many other mechanisms, if the owner or operator has an established relationship with a qualifying financial institution and can provide adequate collateral.

NOTE /3/ U.S. General Accounting Office, Staff Study, "Financial Services--

Developments in the Financial Guarantee Industry," GAO/GGD-87-84, June 25,

1987, pp. 9-13, 17-18 discusses letters of credit as financial guarantees.

1. Features of Mechanism. A letter of credit is a financial instrument under which an issuing institution (the issuer), generally a bank, undertakes to meet a monetary obligation of its customer (the account party) if the bank is presented with specified documents. The issuer, in return for a fee, becomes the primary obligor. A third party, the beneficiary, initiates payment by making a claim directly on the issuer. Thus, a letter of credit is an instrument that substitutes the issuer's superior credit for the account party's credit.

The instrument authorized in today's rule is an irrevocable stand-by letter of credit in which the third-party beneficiaries are any and all persons who may be damaged by a hazardous waste release from the facility whose owner or operator has secured the letter of credit. The irrevocable nature of the instrument precludes its cancellation prior to the end of a required one-year term by the issuer or the owner or operator. After the one-year term, the letter of credit will automatically renew for another year unless, 120 days before the expiration date, the issuer notifies the owner or operator and the Regional Administrator of a decision not to renew the credit (40 CFR 264.151(k)).

2. Who May Provide A Letter of Credit. Today's rule provides that letters of credit for liability coverage must be provided by an authorized financial institution regulated by a Federal or State agency (40 CFR 264.147(h)(2) and 265.147(h)(2)). EPA has established these requirements, which parallel the requirements for letters of credit providing assurance for closure or post- closure care, to ensure the financial viability of the issuer of the letter of credit. The viability of the commercial banks and savings and loan institutions that may issue letters of credit is scrutinized by several oversight organizations, including the Federal Reserve, the Federal Deposit Insurance Corporation, the Federal Savings and Loan Insurance Corporation, the Comptroller of the Currency, and State banking commissioners. These regulatory bodies attempt to ensure that regulated institutions take actions necessary to avoid bankruptcies. EPA concluded that it would be duplicative to establish additional requirements to ensure the solvency of bank and savings and loan institutions issuing letters of credit.

3. Validity of Letter of Credit Providing Liability Coverage. To ensure that letters of credit may be used to provide liability coverage, EPA reviewed the status of legal doctrines that might call into question the authority of a bank to issue a letter of credit for liability coverage, and concluded that no significant legal obstacles currently exist to such use of letters of credit. EPA believes that the proposed use of letters of credit in today's rule is analogous to the use of a letter of credit in situations that courts have approved. The Agency, therefore, concluded that use of a letter of credit for financial assurance for third-party liability coverage is both valid and enforceable.

B. Surety Bond

Today's rule authorizes owners and operators of hazardous waste TSDFs to use surety bonds to satisfy the RCRA third-party liability requirements (40 CFR 264.147(a)(4), 264.147(b)(4), 265.147(a)(4), and 265.147(b)(4)). The adoption of surety bonds as an additional assurance mechanism for liability coverage was widely advocated by the commenters on the August 21, 1985, NPRM.

1. Features of Mechanism. Surety bonds represent agreements between three parties: The principal (i.e., the facility owner or operator); the obligee (i.e., third-party liability claimants) to whom the principal promises to complete a specific act; and the surety, who assures the obligee that the principal will fulfill its obligation and, if the principal fails, that the surety will fulfill the principal's obligation to the obligee. Thus, the surety bond authorized today guarantees that if the owner or operator fails to satisfy valid third-party claims, the surety will pay such claims. A surety company is entitled to reimbursement from the principal when it makes a payment under a bond.

There are two types of surety bonds: payment bonds and performance bonds. Payment bonds guarantee that the principal will pay a certain sum to identified parties under the conditions named in the bond, and if the principal fails to make the payment or payments, the surety will make the payment or payments. Performance bond guarantees that the principal will perform a certain act and, if the principal fails, that the surety will either perform the act for the principal or pay someone else to perform it. The surety bond provided in today's rule is a payment bond, because the obligation it guarantees is limited to the principal's payment of third-party liability claims to satisfy the Subtitle C liability requirements.

A surety company's liability under a payment bond is limited to the "penal sum," which is the amount of coverage guaranteed by the bond. The penal sum of the payment bond being authorized by today's rule has two parts, the per- occurrence limit and the annual aggregate limit (40 CFR 264.151(1)). If the payment bond covers claims resulting from both sudden accidental occurrences and nonsudden accidental occurrences, a separate penal sum will be identified for each type of coverage (i.e., such a bond would have four penal sums).

The payment bond authorized in today's rule will remain in effect unless and until the surety notifies the owner or operator and the Regional Administrator of proposed cancellation by certified mail. Cancellation will become effective 120 days from the receipt of notification (40 CFR 264.151(1), conditions clause (7)).

2. Who May Provide Surety Bonds. Today's rule requires that surety companies issuing payment bonds to assure liability coverage must be listed by the Department of Treasury in Treasury "Circular 570" as surety companies that may issue bonds to the Federal government (40 CFR 264.147(i)(2) and 265.147(i)(2)). This requirement parallels the closure and post-closure care financial assurance regulations and other financial assurance requirements involving surety bonds and assures that the surety company is subject to regulatory oversight by some government agency. To qualify for such a listing, surety companies must comply with the law and regulations of the Department of Treasury (as specified in sections 9304

and 9308 of Title 31 of the United States Code). The names of the companies meeting these Treasury requirements are published on July 1 of each year by the Department of the Treasury in "Circular 570; Surety Companies Acceptable on Federal Bonds."

3. Validity of Surety Bond Providing Liability Coverage. EPA has contacted several State insurance commissions to determine if States would view a surety bond for third-party liability coverage as subject to the State insurance laws. In a number of States, surety companies are already regulated by the State agency that is responsible for insurance. EPA found that in other States, the issue of whether the surety bond constitutes insurance may be examined on a case-by-case (i.e., facility-by-facility or bond-by-bond) basis. Many States may consider it necessary for the firm providing the surety bond to qualify under the State's surety or insurance laws as an insurer. To address this issue, the rule does not allow owners or operators to use a surety bond to demonstrate financial assurance unless the Attorneys General or Insurance Commissioners in the States in which the surety is incorporated and in which the facilities covered by the bond are located certify that the mechanism is valid and enforceable (40 CFR 264.147(i)(4) and 265.147(i)(4)). (See Section IV.C of this preamble for further discussion.)

C. Guarantee

Today's rule extends the use of guarantees for liability coverage to allow guarantees provided by firms that are not the direct parents of facility owners or operators (40 CFR 264.147(g)(1) and 265.147(g)(1)). The use of a parent corporate guarantee for liability coverage was authorized in an interim final rule on July 11, 1986 (51 FR 5350) and promulgated as a final regulation on November 18, 1987 (52 FR 44314). Under this rule, liability coverage may be provided by parent firms that directly own at least 50 percent of the voting stock of a subsidiary firm. Several commenters on the interim final rule urged EPA to allow non-parent firms to provide guarantees.

After analyzing the validity and enforceability of guarantee contracts by non-parent firms, the Agency is authorizing guarantees provided by corporate grandparents and by a corporate "sibling" firm (a firm whose parent corporation is also the parent corporation of the owner or operator). The Agency also is allowing guarantees by other related and unrelated firms, provided that such firms have a substantial business relationship with the owner or operator.

The guarantee in today's rule incorporates the features of the November 18, 1987 rule for parent guarantees with minor revisions necessary to address non-parent guarantees and to ensure consistency with the other instruments allowed by today's rule. Since today's rule incorporates the features of this earlier rule, an extensive discussion of the guarantee has not been included in this preamble. Only the distinctive features of the non-parent corporate guarantee, the definition of who may provide the guarantee, and the basis upon which EPA concluded that it would be a valid and enforceable mechanism are discussed below.

1. Features of Mechanism. The authorized guarantee is an instrument by which a firm promises to pay the liability obligations of the owner or operator is the owner or operator does not do so. The firm providing the guarantee (the guarantor) must submit proof that it passes the financial test requirements of Secs. 264.147(f)(1) or 265.147(f)(1). If the guarantor subsequently becomes unable to pass the financial test, the owner or operator must obtain another financial assurance mechanism for liability

coverage.

2. Who May Provide Guarantees. Today's rule extends EPA's authorization of corporate guarantees beyond the previously allowed parent guarantee to include multi-tier guarantees by corporate grandparents, cross-stream guarantees by corporate siblings, and guarantees by firms with a "substantial business relationship" with the owner or operator. In general, today's rule authorizes three types of guarantees between corporations: (1) A guarantee by a parent corporation or principal shareholder of a subsidiary (a "downstream" guarantee), (2) a guarantee by a sibling corporation (a "cross-stream" guarantee), and (3) a guarantee by a firm that has a "substantial business relationship" with the corporation that receives the guarantee (40 CFR 264.147(g)(1) and 265.147(g)(1)).

A simple single-tier downstream guarantee is one where the direct parent corporation guarantees the obligation of its subsidiary. A multi-tier downstream guarantee (consisting of three tiers of ownership, for example) is a guarantee by which the corporate grandparent or great grandparent (i.e., the ultimate owner of the subsidiary) provides a guarantee for the subsidiary. A cross-stream guarantee is a guarantee between sibling corporations, e.g., a "brother" subsidiary's guarantee of a "sister" subsidiary where the siblings are owned by the same parent. Both of these categories of guarantees have been tested in legal actions and are considered strong and binding legal obligations although analyses of guarantees between siblings typically assume that some economic relationship exists between the two corporations aside from the guarantee.

If the guarantee is being provided by a corporate grandparent or sibling, the guarantor must provide the guarantee to the owner or operator directly, irrespective of the number of intervening levels of ownership that exist in the corporate structure (40 CFR 264.147(g)(1) and 265.147(g)(1)). For example, a corporate grandparent would provide a guarantee for the owner or operator's firm directly, not through the corporate parent.

Today's rule also authorizes unrelated firms and other related firms, aside from parents and siblings, that have a "substantial business relationship" with the owner or operator of a hazardous waste facility to provide guarantees (40 CFR 264.147(g) and 265.147(g)). In authorizing guarantees by these other related and unrelated firms, EPA sought to ensure that a valid and enforceable contract was created. To this end, the Agency is requiring these firms to demonstrate a substantial business relationship with the owner or operator to ensure that the guarantee is a valid contract. Under fundamental principles of contract law, contracts must be supported by "consideration." Consideration is generally defined as a legal detriment that has been bargained for and exchanged for the promise. The general principle underlying the concept of consideration is that the law will not enforce gratuitous promises.

The issue of consideration arises in the context of all guarantees; however, parent and sibling firms authorized to issue guarantees under today's rule can demonstrate consideration by the inherent benefits or detriments that accrue to the guarantor firm by virtue of its corporate relationship with the owner or operator. As noted above, courts have generally recognized that guarantees offered by a parent or sibling corporation are valid and enforceable. EPA believes that other related and unrelated firms should be able to demonstrate sufficient consideration for the contract if they have a substantial business relationship with the owner or operator.

The Agency's review of legal literature indicated that a sufficiently close business relationship between two firms could be comparable to the shared economic interests that typify the relationship between corporate siblings and between a parent and its subsidiary. Because it is these mutual economic interests that underlie the validity and enforceability of downstream and cross-stream guarantees, the existence of such interests between other types of firms should enable guarantees between these firms also to be valid and enforceable. No single legal definition exists of what constitutes a business relationship between two firms that would justify upholding a guarantee between them. Furthermore, such a determination would depend upon the application of the laws of the States of the involved parties. Thus, in defining the underlying business relationship that produces an acceptable guarantee, the Agency provides a broad framework for analyzing business relationships while acknowledging the primary role of State law.

In today's rule, EPA is defining substantial business relationship to mean "the extent of a business relationship necessary under applicable State law to make a guarantee contract issued incident to that relationship valid and enforceable. A 'substantial business relationship' must arise from a pattern of recent or ongoing business transactions, in addition to the guarantee itself, such that a currently existing business relationship between the guarantor and the owner or operator is demonstrated to the satisfaction of the applicable EPA Regional Administrator" (40 CFR 264.141(h)). A guarantee contract, by itself, would be inadequate to demonstrate a substantial business relationship between two parties. However, an existing contract to supply goods or services, separate from the guarantee contract, could supply evidence of such a relationship. An example of such an arrangement might be a contract for hazardous waste disposal between a generator and a disposal facility. Evidence demonstrating such a substantial business relationship is required to be provided in the letter from the Chief Financial Officer of the guarantor.

In addition to demonstrating the existence of a substantial business relationship, these other related and unrelated guarantors must describe the value that they received in consideration for the guarantee contract. In some cases, preexisting business relationships, no matter how substantial, will be insufficient by themselves to demonstrate consideration because they will not have been bargained for to induce the promise in the guarantee contract. For this reason, these guarantors must also describe the consideration for the contract in the letter from their Chief Financial Officer.

EPA considered as a preliminary matter whether corporate guarantees would be regulated as insurance contracts under States' insurance laws. EPA was concerned that guarantors could subject themselves to States' insurance laws through the issuance of guarantees. This issue has arisen in other of the Agency's financial responsibility rulemakings, including the proposed financial responsibility requirements for underground storage tanks containing petroleum (52 FR 12786, April 17, 1987). A discussion of the applicability of State insurance laws to various mechanisms, including corporate guarantees, is contained in the docket for that rulemaking, in the "Supporting Document for Proposed Underground Storage Tanks Containing Petroleum--Financial Responsibility Requirements." That discussion indicates that States' insurance statutes and regulatory bodies have varying ways of describing their jurisdiction over guarantees, oftentimes dependent on the precise circumstances surrounding the transaction. Thus,

the Agency cannot state with any certainty whether any particular guarantee would subject the guarantor to a State's insurance laws. Therefore, the responsibility rests on owners and operators to obtain guarantees that are valid and enforceable and on prospective guarantors to ascertain and comply with the State laws they would subject themselves to if they were to provide guarantees. As discussed in Section IV.C of today's preamble, the first responsibility cited is accomplished by requiring a certification from the Attorney General or Insurance Commissioner of the State in which the guarantor is incorporated and of each State in which a facility covered by the guarantee is located.

3. Validity of Non-Parent Guarantee Providing Liability Coverage. Some commenters questioned whether non-parent guarantees would provide assurance equivalent to that provided by a parent guarantee. The Agency concluded that adequate assurance will be provided by these "intercorporate" guarantees.

Intercorporate guarantees are a common means of assuring a lender that its loan will be repaid. In particular, "cross-stream" guarantees, which are from a "brother" subsidiary to a "sister" subsidiary where both firms are owned by the same corporate parent, are a typical business practice. Normally, collection of funds assured by intercorporate guarantees is a comparatively simple matter of contract enforcement.

In unusual circumstances, such as the situation where the guarantor declares bankruptcy, efforts could be made to avoid the guaranteed obligation. Certain provisions of the Federal bankruptcy code (11 U.S.C.A. 544(b) and 548(a)(2)) allow avoidance of obligations that deplete the debtor's assets to the detriment of its creditors. If, while the guarantor was involved in bankruptcy proceedings, a liability claim was presented to it for payment, a question could arise over whether bankruptcy laws would enable it to avoid satisfying the claim because the payment would deplete its assets to the detriment of its creditors. Under section 548(a)(2) of the Federal bankruptcy code, a trustee in bankruptcy may avoid payments made to any party within a year before the debtor filed bankruptcy if (1) the debtor was insolvent at that time and (2) the debtor did not receive "reasonably equivalent value" in return for the transfer. Section 544(b) essentially enables similar actions to be pursued under applicable State laws.

Intercorporate guarantees, however, should not be vulnerable to such actions if the owner or operator receives reasonably equivalent value in return for the guarantee. In effect, this reasonably equivalent value serves as consideration supporting the guarantee contract, similar to the guarantor having a "substantial business relationship" with the owner or operator.

According to most authorities, there is no difficulty in finding reasonably equivalent value in downstream guarantees, where the guarantor is higher in the corporate hierarchy (e.g., a direct or higher-tier parent) than the subsidiary receiving the guarantee. The subsidiary relationship of a firm to its direct or higher-tier parent is almost always considered a benefit to that parent. In cross-stream guarantees from one subsidiary of a parent to another subsidiary of that same parent, demonstrating reasonably equivalent value is more difficult because the subsidiary to which the guarantee is given is not an asset of the other subsidiary serving as the guarantor. In order to obviate any question about reasonably equivalent value in cross- stream guarantees, therefore, the Agency is requiring a cross-stream guarantor to describe in the Chief Financial Officer's Letter

(Sec. 264.151(g)) the value of the consideration that accrued to it from the guarantee.

The Agency has also concluded that adequate assurance that obligations will not be avoided in the event of bankruptcy will be provided by guarantees made by other related firms (i.e., not corporate siblings or parents) and unrelated firms which demonstrate a substantial business relationship with the owner or operator. As with intercorporate guarantees, collection of funds in most cases will merely be a matter of contract enforcement. In the event of bankruptcy of the guarantor, however, it is particularly important that the guarantee be written so as to demonstrate clearly that the guarantor has received reasonably equivalent value in consideration for the guarantee. As discussed above, the Agency is requiring these guarantors to describe in the Chief Financial Officer's Letter (Sec. 264.151(g)) both the nature of the substantial business relationship and the value derived from the guarantee.

D. Trust Fund

Today's rule authorizes owners or operators of hazardous waste facilities to use trust funds to demonstrate financial responsibility for third-party liability coverage (40 CFR 264.147(a)(5), 264.147(b)(5), 265.147(a)(5), and 265.147(b)(5)), if assets sufficient to cover the full amount of the assurance to be provided by the trust fund are placed in the fund before it becomes effective (i.e., the trust must be fully funded "up-front") (40 CFR 264.147(j)(3) and 265.147(j)(3)). Several comments received on the August 21, 1985 NPRM supported the use of trust funds to demonstrate financial responsibility for third-party liability coverage.

1. Features of Mechanism. A trust fund is an arrangement in which a separate legal entity, the trust, is created to hold property or funds for the benefit of another. At least three parties are necessary under trust agreements: the grantor, who establishes and funds the trust; the trustee, who has a fiduciary responsibility over the property placed in the trust by the grantor; and the beneficiary, the person (or group of people) for whom the arrangement is made. The most significant feature of a trust fund is the shift of legal ownership of the property in the trust from the grantor to the trustee when the trust is established and funded.

The trust document or trust agreement determines the allocation of rights, duties, and responsibilities among the parties to any trust. The trustee, in return for a fee, has a fiduciary responsibility to manage the fund according to the rules specified in the agreement. This agreement also defines the limits of a trustee's liability. In addition, a trust agreement states the manner in which payments are made into and out of the trust, as well as the grounds upon which the trust can be terminated.

2. Validity of Trust Fund for Liability Coverage. A trust used as a financial assurance mechanism should have a fund balance equal to the amount of coverage being demonstrated. The trust agreement may allow a pay-in period during which the grantor makes payments of specified amounts into the trust until the trust is fully funded. The length of the pay-in period typically is designed such that the trust fund balance equals the required amount of coverage before funds are needed for the assured activity. Because liability coverage may be needed immediately, the trust in today's rule must be fully paid up at the time it is relied upon for financial assurance. The trust also may not be cancelled unless and until an alternate financial assurance mechanism is in place. A fully funded

trust provides a high degree of assurance because funds, up to the required amount of coverage, are set aside specifically for the purpose of liability coverage.

To ensure that the full amount of coverage is available each year in which owner or operator must provide financial assurance, the Agency is requiring both that the trust fund be fully funded immediately and, in addition, if a liability claim is paid out of the trust fund balance, the owner or operator is required to refinance the trust annually up to the amount of the required coverage on or before the anniversary date of the establishment of the fund to satisfy the annual aggregate requirement of Secs. 264.147 and 265.147.

Although some owners and operators may conclude that the cost of funding a trust as the sole financial assurance mechanism is prohibitive, they may find it desirable to use a trust fund in combination with one or more other mechanisms. For example, owners and operators who purchase insurance policies that do not provide the full amount of aggregate coverage might use trust funds to demonstrate financial responsibility for the amounts of the aggregate not covered by the insurance policy.

E. Purchase of Insurance by Other Firms

Under the current liability requirements, proof of adequate insurance coverage can be provided by either a certificate of insurance or an endorsement. A certificate of insurance is a statement obtained from the insurer certifying that it has issued insurance as represented in the certificate. The certificate is not a part of the policy, but can be used to demonstrate the existence of the policy. An endorsement is a form attached to the policy that describes the original terms of the policy and any amendments to those terms. An endorsement is a part of the policy and also evidences that insurance has been issued as described in the endorsement.

The Agency is today making minor revisions to the insurance certificate and endorsement to clarify that other firms may purchase insurance on behalf of owners or operators and to ensure that EPA receives proper notice of actions affecting the policy, such as attempted cancellation, where the policy has been purchased by another firm. These changes are reflected in paragraphs 2(d) of the "Hazardous Waste Facility Liability Endorsement" and of the "Hazardous Waste Facility Certificate of Liability Insurance" in Secs.
264.151(i) and 264.151(j), respectively.

Currently, 40 CFR 264.147(a) and 265.147(a) require that an owner or operator must "have and maintain" coverage for bodily injury and property damage to third parties resulting from operation of a hazardous waste management facility. These regulations do not state explicitly that a party other than the owner or operator may purchase or obtain the necessary insurance coverage on behalf of the owner or operator. To clarify in the regulations that such insurance may be purchased by a third party, however, requires only that the language of the notice of cancellation provision in these insurance policies be amended.

To ensure that the cancellation provision in the Endorsement and Certificate covers a situation in which another company has purchased a policy for the owner or operator, the Agency has modified the language of the cancellation provision of both the Certificate and Endorsement to state

explicitly that another firm providing insurance for an owner or operator must notify the Regional Administrator and the owner or operator by certified mail 60 days before insurance is cancelled (40 CFR 264.151(i)(2)(d) and 264.151(j)(2)(d)). In addition, the revised cancellation provision also states that another firm providing insurance for an owner or operator must notify EPA in writing (1) whenever claims are made against the firm or the owner or operator for third-party damages and (2) before any changes are made in the policy. The Agency is concerned that reductions in the level of coverage available to the owner or operator, due to claims made against the firm providing the insurance or changes in the insurance policy by the firm providing the insurance, otherwise may not be reported to EPA.

F. Allowable Combinations of Mechanisms

The Agency will allow an owner or operator to demonstrate the required liability coverage through the use of combinations of financial assurance mechanisms (40 CFR 264.147(a)(6), 264.147(b)(6), 265.147(a)(6), and 265.147(b)(6)). Owners or operators may use any combination of insurance, the financial test, the corporate guarantee, a letter of credit, a surety bond, and a trust fund. In allowing combinations of instruments, EPA is extending the general approach of Subtitle C liability coverage requirements. An owner or operator can use its own financial strength to cover some costs and another financial assurance mechanism to cover the remainder, provided that in combining the mechanism assets are not double-counted. To prevent double- counting, combinations of the corporate guarantee and financial test are allowed only if the financial statement of the guarantor and the owner or operator are not consolidated (40 CFR 264.147(a)(6), 264.147(b)(6), 265.147(a)(6), and 265.147(b)(6)). In a consolidated financial statement, the assets and liabilities of a subsidiary are included in the parent company's financial statement. If the financial statements of the guarantor were consolidated with the statement of the owner or operator, the owner or operator could count its own assets once for the financial test and they could be counted again in the corporate financial statement which is used to support the corporate guarantee. Such double-counting of assets would negate the value of the financial test by overestimating the assets of the guarantor.

Today's rule includes a provision requiring owners and operators to specify which of several combined instruments should be drawn upon first in the event of a claim by designating instruments as "primary" or "excess" coverage.

Under closure and post-closure care financial assurance rules, priorities may be established by the Regional Administrator either by selecting one instrument and drawing upon it, or by drawing upon all instruments simultaneously and then drawing funds from the standby trust without regard to their source (see 40 CFR 264.143, 264.145, 265.143, and 265.145). The Agency considered giving the Regional Administrator similar authority in today's rule. However, the Agency is seeking in this rule to minimize the role of the Regional Administrator in payment of claims. Consequently, under today's rule the Regional Administrator does not establish the order in which financial assurance mechanisms are drawn upon in cases when owners or operators use more than one mechanism to satisfy the liability coverage requirements.

The Agency also considered the option of establishing standardized priorities for drawing upon mechanisms. This option was not adopted, however, because the Agency believes that priorities can better be

established on a case-by-case basis.

While rejecting these two approaches, EPA believes that establishing priorities is necessary to avoid delays in the payment of claims and to define clearly the extent of coverage. For example, priority arrangements are often specified when insurance is combined with another mechanism. Insurers typically include language within policies limiting their obligations in the event that other coverage exists and preventing the "stacking" of policies except in the case of designated "primary" and "excess" coverage. Such language generally specifies that the coverage provided is "primary" (meaning that it is to be drawn upon first) and that if other coverage exists, payment of claims will be shared, or that payment will be made after the other coverage is exhausted up to the liability limits of the policy.

Today's rule requires an owner or operator to specify which of several mechanisms that are being used in combination to satisfy the coverage requirements should be drawn upon first in the event of a claim. The actual determination of priority is, however, left with the owner or operator and may involve negotiation with the providers of the assurance mechanism.
To facilitate the establishment of priorities, the financial assurance instruments adopted in today's rule include language specifying whether the coverage is primary or excess. In addition, the guarantee under Sec.
264.151(h)(2) has been amended to indicate whether it provides primary or excess coverage.

IV. Special Provisions of Additional Mechanisms

This section discusses several special provisions that are common to several of the additional mechanisms for liability coverage authorized by today's rule, and that differ from requirements for closure and post-closure financial assurance.

A. Beneficiaries

In contrast to the mechanisms authorized or proposed under Subtitle C for closure and post-closure care and corrective action, the liability coverage mechanisms authorized today do not name EPA as their beneficiary. In today's rule, the issuer of the mechanism assumes the obligation to satisfy third- party liability claims for personal injury or property damage arising from operation of the facilities covered by the mechanism if the owner or operator does not do so.

Third parties, and not EPA, are designated beneficiaries to ensure that the third parties are paid directly for liability claims without involvement by EPA. The issuer of the mechanism must honor all valid certified claims or judgments upon the mechanism up to the limit of the amount covered.

B. Payment Trigger

To ensure that only valid claims are paid, the mechanisms specify that before making payment the issuer must receive either (a) a certificate of valid claim signed by the third-party claimants and by the owner or operator, or (b) a final court judgment. This provision allows for the resolution of third-party claims without the involvement in the dispute of either the issuer of the mechanism or EPA. Each of the mechanisms authorized today contains a provision that incorporates the payment trigger requirements, including the "certificate of valid claim" (40 CFR 264.151(h)(2), section 13; 264.151(k), clause 2; 264.151(1), condition (4);

and 264.151(m), section (4)).

The purpose of this payment trigger is to avoid placing either the provider of the mechanism or the Regional Administrator in the position of deciding the merits of disputes between the owner or operator and the third-party claimant. The payment trigger is also set up so that claims do not have to be litigated for a final judgment. The certification is designed to allow an owner or operator to settle a claim with a third party without conceding liability in a document accessible by the public, which could be used against the owner or operator in future claims.

The requirement to submit the signed and notarized certification assures that the parties have either agreed that the claim is valid and in the correct amount or they have settled any disputes related to the validity or amount of the claim before coming to the provider for payment. The procedure is designed to reduce administrative burdens and to allow efficient payment of valid claims. The Agency does not expect the requirement to submit a signed and notarized certification of claim to place undue burdens on owners or operators or third-party claimants.

Alternatively, if the owner or operator and the third-party claimant cannot agree on the validity and amount of the claim, a final judgment by a court must be submitted by the third-party claimant, indicating that the claim should be paid. Whether payment of a judgment shall be made is a matter of applicable State law and shall be determined by the laws of the jurisdiction in which the action was brought.

Unlike the requirements for closure and post-closure care and corrective action, EPA is not requiring the establishment of a standby trust for mechanisms issued for liability coverage. A standby trust is necessary when funds are payable to EPA, because by law monies paid to the Federal government must be deposited in the United States Treasury. Because the mechanisms will pay third parties directly, a standby trust is not necessary for liability coverage.

C. Certification of Validity and Enforceability

The surety bond and guarantee authorized in today's rule may be subject to the insurance laws and regulations of certain States. To ensure that these instruments are valid and enforceable, EPA has contacted several State insurance commissions to ask how they would view these mechanisms for liability coverage. The results of those contacts are described in the docket for this rulemaking.

Most of the State commissions contacted said they would probably require a firm providing a surety bond to qualify as an insurer under State insurance laws unless the firm was related to the owner or operator in a corporate structure or it was providing the bond incident to its business relationship with the owner or operator. Two factors may influence the State's determination: whether a premium is charged and whether the firm would make such bonds available to the general public. To be certain that any bonds used as financial assurance mechanisms will be valid and enforceable, the Agency will not approve a surety bond for liability coverage unless the Attorneys General or Insurance Commissioners of the State in which the surety is incorporated, and of each State in which a facility covered by the bond is located, submits a written statement that a surety bond written and executed as required is a legally valid and enforceable obligation (40 CFR 264.147(i)(4) and 265.147(i)(4)). The

certification by each State is required only once, and need not be obtained on a case-by-case basis by the owner or operator; instead it is provided to EPA or to a State agency. Accepting certifications provided to a State agency may be necessary in some circumstances even if EPA is administering the financial assurance requirements, because in many States officials such as the Attorney General will not issue opinions except to State agencies.

Guarantees for liability coverage also may come within the jurisdiction of a State's insurance laws and regulations. Accordingly, EPA is requiring that the guarantee may be used to fulfill liability coverage requirements only if the Attorney General or Insurance Commissioner of the State in which the guarantor is incorporated, and of each State in which a facility covered by the guarantee is located, submits a written statement that a guarantee written and executed as required is a legally valid and enforceable obligation (40 CFR 264.147(g)(2) and 265.147(g)(2)). The corporate guarantee rule provides a parallel requirement for this guarantee. To date, EPA has received evidence from 28 States that the parent guarantee would be acceptable.

D. Cancellation

Today's rule includes cancellation procedures for the authorized mechanisms. These procedures vary somewhat depending on the instrument. For the surety bond and guarantee provided by an unrelated firm, cancellation is allowed 120 days following notification by certified mail to the owner or operator and to the Regional Administrator(s) of the Region(s) in which the affected facilities are located (40 CFR 264.151(h)(2) and 264.151(1)). The Agency believes that 120 days is sufficient time for an owner or operator to locate a new financial assurance mechanism, and that any more stringent requirement, such as one requiring an in-place alternative prior to cancellation, would limit the availability of these mechanisms and would require extensive involvement of the Agency in the claims process.

The cancellation provisions for guarantees provided by some guarantors related to the owner or operator (i.e., corporate parents, siblings, or grand parents) require the guarantor to continue to provide the guarantee until an alternate mechanism is in place (40 CFR 264.151(h)(2)). This more stringent requirement is currently required for the corporate parent guarantee and is today being extended to guarantees provided by some of the other firms that are related to the owner or operator.

The distinctions in the cancellation provisions are based on the nature of the relationship between the provider of assurance and the owner or operator.

EPA believes that a corporate parent or some of the other related corporations, due to their close relationship with the owner or operator, will have a continuing interest in the financial condition of the owner or operator and therefore should bear more responsibility for continued financial assurance than a less related or completely unrelated firm. When guarantees are provided by guarantors closely related to the owner or operator, permitting cancellation only when an alternative has been approved ensures that coverage for liability costs will be continuously available.

Similarly, because the owner or operator provides a trust fund directly, it is not allowed to cancel that mechanism until another form of financial assurance has become effective. EPA is not promulgating a similarly stringent cancellation requirement for providers of insurance, surety bonds, or guarantees by less related and unrelated firms, because it

believes that third-party providers would not provide coverage if they were unable to cancel that coverage, with reasonable notice, at some later date. Today's rule does not amend the current provisions (40 CFR 264.151 (i) and (j)) allowing an insurer to cancel an insurance policy 60 days after the notice of cancellation is received by the Regional Administrator. Insurance providers argued that not allowing cancellation until at least 120 days after notice is given exposes them to considerable risk when the insured fails to pay the premium for the final period of coverage. In consideration of this concern, the Agency is maintaining the current 60-day requirement for insurance policies.

E. Exclusions

The mechanisms in today's rule contain a provision that they do not apply to certain categories of damages or obligations (see 40 CFR 264.151(h)(2), paragraph (4); 264.151(k); 264.151(l), conditions clause (l); and 264.151(m), section 3). These exclusions are patterned on existing standard exclusions found in insurance coverage (see, for example, the Insurance Services Office pollution liability coverage form CG 00 39 11 85). They are intended to ensure that the coverage is not exhausted by the payment of claims that are covered by other compensation systems or that are otherwise not intended to be included within the scope of coverage.

The Agency did not adopt all the standard Commercial General Liability (CGL) and Environmental Impairment Liability (EIL) exclusions, but included only those exclusions it considered relevant to the financial assurance mechanisms for liability. EPA has also recently issued guidance on the acceptability of site-specific pollution exclusion within insurance policies.

This guidance memorandum is applicable only to insurance policies.

Exclusion (a), for bodily injury or property damage for which the owner or operator is obligated to pay damages by reason of the assumption of liability in a contract or agreement, is intended to exclude liabilities assumed by contract that do not involve the hazardous waste treatment, storage, and disposal facility or facilities of the owner or operator. It does not exclude settlements or other agreements to pay damages in connection with accidental occurrences resulting in bodily injury or property damage caused by hazardous waste.

Exclusion (b), for obligations under workers' compensation, disability benefits, or unemployment compensation law or similar law, is intended to ensure that liability coverage is available for non-employee third parties and does not duplicate coverage provided under these other programs or forms of assurance.

Exclusion (c), for bodily injury to the employees, or the immediate family of employees, of the owner or operator, is also intended to ensure that coverage is available for "third parties" and does not duplicate coverage provided under other forms of assurance.

Exclusion (d), for bodily injury or property damage arising out of the ownership or use of any aircraft, motor vehicle, or watercraft, is to prevent use of an authorized financial assurance mechanism for routine accidents that are not directly related to management of hazardous waste.

Exclusion (e), for property damage to property owned, occupied, rented, or in the care, custody, or control of the owner or operator, is intended to

ensure that coverage will be available to compensate third parties, and not the owner or operator, for property damage as a result of activities at TSDFs.

V. Other Issues Presented in the Notice of Proposed Rulemaking

In the August 21, 1985, NPRM, EPA suggested several additional approaches that could be taken to promote compliance with the financial responsibility requirements. Alternatives, other than authorizing additional financial assurance mechanisms, included the suspension or withdrawal of the liability coverage requirements, clarification of the scope of coverage, revision of the required levels of coverage, or authorization of waivers. Numerous comments were received on these alternatives. After considering these comments, the Agency has decided to retain the liability coverage requirements at their present levels, to maintain the present scope of coverage, and to reject the option of generic waivers. This section discusses briefly the comments received on these alternatives in response to the NPRM and explains the reasons why EPA is not adopting them. A more complete discussion of these comments is included within the docket accompanying today's rule.

A. Maintain, Suspend, or Withdraw Existing Liability Coverage Requirements

The Agency received comments from State governments and the public that generally argued in favor of maintaining the requirements. Supporters of the existing requirements argued that the insurance market for EIL coverage would not recover without such requirements; that maintaining the requirement would increase public confidence in hazardous waste facilities and decrease opposition to siting and permitting such facilities; and that low-risk owners and operators were able to obtain coverage. Commenters from State and local governments in particular argued that suspension or withdrawal of the liability coverage requirements would severely damage the chances for an eventual solution to the problem of insurance availability, that suspension would not be acceptable to the public and would undermine the strength of programs to regulate hazardous waste management, and that liability coverage is necessary to protect human health and environment. Facilities that are unable to obtain such coverage, in these commenters' opinion should not continue in operation.

In contrast, a number of firms in the regulated community argued that EPA should not maintain the existing liability coverage requirements, but rather should suspend or withdraw the requirements, because of the difficulty many firms faced in obtaining insurance. Commenters also argued that the liability coverage requirements could be suspended or withdrawn because they were redundant with permitting conditions and that EPA should concentrate on achieving risk control rather than post-loss compensation. They also pointed out that even if the liability coverage requirements were abolished, third parties harmed by hazardous waste management activities could still sue the owner or operator for damages. Finally, commenters argued that the constraints on insurance availability made a short-term suspension necessary, even if the requirements for liability coverage were later reinstituted.

After considering these comments and suggestions made in response to other questions in the NPRM, EPA has concluded that the current liability coverage requirements should be maintained. The Agency believes that the requirements are an important component of the RCRA management system and are necessary to protect human health and the environment. Further,

Congress in the Hazardous and Solid Waste Amendments of 1984 (HSWA) has stressed the importance of satisfying all financial assurance requirements, including liability coverage. Finally, by authorizing the use of additional financial mechanisms for liability coverage, the Agency believes that the problems of insurance availability cited by some commenters as reasons to suspend or withdraw the rule should become less important in the future.

B. Revise Scope and Levels of Coverage

A number of issues were considered by EPA in connection with the scope and levels of coverage. They included coverage levels, distinction between sudden and nonsudden coverage, exclusion of legal defense costs, and deductibles.

Each is discussed in this section.

1. Coverage Levels. EPA established the sudden accidental and nonsudden accidental liability coverage requirements in 1982 at $1 million per occurrence and $3 million per occurrence, respectively, on the basis of the Agency's investigation of existing third-party damage cases. To account for the possibility that the same firm might experience more than one claim in a year, the Agency also established annual aggregate coverage requirements at twice those amounts, or $2 million and $6 million, respectively.

In July 1986, EPA again reviewed third-party damage claims, awards, and settlements for sudden and nonsudden accidental occurrences involving hazardous chemicals as well as hazardous waste to determine whether the required levels of coverage are adequate. Data were limited, however, for several reasons, including the fact that few cases have been litigated to completion. Thus, available data were generally data on amounts claimed, rather than amounts recovered in awards or settlements. Because final awards and settlements often differ significantly from initial claims, it is difficult to draw conclusions based on this data. In addition, commenters did not supply any additional information indicating that the currently required coverage levels should be changed. The Agency concluded, in light of the limited data, that it had insufficient basis to change the requirements at this time.

2. Distinction Between Sudden and Nonsudden Coverage. 40 CFR 264.147(a) and 265.147(a) require all owners or operators of hazardous waste facilities to have "sudden accidental" coverage. Owners and operators of surface impoundments, landfills, or land treatment facilities used to manage hazardous wastes also are required to have "nonsudden accidental" coverage (40 CFR 264.147(b) and 265.147(b)).

A number of commenters on the August 21, 1985, NPRM suggested that the Agency no longer distinguish between sudden and nonsudden accidental coverage. They argued that nonsudden coverage was difficult to obtain, and that insurers were beginning to issue combined policies for sudden and nonsudden coverage. (A more complete discussion of comments on this point is provided in documents accompanying today's rulemaking.)

EPA has decided to maintain the distinction between sudden and nonsudden coverage. The Agency believes that maintaining distinct coverage requirements is still appropriate. Further, the insurance industry continues to write policies that distinguish between sudden and nonsudden events. EPA recognizes, however, that in some cases, courts have interpreted coverage for sudden events broadly to include damage from a gradual release occurring over long periods of time. As a result, some insurers do not distinguish between sudden and nonsudden events, but offer

"combined coverage": coverage for both sudden and nonsudden events on the same policy with single aggregate and per- occurrence limits. Today's rule includes a change to the coverage requirements citation specifying that the Agency will accept "combined coverage" policies, but to provide equivalent levels of coverage, the limits must be at least $4 million per-occurrence ($1 million sudden plus $3 million nonsudden) and $8 million annual aggregate ($2 million sudden plus $6 million nonsudden).

3. Exclusion of Legal Defense Costs from Policy Limits. Currently, Subpart H requires an owner or operator of a TSDF to maintain liability coverage for sudden and nonsudden accidental occurrences at specified levels, exclusive of legal defense costs (40 CFR 264.147 (a) and (b) and 265.147 (a) and (b)). The Agency decided to exclude legal defense costs for two reasons: (1) The insurance industry standard for CGL policies excluded legal defense costs from the coverage, and (2) legal defense costs could absorb a major portion of the required coverage, leaving an inadequate amount to cover actual damages. The Agency continues to believe that these reasons remain valid and do not affect the availability of insurance.

In its August 21, 1985 NPRM the Agency requested comment on whether, in an effort to increase the availability of EIL coverage for TSDFs, legal defense costs should be included in coverage limits. A number of commenters supported including legal defense costs. They argued that the EIL coverage currently available to TSDFs is written to include defense costs within policy limits.

The Agency contacted insurance companies known to provide EIL coverage to ask whether their EIL policies included or excluded legal defense costs. Although some companies stated that defense costs are included in the coverage limits, others said that defense costs were excluded, or that the policy could be written to conform to the RCRA requirements; that is, policies could be written to exclude legal defense costs. Furthermore, current industry practice, including the present industry standard form for this type of insurance, still excludes defense costs from the coverage limits. In addition, while recently there have been attempts by insurers to limit defense cost exposure by including at least some defense costs within policy limits, the trend appears to be toward some other method of limiting costs outside of policy limits.

The second reason commenters presented for changing the RCRA requirements to include legal defense costs was that the assurance of the availability of defense costs is an important element of claims litigation and further that there were insufficient RCRA claims data to warrant requiring coverage excluding legal defense costs.

The Agency continues to believe that it is important for the full amount of liability coverage to be available to cover claims against owners or operators of TSDFs. The Agency decided on the current coverage levels after a thorough investigation of reported third-party damage cases from hazardous waste accidents and these levels do not account for legal defense costs.

Because the size of legal defense costs in this area is somewhat uncertain, the most secure method of ensuring that sufficient funds will be available to cover actual damages is to retain the requirement that defense costs be excluded.

Other commenters stated that including legal defense costs should be permissible, as long as the full amount of RCRA liability coverage was

available to claimants. EPA agrees. If the total coverage includes the full amount required for third-party liability plus additional coverage earmarked for legal defense costs, the policy would be acceptable under current regulations. Thus, for example, a policy would provide acceptable assurance for a surface impoundment if the total coverage was $5 million per occurrence and $10 million annual aggregate if legal defense costs covered under the policy were limited to a maximum of $1 million per occurrence and $2 million annual aggregate. A $5 million per occurrence, $8 million annual aggregate policy without an earmarked limit on legal defense costs would not provide adequate assurance.

4. Deductibles. A number of commenters argued that EPA should not require "first-dollar" coverage for liability costs. If deductibles were allowed, according to these commenters, insurance coverage might be easier to obtain or be less costly.

Although the insurer must provide first-dollar coverage, EPA notes that the regulations do not prevent insurers from requiring reimbursement from owners or operators for first-dollar expenditures. The owner or operator can agree in the insurance contract that the insurer will be reimbursed for these expenditures. The regulations do not, however, allow self-insurance retention. Policies cannot require the owner or operator to cover first-dollar expenditures. Such self-insurance is available to an owner or operator under the regulations only if it can pass the requirements established in the financial test for liability coverage.

EPA contacted a number of insurers to determine whether self-insurance retention could help to alleviate problems of insurance availability and affordability. In general, however, their responses indicated that current problems with EIL insurance are related to other factors, such as difficulty in predicting the size of the risk being covered, and that deductibles would not significantly enhance insurance availability. Therefore, the Agency is retaining the current first-dollar coverage requirement.

C. Mechanisms Considered But Not Adopted

1. Security interests. Security interests are a special procedure, authorized under State law following a pattern established by the Uniform Commercial Code, for creating collateral to serve as a support for the repayment of loans or other financial obligations. Security interests were considered but rejected for liability coverage because of the complicated legal requirements that have to be satisfied to ensure that they provide effective financial assurance. For example, security interests ordinarily must be perfected by filing papers with appropriate agencies in each jurisdiction where collateral exists, and these filings must be kept up to date. EPA would be required to verify that proper filings had occurred. In addition, the Agency would also have to determine that the collateral underlying the agreement had been valued properly. If not, the proceeds from sale of the collateral might fail to supply the amounts required to satisfy valid claims. Finally, the need to satisfy specific legal processes prior to liquidation of collateral could delay payment of valid third-party claims.

Because of these problems, EPA has decided not to adopt security interests at this time.

2. Indemnity contracts. Indemnity contracts are legally binding commitments by a third party or "indemnitor" to pay a debt or obligation of another party. The duty of the indemnitor generally is to repay the primary

debtor after it has satisfied the debt or obligation. The Agency was not willing to adopt such a mechanism because of the administrative difficulties and lengthy time needed to enforce such contracts.

An indemnity contract also may be established in which the indemnitor agrees to assume the obligation even if the primary debtor does not pay. Such a contract, however, so closely resembles a guarantee that EPA determined that in effect no additional financial assurance option would be added to the regulations by inclusion of the indemnity. Therefore the Agency has not added an indemnity contract to the set of options authorized in today's rule.

3. Reserve funds. As a temporary measure pending the growth of the insurance market, some commenters suggested that owners or operators set aside the equivalent of insurance premiums in a reserve fund. Such a mechanism could function in a manner similar to trusts, if control over the fund were given to an independent fiduciary agent. Alternatively, however, some commenters suggested that the reserve fund be only a separate bookkeeping entity under the control of the owner or operator. EPA believes that neither approach would ensure that the reserve would contain sufficient funds when required to satisfy claims. Liability coverage funds may be needed at any time after implementation of the mechanism. Because a reserve fund based on the estimated equivalent of insurance premiums, rather than the amounts equal to the required coverage levels, would accumulate slowly, it would be unlikely to contain adequate funds to satisfy liability claims, especially in the early years.

In addition, EPA is convinced that a reserve fund that is not under the control of an independent trustee but instead remains under the control of the TSDF owner or operator will not provide satisfactory financial assurance.
No independent third party would administer the reserve fund, including assessing its value and controlling payments from the fund. The Agency determined, therefore, not to authorize the use of reserves. Today's rule authorizes a fully funded trust fund, for owners and operators who want to use a similar mechanism.

4. Federal Insurance or Loan Guarantees. Some commenters pointed to other financial assurance programs utilizing Federal insurance or loan guarantees as possible models for EPA. Establishment of insurance or loan guarantees requires specific statutory authority that has not been granted to the Agency. Further, EPA does not believe that as an agency whose primary mandate is protection of human health and the environment, it currently possesses the expertise or resources to administer either an insurance or a loan guarantee program. Such programs or approaches would require the Agency to assess financial characteristics of owners or operators, and to make decisions concerning the validity of claims, when those assessments and decisions can be made more accurately and efficiently by existing institutions that provide financial assurance.

5. Captive Insurance Pools and Risk Retention Groups. EPA believes it is unnecessary in today's rulemaking explicitly to authorize the use of captive insurance pools and risk retention groups. Such instruments are already authorized as forms of insurance. If the policies offered by a pool or risk retention group satisfy EPA requirements, such policies provide acceptable financial assurance.

D. Authorize Waivers

A number of commenters, particularly those from industry, supported granting temporary waivers on a case-by-case basis if a firm can demonstrate that it has made a "good faith effort" to obtain the required liability insurance. However, the Agency believes that the authorization of additional mechanisms, existing enforcement policies, the somewhat improved insurance market for TSDFs and the increased potential of insurance offered by risk retention groups, provide a better solution than simply waiving the liability coverage requirements. Also, existing regulations enable Regional Administrators to grant variances (Secs. 264.147(c) and 265.147(c)) or adjustments (Sec. 264.147(d) and 265.147(d)) to the required liability coverage amounts, if this is justified by the degree and duration of risk associated with a TSDF. The Agency believes that justifiable modifications in the amount of coverage needed are more consistent with the objectives of the liability coverage requirements than would be relieving owners or operators of these requirements entirely, solely because they made a "good faith" effort to obtain coverage.

VI. Consistency With Other Existing and Proposed Financial Assurance Requirements

EPA currently allows owners or operators of hazardous waste TSDFs to use the mechanisms being approved in today's rule, including trust funds, letters of credit, surety bonds, and corporate guarantee contracts, to provide financial assurance for the costs of closure and post-closure care (40 CFR 264.143, 264.145, 264.151, 265.143, and 265.145), and has proposed their use for corrective action (51 FR 37854, October 24, 1986). As described above, certain features of the assurance mechanisms are different because of the differences between these programs and liability coverage.

In addition, EPA has proposed financial assurance rules applicable to owners and operators of underground storage tanks (USTs) containing petroleum under sections 9003 (c) and (d) of RCRA as amended by HSWA (RCRA Subtitle I), and by the Superfund Amendments and Reauthorization Act of 1986 (SARA) (52 FR 12662, April 17, 1987). The proposed rule would establish requirements for demonstrating financial responsibility for taking corrective action and compensating third parties for bodily injury and property damage caused by sudden and nonsudden accidental releases arising from operating an underground storage tank containing petroleum. As in today's rule, under the UST proposal, owners and operators of underground storage tanks containing petroleum would be allowed to use letters of credit, surety bonds, and expanded guarantees to demonstrate financal responsibility for the costs of corrective action and third-party liability claims (52 FR 12786, 12844, April 17, 1987).

VII. Technical Correction to 40 CFR 264.151(b)

The May 2, 1986 rule amending the closure, post-closure care, and financial assurance regulations mistakenly omitted a portion of the required language for the financial guarantee bond found in 40 CFR 264.151(b) (see 51 FR 16422, 16450). Today's rule makes a technical correction to the regulation to restore the required wording of the bond.

VIII. Effective Date

This regulation is being published as a final rule, effective in 30 days.

Section 3010(b) of RCRA provides that EPA's hazardous waste regulations and revisions thereto generally take effect six months after their promulgations.

The purpose of this requirement is to allow sufficient time for the regulated community to comply with major new regulatory requirements. The statute allows for a shorter period prior to the effective date, if (i) the Administrator finds that the regulated community does not need six months to come into compliance; (ii) the regulation responds to an emergency situation, or (iii) other good cause. The Agency believes that since the regulation does not add any compliance requirements, but rather expands the number of mechanisms owners or operators may use to come into compliance, a six-month period prior to the effective date is unnecessary.

Today's amendment adopts additional mechanisms for complying with third-part liability coverage requirements and thus makes it easier for some owners and operators to act in accordance with the RCRA liability coverage regulations. An effective date six months after promulgation for the amendment promulgated today would substantially delay the implementation of the regulations and would be contrary to the interest of the regulated community and the public. Accordingly, the Agency believes that it makes little sense to delay needed relief to owners or operators by an additional five months.

IX. State Authority

A. Applicability of Rules in Authorized States

Under section 3006 of RCRA, EPA may authorize qualified States to administer and enforce the RCRA program within the State. (See 40 CFR Part 271 for the standards and requirements for authorization.) Following authorization, EPA retains enforcement authority under RCRA sections 3008, 7003, and 3013, although authorized States have primary enforcement responsibility.

Prior to HSWA, a State with final authorization administered its hazardous waste program entirely in lieu of EPA administering the Federal program in that State. The Federal requirements no longer applied in the authorized State, and EPA could not issue permits for any facilities in a State where the State was authorized to permit. When new, more stringent Federal requirements were promulgated or enacted, the State was obligated to enact equivalent authority within specified time frames. New Federal requirements did not take effect in an authorized State until the State adopted the requirements as State law.

In contrast, under section 3006(g) of RCRA, 42 U.S.C. 6926(g), new requirements and prohibitions imposed by the HSWA take effect in authorized States at the same time that they take effect in non-authorized States. EPA is directed to carry out those requirements and prohibitions in authorized States, including the issuance of permits, until the State is granted authorization to do so. While States must still adopt HSWA-related provisions as State law to retain final authorization, the HSWA requirements and prohibitions apply in authorized States in the interim.

B. Effect of Rule on State Authorizations

Today's rule promulgates standards that will not be effective in authorized States since the requirements are not being imposed pursuant to HSWA. Thus, the requirements will be applicable only in those States that do not have interim or final authorization. In authorized States, the requirements will not be applicable until the State revises its program to adopt equivalent requirements under State law.

In general, 40 CFR 271.21(e)(2) requires that States that have final

authorization to modify their programs to reflect Federal program changes and subsequently submit the modifications to EPA for approval. It should be noted, however, that authorized States are only required to modify their programs when EPA promulgates Federal standards that are more stringent or broader in scope than the existing Federal standards. Section 3009 of RCRA allows States to impose standards more stringent than those in the Federal program. For those Federal program changes that are less stringent or reduce the scope of the Federal program, States are not required to modify their programs (see 40 CFR 271.1(i)). The standards promulgated today are less stringent than or reduce the scope of the existing Federal requirements.

Therefore, authorized States will not be required to modify their programs to adopt requirements equivalent or substantially equivalent to the provisions listed above. If the State does modify its program, EPA must approve the modification for the State requirements to become Subtitle C RCRA requirements. States should follow the deadlines of 40 CFR 271.21(e)(2) if they desire to adopt this less stringent requirement.

X. Executive Order 12291

Under Executive Order 12291 (section 3(b)) the Agency must judge whether a regulation is major and thus subject to the requirement of a Regulatory Impact Analysis. The notice published today is not major because the rule will not result in an effect on the economy of $100 million or more, will not result in increased costs or prices, will not have significant adverse effects on competition, employment, investment, productivity, and innovation, and will not significantly disrupt domestic or export markets. Therefore, the Agency has not prepared a Regulatory Impact Analysis under the Executive Order.

This regulation was submitted to the Office of Management and Budget (OMB) for review as required by Exective Order No. 12291.

XI. Regulatory Flexibility Act

Under the Regulatory Flexibility Act of 1980 (5 U.S.C. 601 et seq.), Federal agencies must, in developing regulations, analyze their impact on small entities (small businesses, small government jurisdictions, and small organizations). This rule relaxes the existing financial assurance requirements and thus reduces costs associated with compliance. Accordingly, I certify that this regulation will not have a significant economic impact on a substantial number of small entities.

XII. Supporting Documents

Supporting documents available for this interim final rule include comments on the August 21, 1985 Proposed Rule, summary of the comments on the July 11, 1986 Interim Final Rule, and background documents on the finanical test for liability coverage. In addition, background documents prepared for previous financial assurance regulations, as well as documents prepared for this rulemaking, are also available as are letters received from State Attorneys General concerning the corporate guarantee for liability.

All of these supporting materials are available for review in the EPA public docket (RCRA docket #F-88-CGF1-FFFFF), Room S-212, Waterside Mall, 401 M Street, SW., Washington, DC 20460.

List of Subjects

40 CFR Part 264

Hazardous waste, Insurance, Packaging and containers, Reporting and recordkeeping requirements, Surety bonds.

40 CFR Part 265

Hazardous waste, Insurance, Packaging and containers, Reporting and recordkeeping requirements, Surety bonds.

Date: August 19, 1988.
Lee M. Thomas,
Administrator.

For the reasons set out in the preamble, Title 40, Chapter I of the Code of Federal Regulations is amended as set forth below.

40 CFR Part 264 is amended as follows:

PART 264--STANDARDS FOR OWNERS AND OPERATORS OF HAZARDOUS WASTE TREATMENT,
STORAGE, AND DISPOSAL FACILITIES: LIABILITY COVERAGE

1. The authority citation for Part 264 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6924, and 6925.

2. In Sec. 264.141, new paragraph (h) is added to read as follows:

Sec. 264.141 Definitions of terms as used in this subpart.

* * * * *

(h) "Substantial business relationship" means the extent of a business relationship necessary under applicable State law to make a guarantee contract issued incident to that relationship valid and enforceable. A "substantial business relationship" must arise from a pattern of recent or ongoing business transactions, in addition to the guarantee itself, such that a currently existing business relationship between the guarantor and the owner or operator is demonstrated to the satisfaction of the applicable EPA Regional Administrator.

3. In Sec. 264.147, paragraph (h) is redesignated as paragraph (k); paragraphs (a) introductory text, (a)(2), (a)(3), (b) introductory text, (b)(2), (b)(3), (b)(4), (g) heading and (g)(1) introductory text are revised, and by removing and reserving paragraph (g)(1)(ii); paragraphs (g)(2)(i) and (g)(2)(ii) are amended by removing "corporate;" and new paragraphs (a)(4), (a)(5), (a)(6), (a)(7), (b)(5), (b)(6), (b)(7), (h), (i), and (j) are added, to read as follows:

Sec. 264.147 Liability requirements.

(a) Coverage for sudden accidental occurrences. An owner or operator of a hazardous waste treatment, storage, or disposal facility, or a group of such facilities, must demonstrate financial responsibility for bodily injury and property damage to third parties caused by sudden accidental occurrences arising from operations of the facility or group of facilities. The owner or operator must have and maintain liability coverage for sudden accidental occurrences in the amount of at least $1 million per occurrence with an annual aggregate of at least $2 million, exclusive of legal defense costs.

This liability coverage may be demonstrated as specified in paragraphs (a)(1), (2), (3), (4), (5), or (6) of this section:

* * * * *

(2) An owner or operator may meet the requirements of this section by

passing a financial test or using the guarantee for liability coverage as specified in paragraph (g) of this section.

(3) An owner or operator may meet the requirements of this section by obtaining a letter of credit for liability coverage as specified in paragraph (h) of this section.

(4) An owner or operator may meet the requirements of this section by obtaining a surety bond for liability coverage as specified in paragraph (i) of this section.

(5) An owner or operator may meet the requirements of this section by obtaining a trust fund for liability coverage as specified in paragraph (j) of this section.

(6) An owner or operator may demonstrate the required liability coverage through the use of combinations of insurance, financial test, guarantee, letter of credit, surety bond, and trust fund, except that the owner or operator may not combine a financial test covering part of the liability coverage requirement with a guarantee unless the financial statement of the owner or operator is not consolidated with the financial statement of the guarantor. The amounts of coverage demonstrated must total at least the minimum amounts required by this section. If the owner or operator demonstrates the required coverage through the use of a combination of financial assurances under this paragraph, the owner or operator shall specify at least one such assurance as "primary" coverage and shall specify other assurance as "excess" coverage.

(7) An owner or operator shall notify the Regional Administrator in writing within 30 days (i) whenever a claim for bodily injury or property damages caused by the operation of a hazardous waste treatment, storage, or disposal facility is made against the owner or operator or an instrument providing financial assurance for liability coverage under this section and (ii) whenever the amount of financial assurance for liability coverage under this section provided by a financial instrument authorized by paragraphs (a)(1) through (a)(6) of this section is reduced.

(b) Coverage for nonsudden accidental occurrences. An owner or operator of a surface impoundment, landfill, or land treatment facility which is used to manage hazardous waste, or a group of such facilities, must demonstrate financial responsibility for bodily injury and property damage to third parties caused by nonsudden accidental occurrences arising from operations of the facility or group of facilities. The owner or operator must have and maintain liability coverage for nonsudden accidental occurrences in the amount of at least $3 million per occurrence with an annual aggregate of at least $6 million, exclusive of legal defense costs. An owner or operator who must meet the requirements of this section may combine the required per- occurrence coverage levels for sudden and nonsudden accidental occurrences into a single per-occurrence level, and combine the required annual aggregate coverage levels for sudden and nonsudden accidental occurrences into a single annual aggregate level. Owners or operators who combine coverage levels for sudden and nonsudden accidental occurrences must maintain liability coverage in the amount of at least $4 million per occurrence and $8 million annual aggregate. This liability coverage may be demonstrated as specified in paragraphs (b) (1), (2), (3), (4), (5), or (6), of this section:

* * * * *

(2) An owner or operator may meet the requirements of this section by passing a financial test or using the guarantee for liability coverage as specified in paragraphs (f) and (g) of this section.

(3) An owner or operator may meet the requirements of this section by obtaining a letter of credit for liability coverage as specified in paragraph (h) of this section.

(4) An owner or operator may meet the requirements of this section by obtaining a surety bond for liability coverage as specified in paragraph (i) of this section.

(5) An owner or operator may meet the requirements of this section by obtaining a trust fund for liability coverage as specified in paragraph (j) of this section.

(6) An owner or operator may demonstrate the required liability coverage through the use of combinations of insurance, financial test, guarantee, letter of credit, surety bond, and trust fund, except that the owner or operator may not combine a financial test covering part of the liability coverage requirement with a guarantee unless the financial statement of the owner or operator is not consolidated with the financial statement of the guarantor. The amounts of coverage demonstrated must total at least the minimum amount required by this section. If the owner or operator demonstrates the required coverage through the use of a combination of financial assurances under this paragraph, the owner or operator shall specify at least one such assurance as "primary" coverage and shall specify other assurance as "excess" coverage.

(7) An owner or operator shall notify the Regional Administrator in writing within 30 days (i) whenever a claim for bodily injury or property damages caused by the operation of a hazardous waste treatment, storage, or disposal facility is made against the owner or operator or an instrument providing financial assurance for liability coverage under this section and (ii) whenever the amount of financial assurance for liability coverage under this section provided by a financial instrument authorized by paragraphs (a)(1) through (a)(6) of this section is reduced.

* * * * *

(g) Guarantee for liability coverage. (1) Subject to paragraph (g)(2) of this section, an owner or operator may meet the requirements of this section by obtaining a written guarantee, hereinafter referred to as "guarantee." The guarantor must be the direct or higher-tier parent corporation of the owner or operator, a firm whose parent corporation is also the parent corporation of the owner or operator, or a firm with a "substantial business relationship" with the owner or operator. The guarantor must meet the requirements for owners or operators in paragraphs (f)(1) through (f)(6) of this section. The wording of the guarantee must be identical to the wording specified in Sec. 264.151(h)(2) of this part. A certified copy of the guarantee must accompany the items sent to the Regional Administrator as specified in paragraph (f)(3) of this section. One of these items must be the letter from the guarantor's chief financial officer. If the guarantor's parent corporation is also the parent corporation of the owner or operator, this letter must describe the value received in consideration of the guarantee. If the guarantor is a firm with a "substantial business relationship" with the owner or operator, this

letter must describe this "substantial business relationship" and the value received in consideration of the guarantee.

* * * * *

(h) Letter of credit for liability coverage. (1) An owner or operator may satisfy the requirements of this section by obtaining an irrevocable standby letter or credit that conforms to the requirements of this paragraph and submitting a copy of the letter of credit to the Regional Administrator.

(2) The financial institution issuing the letter of credit must be an entity that has the authority to issue letters of credit and whose letter of credit operations are regulated and examined by a Federal or State agency.

(3) The wording of the letter of credit must be identical to the wording specified in Sec. 264.151(k) of this part.

(i) Surety bond for liability coverage. (1) An owner or operator may satisfy the requirements of this section by obtaining a surety bond that conforms to the requirements of this paragraph and submitting a copy of the bond to the Regional Administrator.

(2) The surety company issuing the bond must be among those listed as acceptable sureties on Federal bonds in the most recent Circular 570 of the U.S. Department of the Treasury.

(3) The wording of the surety bond must be identical to the wording specified in Sec. 264.151(1) of this part.

(4) A surety bond may be used to satisfy the requirements of this section only if the Attorneys General or Insurance Commissioners of (i) the State in which the surety is incorporated, and (ii) each State in which a facility covered by the surety bond is located have submitted a written statement to EPA that a surety bond executed as described in this section and Sec.

264.151(1) of this part is a legally valid and enforceable obligation in that State.

(j) Trust fund for liability coverage. (1) An owner or operator may satisfy the requirements of this section by establishing a trust fund that conforms to the requirements of this paragraph and submitting an originally signed duplicate of the trust agreement to the Regional Administrator.

(2) The trustee must be an entity which has the authority to act as a trustee and whose trust operations are regulated and examined by a Federal or State agency.

(3) The trust fund for liability coverage must be funded for the full amount of the liability coverage to be provided by the trust fund before it may be relied upon to satisfy the requirements of this section. If at any time after the trust fund is created the amount of funds in the trust fund is reduced below the full amount of the liability coverage to be provided, the owner or operator, by the anniversary date of the establishment of the fund, must either add sufficient funds to the trust fund to cause its value to equal the full amount of liability coverage to be provided, or obtain other financial assurance as specified in this section to cover the

difference. For purposes of this paragraph, "the full amount of the liability coverage to be provided" means the amount of coverage for sudden and/or nonsudden occurrences required to be provided by the owner or operator by this section, less the amount of financial assurance for liability coverage that is being provided by other financial assurance mechanisms being used to demonstrate financial assurance by the owner or operator.

(4) The wording of the trust fund must be identical to the wording specified in Sec. 264.151(m) of this part.

Sec. 264.151 (Amended)

4. In Sec. 264.151 paragraph (b) is amended by adding the following text to the end of the "Financial Guarantee Bond" to read as follows:

(b) * * *

Financial Guarantee Bond

* * * * *

Or, if the Principal shall provide alternate financial assurance, as specified in Subpart H of 40 CFR Part 264 or 265, as applicable, and obtain the EPA Regional Administrator's written approval of such assurance, within 90 days after the date notice of cancellation is received by both the Principal and the EPA Regional Administrator(s) from the Surety(ies), then this obligation shall be null and void; otherwise it is to remain in full force and effect.

The Surety(ies) shall become liable on this bond obligation only when the Principal has failed to fulfill the conditions described above. Upon notification by an EPA Regional Administrator that the Principal has failed to perform as guaranteed by this bond, the Surety(ies) shall place funds in the amount guaranteed for the facility(ies) into the standby trust fund as directed by the EPA Regional Administrator.

The liability of the Surety(ies) shall not be discharged by any payment or succession of payments hereunder, unless and until such payment or payments shall amount in the aggregate to the penal sum of the bond, but in no event shall the obligation of the Surety(ies) hereunder exceed the amount of said penal sum.

The Surety(ies) may cancel the bond by sending notice of cancellation by certified mail to the Principal and to the EPA Regional Administrator(s) for the Region(s) in which the facility(ies) is (are) located, provided, however, that cancellation shall not occur during the 120 days beginning on the date of receipt of the notice of cancellation by both the Principal and the EPA Regional Administrator(s), as evidenced by the return receipts.

The Principal may terminate this bond by sending written notice to the Surety(ies), provided, however, that no such notice shall become effective until the Surety(ies) receive(s) written authorization for termination of the bond by the EPA Regional Administrator(s) of the EPA Region(s) in which the bonded facility(ies) is (are) located.

(The following paragraph is an optional rider that may be included but is not required.)

Principal and Surety(ies) hereby agree to adjust the penal sum of the bond yearly so that it guarantees a new closure and/or post-closure amount, provided that the penal sum does not increase by more than 20 percent in any one year, and no decrease in the penal sum takes place without the

written permission of the EPA Regional Administrator(s).

In Witness Whereof, the Principal and Surety(ies) have executed this Financial Guarantee Bond and have affixed their seals on the date set forth above.

The persons whose signatures appear below hereby certify that they are authorized to execute this surety bond on behalf of the Principal and Surety(ies) and that the wording of this surety bond is identical to the wording specified in 40 CFR 264.151(b) as such regulations were constituted on the date this bond was executed.

5. In Sec. 264.151, paragraph (g) is revised to read as follows:

(g) A letter from the chief financial officer, as specified in Sec. 264.147(f) or Sec. 265.147(f) of this chapter, must be worded as follows, except that instructions in brackets are to be replaced with the relevant information and the brackets deleted.

Letter From Chief Financial Officer

(Address to Regional Administrator of every Region in which facilities for which financial responsibility is to be demonstrated through the financial test are located.)

I am the chief financial officer of (firm's name and address). This letter is in support of the use of the financial test to demonstrate financial responsibility for liability coverage (insert "and closure and/or post-closure care" if applicable) as specified in Subpart H of 40 CFR Parts 264 and 265.

(Fill out the following paragraphs regarding facilities and liability coverage. If there are no facilities that belong in a particular paragraph, write "None" in the space indicated. For each facility, include its EPA Identification Number, name, and address.)

The firm identified above is the owner or operator of the following facilities for which liability coverage for (insert "sudden" or "nonsudden" or "both sudden and nonsudden") accidental occurrences is being

demonstrated through the financial test specified in Subpart H of 40 CFR Parts 264 and 265: .

The firm identified above guarantees, through the guarantee specified in Subpart H or 40 CFR Parts 264 and 265, liability coverage for (insert "sudden" or "nonsudden" or "both sudden and nonsudden") accidental occurrences at the following facilities owned or operated by the following: . The firm identified above is (insert one or more: (1) The direct or higher-tier parent corporation of the owner or operator; (2) owned by the same parent corporation as the parent corporation of the owner or operator, and receiving the following value in consideration of this guarantee ; or (3) engaged in the following substantial business relationship with the owner or operator , and receiving the following value in consideration of this guarantee .) (Attach a written description of the business relationship or a copy of the contract establishing such relationship to this letter.)

(If you are using the financial test to demonstrate coverage of both liability and closure and post-closure care, fill in the following four paragraphs regarding facilities and associated closure and post-closure cost estimates. If there are no facilities that belong in a particular paragraph, write "None" in the space indicated. For each facility, include its EPA Identification Number, name, address, and current closure and/or post-closure cost estimates. Identify each cost estimate as to whether it is for closure or post-closure care.)

1. The firm identified above owns or operates the following facilities for which financial assurance for closure or post-closure care or liability coverage is demonstrated through the financial test specified in Subpart H of 40 CFR Parts 264 and 265. The current closure and/or post-closure cost estimate covered by the test are shown for each facility: .

2. The firm identified above guarantees, through the guarantee specified in Subpart H of 40 CFR Parts 264 and 265, the closure and post-closure care or liability coverage of the following facilities owned or operated by the guaranteed party. The current cost estimates for the closure or post-closure care so guaranteed are shown for each facility: .

3. In States where EPA is not administering the financial requirements of Subpart H of 40 CFR Parts 264 and 265, this firm is demonstrating financial assurance for the closure or post-closure care of the following facilities through the use of a test equivalent or substantially equivalent to the financial test specified in Subpart H of 40 CFR Parts 264 and 265. The current closure or post-closure cost estimates covered by such a test are shown for each facility: .

4. The firm identified above owns or operates the following hazardous waste management facilities for which financial assurance for closure or, if a disposal facility, post-closure care, is not demonstrated either to EPA or a State through the financial test or any other financial assurance mechanisms specified in Subpart H of 40 CFR Parts 264 and 265 or equivalent or substantially equivalent State mechanisms. The current closure and/or post- closure cost estimates not covered by such financial assurance are shown for each facility: .

5. This firm is the owner or operator of the following UIC facilities for which financial assurance for plugging and abandonment is required under 40 CFR Part 144. The current closure cost estimates as required by 40 CFR 144.62 are shown for each facility: .

This firm (insert "is required" or "is not required") to file a Form 10K with the Securities and Exchange Commission (SEC) for the latest fiscal year.

The fiscal year of this firm ends on (month, day). The figures for the following items marked with an asterisk are derived from this firm's independently audited, year-end financial statements for the latest completed fiscal year, ended (date).

(Fill in part A if you are using the financial test to demonstrate coverage only for the liability requirements.)

Part A. Liability Coverage for Accidental Occurrences

(Fill in Alternative I if the criteria of paragraph (f)(1)(i) of Sec. 264.147 or Sec. 265.147 are used. Fill in Alternative II if the criteria of paragraph (f)(1)(ii) of Sec. 264.147 or Sec. 265.147 are used.)

Alternative I

1.	Amount of annual aggregate liability coverage to be demonstrated	$
*2.	Current assets	$
*3.	Current liabilities	$
4.	Net working capital (line 2 minus line 3)	$
*5.	Tangible net worth	$
*6.	If less than 90% or assets are located in the U.S., given total U.S. assets	$
		Yes No
7.	Is line 5 at least $10 million?	
8.	Is line 4 at least 6 times line 1?	
9.	Is line 5 at least 6 times line 1?	
*10.	Are at least 90% of assets located in the U.S.? If not, complete line 11.	
11.	Is line 6 at least 6 times line 1?	

Alternative II

1.	Amount of annual aggregate liability coverage to be demonstrated	$
2.	Current bond rating of most recent issuance and name of rating service	
3.	Date of issuance of bond	
4.	Date of maturity of bond	
*5.	Tangible net worth	$
*6.	Total assets in U.S. (required only if less than 90% of assets are located in the U.S.)	$
		Yes No
7.	Is line 5 at least $10 million?	
8.	Is line 5 at least 6 times line 1?	
9.	Are at least 90% of assets located in the U.S.? If not, complete line 10.	
10.	Is line 6 at least 6 times line 1?	

(Fill in part B if you are using the financial test to demonstrate

assurance of both liability coverage and closure or post-closure care.)

Part B. Closure or Post-Closure Care and Liability Coverage

(Fill in Alternative I if the criteria of paragraphs (f)(1)(i) of Sec. 264.143 or Sec. 264.145 and (f)(1)(i) of Sec. 264.147 are used or if the criteria of paragraphs (e)(1)(i) of Sec. 265.143 or Sec. 265.145 and (f)(1)(i) of Sec. 265.147 are used. Fill in Alternative II if the criteria of paragraphs (f)(1)(ii) of Sec. 264.143 or Sec. 264.145 and (f)(1)(ii) of Sec. 264.147 are used or if the criteria of paragraphs (e)(1)(ii) of Sec. 265.143 or Sec. 265.145 and (f)(1)(ii) of Sec. 265.147 are used.)

Alternative I			
	1.	Sum of current closure and post-closure cost estimates (total of all cost estimates listed above)	$
	2.	Amount of annual aggregate liability coverage to be demonstrated	$
	3.	Sum of lines 1 and 2	$
	*4.	Total liabilities (if any portion of your closure or post-closure cost estimates is included in your total liabilities, you may deduct that portion from this line and add that amount to lines 5 and 6)	$
	*5.	Tangible net worth	$
	*6.	Net worth	$
	*7.	Current assets	$
	*8.	Current liabilities	$
	9.	Net working capital (line 7 minus line 8)	$
	*10.	The sum of net income plus depreciation, depletion, and amortization	$
	*11.	Total assets in U.S. (required only if less than 90% of assets are located in the U.S.)	$
			Yes / No
	12.	Is line 5 at least $10 million?	
	13.	Is line 5 at least 6 times line 3?	
	14.	Is line 9 at least 6 times line 3?	
	*15.	Are at least 90% of assets located in the U.S.? If not, complete line 16.	
	16.	Is line 11 at least 6 times line 3?	
	17.	Is line 4 divided by line 6 less than 2.0?	
	18.	Is line 10 divided by line 4 greater than 0.1?	
	19.	Is line 7 divided by line 8 greater than 1.5?	
Alternative II			
	1.	Sum of current closure and post-closure cost estimates (total of all cost estimates listed above)	$
	2.	Amount of annual aggregate liability coverage to be demonstrated	$
	3.	Sum of lines 1 and 2	$

6. Section 264.151(h)(2) is amended by revising the heading for the "Corporate Guarantee for Liability Coverage" to read "Guarantee for Liability Coverage" and by removing "corporate" from paragraph (h)(2); and by removing paragraph 12 of the "Guarantee for Liability Coverage"; redesignating paragraphs 4 through 11 as paragraphs 5 through 12, adding new paragraphs 4, 13 and 14; and revising paragraph 10; to read as follows:

* * * * *

(h) * * *

(2) * * *

Guarantee for Liability Coverage

* * * * *

4. Such obligation does not apply to any of the following:

(a) Bodily injury or property damage for which (insert owner or operator) is obligated to pay damages by reason of the assumption of liability in a contract or agreement. This exclusion does not apply to liability for damages that (insert owner or operator) would be obligated to pay in the absnce of the contract or agreement.

(b) Any obligation of (insert owner or operator) under a workers' compensation, disability benefits, or unemployment compensation law or any similar law.

(c) Bodily injury to:

(1) An employee of (insert owner or operator) arising from, and in the course of, employment by (insert owner or operator); or
(2) The spouse, child, parent, brother or sister of that employee as a consequence of, or arising from, and in the course of employment by (insert owner or operator). This exclusion applies:
(A) Whether (insert owner or operator) may be liable as an employer or in any other capacity; and
(B) To any obligation to share damages with or repay another person who must pay damages because of the injury to persons identified in paragraphs (1) and (2).

(d) Bodily injury or property damage arising out of the ownership, maintenance, use, or entrustment to others of any aircraft, motor vehicle or watercraft.

(e) Property damage to:
(1) Any property owned, rented, or occupied by (insert owner or operator);
(2) Premises that are sold, given away or abandoned by (insert owner or operator) if the property damage arises out of any part of those premises;
(3) Property loaned to (insert owner or operator);
(4) Personal property in the care, custody or control of (insert owner or operator);
(5) That particular part of real property on which (insert owner or operator) or any contractors or subcontractors working directly or indirectly on behalf of (insert owner or operator) are performing operations, if the property damage arises out of these operations.

* * * * *

10. (Insert the following language if the guarantor is (a) a direct or higher-tier corporate parent, or (b) a firm whose parent corporation is also the parent corporation of the owner or operator):
Guarantor may terminate this guarantee by sending notice by certified mail to the EPA Regional Administrator(s) for the Region(s) in which the facility(ies) is(are) located and to (owner or operator), provided that this guarantee may not be terminated unless and until (the owner or operator) obtains, and the EPA Regional Administrator(s) approve(s), alternate liability coverage complying with 40 CFR 264.147 and/or 265.147.

(Insert the following language if the guarantor is a firm qualifying as a guarantor due to its "substantial business relationship" with the owner or operator):
Guarantor may terminate this guarantee 120 days following receipt of notification, through certified mail, by the EPA Regional Administrator(s) for the Region(s) in which the facility(ies) is(are) located and by (the owner or operator).

* * * * *

13. The Guarantor shall satisfy a third-party liability claim only on receipt of one of the following documents:
(a) Certification from the Principal and the third-party claimant(s) that the liability claim should be paid. The certification must be worded as follows, except that instructions in brackets are to be replaced with the relevant information and the brackets deleted:
Certification of Valid Claim

The undersigned, as parties (insert Principal) and (insert name and address of third-party claimant(s)), hereby certify that the claim of bodily injury and/or property damage cuased by a (sudden or nonsudden) accidental occurrence arising from operating (Principal's) hazardous waste treatment, storage, or disposal facility should be paid in the amount of $( ).

(Signatures)
Principal

(Notary) Date

(Signatures)
Claimant(s)

(Notary) Date

(b) A valid final court order establishing a judgment against the Principal for bodily injury or property damage caused by sudden or nonsudden accidental occurrences arising from the operation of the Principal's facility or group of facilities.

14. In the event of combination of this guarantee with another mechanism to meet liability requirements, this guarantee will be considered (insert "primary" or "excess") coverage.

I hereby certify that the wording of the guarantee is identical to the wording specified in 40 CFR 264.151(h)(2) as such regulations were constituted on the date shown immediately below.

Effective date:----------

7. In Sec. 264.151(i), paragraph 2.(d) of the "Hazardous Waste Facility Liability Endorsement" is revised to read as follows:

* * * * *

(i) * * *

Hazardous Waste Facility Liability Endorsement

* * * * *

(2) * * *

(d) Cancellation of this endorsement, whether by the Insurer, the insured, a parent corporation providing insurance coverage for its subsidiary, or by a firm having an insurable interest in and obtaining liability insurance on behalf of the owner or operator of the hazardous waste management facility,

will be effective only upon written notice and only after the expiration of 60 days after a copy of such written notice is received by the Regional Administrator(s) of the EPA Region(s) in which the facility(ies) is(are) located.

8. In Sec. 264.151(j), paragraph 2.(d) of the "Hazardous Waste Facility Certificate of Liability Insurance" is revised to read as follows:

* * * * *

(j) * * *

Hazardous Waste Facility Certificate of Liability Insurance

(2) * * *

(d) Cancellation of the insurance, whether by the insurer, the insured, a parent corportation providing insurance coverage for its subsidiary, or by a firm having an insurable interest in and obtaining liability insurance on behalf of the owner or operator of the hazardous waste management facility, will be effective only upon written notice and only after the expiration of 60 days after a copy of such written notice is received by the Regional Administrator(s) of the EPA Region(s) in which the facility(ies) is(are) located.

* * * * *

9. In Sec. 264.151, a new paragraph (k) is added to read as follows:

* * * * *

(k) A letter of credit, as specified in Sec. 264.147(h) or Sec. 265.147(h) of this chapter, must be worded as follows, except that instructions in brackets are to be replaced with the relevant information and the brackets deleted:

Irrevocable Standby Letter of Credit

Name and Address of Issuing Institution
Regional Administrator(s)
Region(s)
U.S. Environmental Protection Agency

Dear Sir or Madam: We hereby establish our Irrevocable Standby Letter of Credit No. in the favor of any and all third-party liability claimants, at the request and for the account of (owner's or operator's name and address) for third-party liability awards or settlements up to (in words) U.S. dollars $ per occurrence and the annual aggregate amount of (in words) U.S. dollars $, for sudden accidental occurrences and/or for third-party liability awards or settlements up to the amount of (in words) U.S. dollars $ per occurrence, and the annual aggregate amount of (in words) U.S. dollars $, for nonsudden accidental occurrences available upon presentation of a sight draft, bearing reference to this letter of credit No. , and (1) a signed certificate reading as follows:

Certification of Valid Claim

The undersigned, as parties (insert principal) and (insert name and address of third-party claimants), hereby certify that the claim of bodily injury (and/or) property damage caused by a (sudden or nonsudden) accidental occurrence arising from operations of (principal's) hazardous waste treatment, storage, or disposal facility should be paid in the amount of $. We hereby certify that the claim does not apply to any of the

following:
(a) Bodily injury or property damage for which (insert principal) is obligated to pay damages by reason of the assumption of liability in a contract or agreement. This exclusion does not apply to liability for damages that (insert principal) would be obligated to pay in the absence of the contract or agreement.

(b) Any obligation of (insert principal) under a workers' compensation, disability benefits, or unemployment compensation law or any similar law.

(c) Bodily injury to:
(1) An employee of (insert principal) arising from, and in the course of, employment by (insert principal); or
(2) The spouse, child, parent, brother or sister of that employee as a consequence of, or arising from, and in the course of employment by (insert principal).

This exclusion applies:
(A) Whether (insert principal) may be liable as an employer or in any other capacity; and
(B) To any obligation to share damages with or repay another person who must pay damages because of the injury to persons identified in paragraphs (1) and (2).

(d) Bodily injury or property damage arising out of the ownership, maintenance, use, or entrustment to others of any aircraft, motor vehicle or watercraft.

(e) Property damage to:
(1) Any property owned, rented, or occupied by (insert principal);
(2) Premises that are sold, given away or abandoned by (insert principal) if the property damage arises out of any part of those premises;
(3) Property loaned to (insert principal);
(4) Personal property in the care, custody or control of (insert principal);
(5) That particular part of real property on which (insert principal) or any contractors or subcontractors working directly or indirectly on behalf of (insert principal) are performing operations, if the property damage arises out of these operations.

(Signatures)
Principal

(Signatures)
Claimant(s)

or (2) a valid final court order establishing a judgment against the principal for bodily injury or property damage caused by a sudden or nonsudden accidental occurrence arising from operation of the principal's facility or group of facilities.

This letter of credit is effective as of (date) and shall expire on (date at least one year later), but such expiration date shall be automatically extended for a period of (at least one year) on (date) and on each successive expiration date, unless, at least 120 days before the current expiration date, we notify you, the USEPA Regional Administrator for Region

(Region #), and (owner's or operator's name) by certified mail that we have decided not to extend this letter of credit beyond the current expiration date.

Whenever this letter of credit is drawn on under and in compliance with the terms of this credit, we shall duly honor such draft upon presentation to us.

In the event that this letter of credit is used in combination with another mechanism for liability coverage, this letter of credit shall be considered (insert "primary" or "excess") coverage.

We certify that the wording of this letter of credit is identical to the wording specified in 40 CFR 264.151(k) as such regulations were constituted on the date shown immediately below.

(Signature(s) and title(s) of official(s) of issuing institution)
(Date)

This credit is subject to (insert "the most recent edition of the Uniform Customs and Practice for Documentary Credits, published by the International Chamber of Commerce" or "the Uniform Commercial Code").

10. In Sec. 264.151, a new paragraph (1) is added to read as follows:
* * * * *

(1) A surety bond, as specified in Sec. 264.147(h) or Sec. 265.147(h) of this chapter, must be worded as follows: except that instructions in brackets are to be replaced with the relevant information and the brackets deleted:

Payment Bond

Surety Bond No. (Insert number)

Parties (Insert name and address of owner or operator), Principal, incorporated in (Insert State of incorporation) of (Insert city and State of principal place of business) and (Insert name and address of surety company(ies)), Surety Company(ies), of (Insert surety(ies) place of business).

EPA Identification Number, name, and address for each facility guaranteed by this bond:

	Sudden accidental occurrences	Nonsudden accidental occurrences
Penal Sum Per Occurrence	(insert amount)	(insert amount)
Annual Aggregate	(insert amount)	(insert amount)

Purpose: This is an agreement between the Surety(ies) and the Principal under which the Surety(ies), its(their) successors and assignees, agree to be responsible for the payment of claims against the Principal for bodily injury and/or property damage to third parties caused by ("sudden" and/or

"nonsudden") accidental occurrences arising from operations of the facility or group of facilities in the sums prescribed herein; subject to the governing provisions and the following conditions.

Governing Provisions:
(1) Section 3004 of the Resource Conservation and Recovery Act of 1976, as amended.

(2) Rules and regulations of the U.S. Environmental Protection Agency (EPA), particularly 40 CFR ("Sec. 264.147" or "Sec. 265.147") (if applicable).

(3) Rules and regulations of the governing State agency (if applicable) (insert citation).

Conditions:
(1) The Principal is subject to the applicable governing provisions that require the Principal to have and maintain liability coverage for bodily injury and property damage to third parties caused by ("sudden" and/or "nonsudden") accidental occurrences arising from operations of the facility or group of facilities. Such obligation does not apply to any of the following:
(a) Bodily injury or property damage for which (insert principal) is obligated to pay damages by reason of the assumption of liability in a contract or agreement. This exclusion does not apply to liability for damages that (insert principal) would be obligated to pay in the absence of the contract or agreement.

(b) Any obligation of (insert principal) under a workers' compensation, disability benefits, or unemployment compensation law or similar law.
(c) Bodily injury to:
(1) An employee of (insert principal) arising from, and in the course of, employment by (insert principal); or
(2) The spouse, child, parent, brother or sister of that employee as a consequence of, or arising from, and in the course of employment by (insert principal). This exclusion applies:
(A) Whether (insert principal) may be liable as an employer or in any other capacity; and
(B) To any obligation to share damages with or repay another person who must pay damages because of the injury to persons identified in paragraphs (1) and (2).

(d) Bodily injury or property damage arising out of the ownership, maintenance, use, or entrustment to others of any aircraft, motor vehicle or watercraft.

(e) Property damage to:
(1) Any property owned, rented, or occupied by (insert principal);
(2) Premises that are sold, given away or abandoned by (insert principal) if the property damage arises out of any part of those premises;
(3) Property loaned to (insert principal);
(4) Personal property in the care, custody or control of (insert principal);
(5) That particular part of real property on which (insert principal) or any contractors or subcontractors working directly or indirectly on behalf of (insert principal) are performing operations, if the property damage arises out of these operations.

(2) This bond assures that the Principal will satisfy valid third party liability claims, as described in condition 1.

(3) If the Principal fails to satisfy a valid third party liability claim, as described above, the Surety(ies) becomes liable on this bond obligation.

(4) The Surety(ies) shall satisfy a third party liability claim only upon the receipt of one of the following documents:
(a) Certification from the Principal and the third party claimant(s) that the liability claim should be paid. The certification must be worded as follows, except that instructions in brackets are to be replaced with the relevant information and the brackets deleted:
Certification of Valid Claim

The undersigned, as parties (insert name of Principal) and (insert name and address of third party claimant(s)), hereby certify that the claim of bodily injury and/or property damage caused by a (sudden or nonsudden) accidential occurrence arising from operating (Principal's) hazardous waste treatment, storage, or disposal facility should be paid in the amount of $( ).

(Signature)
Principal

(Notary) Date

(Signature(s))
Claimant(s)

(Notary) Date

or (b) A valid final court order establishing a judgment against the Principal for bodily injury or property damage caused by sudden or nonsudden accidental occurrences arising from the operation of the Principal's facility or group of facilities.

(5) In the event of combination of this bond with another mechanism for liability coverage, this bond will be considered (insert "primary" or "excess") coverage.

(6) The liability of the Surety(ies) shall not be discharged by any payment or succession of payments hereunder, unless and until such payment or payments shall amount in the aggregate to the penal sum of the bond. In no event shall the obligation of the Surety(ies) hereunder exceed the amount of said annual aggregate penal sum, provided that the Surety(ies) furnish(es) notice to the Regional Administrator forthwith of all claims filed and payments made by the Surety(ies) under this bond.

(7) The Surety(ies) may cancel the bond by sending notice of cancellation by certified mail to the Principal and the USEPA Regional Administrator for Region (Region #), provided, however, that cancellation shall not occur during the 120 days beginning on the date of receipt of the notice of cancellation by the Principal and the Regional Administrator, as evidenced by the return receipt.

(8) The Principal may terminate this bond by sending written notice to the Surety(ies) and to the EPA Regional Administrator(s) of the EPA Region(s) in which the bonded facility(ies) is (are) located.

(9) The Surety(ies) hereby waive(s) notification of amendments to applicable laws, statutes, rules and regulations and agree(s) that no such amendment shall in any way alleviate its (their) obligation on this bond.

(10) This bond is effective from (insert date) (12:01 a.m., standard time, at the address of the Principal as stated herein) and shall continue in force until terminated as described above.

In Witness Whereof, the Principal and Surety(ies) have executed this Bond and have affixed their seals on the date set forth above.

The persons whose signatures appear below hereby certify that they are authorized to execute this surety bond on behalf of the Principal and Surety(ies) and that the wording of this surety bond is identical to the wording specified in 40 CFR 264.151(1), as such regulations were constituted on the date this bond was executed.

11. In Sec. 264.151, a new paragraph (m) is added to read as follows:

* * * * *

(m)(1) A trust agreement, as specified in Sec. 264.147(j) or Sec. 265.147(j) of this chapter, must be worded as follows, except that instructions in brackets are to be replaced with the relevant information and the brackets deleted:

Trust Agreement

Trust Agreement, the "Agreement," entered into as of (date) by and between (name of the owner or operator) a (name of State) (insert "corporation," "partnership," "association," or "proprietorship"), the "Grantor," and (name of corporate trustee), (insert, "incorporated in the State of " or "a national bank"), the "trustee."

Whereas, the United States Environmental Protection Agency, "EPA," an agency of the United States Government, has established certain regulations applicable to the Grantor, requiring that an owner or operator of a hazardous waste management facility or group of facilities must demonstrate financial responsibility for bodily injury and property damage to third parties caused by sudden accidental and/or nonsudden accidental occurrences

arising from operations of the facility or group of facilities.

Whereas, the Grantor has elected to establish a trust to assure all or part of such financial responsibility for the facilities identified herein.

Whereas, the Grantor, acting through its duly authorized officers, has selected the Trustee to be the trustee under this agreement, and the Trustee is willing to act as trustee.

Now, therefore, the Grantor and the Trustee agree as follows:
Section 1. Definitions. As used in this Agreement:
(a) The term "Grantor" means the owner or operator who enters into this Agreement and any successors or assigns of the Grantor.

(b) The term "Trustee" means the Trustee who enters into this Agreement and any successor Trustee.

Section 2. Identification of Facilities. This agreement pertains to the facilities identified on attached schedule A (on schedule A, for each facility list the EPA Identification Number, name, and address of the facility(ies) and the amount of liability coverage, or portions thereof, if more than one instrument affords combined coverage as demonstrated by this Agreement).

Section 3. Establishment of Fund. The Grantor and the Trustee hereby establish a trust fund, hereinafter the "Fund," for the benefit of any and all third parties injured or damaged by (sudden and/or nonsudden) accidental occurrences arising from operation of the facility(ies) covered by this guarantee, in the amounts of (up to $1 million) per occurrence and (up to $2 million) annual aggregate for sudden accidental occurrences and (up to $3 million) per occurrence and (up to $6 million) annual aggregate for nonsudden occurrences, except that the Fund is not established for the benefit of third parties for the following:
(a) Bodily injury or property damage for which (insert Grantor) is obligated to pay damages by reason of the assumption of liability in a contract or agreement. This exclusion does not apply to liability for damages that (insert Grantor) would be obligated to pay in the absence of the contract or agreement.

(b) Any obligation of (insert Grantor) under a workers' compensation, disability benefits, or unemployment compensation law or any similar law.

(c) Bodily injury to:
(1) An employee of (insert Grantor) arising from, and in the course of, employment by (insert Grantor); or
(2) The spouse, child, parent, brother or sister of that employee as a consequence of, or arising from, and in the course of employment by (insert Grantor).

This exclusion applies:
(A) Whether (insert Grantor) may be liable as an employer or in any other capacity; and
(B) To any obligation to share damages with or repay another person who must pay damages because of the injury to persons identified in paragraphs (1) and (2).
(d) Bodily injury or property damage arising out of the ownership, maintenance, use, or entrustment to others of any aircraft, motor vehicle

or watercraft.

(e) Property damage to:
(1) Any property owned, rented, or occupied by (insert Grantor);
(2) Premises that are sold, given away or abandoned by (insert Grantor) if the property damage arises out of any part of those premises;
(3) Property loaned to (insert Grantor);
(4) Personal property in the care, custody or control of (insert Grantor);
(5) That particular part of real property on which (insert Grantor) or any contractors or subcontractors working directly or indirectly on behalf of (insert Grantor) are performing operations, if the property damage arises out of these operations.

In the event of combination with another mechanism for liability coverage, the fund shall be considered (insert "primary" or "excess") coverage.

The Fund is established initially as consisting of the property, which is acceptable to the Trustee, described in Schedule B attached hereto. Such property and any other property subsequently transferred to the Trustee is referred to as the Fund, together with all earnings and profits thereon, less any payments or distributions made by the Trustee pursuant to this Agreement.
The Fund shall be held by the Trustee, IN TRUST, as hereinafter provided. The Trustee shall not be responsible nor shall it undertake any responsibility for the amount or adequacy of, nor any duty to collect from the Grantor, any payments necessary to discharge any liabilities of the Grantor established by EPA.

Section 4. Payment for Bodily Injury or Property Damage. The Trustee shall satisfy a third party liability claim by making payments from the Fund only upon receipt of one of the following documents;
(a) Certification from the Grantor and the third party claimant(s) that the liability claim should be paid. The certification must be worded as follows, except that instructions in brackets are to be replaced with the relevant information and the brackets deleted:
Certification of Valid Claim

The undersigned, as parties (insert Grantor) and (insert name and address of third party claimant(s)), hereby certify that the claim of bodily injury and/or property damage caused by a (sudden or nonsudden) accidental occurrence arising from operating (Grantor's) hazardous waste treatment, storage, or disposal facility should be paid in the amount of $( ).

(Signatures)
Grantor

(Signatures)
Claimant(s)

(b) A valid final court order establishing a judgment against the Grantor for bodily injury or property damage caused by sudden or nonsudden accidental occurrences arising from the operation of the Grantor's facility or group of facilities.

Section 5. Payments Comprising the Fund. Payments made to the Trustee for

the Fund shall consist of cash or securities acceptable to the Trustee.

Section 6. Trustee Management. The Trustee shall invest and reinvest the principal and income, in accordance with general investment policies and guidelines which the Grantor may communicate in writing to the Trustee from time to time, subject, however, to the provisions of this section. In investing, reinvesting, exchanging, selling, and managing the Fund, the Trustee shall discharge his duties with respect to the trust fund solely in the interest of the beneficiary and with the care, skill, prudence, and diligence under the circumstance then prevailing which persons of prudence, acting in a like capacity and familiar with such matters, would use in the conduct of an enterprise of a like character and with like aims; except that:

(i) Securities or other obligations of the Grantor, or any other owner or operator of the facilities, or any of their affiliates as defined in the Investment Company Act of 1940, as amended, 15 U.S.C. 80a-2.(a), shall not be acquired or held unless they are securities or other obligations of the Federal or a State government;

(ii) The Trustee is authorized to invest the Fund in time or demand deposits of the Trustee, to the extent insured by an agency of the Federal or State government; and

(iii) The Trustee is authorized to hold cash awaiting investment or distribution uninvested for a reasonable time and without liability for the payment of interest thereon.

Section 7. Commingling and Investment. The Trustee is expressly authorized in its discretion:

(a) To transfer from time to time any or all of the assets of the Fund to any common commingled, or collective trust fund created by the Trustee in which the fund is eligible to participate, subject to all of the provisions thereof, to be commingled with the assets of other trusts participating therein; and

(b) To purchase shares in any investment company registered under the Investment Company Act of 1940, 15 U.S.C. 81a-1 et seq., including one which may be created, managed, underwritten, or to which investment advice is rendered or the shares of which are sold by the Trustee. The Trustee may vote such shares in its discretion.

Section 8. Express Powers of Trustee. Without in any way limiting the powers and discretions conferred upon the Trustee by the other provisions of this Agreement or by law, the Trustee is expressly authorized and empowered:

(a) To sell, exchange, convey, transfer, or otherwise dispose of any property held by it, by public or private sale. No person dealing with the Trustee shall be bound to see to the application of the purchase money or to inquire into the validity or expediency of any such sale or other disposition;

(b) To make, execute, acknowledge, and deliver any and all documents of transfer and conveyance and any and all other instruments that may be necessary or appropriate to carry out the powers herein granted;

(c) To register any securities held in the Fund in its own name or in the name of a nominee and to hold any security in bearer form or in book entry, or to combine certificates representing such securities with certificates of the same issue held by the Trustee in other fiduciary capacities, or to deposit or arrange for the deposit of such securities in a qualified central depositary even though, when so deposited, such securities may be merged and held in bulk in the name of the nominee of such depositary with

other securities deposited therein by another person, or to deposit or arrange for the deposit of any securities issued by the United States Government, or any agency or instrumentality thereof, with a Federal Reserve bank, but the books and records of the Trustee shall at all times show that all such securities are part of the Fund;

(d) To deposit any cash in the Fund in interest-bearing accounts maintained or savings certificates issued by the Trustee, in its separate corporate capacity, or in any other banking institution affiliated with the Trustee, to the extent insured by an agency of the Federal or State government; and

(e) To compromise or otherwise adjust all claims in favor of or against the Fund.

Section 9. Taxes and Expenses. All taxes of any kind that may be assessed or levied against or in respect of the Fund and all brokerage commissions incurred by the Fund shall be paid from the Fund. All other expenses incurred by the Trustee in connection with the administration of this Trust, including fees for legal services rendered to the Trustee, the compensation of the Trustee to the extent not paid directly by the Grantor, and all other proper charges and disbursements of the Trustee shall be paid from the Fund.

Section 10. Annual Valuations. The Trustee shall annually, at least 30 days prior to the anniversary date of establishment of the Fund, furnish to the Grantor and to the appropriate EPA Regional Administrator a statement confirming the value of the Trust. Any securities in the Fund shall be valued at market value as of no more than 60 days prior to the anniversary date of establishment of the Fund. The failure of the Grantor to object in writing to the Trustee within 90 days after the statement has been furnished to the Grantor and the EPA Regional Administrator shall constitute a conclusively binding assent by the Grantor barring the Grantor from asserting any claim or liability against the Trustee with respect to matters disclosed in the statement.

Section 11. Advice of Counsel. The Trustee may from time to time consult with counsel, who may be counsel to the Grantor with respect to any question arising as to the construction of this Agreement or any action to be taken hereunder. The Trustee shall be fully protected, to the extent permitted by law, in acting upon the advice of counsel.

Section 12. Trustee Compensation. The Trustee shall be entitled to reasonable compensation for its services as agreed upon in writing from time to time with the Grantor.

Section 13. Successor Trustee. The Trustee may resign or the Grantor may replace the Trustee, but such resignation or replacement shall not be effective until the Grantor has appointed a successor trustee and this successor accepts the appointment. The successor trustee shall have the same powers and duties as those conferred upon the Trustee hereunder. Upon the successor trustee's acceptance of the appointment, the Trustee shall assign, transfer, and pay over to the successor trustee the funds and properties then constituting the Fund. If for any reason the Grantor cannot or does not act in the event of the resignation of the Trustee, the Trustee may apply to a court of competent jurisdiction for the appointment of a successor trustee or for instructions. The successor trustee shall specify the date on which it assumes administration of the trust in a writing sent to the Grantor, the EPA Regional Administrator, and the present Trustee by

certified mail 10 days before such change becomes effective. Any expenses incurred by the Trustee as a result of any of the acts contemplated by this section shall be paid as provided in Section 9.

Section 14. Instructions to the Trustee. All orders, requests, and instructions by the Grantor to the Trustee shall be in writing, signed by such persons as are designated in the attached Exhibit A or such other designees as the Grantor may designate by amendments to Exhibit A. The Trustee shall be fully protected in acting without inquiry in accordance with the Grantor's orders, requests, and instructions. All orders, requests, and instructions by the EPA Regional Administrator to the Trustee shall be in writing, signed by the EPA Regional Administrators of the Regions in which the facilities are located, or their designees, and the Trustee shall act and shall be fully protected in acting in accordance with such orders, requests, and instructions. The Trustee shall have the right to assume, in the absence of written notice to the contrary, that no event constituting a change or a termination of the authority of any person to act on behalf of the Grantor or EPA hereunder has occurred. The Trustee shall have no duty to act in the absence of such orders, requests, and instructions from the Grantor and/or EPA, except as provided for herein.

Section 15. Notice of Nonpayment. If a payment for bodily injury or property damage is made under Section 4 of this trust, the Trustee shall notify the Grantor of such payment and the amount(s) thereof within five (5) working days. The Grantor shall, on or before the anniversary date of the establishment of the Fund following such notice, either make payments to the Trustee in amounts sufficient to cause the trust to return to its value immediately prior to the payment of claims under Section 4, or shall provide written proof to the Trustee that other financial assurance for liability coverage has been obtained equalling the amount necessary to return the trust to its value prior to the payment of claims. If the Grantor does not either make payments to the Trustee or provide the Trustee with such proof, the Trustee shall within 10 working days after the anniversary date of the establishment of the Fund provide a written notice of nonpayment to the EPA Regional Administrator.

Section 16. Amendment of Agreement. This Agreement may be amended by an instrument in writing executed by the Grantor, the Trustee, and the appropriate EPA Regional Administrator, or by the Trustee and the appropriate EPA Regional Administrator if the Grantor ceases to exist.

Section 17. Irrevocability and Termination. Subject to the right of the parties to amend this Agreement as provided in Section 16, this Trust shall be irrevocable and shall continue until terminated at the written agreement of the Grantor, the Trustee, and the EPA Regional Administrator, or by the Trustee and the EPA Regional Administrator, if the Grantor ceases to exist. Upon termination of the Trust, all remaining trust property, less final trust administration expenses, shall be delivered to the Grantor.

The Regional Administrator will agree to termination of the Trust when the owner or operator substitutes alternate financial assurance as specified in this section.

Section 18. Immunity and Indemnification. The Trustee shall not incur personal liability of any nature in connection with any act or omission, made in good faith, in the administration of this Trust, or in carrying out any directions by the Grantor or the EPA Regional Administrator issued in

accordance with this Agreement. The Trustee shall be indemnified and saved harmless by the Grantor or from the Trust Fund, or both, from and against any personal liability to which the Trustee may be subjected by reason of any act or conduct in its official capacity, including all expenses reasonably incurred in its defense in the event the Grantor fails to provide such defense.

Section 19. Choice of Law. This Agreement shall be administered, construed, and enforced according to the laws of the State of (enter name of State).

Section 20. Interpretation. As used in this Agreement, words in the singular include the plural and words in the plural include the singular. The descriptive headings for each section of this Agreement shall not affect the interpretation or the legal efficacy of this Agreement.

In Witness Whereof the parties have caused this Agreement to be executed by their respective officers duly authorized and their corporate seals to be hereunto affixed and attested as of the date first above written. The parties below certify that the wording of this Agreement is identical to the wording specified in 40 CFR 264.151(m) as such regulations were constituted on the date first above written.

(2) The following is an example of the certification of acknowledgement which must accompany the trust agreement for a trust fund as specified in Secs. 264.147(j) or 265.147(j) of this chapter. State requirements may differ on the proper content of this acknowledgement.

State of---------- County of----------

On this (date), before me personally came (owner or operator) to me known, who, being by me duly sworn, did depose and say that she/he resides at (address), that she/he is (title) of (corporation), the corporation described in and which executed the above instrument; that she/he knows the seal of said corporation; that the seal affixed to such instrument is such corporate seal; that it was so affixed by order of the Board of Directors

of said corporation, and that she/he signed her/his name thereto by like order.

(Signature of Notary Public)

40 CFR Part 265 is amended as follows:

PART 265--INTERIM STATUS STANDARDS FOR OWNERS AND OPERATORS OF HAZARDOUS WASTE TREATMENT, STORAGE, AND DISPOSAL FACILITIES: LIABILITY COVERAGE

1. The authority citation for Part 265 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6924, and 6925.

2. In Sec. 265.141, new paragraph (h) is added to read as follows:

Sec. 264.141 Definitions of terms as used in this subpart.

* * * * *

(h) "Substantial business relationship" means the extent of a business relationship necessary under applicable State law to make a guarantee contract issued incident to that relationship valid and enforceable. A "substantial business relationship" must arise from a pattern of recent or ongoing business transactions, in addition to the guarantee itself, such that a currently existing business relationship between the guarantor and the owner or operator is demonstrated to the satisfaction of the applicable EPA Regional Administrator.

3. In Sec. 265.147, paragraph (h) is redesignated as paragraph (k); paragraphs (a) introductory text, (a)(2), (a)(3), (b) introductory text, (b)(2), (b)(3), (b)(4) and (g) heading and (g)(1) introductory text are revised, and by removing and reserving paragraph (g)(1)(ii); paragraphs (g)(2)(i) and (g)(2)(ii) are amended by removing "corporate;" and new paragraphs (a)(4), (a)(5), (a)(6), (a)(7), (b)(5), (b)(6), (b)(7), (h), (i), and (j) are added, to read as follows:

Sec. 265.147 Liability requirements.

(a) Coverage for sudden accidental occurrences. An owner or operator of a hazardous waste treatment, storage, or disposal facility, or a group of such facilities, must demonstrate financial responsibility for bodily injury and property damage to third parties caused by sudden accidental occurrences arising from operations of the facility or group of facilities. The owner or operator must have and maintain liability coverage for sudden accidental occurrences in the amount of at least $1 million per occurrence with an annual aggregate of at least $2 million, exclusive of legal defense costs.

This liability coverage may be demonstrated as specified in paragraphs (a)(1), (2), (3), (4), (5), or (6) of this section:

* * * * *

(2) An owner or operator may meet the requirements of this section by passing a financial test or using the guarantee for liability coverage as specified in paragraph (g) of this section.

(3) An owner or operator may meet the requirements of this section by obtaining a letter of credit for liability coverage as specified in

paragraph (h) of this section.

(4) An owner or operator may meet the requirements of this section by obtaining a surety bond for liability coverage as specified in paragraph (i) of this section.

(5) An owner or operator may meet the requirements of this section by obtaining a trust fund for liability coverage as specified in paragraph (j) of this section.

(6) An owner or operator may demonstrate the required liability coverage through the use of combinations of insurance, financial test, guarantee, letter of credit, surety bond, and trust fund, except that the owner or operator may not combine a financial test covering part of the liability coverage requirement with a guarantee unless the financial statement of the owner or operator is not consolidated with the financial statement of the guarantor. The amounts of coverage demonstrated must total at least the minimum amounts required by this section. If the owner or operator demonstrates the required coverage through the use of a combination of financial assurances under this paragraph, the owner or operator shall specify at least one such assurance as "primary" coverage and shall specify other assurance as "excess" coverage.

(7) An owner or operator shall notify the Regional Administrator in writing within 30 days (i) whenever a claim for bodily injury or property damages caused by the operation of a hazardous waste treatment, storage, or disposal facility is made against the owner or operator or an instrument providing financial assurance for liability coverage under this section and (ii) whenever the amount of financial assurance for liability coverage under this section provided by a financial instrument authorized by paragraphs (a)(1) through (a)(6) of this section is reduced.

(b) Coverage for nonsudden accidental occurrences. An owner or operator of a surface impoundment, landfill, or land treatment facility which is used to manage hazardous waste, or a group of such facilities, must demonstrate financial responsibility for bodily injury and property damage to third parties caused by nonsudden accidental occurrences arising from operations of the facility or group of facilities. The owner or operator must have and maintain liability coverage for nonsudden accidental occurrences in the amount of at least $3 million per occurrence with an annual aggregate of at least $6 million, exclusive of legal defense costs. An owner or operator who must meet the requirements of this section may combine the required per- occurrence coverage levels for sudden and nonsudden accidental occurrences into a single per-occurrence level, and combine the required annual aggregate coverage levels for sudden and nonsudden accidental occurrences into a single annual aggregate level. Owners or operators who combine coverage levels for sudden and nonsudden accidental occurrences must maintain liability coverage in the amount of at least $4 million per occurrence and $8 million annual aggregate. This liability coverage may be demonstrated as specified in paragraph (b) (1), (2), (3), (4), (5), or (6) of this section:

* * * * *

(2) An owner or operator may meet the requirements of this section by passing a financial test or using the guarantee for liability coverage as specified in paragraphs (f) and (g) of this section.

(3) An owner or operator may meet the requirements of this section by obtaining a letter of credit for liability coverage as specified in paragraph (h) of this section.

(4) An owner or operator may meet the requirements of this section by obtaining a surety bond for liability coverage as specified in paragraph (i) of this section.

(5) An owner or operator may meet the requirements of this section by obtaining a trust fund for liability coverage as specified in paragraph (j) of this section.

(6) An owner or operator may demonstrate the required liability coverage through the use of combinations of insurance, financial test, guarantee, letter of credit, surety bond, and trust fund, except that the owner or operator may not combine a financial test covering part of the liability coverage requirement with a guarantee unless the financial statement of the owner or operator is not consolidated with the financial statement of the guarantor. The amounts of coverage demonstrated must total at least the minimum amounts required by this section. If the owner or operator demonstrates the required coverage through the use of a combination of financial assurances under this paragraph, the owner or operator shall specify at least one such assurance as "primary" coverage and shall specify other assurance as "excess" coverage.

(7) An owner or operator shall notify the Regional Administrator in writing within 30 days (i) whenever a claim for bodily injury or property damages caused by the operation of a hazardous waste treatment, storage, or disposal facility is made against the owner or operator or an instrument providing financial assurance for liability coverage under this section and (ii) whenever the amount of financial assurance for liability coverage under this section provided by a financial instrument authorized by paragraphs (a)(1) through (a)(6) of this section is reduced.

* * * * *

(g) Guarantee for liability coverage. (1) Subject to paragraph (g)(2) of this section, an owner or operator may meet the requirements of this section by obtaining a written guarantee, hereinafter referred to as "guarantee." The guarantor must be the direct or higher-tier parent corporation of the owner or operator, a firm whose parent corporation is also the parent corporation of the owner or operator, or a firm with a "substantial business relationship" with the owner or operator. The guarantor must meet the requirements for owners or operators in paragraphs (f)(1) through (f)(6) of this section. The wording of the guarantee must be identical to the wording specified in Sec. 264.151(h)(2) of this chapter. A certified copy of the guarantee must accompany the items sent to the Regional Administrator as specified in paragraph (f)(3) of this section. One of these items must be the letter from the guarantor's chief financial officer. If the guarantor's parent corporation is also the parent corporation of the owner or operator, this letter must describe the value received in consideration of the guarantee. If the guarantor is a firm with a "substantial business relationship" with the owner or operator, this letter must describe this "substantial business relationship" and the value received in consideration of the guarantee.

* * * * *

(h) Letter of credit for liability coverage. (1) An owner or operator may satisfy the requirements of this section by obtaining an irrevocable standby letter of credit that conforms to the requirements of this paragraph and submitting a copy of the letter of credit to the Regional Administrator.

(2) The financial institution issuing the letter of credit must be an entity that has the authority to issue letters of credit and whose letter of credit operations are regulated and examined by a Federal or State agency.

(3) The wording of the letter of credit must be identical to the wording specified in Sec. 264.151(k) of this chapter.

(i) Surety bond for liability coverage. (1) An owner or operator may satisfy the requirements of this section by obtaining a surety bond that conforms to the requirements of this paragraph and submitting a copy of the bond to the Regional Administrator.

(2) The surety company issuing the bond must be among those listed as acceptable sureties on Federal bonds in the most recent Circular 570 of the U.S. Department of the Treasury.

(3) The wording of the surety bond must be identical to the wording specified in Sec. 264.151(1) of this chapter.

(4) A surety bond may be used to satisfy the requirements of this section only if the Attorneys General or Insurance Commissioners of (i) the State in which the surety is incorporated, and (ii) each State in which a facility covered by the surety bond is located have submitted a written statement to EPA that a surety bond executed as described in this section and Sec.
264.151(1) of this chapter is a legally valid and enforceable obligation in that State.

(j) Trust fund for liability coverage. (1) An owner or operator may satisfy the requirements of this section by establishing a trust fund that conforms to the requirements of this paragraph and submitting an originally signed duplicate of the trust agreement to the Regional Administrator.

(2) The trustee must be an entity which has the authority to act as a trustee and whose trust operations are regulated and examined by a Federal or State agency.

(3) The trust fund for liability coverage must be funded for the full amount of the liability coverage to be provided by the trust fund before it may be relied upon to satisfy the requirements of this section. If at any time after the trust fund is created the amount of funds in the trust fund is reduced below the full amount of the liability coverage to be provided, the owner or operator, by the anniversary date of the establishment of the Fund, must either add sufficient funds to the trust fund to cause its value to equal the full amount of liability coverage to be provided, or obtain other financial assurance as specified in this section to cover the difference. For purposes of this paragraph, "the full amount of the liability coverage to be provided" means the amount of coverage for sudden and/or nonsudden occurrences required to be provided by the owner or

operator by this section, less the amount of financial assurance for liability coverage that is being provided by other financial assurance mechanisms being used to demonstrate financial assurance by the owner or operator.

(4) The wording of the trust fund must be identical to the wording specified in Sec. 264.151(m) of this part.

SUMMARY: This document corrects certain omission errors in the financial responsibility requirements under subtitle C of the Resource Conservation and Recovery Act (RCRA). These errors were made in a rulemaking related to liability coverage that appeared in the Federal Register on September 1, 1988 (53 FR 33938).

TEXT:

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Parts 264 and 265

(FRL-3968-1)

Standards Applicable to Owners and Operators of Hazardous Waste Treatment, Storage, and Disposal Facilities; Liability Requirements

AGENCY: Environmental Protection Agency.

ACTION: Final rule; technical amendment.

SUMMARY: This document corrects certain omission errors in the financial responsibility requirements under subtitle C of the Resource Conservation and Recovery Act (RCRA). These errors were made in a rulemaking related to liability coverage that appeared in the Federal Register on September 1, 1988 (53 FR 33938).

EFFECTIVE DATE: July 1, 1991.

FOR FURTHER INFORMATION CONTACT: The RCRA/Superfund Hotline at (800) 424 9346 (toll free), or (202) 382-3000 in Washington, DC, or Ed Coe, Office of Solid Waste (OS-341), U.S. Environmental Protection Agency, Washington, DC 20460, (202) 382-6259.

SUPPLEMENTARY INFORMATION: In a final rule published on September 1, 1988 (5 FR 33938), EPA promulgated amendments to the financial responsibility requirements related to liability coverage at 40 CFR subpart H. Following publication of that rule, Chemical Waste Management, Inc. (CWM) filed suit against the Agency challenging several provisions. Among other matters, CWM pointed out certain omissions in the rule language that the Agency recognized to be inadvertant. The parties entered into a settlement agreement on February 23, 1990. To satisfy, in part, the terms of that agreement, this notice corrects omission errors in Secs. 264.147(a)(2) and 265.147(a)(2) (a proposed rule published elsewhere in today's issue satisfies some of the remaining provisions of the settlement agreement). In addition, this notice corrects the omission in the September 1, 1988 rule of "miscellaneous units" as units subject to the requirements of Sec. 264.147(b).

I. Sections 264.147(a)(2) and 265.147(a)(2)

The Agency inadvertently omitted a reference to the financial test as an acceptable means of providing financial assurance for liability coverage when it amended Secs. 264.147(a)(2) and 265.147(a)(2) as part of the September 1, 1988 rulemaking. This notice corrects this error and inserts a reference to the financial test in those sections.

II. Miscellaneous Units--Sections 264.147(b) and 265.147(b)

Section 264.147(b) requires owners and operators of certain hazardous waste management units to demonstrate financial responsibility for bodily injury and property damage to third parties caused by nonsudden accidental occurrences arising from operations of the facility. A final rule published on December 10, 1987 (52 FR 46946) extended that requirement to disposal "miscellaneous" units. When the Agency again amended Sec. 264.147(b) in the September 1, 1988 rulemaking, the December 10, 1987 change was inadvertently omitted. Today's correction restores the December 10, 1987 change, and incorporates all amendments to that paragraph to date.

List of Subjects for 40 CFR Parts 264 and 265

Hazardous waste, Insurance.

Dated: June 6, 1991.

Don R. Clay,
Assistant Administrator.

PART 264--STANDARDS FOR OWNERS AND OPERATORS OF HAZARDOUS WASTE TREATMENT, STORAGE AND DISPOSAL FACILITIES

1. The authority citation for part 264 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6924, and 6925.

2. In Sec. 264.147, paragraph (a)(2) and the first sentence of the introductory text in paragraph (b) are revised to read as follows:

Sec. 264.147 Liability requirements.

(a) * * *
(2) An owner or operator may meet the requirements of this section by passing a financial test or using the guarantee for liability coverage as specified in paragraphs (f) and (g) of this section.

* * * * *

(b) Coverage for nonsudden accidental occurrences. An owner or operator of a surface impoundment, landfill, land treatment facility, or disposal miscellaneous unit that is used to manage hazardous waste, or a group of such facilities, must demonstrate financial responsibility for bodily injury and property damage to third parties caused by nonsudden accidental occurrences arising from operations of the facility or group of facilities. * * *

PART 265--INTERIM STATUS STANDARDS FOR OWNERS AND OPERATORS OF HAZARDOUS WASTE TREATMENT, STORAGE, AND DISPOSAL FACILITIES

3. The authority citation for part 265 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6924, 6925, and 6935.

Sec. 265.147 (Amended)

3. In section 265.147 paragraph (a)(2) is revised to read as follows:
(a) * * *
(2) An owner or operator may meet the requirements of this section by passing a financial test or using the guarantee for liability coverage as specified in paragraphs (f) and (g) of this section.

SUMMARY: The U.S. Environmental Protection Agency (EPA) is amending the regulations for hazardous waste management under the Resource Conservation and Recovery Act (RCRA) by adding three wastes generated during the production of the alpha- (or methyl-) chlorinated toluenes, ring-chlorinated toluenes, benzoyl chlorides, and compounds with mixtures of these functional groups, collectively referred to in this document as "chlorinated toluenes," to the list of hazardous wastes from specific sources. EPA is also amending appendix VII of 40 CFR part 261 to add the constituents for which these wastes are being listed. The effect of this regulation is that these three wastes will be subject to regulation as hazardous wastes. In addition, EPA is amending regulations promulgated under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) that are related to today's waste listings. In particular, EPA is amending CERCLA regulations by designating the listed wastes as CERCLA hazardous substances and establishing the reportable quantities applicable to these wastes.

Hazardous Waste Management System: Identification and Listing of Hazardous Waste and CERCLA Hazardous Substance Designation; Reportable Quantity Adjustment, Chlorinated Toluenes Production Wastes

AGENCY: U.S. Environmental Protection Agency.

ACTION: Final rule.

SUMMARY: The U.S. Environmental Protection Agency (EPA) is amending the regulations for hazardous waste management under the Resource Conservation and Recovery Act (RCRA) by adding three wastes generated during the production of the alpha- (or methyl-) chlorinated toluenes, ring-chlorinated toluenes, benzoyl chlorides, and compounds with mixtures of these functional groups, collectively referred to in this document as "chlorinated toluenes," to the list of hazardous wastes from specific sources. EPA is also amending appendix VII of 40 CFR part 261 to add the constituents for which these wastes are being listed. The effect of this regulation is that these three wastes will be subject to regulation as hazardous wastes. In addition, EPA is amending regulations promulgated under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) that are related to today's waste listings. In particular, EPA is amending CERCLA regulations by designating the listed wastes as CERCLA hazardous substances and establishing the reportable quantities applicable to these wastes.

DATES: Today's final rule will become effective on April 15, 1993. See section VII of the Supplementary Information section concerning compliance dates.

ADDRESSES: The official record for this rulemaking is identified as Docket Number F-92-LCTF-FFFFF and is located in the EPA RCRA Docket, room M2427, 401 M Street, SW., Washington, DC 20460. The docket is open from 9 a.m. to 4 p.m., Monday through Friday, excluding Federal holidays. The public must make an appointment to review docket materials by calling (202) 260-9327. The public may copy 100 pages from the docket at no charge; additional copies are $0.15 per page.

FOR FURTHER INFORMATION CONTACT: The RCRA/Superfund Hotline, toll-free at (800) 424-9346 or locally at (703) 920-9810. For technical information on the RCRA hazardous waste listings, contact Dr. Ambika Bathija, Office of Solid Waste (OS-333), U.S. Environmental Protection Agency, 401 M Street, SW., Washington, DC 20460, (202) 260-4770.

For technical information on the CERCLA portion of the rule, contact Ms. Gerain Perry, Response Standards and Criteria Branch, Emergency Response Division (OS-210), U.S. Environmental Protection Agency, 401 M Street, SW., Washington, DC 20460, (202) 260-2190.

SUPPLEMENTARY INFORMATION:

I. Authority

These regulations are being promulgated under the authority of sections 2002(a) and 3001(b) and (e)(1) of the Solid Waste Disposal Act, as amended, 42 U.S.C. 6912(a) and 6921(b) and (e)(1) (commonly referred to as RCRA), and section 102(a) of the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) 42 U.S.C. 9602(a).

II. Background

EPA proposed to list as hazardous three wastes from chlorinated toluenes production on October 11, 1991. Today's notice promulgates these listings, presented in Section II.C. of the proposed rule, with no substantive modification.

A. Proposed Rule

Pursuant to section 3001 of subtitle C of the Resource Conservation and Recovery Act (RCRA), EPA proposed to list three wastes as hazardous in a notice published in the Federal Register on October 11, 1991 (see 56 FR 51592). At that time, EPA also proposed a no-list decision for three other wastes from chlorinated toluenes production. One other waste from chlorinated toluenes production is already regulated as a hazardous waste under RCRA: EPA Hazardous Waste Number K015-still bottoms from the distillation of benzyl chloride (promulgated on November 12, 1980; see 45 FR 74884). The Agency noted, in the proposal, that the scope of K015 was not affected by the proposed rule.

EPA proposed to add three waste streams generated from the production of the alpha- (or methyl-)chlorinated toluenes, ring-chlorinated toluenes, benzoyl chlorides, and compounds with mixtures of these functional groups, collectively referred to in the proposed rule as "chlorinated toluenes," to the list of hazardous wastes from specific sources found at 40 CFR 261.32. These wastes, which were fully described in the preamble to the proposed rule, are distillation bottoms generated from the production of chlorinated toluenes (K149); the organic residuals generated in the recovery of byproduct hydrochloric acid (HCl) associated with the manufacture of chlorinated toluenes (K150); and wastewater treatment sludges, excluding neutralization sludges and biological sludges, generated during the treatment of wastewaters from the manufacture of chlorinated toluenes (K151).

The basis for this proposed regulation was a determination by the Agency that these wastes frequently contain significant concentrations of benzene, benzotrichloride, benzyl chloride, carbon tetrachloride, chlorobenzene, chloroform, chloromethane, 1,4-dichlorobenzene, hexachlorobenzene, pentachlorobenzene, 1,2,4,5-tetrachlorobenzene, 1,1,2,2-tetrachloroethane, tetrachloroethylene, toluene, and/or 1,2,4-trichlorobenzene. These compounds, at the concentrations found in chlorinated toluenes wastes, present a threat to human health and the environment when the wastes are mismanaged because of their toxicity, mobility, and persistence. These constituents may be carcinogenic, mutagenic, and/or exhibit other chronic systemic effects at certain concentrations. Based on their physical properties and the evidence from damage incidents, EPA has found that most of these constituents are highly persistent and are mobile in the environment. EPA fully described the data documenting the hazards posed by

these wastes in the preamble to the proposed rule. See 56 FR 51596-51602. Because these wastes are capable of posing a threat to human health and the environment when they are improperly treated, stored, transported, disposed of, or otherwise managed, EPA proposed to list them as hazardous. Consequently, as stated in the proposed rule, these wastes would be subject to the applicable requirements of 40 CFR parts 124, 262-266, 268, 270, and 271.

In addition to the Agency's decision to list three wastes from chlorinated toluenes production, the Agency proposed a decision not to list three other wastes from chlorinated toluenes production: wastewaters, spent carbon, and neutralization and biological treatment sludges. Based on information collected by the Agency, these wastes do not meet the criteria for listing as hazardous wastes. The rationale for these no-list determinations was described in detail in the preamble to the proposed rule and is summarized below.

Wastewaters, which are generated throughout the manufacturing processes, contain low concentrations of the constituents of concern. In addition, the production wastewaters at the four chlorinated toluenes manufacturing facilities are treated prior to off-site discharge, thus further reducing the risks these wastes present to human health and the environment.

Spent carbon wastes, generated during the recovery and purification of byproduct hydrochloric acid, also were proposed not to be listed. Most constituents in these residuals are present at relatively low levels. The organic constituents in the spent carbon waste matrix are expected to adhere strongly to the carbon matrix by adsorption, and thus be significantly less mobile than in other matrices such as distillation bottoms. Therefore, spent carbon is not expected to present a significant risk to human health and the environment if mismanaged and therefore does not warrant listing as a hazardous waste.

The composition of wastewater treatment sludges has been found to vary significantly depending on treatment process. The Agency has made a diligent effort to determine the specific wastes from wastewater treatment operations that contain high levels of toxic constituents and to list only those waste streams. Specifically, neutralization and biological sludges have been found to contain contaminants at low levels, if they are detected at all. The levels in these wastes are significantly less than constituent levels found in those gravity separation sludges proposed for listing.

B. HSWA and EDF v. Reilly

On November 8, 1984, the Hazardous and Solid Waste Amendments of 1984 (HSWA), which amended RCRA, were enacted. These amendments had far-reaching ramifications for EPA's hazardous waste regulatory program. Section 3001(e)(2), which was one of the many provisions added by HSWA, directed EPA to make a determination whether to list under section 3001(b)(1) several wastes, including chlorinated aromatics wastes. As discussed in the preamble to the proposed rule, the chlorinated aromatics industry can be divided into three major segments: Chlorinated benzenes, chlorinated phenols, and chlorinated toluenes. Wastes produced by the first two segments of the industry are currently listed as hazardous. See 56 FR 51594 (October 11, 1991). On June 19, 1991, EPA entered into a proposed consent decree which resolved issues raised in EDF v. Reilly, Civ. No. 89-0598

(D.D.C.). Under this decree, EPA was required, in part, to propose a decision regarding the listing of chlorinated toluenes production wastes by September 1991 and to finalize the decision by September 1992. Today's regulation fulfills this latter requirement of the proposed consent decree and completes the investigations that were underway to study wastes from the chlorinated aromatics industry when HSWA was enacted.

The proposed rule (56 FR 51592) specifically addressed, and today's rule finalizes, the determinations for each of the wastes listed in the proposed consent decree (see Table 1).

In its study of the industry, the Agency sampled wastes and gathered information on specific wastes generated from the production of the various types of chlorinated toluene compounds enumerated in the consent decree.

Based on this information, the Agency concluded that wastes from the production of alpha-chlorinated toluenes, ring-chlorinated toluenes, benzoyl chlorides, and compounds with mixtures of these functional groups are very similar and that it is therefore reasonable to identify wastes from these processes as a group. For example, EPA proposed that organic condensates and decantates from the production of all types of chlorinated toluenes be identified as a group and listed as K150 regardless of product identification. Therefore, today's regulation characterizes the wastes at issue differently than the proposed consent decree, which specifies exactly which production wastes are to be the subject of a listing determination. It should be emphasized, however, that the scope of today's rulemaking encompasses all those wastes discussed in the proposed consent decree. The regulatory decisions concerning the wastes presented in the proposed consent decree, as finalized in today's rule, are presented in Table 1.

Table 1.--Regulatory Status of Waste Streams Identified In the EDF v. Reilly Proposed Consent Decree

Decree waste	Regulatory status
Still bottoms from p-chlorobenzoyl chloride production via catalytic steam hydrolysis	K149
Still bottoms from production of trichlorotoluene via Lewis acid catalysts	K149
Still bottoms from production of dichlorotoluene via Lewis acid catalysts	K149
Spent carbon, filter media, filter cartridges and filtered solids from production of benzotrichloride and benzyl chloride via HCl recovery	No-list
Spent carbon, filter media, filter cartridges and filtered solids from production of benzoyl chloride, p-chlorobenzotrichloride and benzotrichloride via HCl recovery	No-list
Spent H_2SO_4 from production of benzoyl chloride, benzotrichloride, and p-chlorobenzotrichloride via HCl recovery	No-list
Still bottoms from benzoylchloride production via catalytic steam hydrolysis	K149
Still bottoms from production of o-	K149

chlorotoluene, p-chlorotoluene, and dichlorotoluene	
Still bottoms from production of dichlorobenzoyl chloride	K149
Organic liquids (condensates and decantates) from production of benzotrichloride/benzoyl chloride	K150
Organic liquids (condensates and decantates) from production of dichlorobenzoyl chloride, benzotrichloride, and p-chlorobenzyltrichloride	K150
Organic liquids (condensates and decantates) from production of benzoyl chloride, benzotrichloride, and p-chlorobenzotrichloride	K150
Wastewaters from production of one or more chlorinated toluenes	No-list
Wastewater treatment sludges from production of one or more chlorinated toluenes	Separation sludges: K151 Neutralization and biological sludges: No-list

III. Summary of the Regulation

A. Overview of the Final Rule

As proposed on October 11, 1991, this rule adds to the list of hazardous wastes from specific sources found at 40 CFR 261.32 three wastes generated during the production of chlorinated toluenes:

K149 Distillation bottoms from the production of alpha- (or methyl-) chlorinated toluenes, ring-chlorinated toluenes, benzoyl chlorides, and compounds with mixtures of these functional groups. (This waste does not include still bottoms from the distillation of benzyl chloride.) K150 Organic residuals, excluding spent carbon adsorbent, from the spent chlorine gas and hydrochloric acid recovery processes associated with the production of alpha- (or methyl-) chlorinated toluenes, ring-chlorinated toluenes, benzoyl chlorides, and compounds with mixtures of these functional groups.

K151 Wastewater treatment sludges, excluding neutralization and biological sludges, generated during the treatment of wastewaters from the production of alpha- (or methyl-) chlorinated toluenes, ring-chlorinated toluenes, benzoyl chlorides, and compounds with mixtures of these functional groups.

These wastes are therefore subject to the applicable requirements of 40 CFR parts 124, 262-266, 268, 270, and 271. EPA is also amending appendix VII at 40 CFR part 261 to add the constituents for which these wastes are being listed. In addition, for the reasons explained in the preamble to the proposed rule and summarized above, EPA is finalizing its determination not to list wastewaters, spent carbon, and neutralization and biological treatment sludges from chlorinated toluenes production.

Finally, as proposed, EPA is amending the CERCLA regulations at 40 CFR part 302 by designating hazardous wastes K149, K150, and K151 as hazardous substances and finalizing RQs of 10 pounds for each of these waste streams.

The listings being finalized today will reduce the risks posed by these wastes to human health and the environment. These listings will prevent the uncontrolled entrance of toxic constituents into the ground water, surface water, soil, and air by requiring environmentally sound management of these wastes. In order to further reduce the potential risk posed by these and other wastes, the Agency encourages the implementation of cost effective pollution prevention programs, source controls, and other efforts to reduce the volume of generated wastes. Such programs may be economically advantageous to generators due to the reduced management costs that accompany a reduction in the amount of wastes generated.

The Agency has determined that the industry-wide economic effect of this listing will be annualized incremental costs of approximately $12,000, which represents an insignificant cost to society. A principal reason for this anticipated low additional cost is that the subject wastes are presently being managed as hazardous by industry.

B. Basis for Listing

After considering the relevant factors outlined in 40 CFR Sec. 261.11(a)(3), the Agency has determined that the wastes being listed as hazardous today are capable of presenting a substantial risk to human health and the environment when mismanaged. In particular, the Agency has found that these wastes frequently contain significant concentrations of toxic constituents which are highly mobile and persistent in the environment.

In general, the information presented in the preamble and in support of the proposed rule remains the best and most current available to EPA and serves as the basis for today's listing determinations (56 FR 57592, October 11, 1992). The Agency has, however, updated Tables 3, 4, and 5 of the preamble to the proposed rule (denoted as Tables 2, 3, and 4 of today's preamble) to reflect the most current information available to the Agency regarding the toxicity of the constituents of concern present in the wastes being listed today. Table 2 presents the constituents of concern and their concentrations in the wastes and concentrations that may reach potential human and environmental receptors and compares these levels with oral HBLs of concern.

Tables 3 and 4 provide information on oral and inhalation HBL toxicity sources. The Agency notes that the changes reflected in these tables have had no effect on the Agency's listing determinations.

Table 2.--Basis for Listing: Hazardous Constituents and Levels of Concern (Oral Route)

	Median concentration (mg/kg)	Waste levels (HBL) 1 (mg/L)	Health-based level to HBL ratio	Waste level to 100xHBL (mg/L)	Waste level to 100xHBL ratio
Distillation or fractionation bottoms from the production of chlorinated toluenes (K149):

Tetrachloroethylene >250 5x10-3 5x10/4/ 5x10-1 5x10/2/
Toluene 34,000 1 3x10/4/ 1x10/2/ 3x10/2/

/1/ Health-based levels (HBLs) are based on either MCLs, RSDs, or RfDs as described in the October 11, 1991 proposed rule.

* The HBL for this constituent is the new MCL (see 57 FR 31778 (July 7, 1992)) and differs from the proposed MCL (see 56 FR 51598 (October 11, 1991)) because of a change in the RfD. However, the concentration of this constituent in K150, as well as the levels that may reach potential human or environmental receptors, exceed both the proposed level and the one used in today's rule.

Table 3.--Oral HBL Toxicity Sources

Line No.	Constituent	Class	Slope factor (mg/kg/day)-1	Carcin HBL (mg/L)
1.	Benzene	A	2.9x10-2	1x10-3

C. Agency Response to Public Comments

Four commenters responded to the Agency's October 11, 1991, proposed rule. The Agency has carefully considered all the comments in preparation of this final rule. The comments the Agency received can be summarized as follows:

1. Listing wastes that are currently managed as characteristically hazardous precludes the successful completion of waste reduction/waste minimization and pollution prevention efforts.

2. Because of current management practices, a small percentage of a listed waste will cause a large volume of characteristic waste to be listed as the result of the mixture rule. Segregation of the two streams is economically prohibitive.

3. The Agency has overlooked the inclusion of one facility's waste in calculating the volume of K151 generated.

4. The weight-of-evidence carcinogenicity classification for chloromethane and perchloroethylene should be corrected, and other minor technical and typographical corrections should be made.

5. A typographical error appears in the way K149 is defined in the proposed rule.

6. The Agency's listing action should be accompanied by an "automatic delisting" provision that would remove a generator's waste from regulation as a listed waste when the waste no longer exhibits any RCRA hazardous waste criteria.

In this preamble, the Agency is providing analyses of and responses to all comments.

1. Effect of Listing on Waste Reduction Efforts

One commenter, a chlorinated toluenes manufacturer, stated that it generates all three subject waste streams and presently manages all as characteristically hazardous (K149 as corrosive and K150 and K151 as ignitable). The commenter objected to the proposed listing because such an action reduces the benefit of the facility's waste minimization efforts to decrease the corrosivity and ignitability of the subject wastes to below characteristic levels.

The Agency has decided to list these wastes because they frequently contain a number of toxic constituents (at levels several-fold higher than the HBLs) that are persistent and mobile in the environment. These wastes, therefore, could impact adversely human health and the environment if improperly managed. The elimination of the hazardous waste characteristics from these wastes (i.e., ignitability and corrosivity) would not necessarily address the potentially toxic levels of the constituents that have been identified in these wastes. For example, using neutralization to eliminate the corrosivity of the waste would not necessarily reduce its toxicity.

The Agency encourages the commenter to decrease the volume of its hazardous wastes. However, as stated above, the commenter's efforts to eliminate the ignitable and corrosive nature of the wastes would not necessarily remove the toxic constituents in the wastes, which could potentially harm human health and the environment due to their high concentrations. The Agency therefore maintains that it is important to list as hazardous these wastes which contain toxic contaminants not already controlled by the RCRA ignitable and corrosive characteristics.

2. Secluded Management and Cost of Listing

One commenter, a chlorinated toluenes manufacturer, presently mixes one of the chlorinated toluenes production wastes with other nonlisted, nonchlorinated toluene process wastes during wastewater treatment. The entire waste stream is currently hazardous due to the characteristic of ignitability, although the commenter is conducting efforts to render the stream non-hazardous. The commenter states that, because of the mixture rule under 40 CFR 261.3, its entire separator bottoms stream (a wastewater treatment sludge) would become listed as K151. The commenter states that segregation of the chlorinated toluenes production waste from the other streams may be feasible, but the capital cost to perform this is estimated to exceed $250,000.

The Agency notes that, as part of its sampling and analysis efforts to support the listing of chlorinated toluene wastes, the commenter's subject mixed production wastes, as currently managed in an unsegregated fashion, were found to contain high levels of the contaminants of concern that are persistent and mobile in the environment. This waste was found to contain high levels of toxic organic constituents even after being mixed with other non-chlorinated toluenes production wastes./1/

NOTE /1/ However, should any of the commenters' mixed waste streams contain low levels of toxic constituents, the commenter may petition the Agency for a delisting pursuant to the requirements of 40 CFR 260.20 and 40 CFR 260.22.

The Agency believes that mixing the chlorinated toluenes production wastes with other wastes to form a large volume of contaminated waste is contrary to waste minimization goals. Although the rule does not require facilities to segregate wastes, EPA encourages facilities to reduce the volume of hazardous wastes. Segregation of hazardous wastes from non-hazardous sources could be one method of achieving this goal. In evaluating the burden created by a new rule, however, the Agency only considers capital costs incurred through investments to segregate or otherwise manage wastes if this investment is the least burdensome method of compliance with the regulation. Based on the available information, the Agency believes no capital outlays are required due to today's rule because all newly-listed wastes, including the commenters (whose waste currently exhibit the characteristic of ignitability), are already managed on-site as hazardous waste. Therefore, the Agency continues to estimate increased waste management costs of less than $12,000 per year for all facilities due to today's new listings./2/

NOTE /2/ The Agency notes, however, that should the commenter be successful in addressing the ignitable characteristic of the waste stream (assuming the subject commenter's estimate of an incurred capital cost of $250,000 for segregation of the subject waste stream is correct), the facility would incur an additional estimated cost of $40,000 per year for the first 10 years following promulgation of the rule. (This is based on annualizing the capital investment cost of $250,000 over 10 years at a 9.5 percent interest rate.) The facility may embark on this capital investment if, after comparing it to the operating costs associated with managing the mixed waste stream as hazardous, it believes it to be a sound investment.

As stated above, today's subject wastes are listed because of the presence of mobile and persistent toxic constituents in these wastes and therefore removal of the ignitability characteristic would not necessarily render these waste streams non-toxic.

3. Generation Volume of K151

One commenter, a chlorinated toluenes manufacturer, states that the Agency underestimated the quantity of K151 generated nationwide (i.e., 600 metric tons/year). See 56 FR 51596 (October 11, 1991). The commenter stated that his facility generated 25,692 tons of primary sludge in 1990. The commenter requested that the volume of this waste stream be included in the tabulation of Table 2 of the proposed rule and be considered when determining available treatment capacity in future land disposal restrictions determinations.

The Agency wishes to clarify the scope of the K151 wastes. The K151 wastes include, but are not limited to, skimmings and sludges from oil/water separators, sludges from settling basins upstream of wastewater treatment, and other residuals from physical separation processes in the absence of other neutralization or biological treatment. These wastes have been found to contain high levels of hazardous constituents and to otherwise meet the criteria for listing wastes as hazardous. Conversely, wastes generated from chemical neutralization or biological treatment do not meet the criteria for hazardous wastes and thus are not included in the scope of K151.

Based on information previously provided to the Agency by the commenter in support of the proposed rule, the Agency does not believe that the sludge in question is K151 because it is generated after neutralization. The Agency's detailed justification is in the docket for this rule. Therefore, the Agency maintains that its original estimate of 600 metric tons as the annual generation rate of K151 is valid.

4. Weight-of-Evidence Classification of Perchloroethylene and Chloromethane and Other Minor Technical Revisions

Two comments concerned the weight-of-evidence classification of tetrachloroethylene (perchloroethylene or PCE) as a B2, probable human carcinogen (with a footnote stating that the Agency is re-evaluating this classification). One commenter stated that on January 8, 1991 (56 FR 643), EPA "corrected" the classification of PCE from B2, probable human carcinogen, to C, possible human carcinogen, and amended the preamble to two recent final rules, (August 14, 1989 (54 FR 33418)) and (December 11, 1989 (54 FR 50968)), to reflect the change. The commenter suggested that the Agency use the C classification in today's rulemaking. The second commenter suggested that EPA delete any reference to perchloroethylene as a Group B2 carcinogen.

The Agency acknowledges the notice in the Federal Register dated January 8, 1991 (56 FR 643), which amends the preamble to regulations published on August 14, 1989 (54 FR 33418), to establish reportable quantities under CERCLA for certain substances, and on December 11, 1989 (54 FR 50968), to list certain wastes from the production of chlorinated aliphatic hydrocarbons as hazardous wastes under RCRA. The January 8, 1991 notice (56 FR 643) documented the various weight-of-evidence assessments performed on

tetrachloroethylene to date, by both the Agency and the Science Advisory Board (SAB). That summary will not be repeated here; interested readers may refer to the January 8, 1991 Federal Register Notice (56 FR 643). That discussion concluded by stating:

EPA is currently deliberating concerning the weight-of-evidence classification for perchloroethylene and the issues raised and advice offered by the SAB concerning perchloroethylene. When these deliberations are completed, EPA will provide a formal reply to the SAB, under the signature of the Administrator or an appropriate designee, which informs the SAB of the Agency's response to the SAB's issues and advice and states the Agency's final position on the weight-of-evidence classification of perchloroethylene.

(56 FR 644 (January 8, 1991)). Based on the discussion presented in the notice (56 FR 643), EPA deleted perchloroethylene from substances referred to at 54 FR 50974 (December 11, 1989), without qualification, as Group B2 carcinogens. However, the notice (56 FR 643) did not reclassify perchloroethylene as a Group C carcinogen.

At the time of the publication of the proposed rule listing K150 and K151, the weight-of-evidence classification for perchloroethylene had not been resolved. However, in the August 1991 final report to the EPA Administrator (Health Effects Assessment of Perchloroethylene, EPA-SAB-EHC-91-013), the SAB's Environmental Health Committee recommended, after an extensive review, that perchloroethylene be placed on a "continuum between B2 and C." SAB's rationale was that although the evidence was not strong enough to warrant designation of PCE as a B2, probable human carcinogen, the evidence for carcinogenicity is stronger than most other compounds classified as C, possible human carcinogen. The Agency has not yet completed its formal response to the SAB recommendation and a designation will not be assigned until EPA has completed its final weight-of-evidence evaluation. As indicated in the January 8, 1991 notice (56 FR 644), EPA's final decision regarding the weight-of-evidence classification will be "separate and distinct from any regulatory evaluations and risk management decisions concerning perchloroethylene."

In order to clarify the fact that there is still no final Agency-wide weight-of-evidence cancer classification for perchloroethylene, the Agency has deleted the reference to this classification in Tables 3 and 4 (Tables 4 and 5 of the proposed rule). The final position on that classification is not relevant to this listing because the health-based level for perchloroethylene used in support of the listing is based on a final MCL (see 56 FR 51596- 51601, October 11, 1991) which was calculated in the absence of a formal Agency weight-of-evidence cancer classification for perchloroethylene (for more information regarding this MCL, see 56 FR 3526 and 3541 (January 30, 1991)).

One commenter also identified some technical errors in the toxicological endpoints for the carcinogenicity of perchloroethylene. These errors have been addressed in the Health Effects Background document prepared for this final rule.

One commenter questioned EPA's use of the 24-month mouse study that resulted in kidney tumors as the basis for the inhalation carcinogenic potency factor for chloromethane (methyl chloride). The commenter stated that the tumors were observed only in male mice and only at the highest

dose level of 1,000 ppm. According to the commenter, EPA's Office of Toxic Substances (OTS) requested industry to repeat the above study in both mice and rats with a increased number of dose levels "on the basis that EPA could not calculate or determine a cancer risk based on a single data point." The commenter noted that this additional study was never performed. Based on this, the commenter stated that the data should not now be used to support the estimation of a slope factor for chloromethane and that the information on carcinogenicity presented in EPA's Integrated Risk Information System (IRIS) are invalid.

As stated by the commenter, the Agency used an interim oral slope factor of 1.3 x 10-2 mg/kg/day based on a route-to-route extrapolation from the CIIT mouse inhalation study in the proposed rule. The Agency is continuing to use this number in the final rule, because although additional information could lead to greater confidence in the slope factor, the Agency has determined that the current level of data is sufficient to estimate carcinogenic potency (for more information, see the Health Effects background document in the docket for today's rule)./3/ Contrary to the commenter's statement, Agency guidelines do allow slope factors to be calculated from effects observed only at the highest dose level (see Guidelines for Carcinogenic Risk Assessment (U.S. EPA, 1986a) which the available in the docket).

NOTE /3/ Although the source for this value in the proposed rule was IRIS, this number was recently removed from IRIS. Consistent with Agency policy, the new source for the number is the Health Effects Assessment Summary Tables (HEAST).

Furthermore, the Agency believes that even though this slope factor is currently under review by the Agency, the levels of chloromethane in K149 and K150 are so high that the compound poses a potential risk to human health and the environment if the wastes are mismanaged. This is because the concentrations of chloromethane in K149 and K150 (i.e., 7,000 and 13,500 mg/ kg, respectively) are in excess of one million times the health-based level for chloromethane. Even if the health-based level were raised significantly based on further review by the Agency, the concentrations of chloromethane in the wastes would most likely still be present at levels that are several orders of magnitude above those considered to be of concern. In addition, the bases for listing K149 and K150 wastes include 13 constituents other than chloromethane. The presence of these other hazardous constituents, without the inclusion of chloromethane, at levels that could potentially harm human health and the environment, provides adequate justification for finalizing today's listings.

The commenter also questioned the "Group C" weight-of-evidence classification for chloromethane. Although the cancer classification for chloromethane had no effect or bearing on this listing decision, the Agency notes that EPA currently verified the "C" classification on IRIS. This classification was based on the CIIT study and other additional information, and interested readers may consult the background document for further information regarding this classification.

The health effects information and/or HBLs of the constituents of concern that have been changed since the proposal, or were in error in the proposal, have been revised to reflect the EPA's current data base. This

information was added to the health effects assessment background document prepared for this final rule and is summarized in Tables 2, 3, and 4.

5. Typographical Error

A commenter notes that a typographical error appears in the proposed rule. The Agency agrees with the commenter that the proposed definition of K149 in 40 CFR 302.4 should read:
"* * * (this waste does not include still bottoms from the distillation of benzyl chloride)." (See 56 FR 51608, October 11, 1991.)

6. "Automatic Delisting" Provision

One commenter suggested that, if the rule is promulgated as proposed, an "automatic delisting" provision should be established for wastes that do not meet any of the hazardous waste characteristics.

The Agency has listed today's wastes because of the presence of toxic constituents for which the Agency has not set hazardous characteristics levels. Of the 15 constituents which comprise the basis for listing these wastes, 8 are not Toxicity Characteristic (TC) constituents. Therefore, even if these wastes could be treated to a point where the wastes no longer exhibit any of RCRA's hazardous waste characteristics, the constituents not regulated by the TC may still be present at hazardous levels in these wastes.
Furthermore, the Agency is also concerned that since the thick and hydrophobic nature of these wastes parallels the characteristics of oily and greasy wastes, the concentrations of constituents may be underestimated by the Toxicity Characteristic Leaching Procedure (for more information regarding such concerns, see the proposed Hazardous Waste Identification Rule, 57 FR 21473 (May 20, 1992)). An exemption program based solely on the present RCRA characteristics program, therefore, would be inappropriate.

IV. Impact of Future Land Disposal Restrictions (LDR) Determinations
The statute requires EPA to promulgate land disposal prohibitions--that is, prohibit from land disposal hazardous wastes that do not meet the pretreatment standards promulgated under section 3004(m) and that are not disposed in so-called no-migration units--under a specific schedule for wastes identified and listed prior to the enactment of the 1984 amendments (RCRA sections 3004(d), 3004(e), and 3004(g)(5), 42 U.S.C. 6924(d), (e) and (g)(5)). If the Agency failed to promulgate land disposal restrictions by the dates specified in section 3004(g)(4), the wastes were absolutely prohibited from land disposal after May 8, 1990, (or in some cases November 8, 1986 or July 8, 1987). The Agency also is required to make a land disposal prohibition determination for any hazardous waste that is identified or listed in 40 CFR part 261 after November 8, 1984, within 6 months after the listing or identification becomes effective (RCRA section 3004(g)(4), 42 U.S.C. 6924(g)(4)). However, the statute does not provide for automatic restriction or prohibition of the land disposal of such wastes if EPA fails to meet this deadline.

Although some of the wastes covered by today's notice are being listed, in part, because of the presence of the same hazardous constituents found in K015, they are newly-listed wastes, and therefore, the treatment standards for K015 do not apply to today's newly-listed wastes. Because the Agency

has not yet completed treatability and capacity analyses for these newly-listed wastes, land disposal restrictions for the wastes listed today are expected to be addressed by April 1993. It should be noted that because the statute does not provide for automatic restriction or prohibition of land disposal for newly-identified wastes until such restrictions are promulgated, land disposal of these wastes will not be restricted or prohibited until the Agency promulgates land disposal restrictions (unless the wastes exhibit one of the hazardous waste characteristics or meet other land disposal prohibitions, such as that on disposing of liquids in landfills). Wastes that exhibit the characteristic of toxicity using the toxicity characteristic leaching procedure (SW-846 Method 1311) are considered newly-identified and are not covered by the LDR, unless the waste also exhibits the characteristic of toxicity using the extraction procedure (SW-846 Method 1310) (see the Third Land Disposal Restrictions Rule, June 1, 1990, 55 FR 22520).

Most of today's newly listed wastes are expected to exhibit the characteristics of ignitability, corrosivity, or reactivity and thus are already subject to the land disposal restrictions standards for those characteristics, which include reporting, recordkeeping, and tracking requirements, dilution and storage prohibitions, and treatment standards (see 55 FR 22520, June 1, 1990). These wastes also may be subject to certain California List treatment standards if not already covered by a more specific prohibition (see 55 FR 22674, June 1, 1990).

V. State Authority

A. Applicability of Final Rule in Authorized States

Under section 3006 of RCRA, EPA may authorize qualified States to administer and enforce the RCRA program within the State. (See 40 CFR part 271 for the standards and requirements for authorization.) Following authorization, EPA retains enforcement authority under sections 3007, 3008, 3013, and 7003 of RCRA, although, authorized States have primary enforcement responsibility.

Before HSWA amended RCRA, a State with final authorization administered its hazardous waste program entirely in lieu of the Federal program in that State. The Federal requirements no longer applied in the authorized State, and EPA could not issue permits for any facilities located in the State with permitting authorization. When new, more stringent Federal requirements were promulgated or enacted, the State was obligated to enact equivalent authority within specified timeframes. New Federal requirements did not take effect in an authorized State until the State adopted the requirements as State law.

By contrast, under section 3006(g) of RCRA, 42 U.S.C. Sec. 6926(g), new requirements and prohibitions imposed by HSWA take effect in authorized States at the same time that they take effect in nonauthorized States. EPA is directed to implement those requirements and prohibitions in authorized States, including the issuance of permits, until the State is granted authorization to do so. While States must still adopt HSWA-related provisions as part of State regulations to retain final authorization, the HSWA requirements apply in authorized States in the interim.

Today's rule is being promulgated pursuant to section 3001(e)(2) of RCRA, a provision added by the HSWA. Therefore, the Agency is amending Table 1 in 40 CFR 271.1(j), which identifies the Federal program requirements that are promulgated pursuant to the HSWA and that take effect in all States, regardless of their authorization status. States may apply for either interim or final authorization for the HSWA provisions identified in Table 1 (40 CFR 271.1(j)), as discussed in the following section of this preamble.

B. Effect on State Authorizations

As noted above, EPA will implement today's rule in authorized States until they modify their programs to adopt this rule and the modifications are approved by EPA. Because today's rule is promulgated pursuant to the HSWA, a State submitting a program modification would be able to apply to receive either interim or final authorization under section 3006(g)(2) or 3006(b), respectively, on the basis of requirements that are substantially equivalent or equivalent to EPA's requirements. The procedures and schedule for State program modifications under section 3006(b) are described in 40 CFR 271.21.
The same procedures should be followed for section 3006(g)(2).

Section 271.21(e)(2) requires that States that have final authorization modify their programs to reflect Federal program changes and that they subsequently submit the modification to EPA for approval. The deadline by which states must modify their programs to adopt this regulation will be determined based on today's date in accordance with 40 CFR 271.21(e)(2).

States with authorized RCRA programs already may have regulations similar to those in today's rule. These State regulations have not been assessed against the Federal regulations being promulgated today to determine whether they meet the tests for authorization. Thus, States are not authorized to implement their States' regulations in lieu of EPA regulations until the State program modification is approved. Of course, States with existing regulations may continue to administer and enforce their regulations as a matter of State law. In implementing the Federal program, EPA will work with States under cooperative agreements to minimize duplication of efforts. In many cases, EPA will be able to defer to the States in their efforts to implement their programs, and thereby avoid taking separate actions under Federal authority.

States that submit official applications for final authorization less than 12 months after the promulgation of EPA's regulations are not required to include standards equivalent to those promulgated in their applications (see 40 CFR 271.3(f)). However, the State must modify its program by the deadlines set forth in Sec. 271.21(e). States that submit official applications for final authorization 12 months after the effective date of these standards must include equivalent standards in their application. Section 271.3 sets forth the requirements that a State must meet when submitting its final authorization application.

VI. CERCLA Designation and Reportable Quantities

All hazardous wastes listed in 40 CFR 261.31 through 261.33, as well as any solid waste that meets one or more of the characteristics of a RCRA hazardous waste (as defined at 40 CFR 261.21 through 261.24), are hazardous

substances under the Comprehensive Environmental Response, Compensation, and Liability Act of 1980, as amended (CERCLA), pursuant to CERCLA section 101(14).

Therefore, the three chlorinated toluenes waste streams listed as hazardous under RCRA by this final rule (K149, K150, and K151) are CERCLA hazardous substances. CERCLA hazardous substances are listed in Table 302.4 at 40 CFR 302.4 along with their reportable quantities (RQs); thus, EPA is today adding entries for K149, K150, K151 to Table 302.4.

A. Reporting Requirements

Under CERCLA section 103(a), the person in charge of a vessel or facility from which a hazardous substance is released in a quantity that equals or exceeds its RQ must immediately upon knowledge notify the National Response Center of the release (see 40 CFR part 302). In addition to this reporting requirement under CERCLA, section 304 of the Emergency Planning and Community Right-to-Know Act of 1986 (EPCRA) requires owners or operators of certain facilities to report the release of a CERCLA hazardous substance to State and local authorities. EPCRA section 304 notification must be given immediately after the release of an RQ or more to the community emergency coordinator of the local emergency planning committee for each area likely to be affected by the release, and to the State emergency planning commission of any State likely to be affected by the release.

B. Adjustment of RQs

Under section 102(b) of CERCLA, all hazardous wastes newly designated under CERCLA will have a statutory RQ of one pound unless and until adjusted by regulation. The Agency's methodology for adjusting RQs of individual hazardous substances begins with an evaluation of the intrinsic physical, chemical, and toxicological properties of each hazardous substance./4/ The intrinsic properties examined--called "primary criteria"--are aquatic toxicity, mammalian toxicity (oral, dermal, and inhalation), ignitability, reactivity, chronic toxicity, and potential carcinogenicity. Generally, for each intrinsic property, the Agency ranks hazardous substances on a scale, associating a specific range of values on each scale with an RQ of 1, 10, 100, 1000, or 5000 pounds. The data for each hazardous substance are evaluated using various primary criteria; each hazardous substance may receive several tentative RQ values based on its particular intrinsic properties. The lowest of the tentative RQs becomes the "primary criteria RQ" for that substance.

NOTE /4/ For more detailed information on this methodology, see the preamble to an RQ adjustment final rule published on August 14, 1989 (54 FR 33426). A different methodology is used to assign adjusted RQs to radionuclides (see 54 FR 22524, May 24, 1989).

After the primary criteria RQs are assigned, substances are further evaluated for their susceptibility to certain degradative processes, which are used as secondary adjustment criteria. These natural degradative processes are biodegradation, hydrolysis, and photolysis (BHP). If a hazardous substance, when released into the environment, degrades relatively rapidly to a less hazardous form by one or more of the BHP

processes, its RQ (as determined by the primary RQ adjustment criteria), is generally raised one level./5/ This adjustment is made because the relative potential for harm to public health or welfare or the environment posed by the release of such a substance is reduced by these degradative processes. Conversely, if a hazardous substance degrades to a more hazardous product after its release, the original substance is assigned an RQ equal to the RQ for the more hazardous substance, which may be one or more levels lower than the RQ for the original substance. The downward adjustment is appropriate because the hazard posed by the release of the original substance is increased as a result of BHP.

NOTE /5/ No RQ level increase based on BHP occurs if the primary criteria RQ is already at its highest possible level (100 pounds for potential carcinogens and 5000 pounds for all other types of hazardous substance-except radionuclides). BHP is not applied to radionuclides.

The methodology summarized above is applied to adjust the RQs of individual hazardous substances. An additional process applies to RCRA waste streams, which contain individual hazardous substances as constituents. As the Agency has stated (54 FR 33440, August 14, 1989), to assign an RQ to a waste stream, the Agency determines the RQ for each waste stream constituent and then assigns the lowest of these constituent RQs to the waste stream itself.

The lowest constituent RQ for each of the waste streams that are the subject of today's final rule (K149, K150, and K151) is 10 pounds. In order to coordinate RCRA and CERCLA rulemakings, the Agency proposed to adjust the one-pound statutory RQs for each of these waste streams to 10 pounds in its October 11, 1991, proposed rule (56 FR 51592). EPA received no comments on these proposed RQ adjustments. The Agency is therefore promulgating these RQ adjustments by including final adjusted RQs of 10 pounds for waste streams K149, K150, and K151 in Table 302.4.

VII. Compliance Dates

A. Notification

Under the Solid Waste Disposal Amendments of 1980 (Pub L. 96-452), EPA was given the option of waiving the notification requirement under section 3010 of RCRA following revision of the section 3001 regulations, at the discretion of the Administrator.

As proposed, EPA is waiving the notification requirement as unnecessary for persons already identified within the hazardous waste management universe.

EPA is not waiving the notification requirement for waste handlers who have neither notified the Agency that they may manage hazardous wastes nor received an EPA identification number.

B. Interim Status

Because HSWA requirements are applicable in authorized States at the same time as in unauthorized States, EPA will regulate K 149, K150, and K151

until States are authorized to regulate these wastes. Thus, once this regulation becomes effective, EPA will apply Federal regulations to these wastes and to their management in both authorized and unauthorized States. Facilities that treat, store, or dispose of K149, K150, and K151, but that have not received a permit pursuant to section 3005 of RCRA and are not operating pursuant to interim status, might be eligible for interim status (see section 3005(e)(1)(A)(ii) of RCRA, as amended). To operate under interim status, the eligible facilities will be required to submit a section 3010 notification (when the requirement is waived, as explained above), pursuant to 40 CFR 270.70(g) and will be required to submit a Part A permit application within 6 months of promulgation of today's listing pursuant to Sec. 270.10(e).

Under RCRA section 3005(e)(3) and 40 CFR 270.73(d), within 18 months of promulgation of today's listing, land disposal facilities qualifying for interim status under section 3005(e)(1)(A)(ii) also will be required to submit a Part B permit application and certify that the facility is in compliance with all applicable ground-water monitoring and financial responsibility requirements. If the facility fails to do so, interim status will terminate on that date.

All existing hazardous waste management facilities (as defined in 40 CFR 270.2) that treat, store, or dispose of K149, K150, and K151 and that are currently operating pursuant to interim status under section 3005(e) of RCRA, will be required to file with EPA an amended Part A permit application within 6 months of promulgation of today's listing.

C. Permitting Requirements

Physical construction of any new facility that will treat, store, or dispose of these wastes may not commence until Parts A and B of the permit application have been submitted and a RCRA permit has been approved. (See 40 CFR 270.10(f).)

Under current regulations, a hazardous waste management facility that has received a permit pursuant to section 3005 may not treat, store, or dispose of K149, K150, and K151 unless the permit modification procedures set forth in 40 CFR 270.42(g) are satisfied.

Under 40 CFR 270.42(g)(1)(v), for newly regulated land disposal units, permitted facilities must certify that the facility is in compliance with all applicable 40 CFR 265 ground-water monitoring and financial responsibility requirements no later than April 15, 1994. If the facility fails to submit these certification, authority to manage the newly listed wastes under 40 CFR 270.42(g) will terminate on that date.

VIII. Economic Analysis

Under Executive Order 12291, EPA must determine whether a regulation is "major" and, therefore, subject to the requirements of a Regulatory Impact Analysis (RIA). As mentioned in the preamble to the October 11, 1991 proposed rule, the total additional cost for disposal of these wastes as hazardous is approximately $12,000 per year, which is significantly less than the $100 million constituting a major regulation.

Since EPA does not expect that the amendments promulgated by today's rule will have an annual effect on the economy of $100 million or more or result in a measurable increase in cost or prices, or have an adverse impact on the ability of U.S.-based enterprises to compete with either domestic or foreign markets, these amendments are not believed to constitute a major action.
Therefore, an RIA is not required.

IX. Regulatory Flexibility Act

Pursuant to the Regulatory Flexibility Act, 5 U.S.C. 601-612, whenever an agency is required to publish a general notice of rulemaking for any proposed or final rule, it must prepare and make available for public comment a regulatory flexibility analysis that describes the impact of the rule on small entities (i.e., small businesses, small organizations, and small governmental jurisdictions). However, if the head of the agency certifies that the rule will not have a significant impact on a substantial number of small entities, no regulatory flexibility analysis is required.

The hazardous wastes proposed to be listed here are not generated by small entities (as defined by the Regulatory Flexibility Act). Accordingly, I hereby certify that this amendment would not have a significant economic impact on a substantial number of small entities. Therefore, this regulation does not require a regulatory flexibility analysis.

X. Paperwork Reduction Act

This rule does not contain any information collection requirements subject to OMB review under the Paperwork Reduction Act of 1980, 44 U.S.C. 3501 et seq.

List of Subjects

40 CFR Part 261

Hazardous materials, Waste treatment and disposal, Recycling.

40 CFR Part 271

Administrative practice and procedure, Confidential business information, Hazardous materials transportation, Hazardous waste, Indian lands, Intergovernmental relations, Penalties, Reporting and recordkeeping requirements, Water pollution control, Water supply.

40 CFR Part 302

Air pollution control, Chemicals, Emergency Planning and Community Right-To-Know Act, Extremely hazardous substances, Hazardous chemicals, Hazardous materials, Hazardous materials transportation, Hazardous substances, Hazardous wastes, Intergovernmental relations, Natural resources, Pesticides and pests, Reporting and recordkeeping requirements, Superfund, Waste treatment and disposal, Water pollution control, Water supply.

Dated: September 30, 1992.

William K. Reilly,
Administrator.

For the reasons set out in the preamble, Chapter I, Title 40 of the Code of Federal Regulations is amended as follows:

PART 261--IDENTIFICATION AND LISTING OF HAZARDOUS WASTE

1. The authority citation for Part 261 continues to read as follows: 42 U.S.C. 6905, 6912(a), 6921, 6922, and 6938.

2. In Sec. 261.32, add the following waste streams in alpha-numeric order to the subgroup "Organic Chemicals" in the table:

Sec. 261.32 Hazardous wastes from specific sources.

* * * * *

Industry and EPA hazardous waste No.	Hazard	Hazardous waste code
* * * * * * *		
K149	Distillation bottoms from the production of alpha- (or methyl-) chlorinated toluenes, ring-chlorinated toluenes, benzoyl chlorides, and compounds with mixtures of these functional groups, (This waste does not include still bottoms from the distillation of benzyl chloride.)	(T)
K150	Organic residuals, excluding spent carbon adsorbent, from the spent chlorine gas and hydrochloric acid recovery processes associated with the production of alpha- (or methyl-) chlorinated toluenes, ring-chlorinated toluenes, benzoyl chlorides, and compounds with mixtures of these functional groups	(T)
K151	Wastewater treatment sludges, excluding neutralization and biological sludges, generated during the treatment of wastewaters from the production of alpha- (or methyl-) chlorinated toluenes, ring-chlorinated toluenes, benzoyl chlorides, and compounds with mixtures of these functional groups	(T)
* * * * * * *		

3. Add the following entries in alpha-numeric order to Appendix VII of Part 261:

Appendix VII.--Basis for Listing Hazardous Waste

EPA hazardous waste No.	Hazardous constituents for which listed
* * * * * * *	
K149	Benzotrichloride, benzyl chloride, chloroform, chloromethane, chlorobenzene, 1,4-dichlorobenzene, hexachlorobenzene,

pentachlorobenzene, 1,2,4,5-tetrachlorobenzene, toluene.
K150 Carbon tetrachloride, chloroform, chloromethane, 1,4-dichlorobenzene, hexachlorobenzene, pentachlorobenzene, 1,2,4,5-tetrachlorobenzene, 1,1,2,2-tetrachloroethane, tetrachloroethylene, 1,2,4-trichlorobenzene.
K151 Benzene, carbon tetrachloride, chloroform, hexachlorobenzene, pentachlorobenzene, toluene, 1,2,4,5-tetrachlorobenzene, tetrachloroethylene.

* * * * * * *

PART 271--REQUIREMENTS FOR AUTHORIZATION OF STATE HAZARDOUS WASTE PROGRAMS

4. The authority citation for part 271 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), and 6926.

5. Sec. 271.1(j) is amended by adding the following entry to Table 1 in chronological order by date of publication:

Sec. 271.1 Purpose and scope.

* * * * *

Table 1.--Regulations Implementing the Hazardous and Solid Waste Amendments of 1984

Promulgation date	Title of regulation	Federal Register reference	Effective date
		* * * * * * *	
October 15, 1992	Listing Wastes from the Production of Chlorinated Toluenes	(insert Federal Register page numbers)	April 15, 1993.
		* * * * * * *	

PART 302--DESIGNATION, REPORTABLE QUANTITIES, AND NOTIFICATION

6. The authority citation for part 302 continues to read as follows:

Authority: 42 U.S.C. 9602, 9603, and 9604; 33 U.S.C. 1321 and 1361.

7. Section 302.4 is amended by adding the following entries to Table 302.4:

Sec. 302.4 Designation of hazardous substances.

* * * * *

Table 302.4.--List of Hazardous Substances and Reportable Quantities

(Note: All comments/notes are located at the end of this table)

Hazardous substance	CASRN	synonyms	RQ	Statutory Code+	RCRA Regulatory waste No.	Final RQ Pounds (kg) Category
				* * * * * * *		

K149 1* 4 K149 A 10 (4.54)
Distillation bottoms from the production of alpha- (or methyl-) chlorinated toluenes, ring-chlorinated toluenes, benzoyl chlorides, and compounds with mixtures of these functional groups. (This waste does not include still bottoms from the distillation of benzyl chloride.)
K150 1* 4 K150 A 10 (4.54)
Organic residuals, excluding spent carbon adsorbent, from the spent chlorine gas and hydrochloric acid recovery processes associated with the production of alpha- (or methyl-) chlorinated toluenes, ring-chlorinated toluenes, benzoyl chlorides, and compounds with mixtures of these functional groups.
K151 1* 4 K151 A 10 (4.54)
Wastewater treatment sludges, excluding neutralization and biological sludges, generated during the treatment of

wastewaters from the production of alpha- (or methyl-) chlorinated toluenes, ring-chlorinated toluenes, benzoyl chlorides, and compounds with mixtures of these functional groups.

+ indicates the statutory source as defined by 1, 2, 3, 4, or 5 below.

* * * * * * *

4 indicates that the statutory source for designation of this hazardous substance under CERCLA is RCRA section 3001.

1* indicates that the 1-pound RQ is a CERCLA statutory RQ

ACTION: Approval of Interim
INTERNAL DATA: (FR Doc. 92-25398 Filed 10-19-92; 8:45 am)
Word Count: 4300

SUMMARY: In the final rule establishing land disposal restrictions (LDR) for Third Third hazardous wastes, EPA granted a national capacity variance for those hazardous soils whose best demonstrated available technology (BDAT) was incineration, retorting, or vitrification, as well as for soils contaminated with radioactive mixed waste, due to a lack of treatment capacity. Approximately 73 percent of the wastes restricted from land disposal by the Third Third rule received the national capacity variance when they were contained in soils. The national capacity variance expired on May 8, 1992.

While the variance was in effect, EPA receive information from generators of hazardous soils and trade association indicating that there would not be sufficient treatment capacity fo hazardous soils when the variance expired on May 8, 1992. In response t this information, EPA gathered data to determine whether treatment capacit is available for hazardous soils to which the national capacity varianc applied, and, if not, to determine the reasons that it is not available Information obtained from various companies and trade association indicated that a shortage of treatment capacity for hazardous soil continues to exist, for reasons beyond their control.

Under 40 CFR 268. , EPA is approving an interim final case-by-case extension of the L R effective date, to May 8, 1993, applicable to all persons handling Thi d Third hazardous soils whose BDAT is either incineration, retorting, r vitrification, or handling Third Third soils contaminated with radioacti e mixed waste. No further applications will be required at this time fr m persons granted the extension by this action. However, EPA is requiri g such persons to do certain recordkeeping, and to meet certain oth r requirements to qualify for the extension.

TEXT:

40 CFR Part 268

(FRL-4524-5)

Hazardous Waste Management System: Land Disposal Restrictions

AGENCY: Environmental Protection Agency (EPA).

ACTION: Approval of Interim Final Hazardous Soil Case-By-Case Capacity Variance.

SUMMARY: In the final rule establishing land disposal restrictions (LDR) for Third Third hazardous wastes, EPA granted a national capacity variance for those hazardous soils whose best demonstrated available technology (BDAT) was incineration, retorting, or vitrification, as well as for soils contaminated with radioactive mixed waste, due to a lack of treatment capacity.

Approximately 73 percent of the wastes restricted from land disposal by the Third Third rule received the national capacity variance when they were contained in soils. The national capacity variance expired on May 8, 1992.

While the variance was in effect, EPA received information from generators of hazardous soils and trade associations indicating that there would not be sufficient treatment capacity for hazardous soils when the variance expired on May 8, 1992. In response to this information, EPA gathered data to determine whether treatment capacity is available for hazardous soils to which the national capacity variance applied, and, if not, to determine the reasons that it is not available. Information obtained from various companies and trade associations indicated that a shortage of treatment capacity for hazardous soils continues to exist, for reasons beyond their control.

Under 40 CFR 268.5, EPA is approving an interim final case-by-case extension of the LDR effective date, to May 8, 1993, applicable to all persons handling Third Third hazardous soils whose BDAT is either incineration, retorting, or vitrification, or handling Third Third soils contaminated with radioactive mixed waste. No further applications will be required at this time from persons granted the extension by this action.

However, EPA is requiring such persons to do certain recordkeeping, and to meet certain other requirements to qualify for the extension.

DATES: This action becomes effective on October 13, 1992 and expires on May 8, 1993. Comments on this action must be submitted on or before November 19, 1992.

ADDRESSES: Any person wishing to comment on this interim final variance must send an original and two copies of their comments to the EPA RCRA Docket (OS- 305), room 2427, U.S. Environmental Protection Agency, 401 M Street SW., Washington, DC 20460. Place the docket number F-92-CD2P-FFFFF on all copies of the comments. The docket is open from 9 a.m. to 4 p.m., Monday through Friday, except on Federal holidays. The public must make an appointment to review docket materials by calling (202) 260-9327. The

public may copy a maximum of 100 pages from any document in the docket at no cost. Additional copies cost $0.20 per page.

FOR FURTHER INFORMATION CONTACT: For general information contact the RCR Hotline at (800) 424-9346 toll-free or (703) 920-9810 locally. For information on specific aspects of this notice, contact Nicholas R. Vizzone, Analysis and Land Disposal Restrictions Section, Capacity Programs Branch (OS-321W), Office of Solid Waste, U.S. Environmental Protection Agency, 401 M Street SW, Washington, DC 20460, (703) 308-8477.

SUPPLEMENTARY INFORMATION: .

Outline

I. Background

A. History

Congress enacted the Hazardous and Solid Waste Amendments (HSWA) of 1984, which amended the Resource Conservation and Recovery Act (RCRA). Among other things, HSWA required EPA to develop regulations that would impose, on a phased schedule, restrictions on the land disposal of hazardous wastes. In particular, sections 3004(d), (e), and (g) of RCRA (2 USC 6924 (D), (e), and (g)) prohibit the land disposal of all wastes identified or listed as hazardous as of November 1984, unless the wastes are treated (or meet treatment standards) in a manner that "substantially diminish(es) the toxicity of the waste or substantially reduce(s) the likelihood of migration of hazardous constituents from the waste so that short-term and long-term threats to human health and the environment are minimized." That alternative to satisfying these treatment standards is disposal in a unit from which there will be no migration of hazardous constituents for as long as the waste remains hazardous.

In developing such a broad program, Congress recognized that adequate alternative treatment, recovery, or protective disposal capacity might not be available by the applicable effective dates. Therefore, section 3004(h)(2) authorized EPA to grant a national capacity variance (based on the earliest date that such capacity would be available but not to exceed two years) that delays the effective date for new treatment standards. In addition, under section 3004(h)(3), EPA can grant an extension of the deadline on a case-by- case basis for one year (renewable for one additional year); however, variances are limited to a four year time period from the effective date.

On June 1, 1990, EPA published a final rule (55 FR 22520) establishing prohibitions and treatment standards for wastes in the final third of scheduled prohibitions. Among other things, the rule established prohibitions and treatment standards for soil contaminated with all

hazardous wastes subject to the LDRs (except for soil contaminated with the solvents and dioxins under section 3004(e) and soil contaminated with "California List Wastes" under section 3004(d) for which land disposal had been prohibited earlier). Because of a lack of treatment capacity as of June 1990, EPA granted a two-year national capacity variance for most hazardous soils (40 CFR 268.35(e))./1/ As such, disposal of these hazardous soils in untreated form became prohibited as of May 8, 1992.

NOTE /1/ The existing treatment standards for hazardous soil subject to the national capacity variance granted on June 1, 1990, and to today's case-by- case extension, are based upon incineration, retorting, or vitrification; the variance and extension also applies to soil contaminated with radioactive mixed wastes.

B. Revised Treatment Standards for Hazardous Soils

Hazardous soils present unique problems under the land disposal restriction program./2/ Hazardous soils are not a distinct waste form; rather, they are an environmental medium which has become contaminated with hazardous waste.

Furthermore, hazardous soils are not the product of particular industrial processes, but rather are generated, for the most part, when hazardous waste is released. The need for treatment generally occurs when the hazardous soil is removed as part of a cleanup effort.

NOTE /2/ Hazardous soil means soil that contains a hazardous waste listed in subpart D of 40 CFR part 261 that is subject to the LDRs of this part, or that exhibits a characteristic of hazardous waste identified in subpart C of 40 CFR part 261 that is subject to the LDRs of this part.

Hazardous soils, however, are regulated as hazardous wastes by virtue of the principle that materials containing hazardous wastes are themselves considered to be hazardous wastes. When EPA promulgated treatment standards for hazardous wastes (see 57 FR 37225 (Aug. 18, 1992)), it did not establish separate standards for wastes contained in other materials such as soil.

Rather, the standards for the specified wastes applied as well to materials in which such wastes are contained or mixed. Thus, the treatment standards for the wastes with which soil is contaminated are the applicable standards for treatment of the soil/waste matrix as well.

However, applying such standards to hazardous soils presents significant difficulties. In general, hazardous soil is more difficult to treat than the corresponding industrially generated RCRA hazardous waste. The treatment standards for most of the wastes affected by today's extension are based on performance of incineration. However, incineration of soil poses some technical problems including the following: (1) The feed systems for most solids incinerators are not designed to sufficiently handle the throughput needed for the large volumes of soils typically found at a site where cleanup is occurring; (2) a large percentage of the hazardous soil is contaminated with low concentrations of toxic organics and is, therefore, primarily non- combustible (due largely to the fact that soil does not burn); and (3) a significant amount of supplemental fuel must be burned and, as such, incineration of soils typically utilizes a great deal of

energy to treat the waste with which the soil is contaminated.

In addition, incinerators that are currently commercially available are typically designed to manage conventional industrial hazardous wastes residues that consist primarily of organics rather than inorganics (such as those that comprise soil). These incinerators are not generally capable of handling significant volumes of hazardous soil due to their throughput designs, feed preparation units, retentions times, ash/residue handling units, etc. Incinerators designed specifically for soil have not generally been constructed, due to the previous low generation rates of soils requiring incineration and the practical problems discussed above which are exacerbated by the fact that the generation of hazardous soils is irregular both spatially and over time. This has made it difficult to develop an adequate amount of effective treatment capacity for their management. The irregular generation patterns has been a particularly significant factor impeding the development of commercial treatment capacity for soils contaminated with radioactive mixed wastes.

Because of these unique considerations where soils are concerned, EPA is currently developing a separate set of treatment standards for hazardous soils. These standards will be based on the use of alternative technologies, including the use of technologies such as soil washing, thermal desorption, and biodegradation. These standards have not been proposed to date, but EPA announced its intention to issue such standards in an Advance Notice of Proposed Rulemaking; see 56 FR 55160, 55172-77 (October 24, 1991). This notice discussed in detail the difficulty in applying the existing BDAT standards to hazardous soils and sought comment on a variety of issues to be addressed before such treatment standards are proposed.

In the meantime, however, the existing treatment standards remain applicable to soils contaminated with a hazardous waste, even though EPA has recognized the impracticality of attempting to comply with them in many instances. As would be expected in light of such impracticality and uncertainty about the standards that will ultimately be adopted, treatment capacity based on the BDAT standards of the Third Third rule has not been developed. While the existing regulations allow the regulated community to obtain treatability variances from the existing treatment standards, the regulated community believes, and EPA agrees, that it is inappropriate to use this regulatory mechanism (which was designed to address exceptional circumstances) as the means to develop treatment standards for hazardous soils; they believe it to be highly inefficient and resource intensive for both the regulated community and EPA.

Therefore, in contrast to other wastes for which the waste volumes and treatment technology are known, and capacity is lacking, but for which EPA expects capacity can and will be developed, EPA does not believe that the development of treatment capacity for effectively managing most hazardous soils can realistically be expected until revised standards more appropriate for such hazardous soils have been issued. In addition, EPA is concerned that fear of liability could hinder present and future voluntary cleanup operations. EPA believes that allowing cleanup projects to continue is more protective of the environment that allowing wastes to remain in the soil.

Therefore, EPA is granting today, on an interim final basis an extension under 40 CFR 268.5, until May 8, 1993, for most hazardous soils. Although

such extensions are normally granted on the basis of site-specific applications, EPA previously granted such extensions on a nationwide basis where it has concluded that conditions warranting such an extension apply to a class of generators, or treatment or storage facilities nationwide. The Agency concludes that such circumstances exist in the case of certain hazardous soils as well.

The capacity extension provided today is applicable to hazardous soil containing Third Third wastes whose BDAT is either incineration, retorting, or vitrification, and to soils contaminated with radioactive mixed waste, which received a national capacity variance in the Third Third rule./3/ Soils contaminated with listed solvent or dioxin waste covered by the section 3004(e) prohibition and soil contaminated with "California List Wastes" pursuant to section 3004(d) are not covered by this extension. The time for granting national and case-by-case capacity extensions for both of these groups has expired, so that further extension is not possible (See 55 FR 2265-52).

NOTE /3/ The major waste types that did not receive a national capacity variance were corrosive wastes (D002), reactive wastes (D003), barium (D005), cadmium (D006), chromium (D007), lead (D008), selenium (D010), and silver (D011) wastes. For soils, contaminated with these wastes, the LDRs became effective May 8, 1990 and EPA has no authority to provide relief from these requirements. For toxicity characteristic wastes, treatment standards have not yet been set; therefore, these soils may still be land disposed.

II. Justification for This Extension

A. Demonstration Under 40 CFR 268.5

In this notice, EPA is taking regulatory action to grant an interim final national case-by-case extension of the effective date for treatment standards for certain hazardous soil, as described elsewhere in the preamble.

40 CFR 268.5 specifies seven demonstrations that must be made for the approval of a case-by-case extension to a treatment standard of the prohibition effective date. From information it has obtained from generators and handlers of hazardous soils, EPA has made an evaluation of these seven required demonstrations as follows:

Demonstration 40 CFR 268.5(a)(1)

The applicant must demonstrate that he has made a good-faith effort to locate and contract with treatment, recovery, or disposal facilities nationwide to manage his waste in accordance with the effective date of the applicable restriction established under subpart C of this part.

Due to the generic nature of the problem presented by hazardous soils, it has not been practicable to gather this information from every owner/operator managing such wastes. However, site-specific information is not required because the information obtained by EPA (and placed in the docket for this extension) indicates that there is a general nationwide lack of capacity for treatment of certain hazardous soils. This is because, as discussed above, the technologies on which the promulgated treatment

standards were based are simply not appropriately designed for soils in many cases, and alternative treatment standards, based on technologies designed specifically for such soils, discussed in this notice have not yet been promulgated. Parties involved in the chemical and petroleum industries, or in the remediation of contaminated sites, have indicated to EPA that they are unable at this time to locate treatment, recovery, or protective disposal capacity for hazardous soils. The data recently provided to the Agency indicate that hazardous soils contaminated with organics will be generated by hundreds of remediation efforts that are underway or are planned. The available capacity for soil incineration (the primary treatment technology for such soil) is limited and would not beable to handle this large influx of soil.

Likewise, there is limited commercial retorting capacity available for the treatment of hazardous soils contaminated with high levels of mercury. The feed systems for commercial mercury retorting units are typically designed for batch processing of small volumes of wastes (such as glass, electrical devices, and light bulbs). Other retorting systems are currently being designed for specific hazardous wastes from the chlor-alkali industry (K106-- mercury sulfide wastes). Neither of these types of retorting systems have been specifically designed to handle soils nor the large volumes of soil that are expected. Information EPA has obtained from companies and trade associations indicate that clean-ups of more than 700 sites contaminated with mercury will produce over 30,000 tons of hazardous soil. The current limited retorting capacity would be overwhelmed by this amount of hazardous soil./4/

NOTE /4/ It should be noted that the process of retorting is designed to thermally desorb (i.e., extract) mercury from an inorganic matrix. In the final rule for debris wastes (57 FR 37194 (August 18, 1992)), EPA recognized the usefulness of other extraction technologies in addition to thermal desorption for the removal of other hazardous constituents from inorganic debris. As such, EPA is currently investigating alternative means of extraction of mercury that are specifically designed for contaminated soil and that could potentially achieve a level of performance similar to retorting.

EPA promulgated standards for arsenic wastes based on the use of a vitrification technology that was designed to handle industrial wastes with very high concentrations of arsenic. On the other hand, contaminated soils are comprised primarily of inert inorganic materials that require a significantly larger amount of energy to vitrify than the industry wastes.
Commercial vitrification capacity designed specifically for soils is virtually nonexistent and, as such, is not adequate. Information obtained from companies and trade associations involved with hazardous soils (available in the docket) indicates that an estimated 120,000 tons or more of arsenic hazardous soil is expected to be generated at over 600 sites nationwide by remediation efforts. There is a clear shortfall of vitrification capacity with regard to arsenic contaminated hazardous soil./5/
NOTE /5/ Many of the sites are contaminated with relatively low total concentrations of arsenic. Data received for the Third rulemaking indicated that industrial wastes containing low concentrations of arsenic could be chemically stabilized (with careful consideration of the unique chemistry of arsenic) to levels that could comply with the standard established based on vitrification. EPA is currently investigating the applicability of these

special chemical stabilization process for contaminated soil as an alternative to the energy intensive vitrification processes.

EPA believes that these data portray the existing insufficient capacity for treatment of hazardous soil. EPA agrees that there is, in general, far less treatment capacity available than would be required to handle the soil being generated, and that the development of capacity consistent with the current treatment standards is uncertain. Furthermore, the Agency would not expect the industry to construct and make available capacity based on alternative technologies until the Agency promulgates revised treatment standards for hazardous soils.

Therefore, for all of the reasons discussed above, through no fault of their own, generators are unable to, or cannot reasonably be expected to enter into contracts at this time, to construct or otherwise obtain access to treatment, recovery, or protective disposal facilities.

Demonstration 40 CFR 268.5(a)(2)

The applicant has entered into a binding contractual commitment to construct or otherwise provide alternative treatment, recovery (e.g., recycling), or disposal capacity that meets the treatment standards specified in subpart D or, where treatment standards have not been specified, such capacity is protective of human health and the environment.

For the reasons discussed above, the treatment of soil to meet certain existing BDAT standards is impractical in most cases and construction of additional capacity will require new standards to be issued. Therefore, until the anticipated revision of the treatment standards for hazardous soils is promulgated, it will be difficult, if not impossible, for generators to construct or enter into contractual commitments to construct or otherwise provide additional treatment capacity.

EPA is requiring, however, that each generator of hazardous soil subject to this extension make a good faith effort to enter into such a contract at the earliest date practicable after revised treatment standards are promulgated (if that occurs during the extension period) to provide the necessary treatment capacity.

Demonstration 40 CFR 268.5(a)(3)

Due to circumstances beyond the applicant's control, such alternative capacity cannot reasonably be made available by the applicable effective date. This demonstration may include a showing that the technical and practical difficulties associated with providing the alternative capacity will result in the capacity not being available by the applicable effective date.

As discussed above, information obtained by EPA indicates major technical and practical difficulties that make it impractical to provide alternative capacity under the current treatment standards. For example, large volumes of hazardous soils are typically found at a site where cleanup is occurring.
Most feed systems on solids incinerators are not capable of handling these

large volumes due to their throughput designs, feed preparation units, retention times, ash/residue handling units, etc.

EPA believes these to be valid concerns and agrees that additional time is needed to resolve these concerns by issuing revised standards tailored to the unique nature of hazardous soils. These circumstances are beyond the control of the generators who need to treat or dispose of their hazardous soils.

Demonstration 40 CFR 268.5(a)(4)

The capacity being constructed or otherwise provided by the applicant will be sufficient to manage the entire quantity of waste that is the subject of the application.

As discussed above, generators will be unable to provide capacity that meets treatment standards until the revised treatment standards are promulgated. Since generators cannot immediately plan to construct capacity because of uncertainty associated with appropriate treatment technology, EPA believes that these uncertainties make it difficult for generators to determine their capacity requirements at this time. In addition, a key timing concern relates to the immediate logistical problems relating to the time needed for permit modifications. EPA does believe, however, that adequate treatment capacity can be provided once the revised hazardous soil standards are promulgated.

Demonstration 40 CFR 268.5(a)(5)

He provides a detailed schedule for obtaining required operating and construction permits or an outline of how and when alternative capacity will be available.

As discussed above, it will be difficult for generators to provide a detailed schedule outlining how and when alternative capacity will be available until revised treatment standards are issued. EPA is requiring, however, as a condition of this variance that owners and operators place a planned schedule into their facility operating record within 90 days after the revised treatment standards are promulgated (if that date occurs before the extension expires).

Demonstration 40 CFR 268.5(a)(6)

The applicant must demonstrate that he has arranged for adequate capacity to manage his waste during an extension and has documented in the application the location of all sites at which the waste will be managed.

Due to the nature of this extension, EPA has little facility-specific information on the amount and location of the capacity that operators will use to manage their hazardous soil during this extension. Rather, as discussed below, EPA is requiring owners and operators to include documentation in the facility record describing the means by which their hazardous soil will be managed between October 13, 1992, and May 8, 1993, and showing the location and adequacy of such capacity.

Demonstration 40 CFR 268.5(a)(7)

Any waste managed in a surface impoundment or landfill during the extension period will meet the requirements of paragraph (h)(2) of 40 CFR 268.5.

Due to the nature of the extension, site specific information available to EPA on management in land disposal facilities during the extension period is not available. However, any generator who intends to manage his hazardous soil in a surface impoundment or landfill during the extension must ensure that the unit meets the requirements of 40 CFR 268.5(h)(2) (i.e., meets the minimum technology requirements set out in regulation 40 CFR parts 264 and 265) (see RCRA section 3004(h)(4)). Failure to do so may be grounds for revocation of the extension for the generator.

B. Consultation With the States

In addition to the above seven demonstrations, EPA is required under 40 CFR 268.5(e) to consult with appropriate State agencies in all affected States.

EPA consulted with the Association of State and Territorial Solid Waste Management Officials (ASTSWMO) who developed a questionnaire regarding hazardous soils contaminated with mercury and arsenic, that was sent out to all the states. The questionnaire was sent to all states, of whom thirty-five states chose to respond to the survey. The responses from these states support the need for an extension of the LDR effective date for hazardous soils. These responses have been included in the docket for this extension.

C. Conclusion

Based on its evaluation of the demonstrations required under 40 CFR 268.5, and for the reasons stated above, EPA is approving an interim final case-by- case extension to the Land Disposal Restrictions for those hazardous soils previously subject to the national capacity variance for soils granted in the Third Third land disposal restriction rule (June 1, 1990) whose BDAT is either incineration, retorting or vitrification, or those Third Third soils were contaminated with radioactive mixed waste. This extension is effective from October 13, 1992, to May 8, 1993. EPA is taking this exceptional regulatory action because of the unique circumstances which have resulted in the lack of treatment, recovery, and protective disposal capacity for hazardous soil, the need for promulgation of revised treatment standards before such capacity can be constructed, and EPA's conclusion that treatment capacity meeting those standards is limited, or is limited due to logistical problems, but can be provided after revised treatment standards are promulgated. EPA believes that granting this extension is the most environmentally protective option because it will eliminate some of the regulatory obstacles that could force cleanup projects to be postponed.

III. Requirements for This Extension

To receive the benefit of this extension, a generator or owner/operator must include the following information in its onsite records by December 21, 1992, or at the time the hazardous soil is generated:

(1) The name, mailing address, location, and EPA identification number (if

assigned) of facility. The term "facility" includes any site, whether permanent (such as a manufacturing plant), or temporary where hazardous soil will be generated;
(2) A description of the hazardous soil waste stream, including the RCRA waste code(s);
(3) Waste generation rates (cu.m./yr.), and estimated inventories (cu.m.);
(4) Certification as required under 40 CFR 268.5(b);
(5) The method of any storage for hazardous soil, storage capacity, and RCRA permit status (i.e., interim status, permitted, or 90-day generator) of the storage unit during the extension period; and
(6) If management of hazardous soil during the extension includes the use of a surface impoundment or landfill, the owner operator must certify that such unit meets the requirements of 40 CFR 268.5(h)(2).

In addition, within 90 days after revised treatment standards are promulgated (if this occurs before the extension expires), each owner and operator must maintain in the facility record (or, for generators, in the files maintained pursuant to Sec. 268.7(a)(5)) a written plan that describes how the facility will obtain adequate treatment capacity. At a minimum, this plan must include a schedule of how the owner or operator plans to design, construct, and obtain the necessary permits to provide on-site treatment, recovery, or disposal capacity or a description of how the owner or operator intends to obtain a binding contractual commitment for off-site capacity.

This information must be furnished upon request, and made available at all reasonable times for inspection by any officer, employee, or representative of EPA, or the appropriate State agency who is duly designated by EPA or the State agency.

Under 40 CFR 268.5(e), the Administrator may renew this extension to allow continued land disposal from May 8, 1993, to May 8, 1994. Prior to the May 8, 1993 effective date, EPA will evaluate the status of available capacity, current capacity needs, as well as the status of the revised treatment standards for hazardous soils as they relate to an owner or operators ability to satisfy the demonstrations. Based on this evaluation, EPA may extend the national case-by-case for up to an additional year; if so, all persons who qualify for today's extension would be allowed until May 1994 to construct or otherwise provide the necessary treatment, recovery, or protective disposal capacity for his hazardous soil.

EPA is also using this opportunity to make certain clarifications to the amendatory language promulgated on June 26, 1992 (57 FR 28628) in connection with a similar extension for contaminated debris. These changes do not alter that extension and are intended solely to clarify the Agency's original intention.

List of Subjects in 40 CFR Part 268

Hazardous waste, Reporting and recordkeeping requirements.

Dated: October 13, 1992.

Don R. Clay,

Assistant Administrator, Office of Solid Waste and Emergency Response.

For the reasons set out in the preamble, title 40, chapter I, of the Code of Federal Regulations is amended as follows:

PART 268--LAND DISPOSAL RESTRICTIONS

1. The authority citation for part 268 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6921, and 6924.

2. In Sec. 268.35 paragraphs (c), (d) and (e) are revised to read as follows:

Sec. 268.35 Waste specific prohibitions--Third Third wastes.

* * * * *

(c) Effective May 8, 1992, the following waste specified in 40 CFR 261.31 as EPA Hazardous Waste Numbers F039 (nonwastewaters); the wastes specified in 40 CFR 261.32 as EPA Hazardous Waste Number K031 (nonwastewaters); K084 (nonwastewaters); K101 (nonwastewaters); K102 (nonwastewaters); K106 (nonwastewaters); the wastes specified in 40 CFR 261.33(e) as EPA Hazardous Waste Numbers P010 (nonwastewaters); P011 (nonwastewaters); P012 (nonwastewaters); P036 (nonwastewaters); P038 (nonwastewaters); P065 (nonwastewaters); P087; and P092 (nonwastewaters); the wastes specified in 40 CFR 261.33(f) as EPA Hazardous Waste Numbers U136 (nonwastewaters); and U151 (nonwastewaters); the following wastes identified as hazardous based on a characteristic alone: D004 (nonwastewaters); and D009 (nonwastewaters); and RCRA hazardous wastes that contain naturally occurring radioactive materials are prohibited from land disposal.

(d) Effective May 8, 1992, hazardous wastes listed in 40 CFR 268.10, 268.11 and 268.12 that are mixed radioactive/hazardous wastes are prohibited from land disposal, except as provided in paragraph (e) of this section.

(e) Subject to applicable prohibitions in Secs. 268.30, 268.31, and 268.32, contaminated soil and debris are prohibited from land disposal as follows:

(1) Effective May 8, 1993, debris that is contaminated with wastes listed in 40 CFR 268.10, 268.11, and 268.12 (including such wastes that are mixed radioactive hazardous wastes), and debris that is contaminated with any characteristic waste for which treatment standards are established in subpart D of this part (including such wastes that are mixed radioactive hazardous wastes), are prohibited from land disposal.

(2) Effective May 8, 1993, hazardous soil having treatment standards in subpart D of this part based on incineration, mercury retorting or vitrification, and soils contaminated with hazardous wastes listed in 40 CFR 268.10, 268.11 and 268.12 that are mixed radioactive hazardous wastes, are prohibited from land disposal.

SUMMARY: On March 3, 1992 (57 FR 7628), the Environmental Protection Agenc (EPA) announced the interim final repromulgation of 40 CFR 261.3, including the "mixture" and "derived-from" rules. These rules are part of the definition of hazardous waste under Subtitle C of the Resource Conservation and Recovery Act (RCRA). The rules define "hazardous waste" to include mixtures of hazardous waste with other solid waste and the residue from managing listed hazardous waste. Today's notice restores language to 40 CFR 261.3 that the Agency inadvertently omitted from the interim final rulemaking.

TEXT:

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 261

(FRL-4136-8)

Hazardous Waste Management System; Definition of Hazardous Waste; "Mixture" and Derived-from" Rules

AGENCY: Environmental Protection Agency.

ACTION: Interim final rule; technical corrections.

SUMMARY: On March 3, 1992 (57 FR 7628), the Environmental Protection Agency (EPA) announced the interim final repromulgation of 40 CFR 261.3, including the "mixture" and "derived-from" rules. These rules are part of the definition of hazardous waste under Subtitle C of the Resource Conservation and Recovery Act (RCRA). The rules define "hazardous waste" to include mixtures of hazardous waste with other solid waste and the residue from managing listed hazardous waste. Today's notice restores language to 40 CFR 261.3 that the Agency inadvertently omitted from the interim final rulemaking.

DATES: This rule is effective on June 1, 1992.

FOR FURTHER INFORMATION CONTACT: Ms. Marilyn Goode, Office of Solid Wast (OS-332), U.S. Environmental Protection Agency, 401 M St., SW., Washington, DC 20460, (202) 260-8551.

SUPPLEMENTARY INFORMATION: On May 19, 1980, EPA promulgated regulations to govern the management of hazardous waste under RCRA, including the "mixture" and "derived-from" rules at 40 CFR 261.3. On December 6, 1991, the United States Court of Appeals for the District of Columbia ruled that the Agency had failed to give sufficient notice and opportunity for comment in promulgating the "mixture" and "derived-from" rules. The court therefore vacated the rules and remanded them to the Agency (Shell Oil v. EPA, No. 80- 1532 et al. (D.C. Cir., December 6, 1991)). At the invitation of the court, EPA reinstated 40 CFR 261.3 on an interim basis under section 553(b)(3)(B) of the Administrative Procedure Act (APA). This interim final rule was published on March 3, 1992 (57 FR 7628).

In reinstating the "mixture" and "derived-from" rules, the Agency neglected to include certain changes to 40 CFR 261.3 that had been promulgated in 1991.

The first change was an amendment to 40 CFR 261.3(d)(1) which EPA promulgated on January 31, 1991 (55 FR 3876). This amendment clarified that wastes exhibiting a hazardous characteristic at the point of generation may still be subject to the land disposal restrictions of 40 CFR part 268, even if the wastes no longer exhibit the characteristic at the point of land disposal.

The second change was an amendment to 40 CFR 261.3(c)(2)(ii)(B) which the Agency promulgated on July 17, 1991 (56 FR 32692). This amendment reflected the fact that on February 21, 1991, EPA has provided an exclusion from the definition of solid waste for coke and coal tar from the iron and steel industry that is used as a fuel and that contains or is produced from decanter tank tar sludge, EPA Hazardous Waste K087. The process of producing coke and coal tar from such decanter tank tar sludge in a coke oven was likewise excluded from regulation in that notice (56 FR 7206-7207). The conforming amendment published on July 17, 1991 deleted the cross-reference in 40 CFR 261.3(c)(2)(ii)(B) to wastes from burning coke and coal tar from the iron and steel industry that contain EPA Hazardous Waste No. K087.

The third change was an amendment to 40 CFR 261.3(c)(2)(ii), promulgated by the Agency on August 19, 1991 (56 FR 41176-41177). This amendment provided an exclusion from the "derived-from" rule for certain residues resulting from treating EPA Hazardous Waste No. K061 by high temperature metal recovery (40 CFR 261.3(c)(2)(ii)(C)).

The omission of these amendments in the March 3, 1992 interim final rule was unintentional. Today's notice restores all of the regulatory amendments described above which were mistakenly excluded from the March 3, 1992 reinstatement of 40 CFR 261.3. In addition, EPA is today deleting an outdated reference in 40 CFR 261.3(a)(2)(i) to the Extraction Procedure Toxicity Characteristic, and replacing it with a reference to the Toxicity

Characteristic, which has replaced the Extraction Procedure Toxicity Characteristic see (55 FR 11798, March 29, 1990).

Because this rulemaking action simply restores omitted text from a preexisting rule and makes other minor technical corrections, public comment is unnecessary (see 5 U.S.C. 553(b)(B)). For the same reasons, the Agency believes that there is good cause for making these changes effective immediately (see 5 U.S.C. 553(d)(3)).

Hazardous waste, Recycling, Reporting and recordkeeping requirements.

Dated: May 14, 1992.

Don R. Clay,
Assistant Administrator for Solid Waste and Emergency Response.

Technical Corrections

In rule document number 91-4255, beginning on page 7628 is the Federal Register published on Tuesday, March 3, 1992, make the following corrections:

PART 261--(AMENDED)

Sec. 261.3 (Corrected)

1. On page 7632, second column, in Sec. 261.3(a)(2)(i), lines 17 and 18, change "Extraction Procedure Toxicity characteristic" to "Toxicity Characteristic".

Sec. 261.3 (Corrected)

2. On page 7633, third column, in Sec. 261.3(c)(2)(ii)(B), line 3, change "Sec. 261.6(a)(3)(v) through (ix)" to "Sec. 261.6(a)(3)(v) through (viii)".

Sec. 261.3 (Corrected)

3. On page 7633, third column, in Sec. 261.3(c)(2)(ii), add paragraph Sec. 261.3(c)(2)(ii)(C) to read as follows:

(C) Nonwastewater residues, such as slag, resulting from high temperature metals recovery (HTMR) processing of K061 waste, in units identified as rotary kilns, flame reactors, electric furnaces, plasma arc furnaces, slag reactors, rotary hearth furnace/electric furnace combinations or industrial furnaces (as defined in 40 CFR 260.10(6), (7), and (12), that are disposed in Subtitle D units, provided that these residues meet the generic exclusion levels identified below for all constituents, and exhibit no characteristics of hazardous waste. Testing requirements must be incorporated in a facility's waste analysis plan or a generator's self-implementing waste analysis plan; at a minimum, composite samples of residues must be collected and analyzed quarterly and/or when the process or operation generating the waste changes.

The generic exclusion levels are:

Constituent	Maximum for any single composite sample (mg/1)
Antimony	0.063
Arsenic	0.055
Barium	6.3
Beryllium	0.0063
Cadmium	0.032
Chromium (total)	0.33
Lead	0.095
Mercury	0.009
Nickel	0.63
Selenium	0.16
Silver	0.30
Thallium	0.013
Vanadium	1.26

For each shipment of K061 HTMR residues sent to Subtitle D unit that meets the generic exclusion levels for all constituents, and does not exhibit any characteristic, a notification and certification must be sent to the appropriate Regional Administrator (or delegated representative) or State authorized to implement part 268 requirements. The notification must include the following information: (1) The name and address of the subtitle D unit receiving the waste shipment; (2) the EPA hazardous waste number and treatability group at the initial point of generation; (3) treatment standards applicable to the waste at the intital point of generation. The certification must be signed by an authorized representative and must state as follows: "I certify under penalty of law that the generic exclusion levels for all constituents have been met without impermissible dilution and that no characteristic of hazardous waste is exhibited. I am aware that there are significant penalties for submitting a false certification, including the possibility of fine and imprisonment."

Sec. 261.3 (Corrected)

4. On page 7633, third column, in Sec. 261.3(d)(1), line 4, add the following at the end of the line:

(However, wastes that exhibit a characteristic at the point of generation may still be subject to the requirements of part 268, even if they no longer exhibit a characteristic at the point of land disposal.)

SUMMARY: Under authority of the Resource Conservation and Recovery Act (RCRA) as amended by the Hazardous and Solid Waste Amendments of 1984 (HSWA), EPA is promulgating this final rule regarding the landfill disposal of containerized liquids mixed with sorbents. This rule satisfies the statutory requirement that EPA issue a rule that prohibits the disposals in hazardous waste landfills of liquids that have been sorbed in materials that biodegrade or that release liquids when compressed as might occur during routine landfill operations. This rule will help assure the stability of materials in hazardous waste landfills.

Hazardous Waste Management; Liquids in Landfills

AGENCY: Environmental Protection Agency.

ACTION: Final rule.

SUMMARY: Under authority of the Resource Conservation and Recovery Act (RCRA) as amended by the Hazardous and Solid Waste Amendments of 1984 (HSWA), EPA is promulgating this final rule regarding the landfill disposal of containerized liquids mixed with sorbents. This rule satisfies the statutory requirement that EPA issue a rule that prohibits the disposals in hazardous waste landfills of liquids that have been sorbed in materials

that biodegrade or that release liquids when compressed as might occur during routine landfill operations. This rule will help assure the stability of materials in hazardous waste landfills.

EFFECTIVE DATE: May 18, 1993.

ADDRESSES: The public docket for this final rule is docket reference code F- 92-CLIF-FFFFF, and the public dockets for the four proposals and supplemental notices are docket reference codes F-86-CLIP-FFFFF, F-87-CLLN-FFFFF, F-91- CLLA-FFFFF, and F-92-CCLA-FFFFF. These dockets are in room M2427, U.S. EPA, 401 M St. SW, Washington, DC 20460, and are open from 9 am to 4 pm, Monday through Friday, excluding holidays. Call 202-260-9327 for an appointment to review docket materials. Up to 100 pages may be copied free of charge from any one regulatory docket. Additional copies are $0.15 per page.

FOR FURTHER INFORMATION CONTACT: The RCRA/Superfund Hotline at 1-800-424-9346 (toll free), or 703-920-9810 in the Washington, DC area. For information on technical aspects of this rule, contact Ken Shuster, Office of Solid Waste (OS-340), U.S. EPA, 401 M St. SW, Washington, DC 20460, 202-260-2214.

SUPPLEMENTARY INFORMATION:

Preamble Outline

I. Authority

These rules are being issued under authority of section 3004(c) of the Solid Waste Disposal Act, as amended by the Resource Conservation and Recovery Act of 1976 and the Hazardous and Solid Waste Amendments of 1984; 42 U.S.C. 6924(c).

II. Background

A. Regulatory Background

Section 3004(c)(2) of HSWA requires EPA to issue final rules, by February 8, 1986, that "minimize the disposal of containerized liquid hazardous waste in landfills," that "minimize the presence of free liquids in containerized hazardous waste to be disposed of in landfills," and that "prohibit the disposal in landfills of liquids that have been absorbed in materials that biodegrade or that release liquids when compressed as might occur during routine landfill operations."

On April 30, 1985 (50 FR 18370) EPA issued a final rule requiring the use of the Paint Filter Liquids Test (PFT), Method 9095, to determine the presence of free liquids in either bulk or containerized waste. Wastes that fail the PFT--i.e., that contain free liquids--cannot be disposed of in landfills. This satisfied the requirement that EPA issue regulations minimizing the disposal of containerized liquid hazardous waste in landfills and minimizing the presence of free liquids in containerized hazardous waste to be disposed of in landfills./1/

NOTE /1/ Section 3004(c)(1) of HSWA prohibits the placement of bulk or noncontainerized liquid hazardous waste in landfills, and section 3004(c)(3) prohibits the placement of liquids which are not hazardous wastes in Subtitle C landfills unless certain demonstrations are made. The PFT is required to determine the presence of liquids or free liquids to comply with these prohibitions, 40 CFR 264.314(c) and 40 CFR 265.314(d).

On December 24, 1986 (51 FR 46824) EPA proposed a rule that would prohibit disposal of containerized liquids treated with sorbents that had more than one percent total organic carbon or TOC (as a measure of biodegradability). In the preamble, EPA recommended that the modified Mebius procedure (Page, A.L., ed., 1982, Methods of Soil Analysis) be used to determine the organic carbon content. EPA also proposed a Liquids Release Test (LRT), a confined compression type test, to simulate the release of liquids from sorbed wastes when compressed during landfill operations. The test relied on a device known as the Zero-Headspace Extractor (ZHE), which was developed in conjunction with the new Toxicity Characteristic Leaching Procedure (TCLP). Containerized sorbed wastes that failed these tests could not be disposed of in landfills.

The proposal was intended to satisfy the section 3004(c)(2) requirement that EPA "prohibit the disposal in landfills of liquids that have been absorbed in materials that biodegrade or that release liquids when compressed as might occur during routine landfill operations."

On June 24, 1987 (52 FR 23695) EPA issued a supplemental proposal regarding the definition of biodegradable in response to comments received on the one percent TOC requirement and on the recommended modified Mebius procedure. In this notice, EPA recommended two additional tests to determine biodegradability: ASTM Method G21-70 (1984a)--Standard Practice for Determining Resistance of Synthetic Polymer Materials to Fungi, and ASTM Method G22-76 (1984b)--Standard Practice for Determining Resistance of Plastics to Bacteria. The Agency also proposed to regulate sorbent pillows in a manner similar to lab packs.

On October 29, 1991 (56 FR 55646) EPA issued another supplemental notice, seeking comments on single and multi-laboratory test results on a revised Liquids Release Test device (also a confined compression type test). Finally, in response to further comments, EPA on May 1, 1992 (57 FR 18853) issued a notice of supplemental information seeking comment on use of the PFT versus the LRT for containerized sorbents.

In today's rule, EPA is taking final action on these proposals and notices of additional information, and is completing EPA's regulatory responsibilities under RCRA section 3004(c)(2).

B. Role of Sorbents in Liquid Hazardous Waste Disposal

Dozens of sorbents are on the market today. These sorbents are used to sorb free liquids in wastes before land disposal, thereby reducing the amount of leachate likely to be generated after disposal, or to sorb free liquids from a spill before they migrate. Some sorbents are by-products of other production processes which are typically discarded, such as fly ash from coal-burning, cement kiln dust from cement production, shredded and ground rubber from tires, shredded paper and sawdust, and corn cobs, peanut shells, and rice hulls from crop harvesting. They tend to be relatively cheap and are often readily available. Other sorbents are derived from mined natural minerals, such as bentonite or montmorillonite clays, diatomaceous earth, volcanic ash, lime and limestone, silicates, and vermiculite. Other common sorbents are synthetic organic polymers such as polyethylene, polypropylene, polyurethane, and polystyrene. Many commercial sorbents are mixtures of sorbent materials. Often these materials, especially the natural minerals, are treated by heat, grinding, sifting, or use of additives to enhance their sorptive capacities.

Sorption can be viewed in two ways: First, as the soaking up of liquid or fluid material so that the material no longer flows, and second, as the rendering of hazardous constituents immobile or less mobile, via attenuation, chemical reactions or fixation, ion exchange, precipitation, neutralization, or encapsulation (also referred to as chemisorption). Some sorbents act in both ways to one degree or another. The focus of today's rule is on the first view of sorbents. Even so, the ultimate selection of a sorbent is usually based on both aspects, as well as on a number of other factors discussed below.

Two very important, interrelated considerations in the selection of a sorbent are: (1) Stability (in terms of both maintaining liquids in an immobile matrix and immobilizing hazardous constituents), and (2) ultimate use or disposal of the sorbed material. If the sorbed material is to be disposed of in a landfill, the first consideration, long-term stability, is of paramount importance. Thus, nonbiodegradable sorbents able to hold up under pressure are desirable. If the sorbed material is to go to an incinerator, then such factors as energy content (Btu's), heavy metal content, and products of combustion are important; long-term stability is not. Thus, for incineration, organic sorbents, whether biodegradable or not, are generally desirable, depending on potential by-products of combustion (e.g., polyvinyl chloride which produces HC1 upon incineration or materials with heavy metals may be less desirable despite their Btu content, but peanut shells, shredded paper, or corn cobs may be desirable). Or, if the sorbed material is to go to a recycling facility (where it will be squeezed out and the oil, gasoline, solvent, or other material recovered), then squeezeability/releasability, without the sorbent breaking down, is desirable.

Some sorbents are more effective, i.e., have greater capacity and retention efficiencies and are faster, than others in soaking up liquids (some soak up considerably larger amounts of liquids per volume or weight of sorbent; some are structurally more stable and retain more liquids under pressure; and some actually react chemically with liquids, sometimes irreversibly, to form a nonliquid mass that further ensures stabilization). The effectiveness of a given sorbent often depends on the properties of the liquid to be sorbed.

This liquid is referred to as the sorbate. Some sorbents are considerably more effective with some sorbates than with others. For example, sorbents

that are both hydrophobic and less dense than water can be very effective in sorbing oils on water (oil spills) where they can be readily skimmed off the surface, whereas other sorbents would soak up more water and less oil, and would sink where they are not readily recoverable. Some sorbents substantially raise the flash points of solvents, decreasing flammability concerns. Some sorbents are ineffective because they are broken down or dissolved by certain sorbates (e.g., hydrofluoric acid breaks down silicates or glass). That is, chemical degradation of the sorbent can occur as well as biodegradation. Sorbent/sorbate properties that affect sorbency include: pH, porosity, surface area, potential capillarity and surface tension or affinity for a sorbate, polarity, and viscosity. Thus, there are technical factors affecting sorbent selection as well as economic and other practical factors, such as availability (especially timeliness in the case of a spill or emergency), cost, sorbent capacity (sorbate to sorbent ratio or percent, by volume and by weight, which affects total volume and weight and therefore cost to transport and use or dispose), and distance to site of use or disposal.

EPA considered these factors in developing today's rule, which is designed to facilitate technological advances and to allow flexibility for the treaters of liquids to select the most effective and practical solutions. The rule sets minimum standards regarding biodegradation and release of liquids that containerized wastes mixed with sorbents must meet before they can be landfilled. EPA did not attempt to evaluate the effectiveness of various sorbents beyond these minimums, nor did EPA attempt to identify efficient sorbate/sorbent combinations. Instead, today's rule allows the selection of the most effective sorbent for a specific situation, as long as it meets the rule's minimum standards.

III. Summary of Today's Rule

Today's rule adopts the Paint Filter Liquids Test, Method 9095, for the testing of containerized liquids to which sorbents have been added before land disposal; lists classes of nonbiodegradable sorbents, and gives examples in each class; and identifies two tests, either of which may be used to determine the nonbiodegradability of sorbents not within a class on the list.
It also requires the use of nonbiodegradable sorbents in lab packs.

IV. Detailed Discussion of the Final Rule

A. Definition of "Sorbents"

In RCRA section 3004(c)(2), Congress requires EPA to establish special standards for "liquids that have been absorbed in materials that biodegrade or that release liquids * * *" (emphasis added). Several commenters on EPA's proposals stated that Congress misused the term absorbed, and should have used the term adsorbed, or perhaps both terms. "Adsorbents" are materials that retain liquids on the surface of their particles by capillary action and surface tension. "Absorbents" retain liquids within the void spaces between particles and within the inner structure of the sorbing material. Discussion of the issue in the legislative history of HSWA clearly indicates that Congress meant adsorbents, as defined above, as well as absorbents. To reflect this clear Congressional intent, EPA uses the terms "sorbent" and "sorb" in today's rule, instead of the terms

"absorbent" and "absorb." These terms are defined in Sec. 260.10. "Sorbent" means a material that is used to soak up free liquids by either adsorption, or both. "Sorb" means to either adsorb or absorb, or both.

B. Paint Filter Liquids Test (PFT) Versus Liquids Release Test (LRT)

In its December 24, 1986, October 29, 1991, and May 1, 1992 Federal Register notices, EPA proposed and solicited comment on a Liquids Release Test (LRT) specifically designed to simulate the behavior or sorbed materials under compression that might occur during routine landfill operations. In December 1986, EPA proposed use of the Zero Head-Space Extractor (ZHE) device, which EPA was developing in conjunction with the new Toxicity Characteristic Leaching Procedure (TCLP). Because of technical concerns raised by commenters on the ZHE, EPA subsequently developed and tested a different compression type device. In the October 1991 proposal, EPA published the results of single and multi-laboratory tests using the new LRT device at 50 psi to simulate worst-case landfill pressures. The 50 psi was based on a 100 ft landfill depth and an overlying material bulk density of 70 lbs/cu ft. A survey conducted by EPA before the December 1986 proposal showed that most landfill depths were less than 60 ft, and the maximum depth was 100 ft.

Commenters continued to raise concerns about the practicality of the revised LRT noticed in October 1991, about perceived technical flaws with the test, and about the test's performance relative to the Painter Filter Liquids Test (PFT). In response, EPA published a supplemental notice in May 1992 soliciting comment on whether the PFT should be used in lieu of the LRT to satisfy the statutory requirements of section 3004(c)(2).

The overwhelming majority of commenters on EPA's May 1, 1992 notice as well as on earlier notices supported use of the PFT over the LRT for all landfilled hazardous wastes, including containerized sorbed liquid wastes. The major reasons commenters gave for preferring the PFT were:
(1) Although the PFT does not involve compression of the sorbed waste, it nonetheless reasonably simulates whether liquids will be released under pressure. In fact, EPA's test data show that in the case of sorbed water-based wastes the PFT gave results that were more conservative than the LRT "pressure" test (i.e., samples failed the PFT at lower moisture contents than in samples that failed the LRT at 50 psi).

(2) The LRT does not work well for testing samples sorbed with Imbiber Beads (R) and similar sorbents. Such materials, which are compressible and elastic, tend to be extruded through the small openings in the LRT device, indicating failure. Such extrusions, however, are not releases of liquids and should not be so interpreted. This "false positive" problem does not exist with the PFT.

(3) The PFT has been required and used since June 1985, whereas commenters raised a number of technical questions with the LRT (e.g., reproducibility, sample size, sample preparation and placement, pressure amount, pressure application rate, test duration, temperature, and lack of test data on a number of sorbent/sorbate combinations).

(4) The PFT is a simpler test, more easily conducted, and simpler to clean up after (the LRT device is especially difficult and time consuming to clean after testing materials like Imbiber Beads (R), whereas the PFT

device is not); it involves a significantly cheaper testing process (equipment and labor); its use eliminates the need for facilities to stock two types of test apparatus for similar purposes and to train personnel in the use of the LRT; and its use avoids potentially significant delays in safe disposal of wastes, since the PFT set-up, test, and clean-up time (10-15 minutes/sample) is significantly less than the LRT (25-75 minutes/sample).

(5) Use of the PFT for containerized sorbed waste would result in consistent environmental performance testing of all materials going into a landfill (whether containerized or not, whether treated with sorbents or not) in terms of the potential for releasing liquids.

(6) The major source of liquids in landfills is precipitation; relative to this, the environmental significance of any difference between the PFT and the LRT is very small (even without consideration of the additional protection afforded by the land disposal restrictions and double liners/ leachate collection requirements for landfills).

Except for the technical questions raised in point (3) above, EPA agrees with these comments, concluding that the PFT is generally a more appropriate test than the LRT for the statutory purpose. By comparing the LRT test results to the PFT test results, EPA has been able to use the LRT to show that the PFT reasonably simulates and serves as a surrogate for a 50 psi pressure test for water-based wastes. Therefore, the additional cost, difficulty, and time for the LRT are unjustified.

At the same time, EPA disagrees that the LRT reproducibility/technical issues raised by the commenters (see 3 above) pose major problems, since sufficient test data exist either to justify the current specification or a modified specification. Further, in developing test methods, EPA need not test every possible matrix at every concentration/saturation level to demonstrate that the method is reproducible and valid. For the LRT, developmental and validation tests were performed on a set of sorbent/sorbate combinations spanning the array of materials expected to be subject to the test method. This is consistent with the approach EPA has taken in developing and validating other RCRA hazardous waste test methods.

The only concern with the PFT is its performance where oily-based wastes are the sorbates. Test data on oily-based sorbates show that the LRT is more conservative than the PFT for this category. EPA, however, notes that this issue is not particular to sorbed wastes. For all oily wastes--not merely sorbed oily wastes--there are wastes that may flow as a liquid but that do not filter within the 5 minute test and, therefore, are not defined as "liquids" under the PFT. Thus, this issue is beyond the scope of today's rulemaking. EPA recognizes that testing procedures for oily waste that can flow in the environment, whether sorbents have been added or not, may need to be improved. EPA is now studying this issue and is considering possible revisions of test procedures, which may be as simple as extending the duration of the PFT and/or using a pressure plate in the PFT for oily wastes.

At the same time, EPA recognizes that such improvements may be unnecessary or of low priority, given that land disposal of oily hazardous wastes is or will soon be strictly controlled by the land disposal restrictions.

For these reasons, EPA is today retaining the PFT, or Method 9095, as the test to be used to determine if liquids will be released from containerized sorbed wastes. This will simplify the proposed testing requirements since

the PFT is already required for all treated and nontreated, sorbed and nonsorbed, containerized and bulk wastes. That is, no wastes disposed in hazardous waste landfills can contain free liquids, as determined by the PFT. This approach provides equal treatment for all landfilled wastes. Also, by adopting the PFT instead of the LRT, the Agency does not have to address the special situation of various sorbent materials that cause problems in the LRT device (e.g., Imbiber Beads(R)). Since the PFT is already required, no changes to the existing regulations are needed for this requirement.

Chemical Fixation/Stabilization. Several commenters argued that chemically stabilized wastes should be exempted from the LRT, primarily because the device either is ruined or does not work well with these materials.
Commenters also argued that chemically fixed wastes should not be classified as sorbed wastes, even though some sorption might take place. Since EPA is not adopting the LRT, this issue is moot.

C. Biodegradability

Many commenters discussed EPA's proposals regarding how to define biodegradable sorbents, and suggested that EPA provide a combination of (1) lists or categories of acceptable and unacceptable sorbents, (2) tests that can be used to determine biodegradability, and (3) other criteria (e.g., environmental stability data). Commenters argued that a combination of options is needed because no one test or definition would be universally applicable (e.g., for inorganic materials with no carbon, the ASTM tests are not necessary), and a list alone would not be all inclusive. Commenters in particular discussed what tests and/or criteria EPA should establish, which sorbents EPA should list, when and by whom the different tests should be performed, and the number of tests that would be necessary.

"Biodegradation" is the process by which bacteria and fungi (microorganisms) consume (metabolize or decompose) an organic material.
Generally, materials that do not contain carbon, and inorganic materials that contain carbon, such as calcium carbonate ($CaCO_3$), are considered to be nonbiodegradable for the purposes of this rule. Commenters pointed out that biodegradation potential exists where a material contains organic carbon, but not all organic carbon is readily available to microorganisms. In fact, very little biodegradation, if any, occurs over periods of many years with some materials containing organic carbon. For example, commenters presented information demonstrating that high-molecular weight synthetic organic polymers such as high density polyethylene and polypropylene are nonbiodegradable. In addition, as EPA noted in its June 24, 1987 proposal, several laboratory tests have been used successfully to determine whether a material is biodegradable.

In response to public comments, today's rule allows two options, in Secs. 264.314(e) and 265.314(f), for defining nonbiodegradability. The rule (1) provides descriptions of classes of sorbent materials, and lists of sorbent materials as examples in each class, that are nonbiodegradable and therefore acceptable without further testing; and (2) provides two tests for sorbents not listed or not falling within one of the classes listed. A sorbent that passes either of these tests is nonbiodegradable and is therefore acceptable for landfill disposal in containers (providing, of course, that the sorbed waste passes the PFT).
Lists of Nonbiodegradable Material. In the first option, EPA has listed three classes of nonbiodegradable sorbent materials.

The first class consists of three types of materials: (1) Naturally occurring inorganic minerals (e.g., clay, diatomaceous earth), (2) man-made inorganic materials, which are often modified natural minerals (e.g., calcined montmorillonite, cement kiln dust, fly ash), and (3) elemental carbon (e.g., activated charcoal).

The second class comprises high molecular-weight synthetic organic polymers (e.g., high density polyethylene).

The third class is made up of mixtures of the nonbiodegradable sorbent materials within the first or second classes.

EPA has concluded that these materials are nonbiodegradable because (1) the inorganic minerals and other inorganic materials do not contain carbon, they contain only inorganic or elemental carbon, or they contain insignificant amounts of organic carbon, and (2) the high-molecular weight synthetic organic materials (i.e., polymers) have proved to be highly resistant to biodegradation.

EPA received numerous comments that synthetic polymeric materials, or specific polymers, should be excluded from the definition of biodegradable. While sorbents derived from natural polymeric materials such as cellulose and starch are generally readily biodegradable, by comparison, high molecular weight synthetic organic polymers generally resist biodegradation.

Biodegradability of synthetic polymers decreases as molecular weight increases. This is partly because the long chains of high molecular weight synthetic polymers tend to provide relatively few places for degradation to occur since microorganisms are generally only able to effectively attack at the ends of the chains. That is, the microbial enzymes are unable to break the backbone linkage of the long polymer chains into smaller molecules, attacking, instead, only the terminal ends and any amorphous parts of the polymer chains. Other characteristics of synthetic polymers thought to contribute to their resistance to biodegradation include: Many are hydrophobic or water repellant (microorganisms need water); they resist enzymatic attack because of their density, orientation, degree of crystallization, and bonding characteristics; and some contain antioxidants or biocidal additives. Whatever the mechanisms, test data and environmental experience show these synthetic polymers to be resistant to biodegradation.

Even where there is evidence that plasticizers and other additives to polymer products are degraded, the synthetic polymeric materials themselves generally are not degraded. EPA is aware of research efforts to develop biodegradable polymers and to enhance biodegradation of synthetic polymers. In most cases, this effort has been based on biopolymers, or materials of biological origin, e.g., cellophane. These materials are explicitly excluded from the definition of nonbiodegradable in today's rule. Also included in the final rule is a restriction that the synthetic polymers not be specifically designed to biodegrade, since plastics can be designed to be relatively biodegradable by adding prooxidants, biodegradable additives (e.g., starch), and other additives that help initiate chemical degradation which make the polymers more susceptible to biological attack.

EPA has also included in today's rule the stipulation that only "high molecular weight" polymers be classified automatically as nonbiodegradable. Low molecular weight polymers--e.g., with average molecular weights of less than a few thousand--may in certain circumstances be biodegradable.

While such materials are generally not suitable as sorbents because of their physical properties, EPA nonetheless believes that they should be excluded from the classification in today's rule. At the same time, EPA does not believe it is necessary or appropriate to draw a specific line defining "high" molecular weight. Effective polymeric sorbents currently in use today generally have molecular weights in the 10's or 100's of thousands, or even in the millions. These are clearly high molecular weights. Below these levels, as polymers approach the low 1000's in molecular weight, professional judgment must come into play in assessing a substance's degradability.

For each category of acceptable sorbents, EPA has listed specific examples in the rule. The materials listed as examples in the rule are not intended to be all-inclusive, but merely to exemplify and help clarify the classes of acceptable sorbents. EPA recognizes that some of the examples are generic (e.g., clays, smectites) that include a number of materials, some of which are also listed separately; that some of the terms are to a certain extent redundant or overlapping; and that some are very specific chemicals. The materials cited are types of nonbiodegradable materials most commonly used as sorbents and most frequently referred to in the public comments and literature. This use of lists, the examples listed, and the classes described, are consistent with the legislative history, which states: "Examples of absorbents that are likely to be found to be acceptable (for both nonbiodegradation and pressure stability reasons) are the chemical reagents discussed above (cement- or lime-based materials, pozzolanic materials, and thermoplastic or organic binders) and fine-grained earthen materials (e.g., bentonite, montmorillionite (sic), kaolinite, and Fuller's earth)" (July 25, 1984, Congressional Record--Senate, S9177).

EPA has not attempted to define or list biodegradable, or unacceptable, sorbent materials in the rule. Since the Agency has defined nonbiodegradable material, it believes that defining biodegradable materials would be redundant. However, EPA notes that certain materials are well known to be biodegradable and would not be acceptable under today's rule. For example, cellulosic or biosynthesized materials are clearly biodegradable (e.g., sawdust, wood fiber or pulp, shredded paper, straw, ground corncobs, ground peanut hulls, municipal waste). These materials do not fall into any of the acceptable categories of sorbents, and they would clearly fail any test of nonbiodegradability. Consequently, they may not be used to sorb liquids in wastes which are subsequently disposed of in a landfill (except as noted below). This is consistent with the legislative history of section 3004(c), which listed sawdust, municipal waste, and shredded paper as examples of biodegradable sorbents, and therefore unacceptable (ibid). These biodegradable sorbents may, however, be used to sorb liquids in wastes which are then treated in accordance with RCRA treatment standards. In this case, the residual may be landfilled, provided it meets all applicable requirements, e.g., it is no longer a liquid. For example, wastes mixed with biodegradable sorbents may be incinerated and then the residual or ash, which is no longer liquid, no longer sorbed waste, and no longer biodegradable, may be landfilled.

EPA recognizes that some inorganic materials or elemental carbon could contain some level of organic carbon. EPA does not intend that these materials necessarily be classified as biodegradable or necessarily be required to be tested for biodegradability. At the same time, EPA wants to make it clear that inorganic materials are considered to be biodegradable if they have been mixed with significant amounts of biodegradable materials

(e.g., with sawdust or ground corncobs), or if they are significantly "contaminated" with organic soils or materials.

In today's rule, EPA has not attempted specifically to define the degree of "contamination" or mixing that would render an inorganic, carbon, or synthetic organic polymeric material ineligible. Commenters, however, provided a significant amount of information on total organic carbon content of materials generally recognized as nonbiodegradable. For example, rice hull ash generally contains 2-6% total organic carbon; fly ash suitable as a sorbent or stabilizer may contain 2-8%. EPA, therefore, concludes that sorbents otherwise meeting the criteria of today's rule should not be excluded or require testing because of organic carbon content within these ranges. For mixtures above these ranges (i.e., above 8%), the mixture sorbent would have to be tested or demonstrated that it is nonbiodegradable.

Tests of Biodegradable Material. In the second option, if a sorbent is not in a class listed in the regulations, then a test must be conducted or a demonstration made. The tests/demonstrations are: (1) The sorbent material is shown to be nonbiodegradable using ASTM Method G21-70 (1984a)--Standard Practice for Determining Resistance of Synthetic Polymer Materials to Fungi; or (2) the sorbent material is shown to be nonbiodegradable using ASTM Method G22-76 (1984b)--Standard Practice for Determining Resistance of Plastics to Bacteria.

The ASTM tests, identified in EPA's June 24, 1987 proposal, are already required by the U.S. Nuclear Regulatory Commission for radioactive wastes to prove their resistance to biodegradation. The ASTM tests are 21-day tests, using specific bacteria and fungi cultures. After the 21-day incubation period, the test material is inspected for growth, which is evidence of biological activity and an indication of biodegradation. Although commenters supported use of these tests, at least one commenter warned of the possibility of false positives (i.e., a nonbiodegradable material might show up in the test as biodegradation). EPA agrees that this is possible. In these cases, the additional ASTM chemical, electrical, and physical tests regarding structural changes listed in the bacterial and fungal test methods can be used to determine whether there is indeed biodegradation or not; or the tests can be rerun.

In the December 24, 1986 notice, EPA proposed to define biodegradability on the basis of total organic carbon content, and the Agency suggested that use of the modified Mebius procedure to determine that content (Page, A.L., ed., 1982, Methods of Soil Analysis, Part 2, Chemical and Microbial Properties, Second Edition, No. 9, Part 2, American Society of Agronomy, Inc. Madison).

Commenters were generally opposed to this approach, in part because EPA's proposed TOC level (1%) would eliminate many high-performing sorbents (e.g., pozzolanic materials and synthetic polymers), and in part because of technical issues related to the appropriateness of the test (e.g., it does not distinguish between elemental carbon and organic carbon). Therefore, EPA has not included in today's rule a TOC criterion. Nevertheless, EPA notes that the modified Mebius test might be used to demonstrate that a material fits on the list as an inorganic with less than 8% TOC i.e., that it is acceptable as a sorbent under Secs. 264.314(e)(1)(i) and 265.314(f)(1)(i).

Alternative Demonstrations/Tests of Biodegradability. A number of commenters encouraged EPA to accept alternative tests, or engineering judgment in addition to the identified tests. EPA agrees that other tests exist, but has decided to limit the final rule to those tests EPA proposed since specific alternatives were not discussed. Also, some flexibility for engineering judgment has been provided in the lists and descriptions in Secs.
264.314(e)(1) and 265.314(f)(1). Therefore, EPA has not gathered and reviewed data on other tests and proposed them for inclusion in today's rule. Instead, EPA decided to require that such demonstrations be made under the already established Part 260 petition process.

D. Spill Cleanups

Numerous commenters recommended that EPA exempt (from the biodegradability and liquids release requirements in the proposed rule) sorbents used in emergency spill cleanups. One commenter, however, suggested exempting only sorbents used for true emergency spills, as contrasted to routine spills at locations where sorbents are (or should be) routinely stockpiled. The basis of this commenter's suggestions was that sorbents that meet the proposed LRT and nonbiodegration criteria are readily available on this market and therefore should be used where a spill can be expected. The commenter, however, also suggested exempting from the LRT the hydrophobic sorbents that are used to clean up oil spills on water, because sorbents currently available for oil spills on water do not meet the proposed criteria.

In today's rule EPA has not provided an exemption for either routine spills or emergencies. Most of the commenters supporting an exemption for emergencies argued that the LRT duration could cause delays and disrupt proper cleanups. Also, commenters were concerned that many sorbents commonly used in cleanups (e.g., Imbiber Beads(R) and sorbent pillows) cannot be effectively tested in the LRT, and might not meet EPA's definition of nonbiodegradability (as originally proposed). Today's rule, however, requires the simpler and faster PFT, which is already required and should not cause such delays. Furthermore, Imbiber Beads(R) and similar materials would generally qualify as nonbiodegradable under today's rule, as they are made of high-molecular-weight synthetic polymers. EPA, therefore, agrees with the commenter that an exemption should not be provided for routine spill situations, where sorbents are stockpiled, since response teams can stockpile and use nonbiodegradable sorbents. Furthermore, EPA believes that a special exemption for "emergency" spill cleanups is inappropriate. In the first place, EPA notes that a wide range of sorbents acceptable under today's rules--including most now commonly in use--are available for emergency spill cleanups. In the second place, it is not clear that the statute provides EPA the authority to exempt certain sorbents from the requirements of Sec.
3004(c)(2), and in any case an exemption for certain (but not all) cleanup situations would be difficult to implement and enforce.

EPA, however, emphasizes that today's rule does not prohibit the use of biodegradable sorbents (e.g., sawdust, corn cobs, etc.) in spill cleanups. In fact, many commenters pointed out that such materials have an important role in cleanups, particularly where sorbed wastes will be recycled or incinerated. The rule, instead, merely prohibits landfilling of such wastes after the cleanup; incineration, recycling, or other treatment, would remain as options. In fact, direct landfilling of these wastes would

already be prohibited, in most cases, by the land disposal restrictions. Therefore, today's rule is unlikely to have significant effect on cleanups.

One commenter asked EPA to clarify that contaminated soils cleaned up during a spill response would not be subject to today's rule affecting sorbents. EPA agrees that contaminated soils are not subject to today's rule.

The rule covers sorbents added to liquid hazardous wastes for the purpose of solidifying or stabilizing the wastes. For contaminated soils, the situation is different. The soils are not added to wastes to eliminate liquids; rather, the contaminated soil is, in effect, the waste as it was generated. Thus, the soil is not a sorbent, and the question of its biodegradability does not arise. Landfilling of the soil, however, would of course remain subject to the land disposal restrictions.

E. Sorbent Pillows

Commenters on the December 24, 1986 proposal argued that EPA should exempt sorbent pillows used to control spills and leaks, primarily so that LRT testing would not impede such efforts because of the difficulties in getting representative samples and time delays to do the testing. In the June 24, 1987 supplemental notice, EPA proposed to exempt sorbent pillows used to control spills or leaks, including socks, wipes, and rags, in a manner similar to lab packs. Under this proposal, the sorbent pillows would have to be nonbiodegradable, be surrounded by enough additional unused nonbiodegradable sorbent material to sorb any releases, and be placed in certain specified containers of 110 gallon capacity or less. Further, the sorbent pillows would still need to pass the PFT and only sorbent pillows could be placed in the same container.

Since the PFT rather than the LRT is required in today's rule, the exemption for sorbent pillows from the LRT is no longer needed. In fact, the proposed exemption, imposing the lab pack requirements in lieu of the LRT, would not be more restrictive than the approach in today's rule. Imposing the lab pack requirements would now treat sorbent pillows more stringently than other sorbed wastes, would complicate remediations, would add to the waste volume to be disposed, would be vague (how much additional sorbent is enough) and difficult to enforce, and would be generally unnecessary, given the land disposal restrictions requirements. Therefore, the Agency is not providing an exemption for sorbent pillows in today's rule.

Commenters also raised questions about the status of rags and wipes. After reviewing the descriptions and examples given in the legislative history, EPA has concluded that rags and wipes are not the types of materials Congress had in mind and should not be considered to be sorbents in the context of today's rule. In discussing sorbent materials Congress did not include rags and wipes nor materials that rags or wipes are made from in the lists of sorbent materials Congress anticipates EPA will find to be acceptable and unacceptable. The legislative history lists sawdust, municipal waste, shredded paper, and certain vermiculites as unacceptable sorbents, and chemical reagents (cement- or lime-based materials, pozzolanic materials, and thermoplastic or organic binders) and fine-grained materials (e.g., bentonite, montmorillonite, kaolinite, and Fuller's Earth). All of these materials are used to treat large quantities of liquids or to soak up relatively large quantities of spills. Rags and wipes on the other hand are used to clean off soiled or wet surfaces. Thus,

today's rule does not change the regulatory treatment under Subtitle C of rags and wipes used in the traditional manner; however, if rags and wipes are used like sorbents, e.g., by putting them in a drum to soak up free-standing liquids, then they need to comply with the nonbiodegradability requirements.

F. Lab Packs and Other Exemptions

The current rules exempt lab packs, very small containers such as ampules, and products that contain liquids for uses other than storage (e.g., batteries) from the liquids in landfills prohibition. These exemptions are consistent with the "minimize liquids in containers" language in the statute, and they are supported by the legislative history. Lab packs are small containers of liquids (typically of one gallon or less), most commonly used for laboratory wastes, that are placed in a drum and surrounded by sufficient sorbent material to sorb the liquids should the containers fail. EPA agrees with the commenters who said the rules should continue to allow the lab pack, ampule, and product container exemptions, with the exception that the rules should be revised to require that lab pack sorbents be nonbiodegradable, for the same reasons that liquids in containers should be sorbed with nonbiodegradable sorbents. Nonbiodegradable sorbents will not degrade, and therefore will not help to produce subsidence and release of liquids when the drums fail. Lab packs are planned management activities in which it is practical to use nonbiodegradable sorbents, and a wide variety of such sorbents are readily available.

G. Waste Analysis and Recordkeeping

In its December 24, 1986 notice, EPA proposed to amend the waste analysis section (Secs. 264.13(b)(6) and 265.13(b)(6)) and the recordkeeping sections (Secs. 264.73(b)(3) and 265.73(b)(3)) to add references to the specific paragraphs within Secs. 264.314 or 265.314 that contain the PFT and the proposed LRT and TOC test requirements. EPA also proposed that a landfill facility's waste analysis plan include procedures that the owner/operator of an offsite landfill will use to determine whether a generator added a biodegradable sorbent to containerized hazardous waste (Secs. 264.13(c)(3) and 265.13(c)(3)).

EPA received numerous comments on these requirements, many addressing the broader issue of who is responsible for waste analysis. In particular, commenters expressed concern that EPA was requiring duplicative testing on the part of landfill owner/operators, and that the responsibility for testing should fall on the generator, the treater, or the sorbent manufacturer rather than the landfill owner/operator. A number of commenters, for example, recommended that EPA require sorbent manufacturers to certify that a sorbent is nonbiodegradable, and that the manifest should be amended to require that the certification be attached.

EPA understands the concerns of the commenters, but it believes that the rule as proposed is sufficiently flexible to accommodate them. Therefore, in today's rule EPA has made only limited changes to the proposal.

First, EPA has eliminated the proposed language added to Secs. 264.13(b)(6), 265.13(b)(6), 264.73(b)(3), and 265.73(b)(3) because these

already refer to Secs. 264.314 or 265.314. It is not necessary to identify the specific paragraphs in these sections that refer to the PFT and the biodegradation standards.

Second, EPA has retained the proposed requirements of Secs. 264.13(c)(3) and 265.13(c)(3) for off-site landfills, with slight rewording to clarify that off-site treaters as well as generators may be adding sorbents. These sections ensure that commercial off-site landfill owner/operators specify in their Waste Analysis Plans the procedures they plan to use to assure compliance.

In response to the commenters described above, EPA emphasizes the flexibility of its approach toward biodegradability in today's rule. The rule does not prescribe how a landfill owner/operator must verify that sorbents are nonbiodegradable--only that the Waste Analysis Plan describe the procedures the landfill owner/operator will use to determine compliance. For on-site disposal, this requirement will be easy to meet. For off-site disposal, EPA expects that the landfill operator will generally rely on information provided by the generator or treater. For example, a landfill operator might require generator notification where sorbents have been used, and certifications that the specific sorbent used meets the criteria of Secs.

264.314(e) or 265.314(f), along with confirmatory data. EPA generally believes such an approach would be appropriate and sufficient. Consistent with today's rule, however, EPA believes that the specific procedures are best addressed on a site-by-site basis. Today's rule provides the flexibility for such an approach.

H. Free-Standing Liquids

Section 264.314(d) states: "Containers holding free liquids must not be placed in a landfill unless: (1) All free-standing liquid: (i) Has been removed by decanting, or other methods; (ii) has been mixed with absorbent or solidified so that free-standing liquid is no longer observed; or (iii) has been otherwise eliminated" (emphasis added). The same requirement appears in Sec. 265.314(c). Sections 264.314(c) and 265.314(d) state that "To demonstrate the absence or presence of free liquids in either a containerized or a bulk waste, the following test must be used: Method 9095 (Paint Filter Liquids Test)" (emphasis added).

In the December 24, 1986, proposal, EPA stated that it saw an inconsistency between these two requirements--on the one hand, containerized wastes containing free liquids could be placed in a landfill, if the liquids were removed (e.g., decanted, Sec. 264.314(d)), and on the other hand, containerized wastes containing free liquids (as defined by the Paint Filter Test) were prohibited from placement in a landfill (Sec. 264.314(c)).

Consequently, EPA proposed to delete Secs. 264.314(d)(1) and 265.314(c)(1), making it clear that wastes placed in landfills cannot contain free liquids, as defined by the PFT.

No comments were received on this proposal. However, after reexamining the regulations, EPA has reached the conclusion that they are not inconsistent. Instead, the regulations spell out two different requirements: (1) That landfilled wastes meet the PFT, and (2) that free-standing liquids in containerized wastes be decanted or otherwise eliminated before land disposal. Containerized wastes must meet both

requirements. EPA sees no reason to modify or eliminate the independent prohibition on free-standing liquids, on the grounds that it is inconsistent or redundant. In fact, EPA has found the requirement a useful enforcement tool, and has no evidence that the regulated community has been confused by it. Therefore, EPA has decided not to finalize the proposed change.

I. Implementation

As discussed in Section V.A. of this preamble, today's rule is promulgated under the authority of the Hazardous and Solid Waste Amendments (HSWA). Therefore, it will become effective in RCRA-authorized and nonauthorized States six months from the publication of this notice.

Interim status facilities will be subject to today's rule on its effective date. Therefore, these facilities should modify their waste analysis plans and procedures appropriately by that date. On the other hand, under EPA's regulations, RCRA permits generally provide a shield against new regulatory requirements (Sec. 270.4). Therefore, permitted facilities may continue to operate under their existing permits (and their waste analysis plans) until EPA modifies the permit in accordance with Sec. 270.41 or as part of a 5-year land disposal permit review, or until the permit terminates and a new permit is issued.

V. State Authority

A. Applicability of Rule in Authorized States

Under section 3006 of RCRA, EPA may authorize qualified States to administer and enforce the RCRA program within the State. Following authorization, EPA retains enforcement authority under sections 3008, 3013, and 7003 of RCRA, although authorized States have primary enforcement responsibility. The standards and requirements for authorization are found in 40 CFR part 271.

Prior to the Hazardous and Solid Waste Amendments of 1984 (HSWA), a State with final authorization administered its hazardous waste program in lieu of EPA's administering the Federal program in that State. EPA could not issue permits for any facilities that the State was authorized to permit. When new, more stringent Federal requirements were promulgated, the State was obliged to enact equivalent authority within specified time frames. New Federal requirements did not take effect in an authorized State until the State adopted the requirements as State law and was authorized for the requirements.

In contrast, under RCRA section 3006(g), new requirements imposed by HSWA take effect in authorized States at the same time that they take effect in non-authorized States. EPA is directed to carry out these requirements in authorized States, including the issuance of permits, until the State is granted authorization to do so. While States must still adopt HSWA-based provisions as State law to retain authorization, the HSWA-based requirements apply in authorized States in the interim.

Today's final rule for containerized liquids in landfills is issued under RCRA section 3004(c), which was added by HSWA. These HSWA-based

requirements are being added to Table 1 in 40 CFR 271.1(j), which identifies the Federal program requirements that are promulgated pursuant to HSWA and take effect in all States, regardless of their authorization status. As noted above, EPA will implement these HSWA-based sections in today's rule in authorized States until the State programs are modified to adopt these rules and the modification is approved by EPA. Because these requirements are finalized pursuant to HSWA, a State submitting a program modification may apply to receive either interim or final authorization under RCRA section 3006(g)(2) or 3006(b), respectively, on the basis of State requirements that are equivalent or substantially equivalent to EPA's. The procedures and schedule for State program modifications for either interim or final authorization are described in 40 CFR 271.21. The deadline by which the States must modify their programs to adopt today's rule is (July 1, 1994).

B. Effect on State Authorizations

Section 40 CFR 271.21(e)(2) requires States that have final authorization to modify their programs to reflect Federal program changes and to submit the modification to EPA for approval. The deadline by which the State must modify its program to adopt this regulation is determined by the promulgation date in accordance with 40 CFR 271.21(e). These deadlines can be extended in certain cases (40 CFR 271.21(e)(3)). Once EPA approves the modification, the State requirements become Subtitle C RCRA requirements.

Authorized States are only required to modify their programs when EPA promulgates Federal regulations that are more stringent or broader in scope than the existing Federal regulations. For Federal program changes that are less stringent or reduce the scope of the Federal program, States are not required to modify their programs. This is a result of RCRA section 3009, which allows States to impose regulations in addition to those in the Federal program. EPA has determined that today's containerized liquids in landfills rule is more stringent than the current Federal regulations. Therefore, authorized States are required to modify their programs if needed to adopt regulations that are equivalent or substantially equivalent to today rule.

States with authorized RCRA programs may already have requirements similar to those in today's rule. These State regulations have not been assessed against the Federal regulations being finalized today to determine whether they meet the tests for authorization. Thus, a State is not authorized to implement these requirements in lieu of EPA until the State program modification is approved. Of course, States with existing standards may continue to administer and enforce their standards as a matter of State law.

In implementing the Federal program, EPA will work with States under agreements to minimize duplication of efforts. In many cases, EPA will be able to defer to the States in their efforts to implement their programs rather than take separate actions under Federal authority.

States that submit official applications for final authorization less than 12 months after the effective date of these regulations are not required to include standards equivalent to these regulations in their application.

States that submit official applications for final authorization 12 months or more after the effective date of these regulations must include standards equivalent to these regulations in their application. The

requirements a State must meet when submitting its final authorization application are set forth in 40 CFR 271.3.

VI. Regulatory Requirements

A. Economic Impact Analysis

Executive Order 12291 (Section 3(b)) requires regulatory agencies to prepare Regulatory Impact Analyses for all "major" rules. Today's rule is not a major rule because it will not result in: an annual effect on the economy of $100 million or more; a major increase in costs or prices for consumers, individual industries, Federal, State, and local government agencies, or geographic regions; or significant adverse effects on competition, employment, investment, productivity, innovation, or international trade.
Therefore, the Agency has not prepared a Regulatory Impact Analysis for today's rule.

EPA did, however, review costs associated with this rule in "Economic Impact Analysis of Liquids in Landfills Rule Regarding Containerized Sorbents." The total additional annualized costs of implementing this rule are estimated to be under $1 million. The implementation costs are minimal because hazardous waste landfills must already use the Paint Filter Test (for all wastes, not just sorbed wastes), and most sorbents currently in use need not be tested for biodegradability because they are clearly identified as acceptable on the nonbiodegradables lists in the rule or as unacceptable on the biodegradables list provided as guidance in the preamble. The rest need be tested only once per sorbent type for nonbiodegradability (it is the sorbents that are tested for biodegradation, not the wastes). For those sorbents that are currently used that are unacceptable, there are readily available sorbents of comparable costs and efficiencies so that the economic impact of such substitutions are minimal.

This rule has been reviewed by the Office of Management and Budget in accordance with Executive Order 12291.

B. Regulatory Flexibility Act

The Regulatory Flexibility Act of 1980 (5 U.S.C. 601 et seq.) requires Federal regulatory agencies to prepare a Regulatory Flexibility Analysis (RFA) for all regulations that have "a significant economic impact on a substantial number of small entities." Today's rule, as EPA's economic analysis indicates, will involve only a trivial increase in costs for regulated industry. Therefore, EPA certifies that today's regulation will not have a significant economic impact on a substantial number of small entities.
As a result, no Regulatory Flexibility Analysis is needed.

C. Paperwork Reduction Act

The information collection requirements in this rule have been approved by the Office of Management and Budget (OMB) under the Paperwork Reduction Act, 44 U.S.C. 3501 et seq. and have been assigned control number 2050-0125.

The public reporting burden for this collection of information is estimated to average 3.6 hours per response for the first year and 0.8 hours per response in subsequent years. This burden includes time for reviewing the regulations, searching existing data sources, gathering and maintaining the required data, and completing and reviewing the collection of information.

Send comments regarding the burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden, to Chief, Information Policy Branch, PM-223Y, U.S. Environmental Protection Agency, 401 M Street, SW, Washington, DC 20460 and to the Office of Information and Regulatory Affairs, Office of Management and Budget, Washington, DC 20503, marked "Attention: Jonathan Gledhill".

VII. Supporting Documents

The following document has been prepared in support of this rulemaking and placed in docket F-92-CLLF-FFFFF.

"Economic Impact Analysis of Liquids in Landfills Rule Regarding Containerized Sorbents," EPA, October 23, 1992.

List of Subjects

40 CFR Part 260

Administrative practice and procedure, Confidential business information, Hazardous waste.

40 CFR Part 264

Air pollution control, Hazardous waste, Insurance, Packaging and containers, Reporting and recordkeeping requirements, Security measures, Surety bonds.

40 CFR Part 265

Air pollution control, Hazardous waste, Insurance, Packaging and containers, Reporting and recordkeeping requirements, Security measures, Surety bonds, Water supply.

40 CFR Part 271

Administrative practice and procedure, Confidential business information, Hazardous materials transportation, Hazardous waste, Indian lands, Intergovernmental relations, Penalties, Reporting and recordkeeping requirements, Water pollution control, Water supply.

Dated: October 30, 1992.

William K. Reilly,
Administrator.

For the reasons set forth in the preamble, 40 CFR parts 260, 264, 265, and 271 are amended as follows.

PART 260--HAZARDOUS WASTE MANAGEMENT SYSTEM: GENERAL

1. The authority citation for part 260 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6921-6927, 6930, 6934, 6935, 6937, 6938, 6939, and 6974.

2. Section 260.10 is amended by adding the definition of "sorbent" in alphabetical order, to read as follows:

Sec. 260.10 Definitions

* * * * *

Sorbent means a material that is used to soak up free liquids by either adsorption or absorption, or both. Sorb means to either adsorb or absorb, or both.

* * * * *

PART 264--STANDARDS FOR OWNERS AND OPERATORS OF HAZARDOUS WASTE TREATMENT, STORAGE, AND DISPOSAL FACILITIES

1. The authority citation for part 264 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6924, and 6925.

2. Section 264.13 is amended by adding paragraph (c)(3) to read as follows:

Sec. 264.13 General waste analysis.

* * * * *

(c) * * *

(3) The procedures that the owner or operator of an off-site landfill receiving containerized hazardous waste will use to determine whether a hazardous waste generator or treater has added a biodegradable sorbent to the waste in the container.

* * * * *

3. Section 264.314 is amended by redesignating paragraph (e) as (f), revising paragraphs (a)(2), (b), and (d)(1)(ii), and adding new paragraph (e) to read as follows:

Sec. 264.314 Special requirements for bulk and containerized liquids.

(a) * * *

(2) Before disposal, the liquid waste or waste containing free liquids is

treated or stabilized, chemically or physically (e.g., by mixing with a sorbent solid), so that free liquids are no longer present.

(b) Effective May 8, 1985, the placement of bulk or non-containerized liquid hazardous waste or hazardous waste containing free liquids (whether or not sorbents have been added) in any landfill is prohibited.

* * * * *

(d) * * *
(1) * * *
(ii) has been mixed with sorbent or solidified so that free-standing liquid is no longer observed; or
* * * * *

(e) Sorbents used to treat free liquids to be disposed of in landfills must be nonbiodegradable. Nonbiodegradable sorbents are: materials listed or described in paragraph (e)(1) of this section; materials that pass one of the tests in paragraph (e)(2) of this section; or materials that are determined by EPA to be nonbiodegradable through the part 260 petition process.

(1) Nonbiodegradable sorbents. (i) Inorganic minerals, other inorganic materials, and elemental carbon (e.g., aluminosilicates, clays, smectites, Fuller's earth, bentonite, calcium bentonite, montmorillonite, calcined montmorillonite, kaolinite, micas (illite), vermiculites, zeolites; calcium carbonate (organic free limestone); oxides/hydroxides, alumina, lime, silica (sand), diatomaceous earth; perlite (volcanic glass); expanded volcanic rock; volcanic ash; cement kiln dust; fly ash; rice hull ash; activated charcoal/ activated carbon); or
(ii) High molecular weight synthetic polymers (e.g., polyethylene, high density polyethylene (HDPE), polypropylene, polystyrene, polyurethane, polyacrylate, polynorborene, polyisobutylene, ground synthetic rubber, cross- linked allylstyrene and tertiary butyl copolymers). This does not include polymers derived from biological material or polymers specifically designed to be degradable; or
(iii) Mixtures of these nonbiodegradable materials.
(2) Tests for nonbiodegradable sorbents. (i) The sorbent material is determined to be nonbiodegradable under ASTM Method G21-70 (1984a)--Standard Practice for Determining Resistance of Synthetic Polymer Materials to Fungi; or

(ii) The sorbent material is determined to be nonbiodegradable under ASTM Method G22-76 (1984b)--Standard Practice for Determining Resistance of Plastics to Bacteria.

4. Section 264.316 is amended by revising paragraphs (b) and (c) to read as follows:

Sec. 264.316 Disposal of small containers of hazardous waste in overpacked drums (lab packs).

(b) The inside containers must be overpacked in an open head DOT-specification metal shipping container (49 CFR parts 178 and 179) of no more than 416-liter (110 gallon) capacity and surrounded by, at a minimum, a sufficient quantity of sorbent material, determined to be nonbiodegradable in accordance with Sec. 264.314(e), to completely sorb all

of the liquid contents of the inside containers. The metal outer container must be full after it has been packed with inside containers and sorbent material.

(c) The sorbent material used must not be capable of reacting dangerously with, being decomposed by, or being ignited by the contents of the inside containers, in accordance with Sec. 264.17(b).

* * * * *

PART 265--INTERIM STATUS STANDARDS FOR OWNERS AND OPERATORS OF HAZARDOUS WASTE TREATMENT, STORAGE, AND DISPOSAL FACILITIES

1. The authority citation for Part 265 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6924, 6925, 6935, and 6936.

2. Section 265.13 is amended by adding paragraph (c)(3) to read as follows:

Sec. 265.13 General waste analysis.

* * * * *

(c) * * *
(3) The procedures that the owner or operator of an off-site landfill receiving containerized hazardous waste will use to determine whether a hazardous waste generator or treater has added a biodegradable sorbent to the waste in the container.

* * * * *

3. Section 265.314 is amended by redesignating paragraph (f) as (g), revising paragraphs (a)(2), (b), and (c)(1)(ii), and adding new paragraph (f) to read as follows:

Sec. 265.314 Special requirements for bulk and containerized liquids.

(a) * * *
(2) Before disposal, the liquid waste or waste containing free liquids is treated or stabilized, chemically or physically (e.g., by mixing with a sorbent solid), so that free liquids are no longer present.

(b) Effective May 8, 1985, the placement of bulk or non-containerized liquid hazardous waste or hazardous waste containing free liquids (whether or not sorbents have been added) in any landfill is prohibited.

(c) * * *
(1) * * *
(ii) has been mixed with sorbent or solidified so that free-standing liquid is no longer observed; or
* * * * *

(f) Sorbents used to treat free liquids to be disposed of in landfills must be nonbiodegradable. Nonbiodegradable sorbents are: materials listed

or described in paragraph (f)(1) of this section; materials that pass one of the tests in paragraph (f)(2) of this section; or materials that are determined by EPA to be nonbiodegradable through the Part 260 petition process.

(1) Nonbiodegradable sorbents. (i) Inorganic minerals, other inorganic materials, and elemental carbon (e.g., aluminosilicates, clays, smectites, Fuller's earth, bentonite, calcium bentonite, montmorillonite, calcined montmorillonite, kaolinite, micas (illite), vermiculites, zeolites; calcium carbonate (organic free limestone); oxides/hydroxides, alumina, lime, silica (sand), diatomaceous earth; perlite (volcanic glass); expanded volcanic rock; volcanic ash; cement kiln dust; fly ash; rice hull ash; activated charcoal/ activated carbon); or

(ii) High molecular weight synthetic polymers (e.g., polyethylene, high density polyethylene (HDPE), polypropylene, polystyrene, polyurethane, polyacrylate, polynorborene, polysobutylene, ground synthetic rubber, cross- linked allylstyrene and tertiary butyl copolymers). This does not include polymers derived from biological material or polymers specifically designed to be degradable; or

(iii) Mixtures of these nonbiodegradable materials.

(2) Tests for nonbiodegradable sorbents. (i) The sorbent material is determined to be nonbiodegradable under ASTM Method G21-70 (1984a)--Standard Practice for Determining Resistance of Synthetic Polymer Materials to Fungi; or

(ii) The sorbent material is determined to be nonbiodegradable under ASTM Method G22-76 (1984b)--Standard Practice for Determining Resistance of Plastics to Bacteria.

* * * * *

4. Section 265.316 is amended by revising paragraphs (b) and (c) to read as follows:

Sec. 265.316 Disposal of small containers of hazardous waste in overpacked drums (lab packs).

* * * * *

(b) The inside containers must be overpacked in an open head DOT-specification metal shipping container (49 CFR parts 178 and 179) of no more than 416-liter (110 gallon) capacity and surrounded by, at a minimum, a sufficient quantity of sorbent material, determined to be nonbiodegradable in accordance with Sec. 265.314(f), to completely sorb all of the liquid contents of the inside containers. The metal outer container must be full after it has been packed with inside containers and sorbent material.

(c) The sorbent material used must not be capable of reacting dangerously with, being decomposed by, or being ignited by the contents of the inside container's in accordance with Sec. 265.17(b).

PART 271--REQUIREMENTS FOR AUTHORIZATION OF STATE HAZARDOUS WASTE PROGRAMS

1. The authority citation for Part 271 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a) and 6926.

2. Section 271.1(j) is amended by adding the following entry to Table 1 in chronological order by date of publication:

Sec. 271.1 Purpose and scope.

Hazardous Waste Management System: Land Disposal Restrictions; Renewal of the Hazardous Debris Case-By-Case Capacity Variance and Renewal of Variance

Volume: 58 Issue: 92 Page: 28506
CITATION NUMBER: 58 FR 28506
Date: FRIDAY, MAY 14, 1993

AGENCY: Environmental Protection Agency--(EPA); Office of Solid Waste--(OSW); Office of Solid Waste and Emergency Response--(OSWER)
DOCUMENT TYPE: Rules and Regulations
CFR: 40 CFR Part 268
NUMBERS: FRL-4655-1
DATES: Effective: 19930508
CONTACT INFORMATION: RCRA Hotline, 800-424-9346, 703-412-9810; Nicholas Vizzone, 703-308-8477
ACTION: Final rule
INTERNAL DATA: (FR Doc. 93-11322 Filed 5-13-93; 8:45 am)
Word Count: 4194

SUMMARY: On May 8, 1992, EPA granted a one-year case-by-case capacity variance of the Land Disposal Restrictions (LDR) to persons managing certain hazardous debris (see 57 FR 20766, May 15, 1992). In that document, EPA indicated that persons desiring a subsequent renewal of the variance--that is, past May 8, 1993--would need to submit an individual application. EPA has received almost 200 applications to date. Confirmed by a capacity analysis conducted by EPA, the large number of applications indicates that a lack of treatment capacity for hazardous debris continues to exist.

Therefore under 40 CFR 268.5, EPA is hereby renewing the extension of the case-by-case capacity variance to May 8, 1994, for all persons managing certain hazardous debris in lieu of responding to the individual applications. (Elsewhere this document explains more fully which hazardous debris is covered by the extension.) No further individual applications will be required from persons granted the extension by this action. However, information provided to EPA indicates that some capacity may exist, at least for some forms of debris. Therefore, EPA is requiring that generators submit a report demonstrating a good-faith effort to locate treatment capacity to qualify for the extension.

EPA wishes to make clear that no further variance or extension of the LDR effective date for hazardous debris can be given after May 8, 1994. By statute, EPA may extend the LDR effective date for a waste for a total of four years, two years by national capacity variance and up to two years for a case-by-case variance. With this renewal, the four years of statutory variance time for hazardous debris will end on May 8, 1994, and therefore no further extensions can be granted.

TEXT:

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 268

(FRL-4655-1)

Hazardous Waste Management System: Land Disposal Restrictions; Renewal of

the Hazardous Debris Case-By-Case Capacity Variance and Renewal of Variance

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: On May 8, 1992, EPA granted a one-year case-by-case capacity variance of the Land Disposal Restrictions (LDR) to persons managing certain hazardous debris (see 57 FR 20766, May 15, 1992). In that document, EPA indicated that persons desiring a subsequent renewal of the variance--that is, past May 8, 1993--would need to submit an individual application. EPA has received almost 200 applications to date. Confirmed by a capacity analysis conducted by EPA, the large number of applications indicates that a lack of treatment capacity for hazardous debris continues to exist.

Therefore under 40 CFR 268.5, EPA is hereby renewing the extension of the case-by-case capacity variance to May 8, 1994, for all persons managing certain hazardous debris in lieu of responding to the individual applications. (Elsewhere this document explains more fully which hazardous debris is covered by the extension.) No further individual applications will be required from persons granted the extension by this action. However, information provided to EPA indicates that some capacity may exist, at least for some forms of debris. Therefore, EPA is requiring that generators submit a report demonstrating a good-faith effort to locate treatment capacity to qualify for the extension.

EPA wishes to make clear that no further variance or extension of the LDR effective date for hazardous debris can be given after May 8, 1994. By statute, EPA may extend the LDR effective date for a waste for a total of four years, two years by national capacity variance and up to two years for a case-by-case variance. With this renewal, the four years of statutory variance time for hazardous debris will end on May 8, 1994, and therefore no further extensions can be granted.

EFFECTIVE DATE: This rule and the extension become effective on May 8, 1993.

ADDRESSES: The official record for this notice is identified as Docket Numbe F-93-DCVN-FFFFF, and is located in the EPA RCRA Docket, room 2427, U.S.
Environmental Protection Agency, 401 M Street SW., Washington, DC 20460. The docket is open from 9 a.m. to 4 p.m., Monday through Friday, except on Federal holidays. The public must make an appointment to review docket materials by calling (202) 260-9327. The public may copy a maximum of 100 pages from any regulatory document at no cost. Additional copies cost $0.20 per page.

FOR FURTHER INFORMATION CONTACT: For general information contact the RCRA Hotline at (800) 424-9346 toll-free or (703) 412-9810 locally. For information on specific aspects of this notice, contact Nicholas R. Vizzone, Analysis and Land Disposal Restrictions Section, Capacity Programs Branch (OS-321W), Office of Solid Waste, U.S. Environmental Protection Agency, 401 M Street SW., Washington, DC 20460, (703) 308-8477.

SUPPLEMENTARY INFORMATION:

Outline

I. Background

A. History

Congress enacted the Hazardous and Solid Waste Amendments (HSWA) of 1984, which amended the Resource Conservation and Recovery Act (RCRA). Among other things, HSWA required EPA to develop regulations that would impose, on a phased schedule, restrictions on the land disposal of hazardous wastes. In particular, sections 3004(d), (e), and (g) of RCRA (42 USC 6924 (e), and (g)) prohibit the land disposal of all wastes identified or listed as hazardous as of November 1984, unless the wastes are treated (or meet treatment standards) in a manner that "substantially diminish(es) the toxicity of the waste or substantially reduce(s) the likelihood of migration of hazardous constituents from the waste so that short-term and long-term threats to human health and the environment are minimized." The alternative to satisfying these treatment standards is disposal in a unit from which there will be no migration of hazardous constituents for as long as the waste remains hazardous.

In developing such a broad program, Congress recognized that adequate alternative treatment, recovery, or protective disposal capacity might not be available by the applicable effective dates. Therefore, section 3004(h)(2) authorized EPA to grant a national capacity variance (based on the earliest date that such capacity would be available but not to exceed two years) that delays the effective date for new treatment standards. In addition, under section 3004(h)(3), EPA can grant an extension of the deadline on a case-by- case basis for one year (renewable for one additional year); however, variances and extensions are limited to a four year total time period from the effective date.

On June 1, 1990, EPA published a final rule (55 FR 22520) establishing prohibitions and treatment standards for wastes in the final third of the scheduled prohibitions. Among other things, the rule established prohibitions and treatment standards for debris contaminated with all hazardous wastes subject to the LDRs (except for the solvent and dioxin wastes covered by section 3004(e) and California List wastes prohibited under section 3004(d)).

Because of a lack of treatment capacity in 1990, EPA granted a two-year national capacity variance that expired on May 8, 1992 (40 CFR part 268.35

(e)). This variance included, not only debris for Third Third wastes, but also debris for First Third and Second Third wastes that had been deferred to the Third Third rule (see 55 FR 22649). EPA stated that it was not the intent of the Agency to penalize generators of First Third and Second Third wastes by allowing less time (i.e., 28 months and 37 months, respectively) for the development of needed capacity, while generators of Third Third wastes in the same treatability group were allowed the maximum 48 months. Therefore, the capacity extension that became effective on May 8, 1990 included First, Second and Third Third wastes. Then on May 8, 1992, EPA, citing a continuing lack of treatment capacity for the same debris wastes addressed in the May 8, 1990, extension, as well as other factors, granted a one-year case-by-case capacity variance of the LDR effective date for most hazardous debris that expires on May 8, 1993.

B. Revised Treatment Standards for Hazardous Debris

The Third Third final rule stated that debris contaminated with a listed waste was subject to the same treatment standards as for the contaminating waste. However, EPA also stated in the preamble that problems did exist with regulating hazardous wastes in debris matrices that could make it difficult for hazardous debris to meet those treatment standards. Therefore, EPA indicated in the Third Third rule that treatment standards specific to hazardous debris would be promulgated in a separate rulemaking.

On January 9, 1992, EPA published proposed treatment standards for hazardous debris. Among other things, comments received on this proposed rule indicated that there would be inadequate capacity for hazardous debris as of May 8, 1992. The shortfall in treatment capacity coupled with the fact that the final rule for the hazardous debris treatment standards would not be promulgated by May 8, created the need for an extension of the effective date for hazardous debris. (The final hazardous debris rule was published in the Federal Register on August 18, 1992, (see FR 57 37194-37282) and was effective on November 16, 1992.)

The hazardous debris capacity variance required that any facility desiring a further extension of the variance to May 8, 1994, would be required to submit an individual application before November 8, 1992. At that time, EPA anticipated that by May 1993, treatment capacity, in compliance with the new hazardous debris treatment standards, would generally be in place, or that generators could obtain contracts for future capacity still under construction. However, EPA has received almost 200 case-by-case applications from generators for renewal of the extension. The applicants have all stated that treatment capacity in compliance with the August 18, 1992, debris rule is still lacking, and that the length of time to permit these treatment and storage units are preventing them from providing the necessary treatment capacity to be in compliance with LDR restrictions. This has resulted in a continuing capacity shortfall. A capacity analysis conducted by EPA has shown that a general lack of treatment capacity for hazardous debris does exist.

(The results of this analysis have been placed in the official record for this notice located in the EPA RCRA Docket.) In addition, the physical and chemical properties for debris from remediation projects is unknown; this information is necessary in order to evaluate the type(s) of available treatment processes and to estimate existing treatment capacity. It is also difficult with existing knowledge to determine which, if any type of preprocessing is necessary prior to treatment (for example, the amount and type of sizing equipment needed), along with the need and availability of

mechanical separation equipment to remove the debris from other contaminated media that may be generated with the debris during remediation. Additionally, the applicants have also stated that once permitting is complete, a construction and start-up period of 6-12 months will be necessary further delaying available capacity.

At the same time EPA has received a letter from the Hazardous Waste Treatment Council (HWTC), dated March 19, 1993, that discusses available treatment capacity for hazardous debris.1 The letter indicates that the HWTC believes that certain capacity is available for hazardous debris excluding debris wastes affected by permitting delays for treatment units, oversized debris requiring specialized size reduction equipment, or specialized materials handling/separation capabilities. The HWTC states that capacity exists for: (1) Small objects that are transportable in containers and do not require sizing prior to treatment (e.g. metal objects, paper and cloth, wood materials); (2) cyanide contaminated debris using chemical oxidation; and (3) debris sized so as to be easily treated in an existing tank or container systems. Treatment volumes were provided for managing cyanide contaminated debris using chemical oxidation technology and solids incineration capacity.

NOTE /1/ The Hazardous Waste Treatment Council is a national association that represents certain commercial hazardous treatment facility owners and operators. EPA notes that information on available commercial hazardous debris treatment facilities may be available from the HWTC. The address for HWTC is 915 15th Street, NW., Fifth Floor, Washington, DC 20005; Telephone (202) 783-0870; FAX Number (202) 737-2038.

Subsequent to that letter, HWTC provided additional information in a letter dated May 4, 1993 to EPA on hazardous waste treatment capacity. In particular HWTC stated that 300,000 tons/year of combustion treatment capacity exists for certain debris types (i.e., wood, cloth, PPE, rubber, plastic, etc.) contaminated with organics. In addition, 175,000 tons/year of chemical oxidation treatment capacity is available for debris contaminated with cyanide. Furthermore, HWTC stated that 320,000 tons/year of metals treatment capacity exists in the form of water washing and spraying, high pressure water washing, acid/alkaline solution extraction, chemical oxidation, chemical reduction, abrasive blasting and microencapsulation.

Based on the available knowledge of debris characteristics, it is difficult for EPA to project the amount of combustion or metals treatment capacity that will be necessary to treat currently generated debris because EPA only has very general information on the hazardous constituents that are in debris.

For example, the facilities that submitted applications for an extension did not provide detailed information on the types of hazardous constituents contaminating their debris; therefore, it is impossible to know whether the types of capacity that HWTC states is available could be used to treat such debris. Furthermore, the amount of hazardous debris treatment necessary is difficult to accurately estimate before the generation of debris from remediation projects because of uncertainty in knowing what actually will be generated. The volume of debris that the applicants anticipate generating could exceed the total capacity that HWTC believes to be available, depending upon the nature of the debris. EPA also believes that

it would be difficult to determine which debris could be treated in tanks and containers based on the physical size of the debris; therefore, EPA believes it would be inappropriate to limit the extension renewal based on the size of the debris, as HWTC suggested.

Thus, EPA's information indicates that there is still a general shortfall of capacity, although some treatment capacity is available for some kinds of debris. Because a shortfall appears unavoidable considering the large volumes of hazardous debris that will require treatment, EPA believes that a conditional one-year renewal of the hazardous debris case-by-case variance for all persons managing such debris is appropriate. However, as will be discussed in greater detail below generators will be expected to make a good faith effort to locate and use such treatment capacity as may be suitable for their debris.

As under the original extension, debris contaminated with the following wastes are not covered by this extension: (1) A listed solvent or dioxin waste covered by the section 3004 (e) prohibition, and (2) a non-liquid "California list" waste pursuant to section 3004 (d) because the statutory time for granting an extension for the wastes has elapsed.

EPA notes that the final rule establishing revised treatment standards for debris (see Fed. Reg. 37194 (Aug. 28, 1992)) defined debris to consist of solid material having a particle size of 60 mm or larger and intended for land disposal. This definition excluded process residuals such as smelter slag and residues from the treatment of waste, wastewater, sludges or air emissions residues. The excluded process residuals will, however, be included within the scope of today's renewal of the hazardous debris extension to the extent the residuals fall within the previously applicable definition of debris and are not excluded from the extension as indicated above.

C. Paperwork Reduction Act

The information collection requirements in this notice have been approved by the Office of Management and Budget (OMB) under the Paperwork Reduction Act, 44 U.S.C. 3501 et seq and have been assigned OMB control number 2050-0085.

Public reporting burden for this collection of information is estimated to average 25 hours per response, including time for reviewing instructions, searching existing data sources, gathering the required data, and completing and reviewing the collection of information.

Send comments regarding the burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden, to Chief, Information Policy Branch, PM-223Y, U.S. Environmental Protection Agency, 401 M Street, SW., Washington, DC 20460; and to the Office of Information and Regulatory Affairs, Office of Management and Budget, Washington, DC 20503, marked "Attention: Jonathan Gledhill."

II. Justification for This Extension

A. Demonstration Under 40 CFR 268.5

40 CFR 268.5 specifies seven demonstrations that must be made for the

approval of a case-by-case extension to a treatment standard of the prohibition effective date. From comments and information submitted, EPA has made an evaluation of these seven required demonstrations as follows:

Demonstration 40 CFR 268.5(a)(1): The applicant must demonstrate that he has made a good-faith effort to locate and contract with treatment, recovery, or disposal facilities nationwide to manage his waste in accordance with the effective date of the applicable restriction established under subpart C of this part.

The applicants indicated that they are unable at this time to locate and contract with treatment, recovery, or disposal facilities. Response letters from commercial sites submitted with the applications indicated that future plans to develop and construct treatment capacity exist but the length of time required to issue new permits or modifications of existing permits is delaying current construction of treatment capacity. Permits to allow construction of these new units have not been issued yet and may require additional time. Permitting and construction of many new debris treatment units will probably not be completed when the existing variance expires on May 8, 1993.

In addition, information received by EPA indicates a general lack of capacity for treatment of debris. For example, information from the 200 applicants indicates that from 1.2-1.8 million cubic meters of hazardous debris will be generated during the period of May 1993, to May 1994. The applicants indicating that capacity was unavailable did not generally distinguish between categories of debris, and in light of their submission, EPA is reluctant to assume that sufficient capacity does in fact exist for those wastes. In addition, EPA is not confident that the categories of debris for which capacity is most likely to exist can easily be identified.

At the same time, the information provided by HWTC does indicate that significant capacity may exist, at least for certain categories of debris.

Therefore, it is a condition of this extension that generators make a good faith effort to find treatment capacity, and if capacity is found, to use it to the fullest extent possible. Therefore, the extension will not apply to any wastes for which capacity is or becomes available. The report required under 40 CFR 268.5(g) will document each generator's good faith effort to locate capacity.

Demonstration 40 CFR 268.5(a)(2): The applicant has entered into a binding contractual commitment to construct or otherwise provide alternative treatment, recovery (e.g., recycling), or disposal capacity that meets the treatment standards specified in subpart D or, where treatment standards have not been specified, such capacity is protective of human health and the environment.

The applicants have shown that the availability of treatment technologies to meet the proposed treatment standards is limited and will require substantial capital investment to bring such technology on-line. EPA believes, however, that there will be no ultimate difficulty in constructing or otherwise developing the needed treatment technology because the types of treatment technologies involved all exist and should be available given time.

As of May 8, 1994, EPA may not, by statute, grant any further extensions of the LDR effective date for hazardous debris. Therefore, it is to the generators' advantage to enter into a contractual agreement for treatment of hazardous debris as soon as possible to ensure adequate treatment

capacity for compliance by the May, 1994, deadline.

Demonstration 40 CFR 268.5(a)(3): Due to circumstances beyond the applicant's control, such alternative capacity cannot reasonably be made available by the applicable effective date. This demonstration may include a showing that the technical and practical difficulties associated with providing the alternative capacity will result in the capacity not being available by the applicable effective date.

The applicants provided numerous examples regarding logistical difficulties associated with providing the alternative capacity--among them that EPA guidance on the hazardous debris rule has not been issued and the delay in the permitting process. Applicants stated that issuance of new permits or modifications to existing permits for storage and treatment facilities along with approval of treatment processes has taken longer than planned, causing delays in planning and construction schedules. Also, the applicants stated that it will take time for industry to adapt the available technologies identified in the August 1992 debris treatment standards to the various types of hazardous debris to achieve BDAT. These circumstances are beyond the control of the generators who need to treat or dispose of their hazardous debris, and the information provided to EPA suggests that these circumstances affect most if not all debris generators.

EPA regional offices have indicated that interim status for treatment facilities is generally not available. Therefore, new permits or modifications to permits will have to be issued. EPA believes there to be valid concerns and agrees that additional time is needed to resolve the issues. These circumstances are beyond the control of the generators who need to treat or dispose of their hazardous debris.

Demonstration 40 CFR 268.5(a)(4): The capacity being constructed or otherwise provided by the applicant will be sufficient to manage the entire quantity of waste that is the subject of the application.

Some of the applicants have indicated that they have difficulty in determining at this time the types of treatment technologies to use for certain debris wastes. EPA believes that this uncertainty makes it difficult for some owners and operators to determine their capacity requirements at this time. The unpredictable nature of debris generation also makes predicting future needs difficult.

A critical timing concern relates to the time needed for permit modifications, plus (in some cases) time needed to construct specialized debris treatment units like containment buildings. As noted previously in the discussion of needed contractual commitments, EPA believes that adequate treatment capacity will be provided once these elements are achieved.

Demonstration 40 CFR 268.5(a)(5): He provides a detailed schedule for obtaining required operating and construction permits or an outline of how and when alternative capacity will be available.

A detailed schedule outlining the amount of time required to obtain operating permits and construction time for on-site facilities or outlining the amount of time required to enter into a binding contractual agreement for off-site treatment can be developed, and EPA does not anticipate that generators will have any problems in the development of a schedule.

However, submission of a detailed schedule is not a requirement of this variance.

Demonstration 40 CFR 268.5(a)(6): The applicant must demonstrate that he has arranged for adequate capacity to manage his waste during an extension and has documented in the application the location of all sites at which the waste will be managed.

The applications received by EPA indicated that hazardous debris generators will continue to store or dispose of their wastes onsite or contract for offsite storage or disposal with a permitted facility. EPA believes that generators will be able to find adequate capacity to manage their hazardous debris during the extension period.

Demonstration 40 CFR 268.5(a)(7): Any waste managed in a surface impoundment or landfill during the extension period will meet the requirements of paragraph (h)(2) of 40 CFR 268.5.

It is an absolute legal requirement of this renewal that any generator or owner or operator who intends to manage hazardous debris in a surface impoundment (which is highly unlikely) or landfill during the one-year extension must ensure that the unit meets the requirement of 40 CFR 268.5(h)(2) (see RCRA section 3004(h)(4)). This requirement includes, among other things, that that unit be equipped with a double liner system with a leachate collection system and adequate ground-water monitoring.

B. Consultation With the States

In addition to the above seven demonstrations, EPA is required under 40 CFR 268.5(e) to consult with appropriate state agencies in all affected states.

Before issuing the case-by-case capacity variance on May 8, 1992, EPA consulted with several state agencies which supported the need for an extension of the LDR effective date for hazardous debris. After May 8, 1992, EPA has consulted with the Association of State and Territorial Solid Waste Management Officials (ASTSWMO) regarding the state's opinions on the hazardous debris issue. ASTSWMO has indicated that the states are in favor of a renewal of the hazardous debris capacity variance since many of the generators are unable at this time to determine which treatment methods are required for their debris.

C. Conclusion

Based on its evaluation of the demonstrations required under 40 CFR 268.5, and for the reasons stated above, EPA is renewing the case-by-case extension to the Land Disposal Restrictions for hazardous debris as described elsewhere in the preamble. This renewal is effective from May 8, 1993, to May 8, 1994.

EPA is taking this regulatory action because of the unique circumstances which have resulted in the lack of treatment, recovery, and protective disposal capacity for hazardous debris, and EPA's conclusion that treatment capacity meeting the recently promulgated standards is inadequate, or not available due to logistical problems such as permitting delays, but can ultimately be provided. EPA believes that granting this renewal (conditioned upon a requirement to seek available treatment capacity) is

the most environmentally protective option because it will eliminate a regulatory obstacle that could otherwise force cleanup projects to be postponed.

III. Requirements for This Extension

To receive the benefit of this renewal, a generator or owner/operator must provide the following information to EPA in a report under 40 CFR 268.5(g) by August 12, 1993, or 90 days after the hazardous debris is generated:

(1) The name, mailing address, location and EPA identification number (if assigned) of the facility. The term "facility" includes any site, whether permanent (such as a manufacturing plant), or temporary where hazardous debris will be generated;

(2) A description of the hazardous debris waste stream, including the RCRA waste code(s);

(3) Waste generation rates (cu. m./yr.), and estimated inventories (cu.m.);

(4) The owner/operator or generator must demonstrate that a good-faith effort has been made to locate and contract with treatment or recovery facilities to manage the waste in accordance with the effective date of the applicable restriction in order to utilize this variance. The documentation of this effort must be submitted to EPA.

To make the good-faith effort showing, generators must include a summary of their activities that demonstrate that they have contacted treatment or recovery facilities, but they rejected the waste on the basis of its composition or because the facility did not have treatment capacity to handle the waste. Generators must provide a summary of the letters sent to facilities describing the waste and requesting treatment, recovery, or disposal (protective) for the waste. Generators must also include a summary of responses from the facilities rejecting their waste; if the correspondence from a facility does not clearly state why the waste was rejected, generators must provide an explanation.

In the report, generators must include documentation demonstrating that they have contacted a substantial number of treatment or recovery facilities (EPA believes that contact with 10 or more facilities would constitute a substantial number), but they rejected the waste on the basis of its composition or because the facility did not have treatment capacity to handle the waste. This report must be submitted to EPA by August 12, 1993 or within 90 days after the generation of the hazardous debris. Generators must contact facilities that provide appropriate treatment services for their wastes, if possible.

If capacity is found to be available during the extension period, the owner or operator must use the treatment capacity for as large a portion of its waste as possible; and

(5) Certification as required under 40 CFR 268.5(b).

Two copies of the above information should be sent to the following address: Chief of Training and Technical Assistance Branch, U.S. Environmental Protection Agency, Office of Waste Programs Enforcement (OS-520), 401 M Street, SW., Washington, DC 20460, Attn: Debris Case-by-Case Progress Report.

Finally, EPA notes that the regulatory amendment promulgated today contains a technical amendment to 40 CFR 268.35(e)(2), which relates to the

case-by- case renewal for contaminated soils. This amendment clarifies that the extension granted for soils on October 20, 1992 applied only to soils regulated under the Third Third rule.

List of Subjects in 40 CFR Part 268

Hazardous waste, Reporting and recordkeeping requirements.

Dated: May 7, 1993.

Richard J. Guimond,
Assistant Surgeon General, USPHS, Acting Assistant Administrator, Office of Solid Waste and Emergency Response (OS-100).

For the reasons set out in the preamble, title 40, chapter I, of the Code of Federal Regulations is amended as follows:
PART 268--LAND DISPOSAL RESTRICTIONS

1. The authority citation for part 268 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6921, and 6924.

2. In Sec. 268.35 paragraph (e) is revised to read as follows:

Sec. 268.35 Waste specific prohibitions--Third Third wastes.

* * * * *

(e) Subject to applicable prohibitions in Secs. 268.30, 268.31, and 268.32, contaminated soil and debris are prohibited from land disposal as follows:
(1) Effective May 8, 1994, debris that is contaminated with wastes listed in 40 CFR 268.12, and debris that is contaminated with any characteristic waste for which treatment standards are established in subpart D of this part, are prohibited from land disposal.

(2) Effective May 8, 1994, mixed radioactive hazardous debris that is contaminated with wastes listed in 40 CFR 268.12 and mixed radioactive hazardous debris that is contaminated with any characteristic waste for which treatment standards are established in subpart D of this part, are prohibited from land disposal.

(3) Paragraphs (e) (1) and (2) of this section shall not apply where the generator has failed to make a good-faith effort to locate treatment capacity suitable for its waste, has not utilized such capacity as it has found to be available, or has failed to file a report as required by 40 CFR 268.5(g) by August 12, 1993 or within 90 days after the hazardous waste is generated (whichever is later) describing the generator's efforts to locate treatment capacity. Where paragraphs (e) (1) and (2) of this section do not apply, all wastes described in these paragraphs are prohibited from land disposal effective May 8, 1993.

(4) Effective May 8, 1993, hazardous soil contaminated with wastes specified in this section having treatment standards in subpart D of this part based on incineration, mercury retorting or vitrification, and soils contaminated with hazardous wastes listed in 40 CFR 268.10, 268.11 and 268.12 that are mixed radioactive hazardous wastes, are prohibited from land disposal.

(5) When used in paragraphs (e) (1) and (2) of this section, debris is defined as follows:

(i) Debris as defined in 40 CFR 268.2(g); or

(ii) Nonfriable inorganic solids that are incapable of passing through a 9.5 mm standard sieve that require cutting, or crushing and grinding in mechanical sizing equipment prior to stabilization, limited to the following inorganic or metal materials:

(A) Metal slags (either dross or scoria).

(B) Glassified slag.

(C) Glass.

(D) Concrete (excluding cementitious or pozzolanic stabilized hazardous wastes).

(E) Masonry and refractory bricks.

(F) Metal cans, containers, drums, or tanks.

(G) Metal nuts, bolts, pipes, pumps, valves, appliances, or industrial equipment.

(H) Scrap metal as defined in 40 CFR 261.1(c)(6).

ACTION: Interim final rule
INTERNAL DATA: (FR Doc. 93-11877 Filed 5-21-93; 8:45 am)
Word Count: 23606

SUMMARY: The Environmental Protection Agency (EPA) is today amending the treatment standards under the land disposal restrictions (LDR) program for wastes displaying the characteristic of ignitability (EPA Hazard Code D001) other than those ignitable wastes containing greater than 10 percent total organic carbon (i.e., D001 high TOC subcategory), and corrosivity (EPA Hazard Code D002) that are managed in systems other than those regulated under the Clean Water Act (CWA), those zero dischargers treating wastewater by CWA- equivalent treatment prior to ultimate land disposal, and those injecting into Class I deep wells regulated under the Safe Drinking Water Act (SDWA). This action is being taken to comply with the September 25, 1992 decision of the U.S. Court of Appeals in Chemical Waste Management v. EPA, 976 F.2d 2 (D.C. Cir. 1992). The underlying rule at issue in the opinion was signed on May 8, 1990, and published on June 1, 1990 (55 FR 22520). In the court's decision, the deactivation treatment standards for certain ignitable and corrosive wastes were vacated. Because land disposal of these wastes would be prohibited if no treatment standard is in place, EPA is replacing the vacated treatment standard before the court's mandate becomes effective to avoid an absolute ban on land disposal of these wastes.

TEXT:

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Parts 264, 265, 268, 270, and 271

(FRL 4656-7)

Land Disposal Restrictions for Ignitable and Corrosive Characteristic Wastes Whose Treatment Standards Were Vacated

AGENCY: Environmental Protection Agency (EPA).

ACTION: Interim final rule.

SUMMARY: The Environmental Protection Agency (EPA) is today amending the treatment standards under the land disposal restrictions (LDR) program for wastes displaying the characteristic of ignitability (EPA Hazard Code D001) other than those ignitable wastes containing greater than 10 percent total organic carbon (i.e., D001 high TOC subcategory), and corrosivity (EPA Hazard Code D002) that are managed in systems other than those regulated under the Clean Water Act (CWA), those zero dischargers treating wastewater by CWA- equivalent treatment prior to ultimate land disposal, and those injecting into Class I deep wells regulated under the Safe Drinking Water Act (SDWA).

This action is being taken to comply with the September 25, 1992 decision of the U.S. Court of Appeals in Chemical Waste Management v. EPA, 976 F.2d 2 (D.C. Cir. 1992). The underlying rule at issue in the opinion was signed on May 8, 1990, and published on June 1, 1990 (55 FR 22520). In the court's decision, the deactivation treatment standards for certain ignitable and corrosive wastes were vacated. Because land disposal of these wastes would be prohibited if no treatment standard is in place, EPA is replacing the vacated treatment standard before the court's mandate becomes effective to avoid an absolute ban on land disposal of these wastes.

DATES: This interim final rule is effective on May 10, 1993.

Comments may be submitted on or before July 9, 1993.

ADDRESSES: The public must send an original and two copies of their written comments to the EPA RCRA Docket (OS-305), U.S. Environmental Protection Agency, 401 M Street SW., Washington, DC 20460. Place the Docket Number F-93- TTCF-FFFFF on your comments. The official record for this rulemaking is also located in the RCRA Docket, room 2427, at the above address. It is open from 9 a.m. to 4 p.m., Monday through Friday, except on Federal holidays. The public must make an appointment to review docket materials by calling (202) 260-9327. A maximum of 100 pages from the docket may be copied at no cost.

Additional copies cost $.15 per page.

FOR FURTHER INFORMATION CONTACT: For general information, contact the RCRA Hotline at (800) 424-9346 (toll free) or (703) 412-9810 locally. For information on specific aspects of this rule, contact Rhonda Craig, and for technical information about treatment standards, contact Lisa Jones, Office of Solid Waste (OS-322W), U.S. Environmental Protection Agency, 401 M Street SW., Washington, DC 20460, telephone (703) 308-8434. For information on capacity determinations, contact Bengie Carroll, Office of Solid Waste (OS- 321W), U.S. Environmental Protection Agency, 401 M Street SW., Washington, DC 20460, telephone (703) 308-8440.

SUPPLEMENTARY INFORMATION:

Outline

I. Background

A. Summary of the Hazardous and Solid Waste Amendments of 1984

The Hazardous and Solid Waste Amendments (HSWA) to the Resource Conservation and Recovery Act (RCRA), enacted on November 8, 1984, allow hazardous wastes to be land disposed only if they satisfy either of two conditions: (1) They are treated, or otherwise satisfy the requirement of

RCRA section 3004(m), which provision requires EPA to set levels or methods of treatment, if any, which substantially diminish the toxicity of the waste or substantially reduce the likelihood of migration of hazardous constituents from the waste so that short-term and long-term threats to human health and the environment are minimized; or, (2) they can be land disposed in units satisfying the no-migration standard in sections 3004(d)(1), (e)(1), and (g)(5). Land disposal includes any placement of hazardous waste in a landfill, surface impoundment, waste pile, injection well, land treatment facility, salt dome formation, salt bed formation, or underground mine or cave. RCRA section 3004(k).

EPA was required to promulgate land disposal prohibitions and treatment standards under a congressionally-mandated schedule. Treatment standards had to be promulgated by May 8, 1990, for all wastes that were either listed or identified as hazardous at the time of the 1984 amendments to avoid a ban on land disposal of those hazardous wastes, a task EPA completed within the statutory time frame (although certain of those standards were later vacated by the D.C. Circuit, necessitating today's emergency interim final rule).
RCRA section 3004 (d), (e), and (g).

The land disposal restrictions are effective upon promulgation. RCRA section 3004(h)(1). However, the Administrator may grant a national capacity variance from the effective date of the prohibition and establish a later effective date (not to exceed two years) based on the earliest date on which adequate alternative treatment, recovery, or disposal capacity which protects human health and the environment will be available. RCRA section 3004(h)(2).
The Administrator may also grant a case-by-case extension of the effective date for up to one year, renewable once for up to one additional year, when an applicant successfully makes certain demonstrations. RCRA section 3004(h)(3).

In addition to prohibiting land disposal of hazardous wastes, Congress prohibited storage of any waste which is prohibited from land disposal unless such storage is solely for the purpose of accumulating such quantities of hazardous waste as are necessary to facilitate proper recovery, treatment or disposal. RCRA section 3004(j). The provision applies, of course, only to storage which is not also defined as land disposal in section 3004(k).

B. Summary of Third Third Standards for Ignitable, Corrosive and Reactive Characteristic Wastes

On May 8, 1990, EPA promulgated regulations addressing the last of five congressionally-mandated prohibitions on land disposal of hazardous wastes for those wastes that were either listed or identified as hazardous at the time of the 1984 amendments (the third one-third of the schedule of restricted hazardous wastes, hereafter referred to as the Third Third). Among other things in the Third Third final rule, the Agency promulgated treatment standards and prohibitions for hazardous wastes that exhibited one or more of the following characteristics: ignitability, corrosivity, reactivity, or EP toxicity (40 CFR 261.21-261.24). The Third Third rule established treatment standards for the characteristic wastes in one of four forms: (1) A concentration level for hazardous constituents equal to, or greater than, the characteristic level; (2) a concentration level for

hazardous constituents less than the characteristic level; (3) a specified treatment technology (e.g., for ignitable wastes containing high levels of total organic carbon); and, (4) a treatment standard of "deactivation" which allowed the use of any technology, including dilution, to remove the characteristic property. For ignitable, corrosive, and reactive wastes, consideration was given to the hazardous constituents in the waste only when the Agency had information that such constituents were present (e.g., reactive cyanide wastes); otherwise, only the hazardous property of the characteristic waste had to be addressed.

The Agency also evaluated the applicability of certain provisions of the land disposal restrictions' framework with respect to characteristic wastes, including wastes regulated under the Clean Water Act (CWA) and the Safe Drinking Water Act (SDWA) Underground Injection Control (UIC) programs. This was done in an effort to ensure the successful integration of these programs with the LDR regulations, as required by section 1006 of RCRA which specifies that the Administrator shall integrate RCRA for purpose of administration and enforcement and shall avoid duplication to the maximum extent practicable.
See generally 55 FR 22653-59 (June 1, 1990). Specifically, the Agency considered the appropriateness of the dilution prohibition for each of the characteristic waste streams, and the applicability of treatment standards expressed as specified methods.

The Agency found, generally, that mixing waste streams to eliminate certain characteristics was appropriate and permissible for corrosive wastewaters, or in some cases, reactive or ignitable wastewaters. Furthermore, EPA stated that the dilution prohibition did not normally apply to characteristic wastewaters that are managed in treatment trains which include surface impoundments where the ultimate discharge is subject to regulation under the pretreatment and National Pollutant Discharge Elimination System (NPDES) programs under sections 307(b) and 402 of the CWA, or in Class I underground injection well systems regulated under the SDWA. In particular, the Agency stated that the treatment requirements and associated dilution rules under the CWA are generally consistent with the dilution rules under RCRA, and therefore decided to regulate these wastes exclusively under the existing CWA provisions. However, the Agency also singled out certain particularly toxic wastewaters or wastewaters not readily amenable to centralized wastewater management to which the dilution prohibition still applies notwithstanding management in CWA systems. 40 CFR 268.3(b).

Similarly, EPA stated that the regulatory program for Class I wells under the SDWA adequately protects drinking water sources. Class I deep wells inject below the lowermost geologic formation containing an underground drinking water source and are subject to federal location, construction, and operation requirements. The Agency stated that application of the dilution prohibition to these wastes would not further minimize threats to human health and the environment, so that it was permissible to inject wastes that were decharacterized by dilution into Class I wells.

C. Summary of the D.C. Circuit's Opinion

On September 25, 1992, the United States Court of Appeals for the District of Columbia Circuit ruled on the various petitions for review filed against the Third Third rule. Chemical Waste Management, Inc. et al. v. EPA, 976 F.

2d 2. The principal holdings of the case with respect to characteristic wastes, under EPA's initial reading of the opinion, are that: (1) EPA may require treatment under RCRA section 3004(m) to more stringent levels than those at which wastes are identified as hazardous so long as the level defining the waste as hazardous was above the level at which threats to human health and the environment are minimized, 976 F. 2d at 12-14; (2) section 3004(m) requires that treatment standards address both short-term and long- term potential harms posed by hazardous wastes, and consequently must result in destruction, removal or immobilization of hazardous constituents as well as removal of the characteristic property, id. at 16, 17, 23; as a consequence, dilution is permissible as an exclusive method of treatment only for those characteristic wastes that do not contain hazardous constituents "in sufficient concentrations to pose a threat to human health or the environment" (i.e., the minimize threat level in section 3004(m)), id. at 16; and, (3) situations where characteristic hazardous wastes are diluted, lose their characteristic(s) and are then managed in centralized wastewater management land disposal units (i.e., subtitle D surface impoundments or Class I injection wells) are legal only if it can be demonstrated that hazardous constituents are reduced, destroyed or immobilized to the same extent as they would be pursuant to otherwise-applicable RCRA treatment standards, id. at 7.

As a consequence of these holdings, the court held that the deactivation standard for ignitable and corrosive wastes did not fully comply with RCRA section 3004(m). This was because that standard could be achieved by dilution, and dilution fails to destroy, remove, or immobilize the hazardous constituents that can be present in the wastes. Id. The court further held that dilution was ordinarily a permissible means of removing the ICR property of the wastes, but stated that it could be an impermissible means of removing ignitability and reactivity. This was because the court thought the emission of volatile organic constituents (VOCs) might be greater during the process of diluting ignitable wastes than when they are treated by other means, and that the risks of explosion of reactive wastes might be greater when those wastes are treated by dilution to remove the reactivity property. 976 F. 2d at 17, 18.

(It should be noted that the court also addressed several other issues that the Agency is not required to respond to in this interim final rule, either because it denied the petitioner's request for review, or because certain rules were remanded rather than vacated. For instance, the court remanded the lead and chromium treatment standards because EPA appeared to have relied on data that does not support its conclusion, and it denied review of a petition for review of test compliance procedures.)

D. Response to the Court Decision

EPA filed a petition for rehearing with the D.C. Circuit on November 9, 1992. In its petition, EPA requested clarification of whether the provisions of the Third Third rule that allowed dilution of wastes going to CWA/SDWA units were vacated or remanded, suggesting that these provisions were more appropriately remanded. EPA also requested a 90-day stay of the mandate.

In a separate action, industry petitioners filed an unopposed motion seeking a 90-day stay of the mandate. On November 24, the D.C. Circuit issued an order partially granting industry's motion, staying the mandate through January 5, 1993. Then on January 5, industry petitioners filed a petition with the U.S. Supreme Court seeking a writ of certiorari. The government's response opposing grant of that motion was filed on April 8,

1993.

The Court denied EPA's request for rehearing on January 11, 1993, stating, however, that the Third Third treatment standards were vacated only insofar as expressly indicated in the September 25 opinion. On January 19, EPA published a Notice of Data Availability requesting comments and data on options for responding to the court decision (58 FR 4972).

Industry's petition for certiorari continued the stay of mandate issued by the D.C. Circuit pending action by the Supreme Court. On April 26, 1993, the Supreme Court denied certiorari, and the D.C. Circuit's mandate issues on May 10, 1993.

1. Options Prepared for the Notice of Data Availability

As mentioned above, on January 19, 1993, EPA published a Notice of Data Availability to solicit as many comments as possible on all issues in the court opinion (58 FR 4972). The Agency prepared a Supplemental Information Report that was distributed to the public that set out the Agency's options for complying with the court's decision.

The report included options for establishing treatment standards for the underlying hazardous constituents in ignitable, corrosive and reactive (ICR) wastes that would have to be met prior to land disposal (including disposal in UIC wells). Two approaches were set out, along with the Agency's views on possible advantages and disadvantages of each. Under approach one, the Agency discussed the possibility of adopting concentration limits for underlying hazardous constituents. Under approach two, the Agency discussed specifying required treatment technologies. The Agency discussed how these possible approaches might apply to ICR wastes that are not managed in CWA centralized wastewater treatment systems. Furthermore, the applicability of LDR treatment standards to CWA facilities, and possible implementation scenarios under the CWA were also discussed.

Additional issues involving the establishment of treatment standards were also discussed: options for addressing potential volatile organic constituent (VOC) emissions during dilution of ignitable wastes, and potential violent reactions during dilution of reactive wastes were presented.

The Agency discussed options for how to determine the equivalency of CWA treatment systems with treatment under RCRA. The "equivalency" discussion included possible options for addressing air emissions, leaks, and sludges from CWA treatment surface impoundments. Also mentioned were other Agency efforts such as the Hazardous Organic NESHAPs being developed by the Office of Air, and information being gathered by the Office of Solid Waste from existing databases on the management of nonhazardous industrial wastes as possibly being useful for addressing equivalency of CWA treatment impoundments.

The Agency also discussed possible alternative means of compliance with the treatment standards for the underlying hazardous constituents once they were developed. Options included the possible use of risk-based standards being developed for the Hazardous Waste Identification Rule (HWIR) to "cap" LDR treatment standards; meeting treatment standards before land disposal

in a treatment surface impoundment; compliance with requirements of RCRA section 3005(j)(11) (i.e., installing double liners, groundwater monitoring, and leachate collection systems and removing sludge not meeting LDR standards annually for further treatment); and, the possibility of performing waste minimization as a means of meeting the requirements of treatability, and possibly capacity, variances.

Miscellaneous issues were also discussed, such as: does the opinion apply when characteristic wastes are treated by means other than dilution? Should de minimis losses of characteristic wastes sent to wastewater treatment systems be prohibited? Applicability of the decision to RCRA Subtitle C surface impoundments; and possible revisions to the principle established in the Third Third rule that a change in treatability group constituted a new point of generation for characteristic wastes.

Preliminary capacity determinations were also presented for comment, as well as the legal basis for possibly granting a national capacity variance. Finally, preliminary regulatory impact screening analyses for surface disposed and underground injected wastes were also presented.

2. Solicitation of Comments on the Supplemental Information Report

The Agency solicited comments on various aspects of the options in the Supplemental Information Report. Approximately 60 public comments were received in response to the Notice of Data Availability. The Agency's response to issues that pertain to today's interim final rule have, in some cases, been included in the preamble discussion; the remainder of the Agency's responses may be found in the Response to Comments Background Document, available in the RCRA Docket. Other issues raised in the public comments that pertain to remanded portions of the court's opinion will be considered when the Agency prepares proposed approaches in future rulemakings.

E. Rules Compelled by the Opinion to be Issued on An Emergency Basis

EPA is issuing this interim final rule on an emergency basis only with respect to those treatment standards that were vacated (as opposed to remanded) by the court. The distinction between vacated and remanded rules is that vacated rules are no longer in effect (once the court's mandate issues), whereas remanded rules remain in force until the Agency acts to replace them.

This distinction has considerable significance with respect to LDR treatment standards. If there is no treatment standard for a prohibited waste (for example, as a result of a vacatur), that waste is prohibited from land disposal, because it has not been treated to meet the treatment standard established by EPA, and (presumably) is not being disposed in a no-migration unit. RCRA sections 3004 (d), (e), and (g)(5). A remanded treatment standard, on the other hand, would remain in effect and disposal of prohibited wastes treated pursuant to that standard is legal until the standard is amended.

In its November 9 request for rehearing to the court, EPA specifically requested that the Court clarify if it intended to remand, not vacate, the rules addressing dilution and subsequent land disposal of certain decharacterized wastes being managed in Class I injection wells or in

subtitle D surface impoundments whose ultimate discharge is subject to the CWA. The Court indicated in its January 11, 1993 response that the RCRA treatment standards were vacated only insofar as expressly indicated in the September 25 opinion.

In light of this order, the Agency's opinion is that the rules dealing with centralized wastewater management involving land disposal (Secs. 268.1(c)(3) and 268.3(b)) were remanded, not vacated. (See 976 F. 2d at 7, 19-26 where these rules are discussed and not expressly vacated.) This means that the only wastes to which today's rule applies are those ignitable and corrosive wastes for which the treatment standard was deactivation (since the deactivation standard for these wastes was vacated) and which are not managed in the types of centralized wastewater management systems covered by the remanded rules cited above. Today's rule would thus apply, for example, to corrosive wastes that are being incinerated.

An issue exists under this interpretation as to whether centralized wastewater management systems receiving decharacterized ignitable or corrosive wastewaters would have to meet the treatment standards for those wastes promulgated in today's rule. The Agency does not read the opinion as requiring this result. In the first place, it seems clear from the structure of the opinion that the court was considering all issues relating to centralized wastewater management as essentially one single issue, see 976 F.
2d at 19-26, and did not vacate the rules affecting those systems.

Second, by not vacating the rules allowing treatment standards to be achieved through dilution where centralized wastewater management is involved, if EPA were to apply the amended ignitable and corrosive treatment standards to these centralized wastewater management situations, facilities could still dilute to meet the standards. Such a result makes no sense as a policy matter, and so does not appear to reflect the court's intent.

Third, the remanded rule relating to Class I injection wells allows injection of decharacterized wastes provided the wastes do not exhibit a characteristic at the point of injection. Consequently, ignitable and corrosive wastes could continue to be decharacterized (by any means) and injected in Class I deep wells without meeting the treatment standards for those wastes (since Sec. 268.1(c)(3) was remanded). Section 268.3(b), on the other hand, is drafted somewhat differently to provide that characteristic wastes that are managed in wastewater treatment systems whose discharge is ultimately subject to the CWA and that involve some type of land disposal can be diluted to meet the treatment standards. Although this language, unlike the parallel provision in 268.1 respecting Class I deep wells, does not expressly allow wastes not exhibiting a characteristic at the point of disposal to be managed in such systems, it would be anomalous to read the opinion as requiring more stringent rules to apply to CWA systems than to UIC systems, since the CWA systems perform treatment and do not (as the court viewed it) involve permanent land disposal. 976 F.2d at 24, 26. In addition, EPA intended that the provisions allowing dilution for characteristic wastes going to CWA systems and Class I deep wells have the same scope. 55 FR at 22656-58. Consequently, they should have the same scope in assessing the affect of the court's vacatur.

Finally, the opinion does not vacate the treatment standards for wastewaters exhibiting the EP characteristic. Consequently, since the rules

on dilution were only remanded, such wastes can continue to be diluted and land disposed in CWA systems, or in Class I deepwells. By extension, it makes sense to allow dilution of ignitable and corrosive wastewaters, which, by definition, would contain EP constituents (if at all) in lower concentrations.1

NOTE 1 The Agency also believes that any issues relating to the extent to which the opinion applies to subtitle C impoundments receiving decharacterized ignitable and corrosive wastes do not have to be addressed in today's rule because they arise only with respect to rules that were remanded. EPA solicited comment on the issue of whether subtitle C impoundments receiving decharacterized wastes could be affected by the court's opinion. Supplemental Information, pp. 40-1. The Agency has not resolved these issues. However, the court's opinion does not discuss the issue directly, and it would be anomalous for such facilities to be immediately subject to treatment standards when facilities with subtitle D impoundments are not. Consequently, today's rules do not apply to subtitle C impoundments receiving decharacterized ignitable and corrosive wastes.

The following discusses those types of centralized wastewater management that could be covered by today's rule, and the circumstances under which they are and are not covered.

1. Zero Discharge Facilities

In its Notice of Data Availability, EPA solicited comment on whether facilities that treat wastewater but do not ultimately discharge it to a navigable water or a POTW should be subject to the same standard of equivalent treatment as direct and indirect dischargers (see Supplemental Information Report, pp. 38-9). Commenters agreed that the same principles should apply. The Agency also believes that these facilities should be on the same regulatory timetable as direct and indirect dischargers, and consequently that today's treatment standards should not apply to such facilities when they do not apply to direct and indirect dischargers. Based on these comments, and for the reasons set out below, facilities that treat ignitable and corrosive wastes (either in tanks or in land-based units) in the manner described below and then land dispose the wastewaters, for example, by spray irrigation rather than by discharging to a navigable water or a POTW, do not have to meet the treatment standards for ignitable and corrosive wastes adopted today.

The Agency is taking this step in response to commenters who indicated that they treat wastewaters as well as direct or indirect dischargers, but are located in areas where there is no body of water into which to discharge (see, e.g. Comments of Hoechst Celanese). These facilities, in some cases, are subject to federal or state regulatory limitations that are as strict as those that apply to direct and indirect dischargers.

To avoid subjecting zero dischargers that substantially treat their wastewater to regulatory requirements not applicable to similarly-situated direct and indirect dischargers, the emergency rule provides that zero discharge facilities performing treatment equivalent to that performed by facilities subject to CWA limitations and standards are not subject to the emergency rule. This standard of equivalence is not the same as that which the Agency must ultimately address under the opinion regarding the extent

of "RCRA-equivalent" treatment that must be performed to allow continued management involving surface impoundments. (Supplemental Information Report, pp. 15-25) Rather, EPA intends that, for purposes of today's rule, facilities that treat ignitable and corrosive wastewaters by the types of treatment that form the technical basis for most of the CWA standards and limitations (as well as the F039 wastewater standards) are not subject to the rule. These types of treatment are biological treatment for organics, reduction of hexavalent chromium, precipitation/sedimentation for metals, alkaline chlorination or ferrous sulfate precipitation of cyanide (to the extent these constituents are present in the untreated influent to wastewater treatment systems), or treatment that the facility can show performs as well or better than these enumerated technologies. The Agency reiterates that these criteria has limited application only to this interim final rule. It is included because the Agency is promulgating this rule under emergency circumstances and this criteria provides a readily ascertainable way of determining who is and is not affected by today's rule. It is not meant to affect in any way what the appropriate CWA effluent limitation guidelines or individual permit limitations based on permit writers' Best Professional Judgement may be.

In determining whether a facility is performing CWA-equivalent treatment, treatment would need to be performed only for those hazardous constituents in the ignitable or corrosive wastes (for purposes of this evaluation). Cf. Supplementary Information Report, p. 37 (treatment of characteristic wastes, before aggregation, is sufficient to comply with treatment standard, notwithstanding that the same constituents may be present in noncharacteristic streams and thus may be present in the aggregated mixture of the treated characteristic wastes and non-characteristic wastes).
Consequently, if a zero-discharge facility has metals found at 40 CFR part 261, appendix VIII in ignitable or corrosive wastes, the only type of treatment it would need to be conducting for purposes of this CWA-equivalent treatment showing would be treatment for the metals, even if other waste streams at the facility contain organics. The Agency, at least at this time, does not believe that the opinion requires treatment of those hazardous constituents not contributed at least in part by the prohibited wastes.
Consequently, the demonstration should only concern itself with constituents present in the prohibited wastes.

Although the Agency has no information supporting that such facilities exist, today's rule would apply to zero dischargers who are not treating their wastes to this extent. Examples are facilities that have seepage impoundments or evaporation ponds (without concurrent treatment, as described above), or that spray irrigate without CWA-equivalent treatment of the wastewater. These facilities would not be within either the language or the policy of remanded Sec. 268.3(b), and consequently would have to meet the treatment standards for ignitable and corrosive wastes adopted today before the decharacterized wastes are land disposed.

EPA solicits comment on this approach, in particular, if any more precise definition of CWA-equivalent treatment is needed. The Agency's view at this time, however, is that attempting to quantify this standard beyond specifying that zero discharge facilities utilize the types of treatment that form the basis of the CWA standards and limitations would unnecessarily complicate an already complex set of regulations to little ultimate benefit.

2. Underground Injection Wells Other Than Class I

As discussed above, EPA reads the court's opinion as remanding, rather than vacating, rules pertaining to injection of decharacterized ignitable and corrosive wastes into Class I wells. However, because Sec. 268.1(c)(3) only applies to Class I injection (see the reference in that regulation to 40 CFR 144.6(a)), the treatment standards for ignitable and corrosive wastes promulgated today apply when those wastes are injected into other than Class I wells even if the wastes are decharacterized first. Today's requirements thus may apply to some injection practices, in particular, those involving a limited number of Class V injection wells. These typically are wells injecting nonhazardous wastes above or into underground sources of drinking water. Class II wells, it has been suggested, could also be subject to today's rule if they were to inject decharacterized ignitable and corrosive wastes that are not drilling fluids, produced waters, and other wastes uniquely associated with the exploration, development, or production of crude oil, natural gas or geothermal energy, materials that are not hazardous wastes even at their point of generation (see Sec. 261.4(b)(5) and 268.1(b)).

(See discussion of this point in the next preamble section.)

The Agency notes, however, that if the ignitable and corrosive wastes injected into non-Class I wells were to be treated by CWA-equivalent means before injection, today's rule would not apply. Such facilities would be a type of zero discharge facility and, since they are treating by the same means as facilities discharging directly or indirectly, would not be immediately subject to today's rule, as explained above.

F. Identification of Affected Facilities

Very limited data are available upon which to determine the number and types of facilities that will be impacted by this interim final rule.

Estimates have been made, however, based primarily on information available from the states and the Biennial Reporting Survey (BRS) database for 1989.

The problem is compounded by the fact that the facilities impacted may not all be subject to any federal requirement through which information could be gathered.

1. Underground Injection Wells

The Agency has limited and conflicting information about how many Class V wells may be impacted, as well as the volumes and types of formerly characteristic waste injected in these wells, making it difficult to fully assess the need for relief, such as national capacity variances for these facilities. An estimate of the number of facilities that could potentially be impacted by this interim final rule is 100. The Agency believes that many of the Class V wells may fall under the Small Quantity Generator (SQG) exclusion and are conditionally exempt from the RCRA requirements, including the LDRs (see 268.1(e)(1)). From information gathered, and comments received on the Notice of Data Availability, EPA further believes that a number of the deep Class V wells treat their wastes prior to injection, and thus would not be affected by this rule if such a practice would qualify them as a CWA- equivalent facility. As an interim measure, however, the Agency is granting a national capacity variance extending the

effective date of today's rule for nine months from the date of signature for decharacterized ignitable and corrosive wastes injected into Class V wells that do not engage in CWA- equivalent treatment before injection, in order for the facility to determine if it is impacted, to develop appropriate on-site modifications for alternative treatment, and to obtain off-site treatment or submit petitions for case-by-case capacity variances (see section IV of this preamble). The Agency also solicits additional information on the number of Class V wells, the types of wastes, and the volumes of such wastes injected. The Agency believes that it would be prudent for these Class V, and any other non-Class I, wells to apply for case-by-case extensions of the effective date during this nine-month period.

A number of companies extract elemental bromine from deep geologic formations, recover the bromine through ion exchange processes that change the pH of the brine to less than two, neutralize the pH to that of the original brine and reinject the spent solution into the original geologic formation. Because the reinjection process is classified as a Class V injection well, and because the brine's pH is changed to less than two during the process of extracting bromine, these companies raised the issue in their comments as to whether contemplated rules could affect these practices.

As described in the comments, these practices involve beneficiation and possibly mineral processing operations. (The Agency had insufficient information to determine whether the operations were totally beneficiation or also included some mineral processing.) In either case, the solution injected into the Class V wells would not be affected by today's rule. In particular, if these wastes were generated only from beneficiation operations, they would not be hazardous at the point of generation and thus, not affected by today's rule (see Sec. 268.1(b)). If some of the wastes are generated from mineral processing operations, they still would not be affected by today's rule since these wastes (if hazardous) were not identified as hazardous until after 1984, and thus were not included within the scope of the Third Third rule (55 FR at 22667, June 1, 1990). Rather, treatment standards for these wastes-- characteristic mineral processing wastes--will be promulgated in the future.
The Agency is also aware of fundamental arguments as to whether brine reinjected in this manner is a solid waste. The Agency is not addressing this issue at this time.

After an examination and evaluation of the comments received on the Notice of Data Availability, the Agency believes that Class II UIC wells (see complete definition of Class II wells under 40 CFR 144.6(b)) injecting oil and gas exploration and production wastes are not newly impacted by this rule. While one commenter indicated that this rule would impact their injection of decharacterized ignitable and corrosive wastes into a Class II UIC well, the Agency disagrees. First, injection into Class II disposal wells of decharacterized wastes not covered by the exemption in Sec. 261.4(b)(5) would violate existing UIC regulations. See Sec. 146.5(b)(1) specifying which wastes may be injected into Class II disposal wells. Because the conduct is already illegal, EPA does not view today's rule as having any further regulatory impact on that conduct.

Second, injection of such wastes into Class II enhanced recovery wells might also be illegal. To be permissible, the injected materials must qualify as an "enhanced recovery fluid." To do so, the fluid "must function

primarily to enhance recovery of oil and gas and must be recognized by the Agency as being appropriate for enhanced recovery * * * In this context, 'primarily functions' means that the main reason for injecting the materials is to enhance recovery of oil and gas rather than to serve as a means for disposing of those materials." See Report to Congress; Management of Wastes from the Exploration, Development, and Production of Crude Oil, Natural Gas, and Geothermal Energy; Volume 1 of 3; Oil and Gas, EPA/530-SW-88-003, December, 1987, p. II-18. The Agency gave produced waters as one example of materials appropriate for enhanced recovery. Id. In determining what fluids are appropriate, the Agency is of the view that fluids that are hazardous wastes at the point of injection would never meet the test. Decharacterized fluids might also fail to satisfy the test depending on their composition as well as the motivation for the injection. Since the commenter provided none of this information (or even indicated if the comment referred to injection in disposal or enhanced recovery wells), the Agency is unable to assess further whether today's rule might have any effect on these operations.

2. Combustion and Stabilization

Additionally, some of the wastes covered by this rule have been, and will continue to be, managed in combustion and stabilization devices. Upon promulgation of this rule, such facilities must treat the wastes to remove any hazardous characteristic and meet the treatment standards for any underlying hazardous constituents, prior to land disposal. EPA estimates that the number of such facilities that could potentially be impacted by this rule is approximately 340. Submittal of additional data and information characterizing the universe of facilities affected by this rule is encouraged. See section IV of this preamble for more information on these issues.

G. Future Response to Issues Remanded by the Court Decision

The Agency plans to address issues which have been remanded by the court in future rulemakings. Many of these remanded issues are significantly more complex than those dealt with in this interim final rule regarding the vacated deactivation treatment standards. In addition, the universe of facilities affected by the remanded portions of the Third Third rule is much broader than that covered today, as it will include (among other things) treatment systems regulated under the CWA, Class I injection wells regulated under the SDWA, plus zero discharge facilities that are engaged in treatment that is equivalent to CWA dischargers. Furthermore, the volumes of wastes affected by the remanded rules are much greater than those at issue in this regulation (one estimate is that Class I injection wells dispose more than 6 billion gallons of hazardous waste per year).

It is important that facilities that will be impacted in the future by the remanded portions of the court's decision begin immediately to plan and take actions that will help the facility comply with the new treatment standards for ignitable, corrosive, and reactive wastes consistent with the court's decision. Options for addressing these issues were presented in the Supplemental Information Report prepared for the January 19 Notice of Data Availability. The court vacated the deactivation treatment standard for ignitable and corrosive wastes, instructing EPA to develop treatment standards for the hazardous constituents in ignitable and corrosive (and by natural extension of the logic, in reactive) wastes.

Also, it is clear that the court intends for the Agency to address the special dilution provisions for CWA and SDWA Class I injection wells, specifying that dilution alone is not adequate treatment if an ignitable, corrosive, (and, presumably, reactive) waste contains underlying hazardous constituents. This will potentially greatly impact the injection of these wastes in deep wells, since there are few treatment systems currently in place upstream of the injection well that could treat underlying hazardous constituents, if present. Such facilities seem to have few options for dealing with the court's decision: undertaking substantial waste minimization efforts; installing on-site treatment systems; arranging for off-site transport and treatment; or, applying for, and being granted, a no-migration petition that would allow continued land disposal of untreated wastes.

Although commenters suggest that EPA can promulgate a rule that does not require treatment of underlying hazardous constituents, based on a generic finding that injection is a protective practice, the Agency's tentative view is that this is not a viable option (see Supplemental Information Report, pp.

25-7). However, the Agency seeks additional comments on the technical and legal issues raised in this notice.

Probably the biggest issue for CWA wastewater treatment facilities will be that of demonstrating the equivalency of CWA treatment systems with RCRA LDR treatment. Associated issues such as whether the opinion authorizes controls on leakage or volatilization from treatment surface impoundments, or whether sludges generated in impoundments must be treated, may be especially difficult to resolve, even though the court's opinion stated that RCRA LDR requirements should make some accommodations to allow continued treatment of these wastes in CWA treatment systems. EPA will consider the extensive comments on the equivalency demonstration and associated issues as the Agency develops an approach for future proposed rules.

II. Overview of the Interim Final Rule

The Agency is promulgating revised treatment standards for certain ignitable and corrosive wastes that are not managed: (1) In centralized wastewater treatment systems subject to the CWA or in Class I underground injection wells subject to the SDWA Underground Injection Control (UIC) program; or, (2) by a zero discharger with a wastewater treatment system equivalent to that utilized by CWA dischargers prior to land disposal. The treatment standards promulgated in this interim rule retain the requirement of deactivation to remove the hazardous characteristic (see DEACT in Table 1, 40 CFR 268.42); however, this rule also sets numerical treatment standards for the underlying hazardous constituents that may be present in the wastes.

EPA is also promulgating alternative treatment standards of incineration, fuel substitution, and recovery of organics for ignitable wastes.

In addition, changes have been made in the format of 40 CFR 268.42, Table 2, that simplify the way the treatment standards appear, and thus simplify compliance monitoring. The various D001 and D002 subcategories that have appeared in Table 2 since promulgation of the Third Third rule are combined, so that now there are only three D001 subcategories and two D002 subcategories. In particular, for D001 wastes, EPA has broken the subcategories into: The 40 CFR 261.21(a)(1) High TOC Ignitable Liquids

Subcategory (greater than 10% total organic carbon)--the court decision had no impact on this treatability group; D001 wastes that include all descriptions at 40 CFR 261.21 except for the Sec. 261.21(a)(1) High TOC Ignitable Liquids Subcategory managed in non-CWA/non-CWA-equivalent/non-Cla ss I SDWA systems; and, D001 wastes that include all descriptions at 40 CFR 261.21 except for the Sec. 261.21(a)(1) High TOC Ignitable Liquids Subcategory managed in managed in CWA/CWA-equivalent/Class I SDWA systems.

Furthermore, new precautionary measures are being established in the LDR regulations in 40 CFR 268 to prevent emissions of volatile organic constituents or violent reactions during the process of diluting ignitable and reactive wastes. All are described in detail in subsequent sections of this preamble.

Finally, the Agency is granting a three-month national capacity variance that extends the effective date until August 9, 1993, for persons affected by this interim final rule, and an additional extension for those persons who manage ignitable or corrosive wastes and dispose of them in Class V UIC wells, which facilities are not performing CWA-equivalent treatment before injection, that extends the effective date until February 10, 1994. These extensions are necessary because the Agency realizes that even where sufficient treatment capacity exists, it may not be immediately available. See section IV of this preamble for additional information on these capacity extensions.

III. Treatment Standards for Ignitable and Corrosive Wastes

A. Overview of Treatment Standards for Ignitable and Corrosive Wastes Not Disposed in CWA or SDWA Facilities or That Do Not Engage in CWA-Equivalent Treatment Prior to Land Disposal

The Agency is promulgating revised treatment standards for certain ignitable (D001) and corrosive (D002) wastes. (See list of applicable waste streams below.) The revised standards retain the requirement to remove the hazardous characteristic (i.e., the deactivation treatment standard (DEACT) remains applicable); it also requires that the waste be treated so that each underlying hazardous constituent in the waste meets the same concentration- based treatment standard promulgated for that constituent in the treatment standards for F039 wastewaters and nonwastewaters. (F039 is the hazardous waste code for liquids that have percolated through land disposed wastes (i.e., leachate) resulting from the disposal of more than one listed hazardous waste. See 40 CFR 261.31.)

By means of incorporating the F039 treatment standards into the treatment standards for certain ignitable (D001) and corrosive (D002) wastes, this rule allows the Agency to address any and all of those constituents regulated elsewhere in the Land Disposal Restrictions program with concentration-based treatment standards. Table III-1 presents these concentrations for the reader's convenience.

D001--Ignitable Liquids based on 261.21(a)(1)--Wastewaters.
D001--Ignitable Liquids based on 261.21(a)(1)--Low TOC Ignitable Liquids Subcategory--Less than 10% total organic carbon (Nonwastewaters).
D001--Ignitable Reactives based on 261.21(a)(2) (Nonwastewaters).
D001--Ignitable Compressed Gases based on 261.21(a)(3) (Nonwastewaters).
D001--Oxidizers based on 261.21(a)(4) (Wastewaters and Nonwastewaters).
D002--Acid Subcategory based on 261.22(a)(1) with Ph less than or equal to

2 (Wastewaters and Nonwastewaters).
D002--Alkaline Subcategory based on 261.22(a)(1) with Ph greater than or equal to 12.5 (Wastewaters and Nonwastewaters).
D002--Other Corrosives based on 261.22(a)(2) (Wastewaters and Nonwastewaters).

B. The Basis of the Numerical Treatment Standards

While the Court agreed that deactivation by any means to remove the characteristic property normally was appropriate treatment, the Court held that because hazardous constituents could be present in these wastes at concentrations of concern, the deactivation standard alone did not fully comply with RCRA section 3004(m). Consequently, EPA is now promulgating a treatment standard that retains the requirement of deactivation to remove the hazardous characteristic (i.e., DEACT) and that also sets numerical treatment standards for the hazardous constituents that may be present in D001 and D002 wastes. The numerical treatment standards for organics are established based on whether the residues are wastewaters (with total limits expressed in mg/L) or nonwastewaters (with total limits expressed in mg/Kg). The numerical treatment standards for metals are established based on whether the residues are wastewaters (with total limits expressed in mg/L) or nonwastewaters (with TCLP limits expressed in mg/L). Constituent-specific concentration limits allow a certain degree of freedom in selecting the most effective, practical and economical means of achieving compliance through treatment and/or waste minimization.

The Agency has already promulgated numerical treatment standards for organics that EPA believes are achievable for most RCRA hazardous wastes. The Third Third final rule, along with revisions promulgated on August 18, 1992 (57 FR 37203-37206), established numerical treatment standards for organics that were essentially applied universally to most RCRA waste codes. The treatment standards promulgated in today's rule for D001 and D002 wastes are based on a transfer of these same treatment data and are represented by the existing standards for F039. As such, the new standards for D001 and D002 wastes are essentially a compilation of all earlier treatment standards and include virtually every RCRA hazardous constituent that can be routinely analyzed by existing analytical methods, (i.e, a set of approximately 200 constituents)./2/ Table III-1 at the end of this section tabulates these wastewater and nonwastewater numerical standards.

NOTE /2/ While the Agency is establishing treatment standards for approximately 200 hazardous constituents, as discussed later in this preamble, compliance with the treatment standards will be met for those hazardous constituents reasonably expected to be present in the ignitable and/or corrosive waste.

EPA evaluated treatability data for nonwastewaters and wastewaters that are currently available for each hazardous constituent. The resulting set of treatment standards reflect EPA's preference for data from full-scale operations over data from pilot- or bench-scale units, and for processes treating high concentration, difficult-to-treat wastes. The Final BDAT Background Document for U and P Wastes and Multisource Leachate, Volumes A and C, explain on a constituent-by-constituent basis how each wastewater and nonwastewater standard, respectively, was calculated.

EPA developed the wastewater treatment standards using constituent-specific data from treatment of both RCRA and non-RCRA wastewaters. These performance data were from three major sources: (1) Industrial waste treatment data generated by the Office of Water in the Effluent Guidelines development effort; (2) data from EPA's Office of Research and Development Wastewater Treatment Database, a compilation of treatability research results reported in the technical literature; and, (3) industry-generated data submitted to EPA for the purpose of providing data for the Third Third rule. Activated sludge and other forms of biological treatment were the technologies most frequently used as the basis of the treatment standards for organic constituents. Granulated and powdered activated carbon, steam and air stripping, and wet-air and chemical oxidation were also utilized to establish standards for certain organics. Standards for metals were generally based on lime precipitation followed by sedimentation and filtration.

EPA developed the nonwastewater treatment standards using constituent-specific data from treatment of primarily RCRA wastes. Most data were from the analysis of ash residues from the incineration of 14 different waste types.

C. Alternative Standards for Ignitable Wastes

For D001 wastes, EPA is also promulgating alternative standards of incineration (INCIN), fuel substitution (FSUBS) and recovery of organics (RORGS). EPA previously promulgated these same standards as BDAT for D001 nonwastewaters in the High TOC Ignitable Liquids Subcategory. Therefore, this is simply an extension of an existing provision for these methods to serve as standards for these wastes and does not reflect any change in EPA's preference for establishing constituent-specific concentration levels rather than treatment methods as the LDR treatment standards. Since low TOC nonwastewaters and the D001 wastewaters would necessarily contain lower concentrations of organics than the D001 nonwastewaters in the high TOC Subcategory, treatment methods based on high temperature thermal destruction (i.e., INCIN and FSUBS) would be expected to achieve similar performance for the hazardous organic constituents present in these other D001 wastes. Also, while the recovery of organics from D001 wastewaters that necessarily contain lower concentrations of organics may be technically more difficult and somewhat less economically desirable than recovery from D001 wastes with higher concentrations of organics, the Agency does not want to discourage on- going environmentally sound recovery practices such as steam stripping, oil- water separation, and distillation that are currently being performed.
Additionally, all of these specified methods will remove the D001 characteristic of ignitability.

Because the emissions from thermal technologies are regulated under 40 CFR part 264, subpart O, or 40 CFR part 266, subpart H, and the Agency wants to encourage environmentally sound resource conservation, the Agency finds INCIN, RORGS and FSUBS to be acceptable interim alternatives to the numerical treatment standards, notwithstanding the Agency's preference for numerical treatment standards. Therefore INCIN, RORGS and FSUBS are being promulgated in today's rule as an alternative to compliance with the DEACT plus numerical standards until the Agency can complete a more thorough investigation on the need to apply the numerical standards to the residues. The treater or generator has, for the interim, the option of choosing

either regulatory alternative.

There are advantages to either means of compliance. Using the specified methods reduces the need for costly compliance monitoring. Using the numerical standards (along with deactivation of the characteristic) allows more freedom in selecting treatment technologies. As a general matter, the Agency heard in the LDR Evaluation Project Roundtable meeting /3/ held January 12-14, 1993, there is a need for more efficient and meaningful monitoring to demonstrate compliance with the numerical treatment standards.

EPA is assessing broad-based changes to the LDR monitoring requirements and intends to address this issue in upcoming notices of proposed rulemaking.

NOTE /3/ The LDR Evaluation Project Roundtable meeting was held with EPA regional and State regulators, an environmental group, the waste management industry, and the regulated community. The main intention of the meeting was to provide these persons an opportunity to comment on various aspects of the LDR program, and to offer suggestions on how the program could be improved. A summary of the Roundtable proceedings is available in the RCRA Docket, number F-92-CD2F-SO144.

D. Alternatives Discussed in the Supplemental Information Report

EPA considered mandating the use of particular treatment technologies (such as those identified in appendix VI to part 268) as a means of regulating the hazardous constituents for all ignitable, corrosive, and reactive (ICR) wastes. This approach appears unnecessarily complicated and the Agency concluded it would lead to unnecessary and potentially burdensome controls and governmental review. In many cases, specifying treatment methods would require establishing surrogate or indicator parameters for compliance monitoring to ensure treatment of the hazardous constituents. Then, all the generators and treaters would be required to identify and verify that the surrogate parameters were indeed indicators of treatment for the hazardous constituents present.

In addition, for wastes containing both metal and organic constituents, specifying single types of treatment does not necessarily result in treatment of all of the constituents that are present. While EPA could have designated a treatment train, i.e., a specified sequence of treatment processes, as a method of treatment, situations could arise where wastes containing only a single type of hazardous constituent would, then, be overregulated requiring unnecessary and costly treatment.

EPA also considered specifying the methods that were considered BDAT during the development of the treatment standards for each individual hazardous constituent. However, the above-mentioned problems with specifying methods remained and new ones appeared; for example: specific on-site technical and engineering decisions, including the possibility of Agency review and approval on the proper sequencing of treatment units would have been necessary; additional sequencing decisions dependent upon the types and concentrations of hazardous constituents present would have to have been made; and whenever new constituents or wastes were introduced, the sequence decisions would have to be reviewed and reapproved.

As such, EPA believes that constituent-specific numerical treatment standards ensure treatment of the hazardous constituents more efficiently (on a regulatory basis) than the approach of mandating the use of specific

technologies. Most of the commenters agreed. Although the alternative standards, FSUBS, INCIN and RORGS are appropriate as interim standards pending EPA's subsequent development of treatment standards reflecting a more thorough evaluation of these waste streams, they are a special case reflecting the need to respond promptly to the court by instituting adequate treatment standards for the hazardous constituents in these wastes.

Additional reasons supporting the FSUBS, INCIN and RORGS options are discussed in section C immediately preceding this section.

EPA continues to prefer constituent-specific numerical treatment standards whenever possible. Setting numerical standards also provides for the encouragement of innovative technologies and practices to achieve these limits. This also encourages the use of source reduction techniques to reduce the overall loading of hazardous constituents into these wastes as alternative and cost-effective means of compliance.

Table III-1.--Regulated Constituents and Standards

Constituent	Wastewater (mg/l)	Nonwastewater (mg/kg)
Acetone	0.28	160
Acenaphthalene	0.059	3.4
Acenaphthene	0.059	4.0
Acetonitrile	0.17	NA
Acetophenone	0.010	9.7
2-Acetylaminofluorene	0.059	140
Acrolein	0.29	NA
Acrylonitrile	0.24	84
Aldrin	0.021	0.066
4-Aminobiphenyl	0.13	NA
Aniline	0.810	14
Anthracene	0.059	4.0
Aramite	0.36	NA
Aroclor 1016	0.013	0.92
Aroclor 1221	0.014	0.92
Aroclor 1232	0.013	0.92
Aroclor 1242	0.017	0.92

/1/ These concentrations are expressed in mg/l and are measured through an analysis of TCLP extract; all others measured through a total waste analysis.

E. Changes in Treatability Group Are Not a New Point of Generation for Purposes of Today's Rule

Treatment of a wastewater often generates a nonwastewater sludge as well as a treated wastewater. Similarly, incineration of a wastewater can generate a nonwastewater (ash) as well as a wastewater (scrubber water) residue. The issue under discussion here is whether these residues that are different treatability groups require further treatment. The Agency has approached this issue differently for listed and characteristic wastes. Under the "derived- from" rule, residues generated from the treatment of listed wastes are subsequently managed as the listed waste; thus treatment must continue until the LDR treatment standards are achieved as measured in the treatment residue.

No derived-from rule applies to characteristic wastes, however. In the Third Third final rule, EPA stated that for characteristic wastes, each change of treatability group in a treatment train marked a new point of generation for determining if a characteristic waste was prohibited from land disposal (55 FR 22661-62). Thus, if a characteristic wastewater were treated and generated a sludge (a nonwastewater) that did not exhibit a characteristic, the sludge would not be subject to any prohibition.

This issue was discussed in the Supplemental Information Report prepared for the Notice of Data Availability published on January 19, 1993 (see Supplemental Information Report, pp. 41-2). It was explained that this principle made sense in the context of the Third Third rule where the treatment standard for most characteristic wastes was deactivation. Now that the court has directed EPA to set standards for the underlying hazardous constituents in wastes that are deactivated, the Agency is reexamining this principle. EPA solicited comment in the Supplemental Information Report on how much force the change of treatability group principle retains after the court's opinion.

Several commenters addressed this issue by saying that EPA should reaffirm its prior pronouncements on the rules governing changes in treatability groups. Some suggested that if changes were necessary, they would be better made in the context of changes in the dilution provisions of 40 CFR 268.3, when the remanded portions of the court opinion are considered in the future.

On the other hand, other commenters argued that the only way to be consistent with the court's direction to minimize threats to human health and the environment from hazardous constituents is to apply BDAT standards to treatment residues. They said that such an approach would remove subjectivity and questions about compliance with the LDR treatment standards.

For wastes addressed in this interim final rule and treated in combustion and other devices, the Agency is adopting an approach where the LDR treatment standards attach at the point of generation of the original

ignitable or corrosive waste. Residues that derive from the treatment of the original ignitable or corrosive waste would be subject to either the wastewater or nonwastewater F039 treatment standards, based on the physical form of the residue. (There is no requirement, however, to measure residues for D001 waste when a method of treatment has been established as an alternative standard and that method has been used.)

The Agency is taking this approach in today's rule in part because of the exigent need to issue an emergency rule, and the consequent lack of time to try and develop an alternative. In addition, EPA expects that combustion processes will be the principal type of technology utilized to comply with the wastes affected by today's rule, and the principal treatment residue left from combustion treatment is an ash (a nonwastewater), leaving that ash as the only logical thing to test to determine that the treatment standards have been satisfied. To the extent that an ignitable or corrosive wastewater is being disposed in a land disposal unit that is not part of a system regulated under the CWA, a zero discharger that is not treating the wastewater by CWA- equivalent treatment, or injecting in other than a Class I underground injection well system, this also should not be an issue since the treatment standards, including those for the underlying hazardous constituents, must be met before the wastewater is land disposed.

EPA emphasizes that it is making no decision, and establishing no precedent, on the issue of whether nonwastewater residues from wastewater treatment, such as wastewater treatment sludges, require further treatment when such nonwastewater residues are not hazardous waste when they are generated (see Supplemental Information Report, pp. 23-5). As a legal matter, the court did not directly decide the issue, and the Agency's rules established in the Third Third rule were not challenged. In addition, the effectiveness of a wastewater treatment system is most appropriately determined by monitoring the effluent wastewater, unlike the situation with combustion technology where treatment of a wastewater or nonwastewater is most appropriately measured by testing an ash (a nonwastewater).

F. Minimize Threat Levels

The treatment standards adopted today are based on the performance of available treatment technologies. This approach to establishing treatment standards was upheld in Hazardous Waste Treatment Council v. EPA, 886 F. 2d 355, 361-62 (D.C. Cir. 1989), cert. denied, 111 S. Ct. 139 (1990) (HWTC III).

The levels of the treatment standards are, of course, constrained by the requirement that the standards not be lower than the level at which threats to human health and the environment are minimized. Section 3004(m)(1); HWTC III, 886 F. 2d at 363; Third Third Opinion, 976 F. 2d at 14. It was not possible to develop such levels in today's rule because of the need to issue this as an emergency rule. However, the Agency will continue to evaluate various approaches for setting such minimize threat levels and, as appropriate, propose them in future rulemakings. The Agency solicits technical and factual information that could aid in defining the minimize threat levels.

G. Compliance Monitoring Requirements

As noted in the Supplemental Information Report, one concern with implementing numerical treatment standards for the ignitable (D001) and corrosive (D002) wastes is which hazardous constituents must be monitored

to determine compliance and the frequency of such monitoring. The treatment standards that are being promulgated (in addition to the existing deactivation treatment standard) for D001 wastes (other than the D001 high TOC subcategory, which is unaffected by today's rule), and D002 wastes, set numerical limits for over 200 constituents. Since each facility's ignitable or corrosive wastes likely will contain only a subset of these hazardous constituents, it seems unnecessary and wasteful to routinely require monitoring of all constituents. Therefore, compliance with the treatment standards promulgated in this rule for ignitable and corrosive wastes must be monitored for only for those hazardous constituents "reasonably expected to be present" in the hazardous waste.

The determination of "reasonably expected to be present" for compliance purposes may be based on knowledge of the raw materials used, the process, and potential reaction products, or the results of a one-time analysis for the entire list of F039 hazardous constituents that may be present in the untreated hazardous waste. If a one-time analysis of the entire list of F039 hazardous constituents is conducted, subsequent analyses would be required for only those pollutants which would reasonably be expected to be present in the waste as generated, based on the sampling and analysis results.

This approach is similar to that developed in the Third Third final rule for measuring compliance with multi-source leachate (F039) standards (55 FR 22620, 22621). (However, this approach for determining which constituents are present in the waste is not necessarily the approach that will be taken in future rulemakings when the remanded rules are addressed.) If the facility is permitted under RCRA, and the facility's Waste Analysis Plan requires modification to accomplish this, the Plan may be modified through a Class 1 permit modification with prior approval. (See amendment to 40 CFR 270.42 promulgated as part of today's rule. See also 55 FR 22621 explaining why it is reasonable to use Class I modification procedures.) If the facility is not permitted under RCRA, the results of the one-time analysis for all hazardous constituents and any other relevant information should be kept in the facility's files. See 40 CFR 268.9, 268.7(b)(5), and discussion at section I below. Generators covered by the rule utilizing Sec. 262.34 tanks for treating the wastes may also amend their waste analysis plans prepared pursuant to Sec. 268.7(a)(4). Changes in waste generation should be documented in the facility files; furthermore, it is recommended that another analysis of the F039 list of hazardous constituents be made. Commenters generally supported such an approach.

H. Addressing Potential VOC Emissions and Violent Reactions During Dilution of Ignitable and Reactive Wastes

1. Potential VOC Emissions During Dilution of Ignitable Wastes--Background and Comments

The court held that EPA must address the problem of VOC (volatile organic constituents) emissions from ignitable waste during dilution. The court pointed out that the Agency had initially proposed in the Third Third to prohibit dilution of all ignitable wastes because of the risk of VOC emissions during dilution. Furthermore, the court stated that EPA had presented inadequate justification in the final rule not to control emissions during dilution of ignitable wastes. Thus, in vacating the standard, the court invited the Agency to justify non-regulation with

evidentiary support or require actions to minimize the risk. 976 F.2d at 17.

As was explained in the Supplemental Information Report, the Agency has reconsidered its premise set forth in the proposed Third Third rule (see Supplemental Information Report, pp. 34-5). In most cases, whatever the risk of VOC emissions from ignitable wastes is, it is not increased during the dilution process. Nor does dilution normally pose a risk of VOC emission greater than that posed by other methods of treating these wastes. In the Supplemental Information Report, the Agency also pointed out, however, that there are instances where diluting certain wastes could cause exothermic reactions that would increase volatilization or acid misting. Id.

Furthermore, even in situations where emissions are not increased during the dilution process, the wastewater treatment system may still pose risks due to emissions. EPA solicited comments on these issues.

A few commenters responded. The Chemical Manufacturers Association and others agreed with EPA that in most cases the risk of VOC emissions from ignitable wastes is not increased during the dilution process. No commenter disagreed with EPA's tentative conclusion.

2. Potential Violent Reactions During Dilution of Reactive Wastes--Background and Comments

In the proposed Third Third rule, EPA stated that dilution of reactive wastes should not automatically be considered a legitimate form of treatment (54 FR at 48426). The preamble discussion indicated that most reactive wastes cannot be diluted without violent reaction, and thus concluded that dilution is not a viable management alternative for these wastes. The Agency took a different position in the final rule (i.e., many reactive wastes should be diluted with some type of liquid, such as kerosene, in the case of water reactive wastes, in order to safely transport such wastes to incineration or chemical treatment); however, the court looked primarily at the proposal in reaching its conclusion, saying that while there seemed to be no toxicity concern with these wastes, any treatment standard written for these wastes must curb the risk of violent reaction during treatment. 976 F. 2d at 18.

As was explained in the Supplemental Information Report, because of their very nature, reactive wastes are typically handled carefully to avoid violent reaction such as explosion. It is logical that workers are very careful with such wastes and take precautions against any risk of reaction, whether through dilution or other practices, to protect their health and very life.

Comments were solicited on whether dilution is any more risky than other waste management practices for reactive wastes. Comments were also solicited on other types of controls that may be in place under OSHA and Department of Transportation requirements, or even under local fire codes, and whether such controls may be adequate to address the potential for violent reactions during dilution.

Commenters stated that in any situation where these wastes are deactivated by reaction with water, generators are already appropriately regulated under other statutes, including the Bureau of Alcohol, Tobacco, and Firearms regulations at 27 CFR 55, OSHA process safety management standards at 29 CFR 1710.119, and the chemical process safety standards of section

304 of the Clean Air Act. In addition, comments provided by members of the Chemical Manufacturers Association (CMA) indicate that reactive wastes are not commonly managed by dilution, and generators are highly motivated to prevent explosions and fires by concerns about employee and community safety, business continuity, and cost. Other commenters pointed out, as EPA did in the final Third Third rule, that dilution of some types of reactive wastes is the best means of removing the reactivity property (55 FR at 22553).

3. Final Approach

The Agency is adopting in this interim final rule an approach to address the potential for increased emissions during the process of dilution of ignitable wastes and for violent reactions during dilution of reactive wastes, the two principal risks potentially warranting extra control. The Agency is modifying 40 CFR 268 to require that the general facility standards set out at 40 CFR 264.17(b) and 265.17(b) for permitted and interim status facilities be met during dilution of ignitable or reactive characteristic wastes. These standards require persons managing ignitable or reactive wastes to take the necessary precautions to prevent reactions which generate extreme heat or pressure, fire or explosions, or violent reactions, produce uncontrolled toxic mists, fumes, dusts, or gases in harmful concentrations, or produce uncontrolled flammable fumes or gases that could pose risk of fire or explosion. As noted above, facilities not already subject to these requirements should be complying with them by virtue of meeting OSHA requirements, fire codes, or other safety-related requirements.

Dilution of reactive or ignitable wastes could take place in wastewater treatment tanks that are presently exempt from subtitle C regulation pursuant to Secs. 264.1(g)(6) and 265.1(c)(10). We are making this exemption contingent on satisfying the performance standard in Sec. 264.17(b)(and 265.17(b)). This obviously does not mean that such units become subject to any other type of subtitle C standard. Nor does it mean that these units necessarily lose their subtitle C-exempt status in the unlikely event of an explosion due to lack of precautions when diluting ignitable or reactive wastes. It only means that owners and operators of such units must take precautions when they use them to dilute ignitable and reactive wastes. In addition, because the Agency believes that almost all facilities managing these wastes in exempt tanks will take (and are already taking) proper precautions, and because it will ordinarily be readily apparent when such precautions are not taken, EPA is taking the unusual step of not adopting any type of recordkeeping requirement to document compliance with this new requirement.

I. Notification Requirements

1. Constituents To Be Included on the LDR Notification

EPA solicited comment in the Supplemental Information Report on how to limit the underlying hazardous constituents to be monitored (and thus, the ones required to be reported on the LDR notifications) (see Supplemental Information Report, pp. 8-10). Commenters on this issue generally said that the regulated community should only be required to address those constituents which are in the ignitable or corrosive wastes as generated,

prior to any subsequent mixing with other wastes, and the generators should monitor only for those hazardous constituents reasonably expected to be present in the I/C waste. This is the approach being adopted for this interim final rule (see section III.G above). The determination of which underlying hazardous constituents are in the waste may be made based on a one-time analysis of the waste to determine which of the F039 hazardous constituents are present, or it may be made based on knowledge of what constituents are reasonably expected to be present in the waste. Supporting documentation for the determination must be kept in the generator's on-site files. This approach for determining which constituents are present in the waste is not necessarily the approach that will be taken in future rulemakings when the remanded rules are addressed.

2. Management in Subtitle C--Regulated Facilities

The Agency has information that many of the ignitable and corrosive wastes that are not managed in CWA or SDWA systems are being treated in hazardous waste management units (primarily incinerators) subject to RCRA subtitle C. In such a case, the notification, certification, and recordkeeping requirements set out in 40 CFR 268.7 apply. This means, generally, that a notification would be prepared for each waste shipment sent from the generator to the treatment facility, in the same manner that such paperwork follows a listed waste from "cradle to grave." Once the waste is no longer hazardous, however, the only further recordkeeping and documentation required is set out in 40 CFR 268.9. Section 268.9 requires that the generator/treater (including generators who treat, see 51 FR at 40598, November 7, 1986) prepare a one-time notification which is sent to the EPA Region or authorized state and also kept in the generator or treater's files. The notification must include the name and address of the subtitle D facility receiving a waste shipment, a description of the waste initially generated, and the treatment standard to which the waste is subject (see Sec. 268.9 (d), as amended at 57 FR at 37271 (Aug. 18, 1992)). For wastes covered by today's rule, these treatment standards would be the numerical standards for ignitable and corrosive wastes. These treaters must certify that they are familiar with the treatment process used at their facility and that the process can successfully treat the waste to meet the treatment standards without impermissible dilution. See Sec. 268.7(b)(5), which applies to persons who treat formerly characteristic wastes (see Sec. 268.9(d)(2)). The Agency believes that, normally, at least some waste analysis is needed to make a good faith showing for the treatment standards in today' s rule, given the number of hazardous constituents covered by those standards.

It is important to state that in addition to other waste codes that are currently required to be included on notifications under Sec. 268.7, generators of ignitable and corrosive wastes that are managed in non-CWA/non- CWA-equivalent/non-Class I SDWA systems must identify the underlying hazardous constituents (as defined in Sec. 268.2) along with the corresponding constituent treatment standards.4

NOTE 4 An important issue that was discussed at the January 13-14, 1993, LDR Evaluation Project Roundtable meeting was the notification/recordkeeping requirements that are currently in place. Today's rule adds certain requirements to the existing notification/recordkeeping system. In response to the concerns expressed by Roundtable participants, however, the Agency will examine all the

notification/recordkeeping requirements of the program to see if they can be simplified.

3. Management of Deactivated Ignitable or Corrosive Wastes at a Subtitle D Waste Management Facility

In certain cases, a generator, after removing the characteristic, may send the deactivated ignitable and corrosive waste off-site to a subtitle D waste treatment facility for treatment to address the underlying hazardous constituents. Such a situation points out a gap in the current regulations. Although the initial generator of the waste would have to comply with Sec. 268.9 as explained above, there is no current requirement that the generator notify a subtitle D nonhazardous waste treater of what the treatment standards are, or for the subtitle D treater to verify compliance with those standards or to notify the ultimate disposal facility as to what the standards are. The Agency is aware that these are deficiencies in the notification, certification, and recordkeeping requirements in this interim final rule as they pertain to nonhazardous waste (non-subtitle C) treatment facilities.

EPA is not creating new requirements in this rule to redress these deficiencies because the Agency believes it is unlikely that decharacterized ignitable and corrosive wastes would be treated sequentially at different facilities. (In addition, the same problem already exists for other Third Third wastes. See 55 FR at 22663, column 1.) It seems much more likely that generators that must send their waste off-site will send it to a subtitle-C hazardous waste management facility to have both the characteristic property removed and to treat the underlying hazardous constituents. Generators who decharacterize their ignitable waste on-site may also be equipped to treat the waste to meet the treatment standards for the underlying hazardous constituents. The Agency solicits comment, however, on whether generators will send their decharacterized wastes to a nonhazardous waste treatment facility for treatment of underlying hazardous constituents. If so, additional comments are solicited on what requirements should be imposed on the generator and on the nonhazardous waste treater to adequately document "cradle to grave" waste management or on whether existing liability and contractual agreements will lead the treater to obtain complete information about each waste shipment. For example, if EPA determines that additional federal regulation is necessary, one option that EPA is considering is to require a generator that decharacterizes an ignitable or corrosive waste and sends it off-site to a nonhazardous waste facility for treatment of the underlying hazardous constituents to provide a notification (see 40 CFR 268.7(a)) to inform the treater of the underlying hazardous constituents in the waste and the applicable treatment standards that must be met. Once the waste is treated to meet the treatment standards for the underlying hazardous constituents, the nonhazardous waste treater would provide a one-time notification and certification to the EPA Region or Authorized state (see 40 CFR 268.9, as amended on August 18, 1992, 57 FR 37194). This would include a recordkeeping requirement that a copy of the notification and certification be maintained in the facility's files. Comments are solicited on such an approach.

The disposer of a waste that was hazardous at the point of generation and prohibited from land disposal has the ultimate responsibility for land disposing only wastes that meet LDR treatment standards (see Sec. 268.37 in this interim final rule which implements the RCRA section 3004(g)(5)

prohibition). This applies to both subtitle C and subtitle D disposers. The Agency assumes that the nonhazardous waste treater is also likely to be the disposer of the waste. Therefore, EPA recommends that generators provide to the nonhazardous waste treater information on what underlying hazardous constituents are present in the decharacterized waste, along with the treatment standards. Furthermore, the nonhazardous treater may want to ask the generator for such information as a condition of doing business, particularly if they are also disposing the waste and so are responsible for meeting the LDR treatment standards before disposal.

J. De Minimis Losses of Characteristic Materials Are Not Prohibited

1. De Minimis Losses of Ignitable (D001), or Corrosive (D002) Commercial Chemical Products or Chemical Intermediates Containing Underlying Hazardous Constituents

Another issue demanding attention as a result of the court's opinion is that of the status of de minimis losses to wastewater treatment systems of commercial chemical products or chemical intermediates that are ignitable (D001), or corrosive (D002), and that contain underlying hazardous constituents.

The Supplemental Information Report discussed whether an approach similar to the mixture rule exception in 40 CFR 261.3(a)(iv)(D) should apply to these de minimis losses. The Agency stated that it would seem incongruous for minor leaks of an acid to a wastewater treatment system, which leaks are inevitable as a practical matter and can most responsibly be handled by management in the plant's wastewater treatment system (46 FR 56583, Nov. 17, 1981), to potentially trigger all of the potential consequences of the Third Third opinion (see Supplemental Information Report, pp. 39-40). Moreover, this result would be more stringent than for de minimis losses of listed wastes (which tend to be more concentrated, 976 F. 2d at 30), since the mixture rule does not apply to such losses. The Agency stated further that it did not believe that the court considered this type of incidental loss when writing its opinion.

Commenters supported the approach discussed in the Supplemental Information Report. Therefore, for the reasons stated in the Report, the Agency is promulgating an approach whereby de minimis losses to wastewater treatment systems of ignitable (D001), or corrosive (D002) commercial chemical products or chemical intermediates containing underlying hazardous constituents are not considered to be prohibited wastes. De minimis is defined as losses from normal material handling operations (e.g. spills from the unloading or transfer of materials from bins or other containers, leaks from pipes, valves or other devices used to transfer materials); minor leaks of process equipment, storage tanks or containers; leaks from well-maintained pump packings and seals; sample purgings; and relief device discharges.

2. Wastewaters From Laboratory Operations

The Agency also solicited comments on whether the exclusion for wastewaters from laboratory operations presently applicable to listed wastewaters (see 40 CFR 261.3(a)(2)(iv)(E)) should also apply to ignitable and corrosive wastes covered by this interim final rule. As stated in the Supplemental Information Report, it seems logical that this same type of

exception is needed for ignitable and corrosive wastes. The mixture rule exception for listed wastes has not been seriously questioned since it was adopted in 1981, and these characteristic wastes will typically contain lower concentrations of hazardous constituents than listed wastes. CF. 976 F. 2d at 29-30. Thus, the Agency believes, a fortiorari, that the same exception should apply for these characteristic laboratory wastes. Commenters on this issue all favored such an approach.

The Agency, therefore, is promulgating in 40 CFR 268.1 an exclusion that says that land disposal prohibitions do not apply to ignitable and corrosive laboratory wastes that are commingled with other plant wastewaters under designated circumstances: ignitable and corrosive laboratory wastes containing underlying hazardous constituents from laboratory operations, that are mixed with other plant wastewaters at facilities whose ultimate discharge is subject to regulation under the CWA (including wastewaters at facilities which have eliminated the discharge of wastewater), provided that the annualized flow of laboratory wastewater into the facility's headwork does not exceed one percent, or provided that the wastes' combined annualized average concentration does not exceed one part per million in the facility's headwork (the same condition that applies to the existing exemption in 40 CFR 261.3(a)(2)(iv)(E)).

K. Status of Impoundments and Landfills Receiving Decharacterized Ignitable and Corrosive Wastes Subject to a Capacity Variance

Although prohibited wastes that are subject to a national capacity variance that are going to be disposed in landfills or surface impoundments can ordinarily only be disposed in landfills and impoundments that satisfy minimum technology requirements (MTR) (Sec. 268.5(h)(2)), this does not apply to decharacterized prohibited wastes subject to a capacity variance that are disposed in subtitle D units. As the Agency explained in the Third Third rule, the MTR only apply to subtitle C units, and consequently do not apply to subtitle D landfills and impoundments receiving decharacterized wastes. 55 FR at 22664.

IV. Capacity Determinations

This section presents the capacity analysis for ignitable (D001 or I wastes) and corrosive wastes (D002 or C wastes) for which the deactivation (DEACT) treatment standards promulgated in the Third Third rule were vacated by the court and for which new treatment standards are being promulgated today.

A. Data Sources and Limitations

In conducting this analysis, EPA became aware of several limitations in its data. First, data from the 1989 Biennial Report reflect generation and management of IC wastes prior to the Third Third rule coming into effect. Second, the quantities of wastes from the 1989 Biennial Reporting System (BRS) may be underestimated if disposed wastes were diluted very shortly after generation and not reported in the survey (commenters have noted that these wastes have not generally been considered IC wastes). Third, data on constituent concentrations in waste streams and in the residuals from the treatment of IC wastes are very limited. Finally, while the Agency expects that much of the unreported diluted IC wastes are disposed in CWA and SDWA-regulated systems, the Agency has very little information on unreported

quantities of IC wastes affected by this rule.

In addition, the Agency is promulgating alternative treatment standards expressed as required methods of treatment (incineration, fuel substitution, and solvent recovery) for D001 wastes. These methods are the same as those promulgated in a previous rule for the D001 High TOC subcategory. In the Third Third rule capacity analysis, EPA assigned the entire volume of D001 ignitable liquid nonwastewaters to incineration (both high TOC and low TOC) (55 FR 22635) because these categories could not be distinguished in available data. For this analysis, EPA is able to distinguish between liquid and solid nonwastewaters using BRS data. However, the Agency is still unable to distinguish between high and low TOC D001 ignitable liquid nonwastewaters.

Therefore, by assigning the entire quantity of D001 ignitable liquid nonwastewaters subject to this rule to the D001 wastes covered by this rule, the Agency may be overestimating the required capacity for these wastes.

B. Comments on Capacity From the Notice of Data Availability

EPA has received approximately 60 public comments on the Supplemental Information Report prepared for the Notice of Data Availability. Of these, 40 commenters dealt with capacity issues raised in the Supplemental Information Report. However, few commenters addressed issues related to the wastes covered in this rule (i.e., deactivated wastes whose discharges are not regulated under CWA, CWA-equivalence, or Class I SDWA).

Many commenters expressed the need for a capacity variance for wastewater treatment systems in which IC wastes are deactivated. As discussed above, the Agency will address IC wastes managed in CWA/SDWA systems in future rulemakings and will make variance determinations at that time.

Some commenters (e.g., Texaco, Ethyl Corporation) expressed concern that the impact of this rule on Class V injection wells will have significant economic and capacity impacts. Several commenters (e.g., CMA, PMA, Dupont) confirmed that the Biennial Report Survey is likely to underestimate the number of facilities and quantities of wastes potentially affected by this rule because many respondents did not report wastes managed in non-hazardous systems.

C. Methodology and Analysis

In conducting its capacity analysis for this rule, the Agency relied primarily on data from the 1989 Biennial Reporting System (BRS), comments to the Notice of Data Availability and discussions with EPA regional and state officials as well as other knowledgeable persons. The IC wastes potentially affected by this rule are deactivated wastes that are not disposed of in CWA centralized wastewater treatment systems involving impoundments or injected in SDWA-permitted Class I deepwells, or zero discharge facilities performing CWA equivalent treatment of IC wastes before final disposal of those wastes.

EPA's capacity analysis thus focused on treatment and treatment residuals of IC wastes that may not meet the standards promulgated in today's rule, which wastes are currently being deactivated in systems that are not regulated under the types of CWA, SDWA, or CWA-equivalent systems described

above.

1. Treatment and Treatment Residuals

Treatment and residuals from the treatment of IC wastes may be affected by today's rule and require additional treatment. Tables IV-1 and IV-2 show the quantities of D001 and D002 wastes going to on- and off-site incineration, reuse as fuel, stabilization systems, solvent recovery and evaporation, according to the 1989 Biennial Report. These tables are organized to show the quantities of wastes potentially affected by this rule. Whether IC wastes are affected depends on whether they are managed alone or with other codes and on how they are currently treated.

Table IV-1 shows wastes treated in off-site systems, while Table IV-2 shows wastes treated in on-site systems. The first row of these tables contains the quantities of wastes carrying only the D001 waste code. The second row contains the quantities of wastes carrying only the D001 code, and any D004- 11 codes. These waste streams do not carry any listed codes, or other characteristic codes. The third row contains the quantities of wastes carrying the D001 code, any D004-11 code, along with any listed or characteristic codes the stream may also carry. The fourth row shows the quantities of wastes carrying the D001 code, and a solvent code (F001-5), but no other codes. The fifth row shows the quantities of wastes in wastes streams carrying the D001 code, a solvent code (F001-5), and any other code.

The sixth row contains the quantities of wastes only carrying both D001 and D002 codes. The final three rows are similar to the first three, reporting quantities of wastes carrying only D002, D002 with any D004-11, and all streams with D002 and D004-11 as well as any other listed or characteristic codes. It should be noted that the Biennial Report only allows one system code to be checked per waste stream. Therefore, wastes that are incinerated prior to being stabilized are not likely to appear in the stabilization totals. The Agency believes that the majority of D001 waste streams are being treated in combustion systems, and will not be affected by today's rule.

Tables IV-1 and IV-2 show that approximately 7,000 tons of D001 wastes are reported to be stabilized as their primary treatment. By today's rule, these wastes may require incineration, reuse as fuel, or solvent recovery as their initial treatment.

Table IV-2 shows that relatively large quantities of D002 are reported in the Biennial Report as being treated in combustion systems (D001-2 Only, and D002 & D004-11 mixed with other codes). Approximately 300,000 tons of D002 wastes are managed on-site in combustion systems. Of these wastes, 70,000 tons are mixed with metal wastes and other codes. Assuming a 10 percent residuals to waste ratio, EPA expects that approximately 10,000 tons of D002 wastes mixed with metal codes may require additional treatment, provided the constituent concentrations in the ash exceed today's treatment standards.

Table IV-1.--Quantities of Wastes Treated in Off-site Incineration, Reuse as Fuel, and Stabilization, Solvent Recovery and Evaporation Systems (tons/year)

2. IC Wastes Currently Deactivated Covered By This Rule

In order to estimate the potential quantities of IC wastes affected by this rule, EPA extracted data from the BRS on IC wastes managed in surface impoundments whose discharges are not regulated under CWA or SDWA (as explained above). Data from the BRS indicates that 99.9% of all waste quantities disposed of in surface impoundments are discharged under CWA or in SDWA Class I wells. EPA believes that IC wastes are land disposed in the same proportions as other wastes; therefore, EPA believes that most IC wastes that are placed in surface impoundments are part of a CWA system or

sent to Class I wells. The Agency estimates that approximately 1,000 tons of D001 wastes may be managed in evaporation systems--that is, wastes that are subject to today's rule. These wastes may require alternative treatment capacity if the underlying hazardous constituents in these wastes are above F039 standards.

EPA has not assigned these quantities to treatment technologies because of the lack of data on constituent composition in these evaporation systems.

The Agency has also become aware of wastewater treatment systems that are not regulated under CWA/SDWA and that may be impacted by this rule. (As described earlier, only those zero-discharge facilities that do not provide CWA-equivalent treatment would be impacted by today's rule.) These systems are generally state-regulated through zero discharge, land application, or ground-water protection permits. State data received by EPA did not indicate whether the wastes discharged under these systems are IC wastes or contain decharacterized IC wastes or what constituent levels are allowed in the state permits. Furthermore, state standards exist either on a case-by-case basis or in general form and are not necessarily consistent across states.

States generally require treatment of wastes regulated through no-discharge permits. EPA has determined that many of these facilities are providing treatment similar to other facilities whose discharges are regulated under CWA. As explained above, the Agency has determined that such zero discharge systems will be addressed at a future date, along with similar CWA discharge systems. The Agency believes that most of the wastes regulated by states through no-discharge, land application, or ground-water protection permits receive treatment similar to CWA discharge systems and are therefore not covered by this rule.

In addition, deactivated IC wastes that currently are disposed without CWA- equivalent treatment into UIC program injection wells other than Class I wells would be affected by today's rule to the extent that these wastes do not meet F039 standards. In particular, commenters to the Notice of Data Availability voiced concerns about Class II and Class V wells.

As described in section I.F above, after an examination and evaluation of the comments received on the Notice of Data Availability, the Agency believes that Class II UIC wells reinjecting oil and gas primary production wastes are not newly impacted by this rule.

Data available to EPA indicates that there may be up to 200,000 industrial Class V wells. Because of the lack of waste characterization data, it is not known how many of these wells receive deactivated IC wastes or would meet F039 treatment standards before injection. Typical quantities of wastes injected in these wells vary widely between 35 and 1,000 gallons per week.

EPA estimates that approximately 15,000 tons per year of wastes injected in Class V wells may contain deactivated IC wastes. This estimate takes into account that some of these wastes receive treatment prior to Class V injection and are either likely to meet F039 standards or to be CWA equivalent zero dischargers (and thus not be impacted by today's rule).

The Agency suspects that many of these Class V wells fall under the Small Quantity Generator (SQG) exclusion and are conditionally exempt from RCRA requirements, including the LDRs (see 268.1(e)(1)). From the information gathered, and comments received on the Notice of Data Availability, EPA

further believes that a number of the deep Class V wells treat their wastes prior to injection, and thus would not be affected by this rule if such a practice would qualify them as a CWA-equivalent facility.

3. Affected Facilities

Table IV-3 shows the number of facilities which indicated in the BRS that they treated D001 and D002 wastes in incineration, reuse as fuel, solvent recovery, stabilization, and evaporation systems. The table shows both the number of facilities managing IC wastes on-site and those treating wastes received from off-site. These include commercial treatment and company-captive treatment facilities.

The first two rows of Table IV-3 show the number of facilities which reported sending waste streams carrying a D001 code, and any other D codes, but no listed codes, to stabilization and evaporation systems. The next three rows show the number of facilities which reported sending waste streams carrying both the D001 and D002 codes, and any other D codes, but no listed codes, to incineration, reuse as fuel, and solvent recovery systems. The last five rows show the number of facilities which reported sending waste streams carrying a D002 code, and any other D codes, but no listed codes, to stabilization, incineration, reuse as fuel, evaporation, and solvent recovery systems.

Overall, Table IV-3 indicates that 73 facilities with on-site treatment systems and 279 commercial and company-captive facilities may be affected by this rule. On-site treatment facilities may have to reconfigure their current treatment systems to include additional technologies. Commercial facilities are also included as potentially affected although EPA recognizes that these facilities have some discretion in their decision to accept or reject wastes for treatment.

EPA contacted state officials to obtain information on non-CWA/SDWA systems that are state-regulated through zero discharge land application permits, as discussed in the previous section. Based on professional judgement, EPA estimates that approximately 100 facilities regulated under these state programs may manage deactivated IC wastes.

Following discussions with regional and state officials, EPA has determined that the types of Class V industrial wells that may be impacted by this rule are:

** Industrial process water and waste disposal wells that are used to dispose of a wide variety of wastes and wastewaters from industrial, commercial, or utility processes. Industries include refineries, chemical plants, pharmaceutical plants, laundromats and dry cleaners, tanneries, laboratories, petroleum storage facilities, electric power generation plants, car washes, electroplating industries, etc.

** Automobile Service Station Disposal Wells that inject wastes from repair bay drains at service stations, garages, car dealerships, etc.

However, the Agency believes that many of these facilities are either Small Quantity Generators (SQGs), or generate IC wastes from de minimis losses of ignitable or corrosive products, as described in this rule, or treat their wastes in CWA-equivalent systems before permanent disposal, and are therefore not covered by this rule. Based on contacts with regional and

state officials, EPA estimates that fewer than 100 facilities with Class V wells may be impacted. These include primarily wastes from industrial facilities that are not treated prior to injection, and wastes from large repair/ maintenance facilities. The Agency solicits comment on estimates, as well as additional information on the number of Class V wells, the types of wastes, and the volumes of such wastes injected.

Table IV-3.--Number of Facilities Potentially Impacted by This Rule

Type of waste	Type of treatment	Number of facilities receiving on-site treatment	Number of facilities receiving off-site treatment	Number of facilities reporting wastes from off-site
Waste streams carrying at least a D001 code, may have any other D code but no listed codes	Stabilization	4	64	
Waste streams carrying at least a D001 code, may have any other D code but no listed codes	Evaporation	3	3	
Waste streams carrying at least a D001 and D002 code, may have any other D code but no listed codes	Incineration	22	89	
Waste streams carrying at least a D001 and D002 code, may have any other D code but no listed codes	Reuse as fuel	9	31	
Waste streams carrying at least a D001 and D002 code, may have any other D code but no listed codes	Solvent recovery	1	27	
Waste streams carrying at least a D002 code, may have any other D code but no listed codes	Stabilization	8	93	
Waste streams carrying at least a D002 code, may have any other D code but no listed codes	Incineration	44	206	
Waste streams carrying at least a D002 code, may have any other D code but no listed codes	Reuse as fuel	11	67	
Waste streams carrying at least a D002 code, may have any other D code but no listed codes	Evaporation	7	2	
Waste streams carrying at least a D002 code, may have any other D code but no listed codes	Solvent recovery	4	78	
Total facilities affected, on-site and off-site	All of the above	73	279	
Total number of unique facilities affected	All of the above /1/	338		

/1/ This total does not add up to the totals of the two columns because it includes facilities that report they treat wastes generated on-site as well as received from off-site. Source of data: 1989 Biennial report.

D. Variance Determinations

The Agency's analysis indicates that the quantities of wastes potentially affected by this rule is relatively small, approximately 30,000 tons per year. EPA estimates that there is 750,000 tons of combustion capacity for liquids and solids, and over 1,000,000 tons of stabilization treatment capacity. Therefore, a capacity extension is not generally warranted. However, capacity to provide additional treatment for these wastes may not be immediately available. Therefore, in order to allow all generators and off- site treatment facilities the time necessary to install additional treatment equipment that may be needed, and to perform the necessary testing procedures to determine whether their wastes are affected by this rule, the Agency is granting a 90-day national capacity variance from the effective date of this rule to ignitable (D001) and corrosive (D002) wastes covered under this rulemaking.

As noted above, the Agency believes that most of the Class V wells which could be potentially impacted by this rule either fall under the Small Quantity Generator (SQG) exclusion and are conditionally exempt from RCRA requirements, including the LDRs (see 268.1(e)(1)), or have CWA-equivalent treatment systems and are therefore not affected by today's rule. As an interim measure, however, the Agency is granting a national capacity variance extending the effective date of today's rule for nine months from the date of signature for decharacterized ignitable and corrosive wastes injected into Class V wells in order for the facility to determine: (1) If it is impacted; (2) to develop appropriate on-site modifications for alternative treatment; (3) to obtain off-site treatment; and, if necessary, submit petitions for case-by-case capacity variances (see section IV of this preamble). The Agency also solicits additional information on the number of Class V wells, the types of wastes, and the volumes of such wastes injected. The Agency believes that it would be prudent for these Class V wells to apply for case-by-case extensions of the effective date during this nine-month extension period.

The Agency wishes to emphasize that deactivated IC wastes regulated under CWA/CWA-equivalent/SDWA will be addressed in future rulemakings. Current treatment standards for wastes managed in these systems remain in effect.

V. State Authority

A. Applicability of Rules in Authorized States

Under section 3006 of RCRA, EPA may authorize qualified States to administer and enforce the RCRA program within the State. Following authorization, EPA retains enforcement authority under sections 3008, 3013, and 7003 of RCRA, although authorized States have primary enforcement responsibility. The standards and requirements for authorization are found in 40 CFR part 271.

Prior to the Hazardous and Solid Waste Amendments of 1984 (HSWA), a State with final authorization administered its hazardous waste program in lieu of EPA administering the Federal program in that State. The Federal requirements no longer applied in the authorized State, and EPA could not issue permits for any facilities that the State was authorized to permit. When new, more stringent Federal requirements were promulgated or enacted, the State was obliged to enact equivalent authority within specified time frames. New Federal requirements did not take effect as RCRA requirements

in an authorized State until the State adopted the requirements as State law, and EPA approved the State's revisions.

In contrast, under RCRA section 3006(g) (42 U.S.C. 6926(g)), new requirements and prohibitions imposed by HSWA take effect in authorized States at the same time that they take effect in nonauthorized States. EPA is directed to carry out these requirements and prohibitions in authorized States, including the issuance of permits, until the State is granted authorization to do so. While States must still adopt HSWA-related provisions as State law to retain final authorization, HSWA applies in Federally authorized States in the interim.

Today's rule is being promulgated pursuant to sections 3004 (d) through (k), and (m), of RCRA (42 U.S.C. 6924 (d) through (k), and (m)). It is added to Table 1 in 40 CFR 271.1(j), which identifies the Federal program requirements that are promulgated pursuant to HSWA and that take effect in all States, regardless of their authorization status. States may apply for either interim or final authorization for the HSWA provisions in Table 1, as discussed in the following section of this preamble. Table 2 in 40 CFR 271.1(j) is also modified to indicate that this rule is a self-implementing provision of HSWA.

B. Effect on State Authorization

As noted above, EPA is today finalizing an interim rule that will be implemented in non-authorized and authorized States until their programs are modified to adopt these rules and the modification is approved by EPA.

Because the rule is promulgated pursuant to HSWA, a State submitting a program modification may apply to receive either interim or final authorization under RCRA section 3006(g)(2) or 3006(b), respectively, on the basis of requirements that are substantially equivalent or equivalent to EPA's. The procedures and schedule for State program modifications for either interim or final authorization are described in 40 CFR 271.21.

Section 271.21(e)(2) requires that States with final authorization must modify their programs to reflect Federal program changes and to subsequently submit the modification to EPA for approval. The deadline by which the State would have to modify its program to adopt these regulations is specified in Sec. 271.21(e). The deadline is July 1, 1994, because this rulemaking was finalized on or before June 30, 1993. This deadline can be extended in certain cases (see Sec. 271.21(e)(3)). Once EPA approves the modification, the State requirements become Subtitle C RCRA requirements, and the State assumes responsibility for this implementation.

States with authorized RCRA programs may already have requirements similar to those in today's final rule. These State regulations have not been assessed against the Federal regulations being finalized today to determine whether they meet the tests for authorization. Thus, a State is not authorized to implement these requirements in lieu of EPA until the State program modifications are approved. Of course, states with existing standards could continue to administer and enforce their standards as a matter of State law. In implementing the Federal program, EPA will work with States under agreements to minimize duplication of efforts. In many cases, EPA will be able to defer to the States in their efforts to implement their programs rather than take separate actions under Federal authority.

States that submit their first official applications for final

authorization less than 12 months after the effective date of these regulations are not required to include standards equivalent to these regulations in their application. However, the State must modify its program by the deadline set forth in Sec. 271.21(e). States that submit official applications for final authorization 12 months after the effective date of these regulations must include standards equivalent to these regulations in their application. The requirements a state must meet when submitting its final authorization application are set forth in 40 CFR 271.3.

The regulations being finalized today need not affect the State's Underground Injection Control (UIC) primacy status.

VI. Regulatory Requirements

A. Economic Impact Screening Analysis Pursuant to Executive Order 12291

Executive Order No. 12291 requires that a regulatory agency consider for each regulation the potential benefits as compared to the potential costs to society. To this end, for all major rules, a Regulatory Impact Analysis (RIA) must be conducted. An RIA is a quantification of the potential benefits, costs, and economic impacts of a rule. A major rule is defined as a regulation estimated to result in:

** An annual effect on the economy of $100 million or more; or

** A major increase in costs or prices for consumers, individuals, industries, Federal, State, and local government agencies, or geographic regions; or

** Significant adverse effects on competition, employment, investment, productivity, innovation, or on the ability of United States-based enterprises to compete with foreign-based enterprises in domestic or export markets.

The Agency conducted a screening analysis to learn whether the costs incurred under the today's rule exceed $100 million annually, thus making it a major rule. EPA determined that the incremental cost of the rule is between $8 and $13 million per year. Because today's rule is a minor rule, the Agency has prepared an Economic Impact Screening Analysis (EIA), analyzing the costs and economic impacts of the rule. The Agency has not performed a quantification of the benefits attributable to today's rule.

The discussion which follows addresses the methodology and results of the EIA. The methodology section summarizes the approach taken for determining the volumes, costs and economic impacts associated with today's rule. The results section describes the results for the volume, cost and economic impact estimations. A more detailed description of the methodology and results sections may be found in the "Economic Impact Analysis for the Interim Final Rule in Response to the Third Third Court Case," which has been placed in the docket for today's rule.

1. Methodology

a. Estimation of Affected Volumes--Overview. The volume addressed in today's rule covers the ignitable (D001) and corrosive (D002) (IC) wastes with hazardous constituents at levels greater than the F039 treatment standards that are managed at facilities other than those whose discharge is regulated under the CWA, zero-discharge facilities engaging in

CWA-equivalent treatment prior to land disposal, and facilities injecting these wastes into Class I deep injection wells regulated under the SDWA. Because of differences in baseline and post-regulatory management practices for D001 and D002 liquids and treatment residuals, EPA considered these three subsets of affected wastes separately in its analysis.

The Agency relied heavily on three sources of information to develop an estimate of the waste volumes affected by today's rule. The 1989 BRS provided D001 and D002 quantities as reported to EPA by large quantity generators. EPA used the 1986 Treatment, Storage, Disposal and Recycling Facility Survey (TSDR) and 1989 telephone survey update performed by OSW to help estimate the proportions of (1) liquid wastes discharged directly (i.e., without placement in a land based unit) under the CWA, and (2) liquid wastes placed in a surface impoundment with no discharge. Thirdly, EPA used responses to the Questionnaire for Facilities that Land Dispose Newly-Identified Organic TC Wastes (referred to hereafter as the 1992 TC Survey) to update wastewater management information collected for the TSDR and the subsequent 1989 telephone update. A more detailed description of the Agency's volume estimation process is described in the background document in the docket for today's rule.

It should be noted that in estimating the affected volumes for today's rule there is a volume of D001 and D002 never reported as hazardous waste in the Agency's survey data. While the Agency performed a sensitivity analysis to determine how this unreported quantity may increase the impact of today's rule, the lack of data presented limitations to the analysis.

b. Estimation of Affected Volumes--Liquids. The Agency employed the BRS to identify, using information on treatment practices for liquids, which liquids could potentially be managed on the land. EPA then used factors to approximate the quantities of liquids: (1) that could be placed on the land, and (2) that would not be managed in systems regulated under the CWA/CWA- equivalent/SDWA not affected by today's rule. To determine these factors, the Agency reviewed waste management information from the TSDR, as modified by the 1989 telephone update. The Agency then employed information collected as part of the 1992 TC Survey which indicated that 8 of the 10 largest generators of potentially land-disposed liquids, as reported in the 1989 BRS, no longer had surface impoundments. EPA linked this information to the management information contained in the TSDR, and determined that in general only 13 percent of liquids are managed in surface impoundments during treatment, storage or disposal. Therefore, EPA multiplied all the D001 and D002 liquid volumes it obtained from the BRS by 13 percent to estimate the quantities of D001 and D002 likely managed on the land.

In developing a generic factor to estimate quantities of D001 and D002 liquids affected by today's rule, the Agency first assumed that any liquids in the 1986 TSDR survey denoted as being managed in treatment or storage impoundments were being managed in those units temporarily, and would eventually be discharged pursuant to CWA regulations. Furthermore, EPA assumed that liquids denoted in the TSDR as being managed in surface impoundments with no discharge were managed in those units permanently and would not be regulated under these two statutes. Based on these two assumptions of surface impoundment management, EPA estimated that one percent of the liquids managed in land-based units are permanently managed in these units, and are not subsequently discharged through systems regulated under the CWA or SDWA, or receiving CWA-equivalent treatment. Therefore, by combining its two factors (i.e., 13 percent and 1 percent),

EPA estimated that, in general, only 0.13 percent of potentially land-disposed liquids in the 1989 BRS would be affected by today's rule. EPA applied this percentage generically to all IC waste to determine the waste quantities for its cost analysis.

c. Estimation of Affected Volumes--Residuals. As EPA has specified treatment methods for D001 wastes, which if used remove the burden of testing for compliance, the Agency is assuming that the only costs incurred under today's rule for the treatment of residues will be incurred for those residues generated from the treatment of D002 wastes. To determine the quantity of residuals affected by today's rule, the Agency used the 1989 BRS data to identify the volumes of D002 liquids, sludges, and solids currently going to three categories of treatment: incineration, fuel substitution, and recovery of organics. EPA then developed residual factors for the combinations of waste forms and treatment categories. EPA assumed, as an upper bound, that at least one constituent concentration in the residuals would exceed the treatment standards in every case. However, because the treatment technologies currently being employed to treat D002 are effective in destroying or removing organics, EPA assumed that these residuals would only require stabilization to reduce leachable levels of metals. In other words, EPA assumed that all residuals would fail the treatment standards, but only for metals, and therefore would require treatment in the form of stabilization in all cases. EPA considered the solid fraction of waste only, expecting that any facility with substantial liquid residuals will already have a treatment system regulated under the CWA or SDWA.

d. Estimation of Affected Volumes--Affected Class V Wells. To estimate the volumes of waste from the affected Class V wells, the Agency drew from volume estimates prepared by the Office of Water for work on a Class V injection well proposed rule. The volume estimating process is described in greater detail in the "Economic Impact Analysis for the Interim Final Rule in Response to the Third Third Court Case," which has been placed in the docket for today's rule.

The Agency used estimates of the number of wells affected, and the disposal rate of waste for model wells in order to develop an estimate of the total annual disposal rate of waste in tons per years for the Class V wells. Next, EPA approximated the percentage of this total volume which would be IC waste, and thus potentially covered under today's rule. This approximation was derived using the 1989 BRS Summary Report and the 1990 RIA for the Third Third LDR. This interim result represents the total annual amount of IC waste disposed in Class V wells. Using this result, the Agency estimated those volumes which are managed under the small quantity exemption, and therefore would not be affected by today's rule. Further, EPA estimated the volumes which have hazardous constituents below F039 levels, and so would also not be affected by today's rule. The resultant volume represents the total amount of Class V injected waste affected by today's rule.

e. Estimation of Costs Incurred--Liquids, Residuals and Affected Class V Wells. To estimate the range of costs expected to be incurred as a result of today's rule, the Agency developed baseline and post-regulatory management assumptions for IC wastes. The incremental costs of the rule are derived by comparing baseline costs with the costs resulting under the post-regulatory scenario.

The baseline waste management scenario for all IC waste is assumed to be deactivation followed by subtitle D disposal. Treatment to comply with

standards set in today's rule will vary widely, depending on the chemical composition and physical form of the waste. Because of data limitations, it is impossible to predict exact treatment technologies which would be employed by waste management facilities; thus, the Agency relied on assumptions to estimate the upper-bound of the post-regulatory compliance cost.

The Agency employed an upper-bound estimate that all facilities managing wastewaters in non-CWA/non-CWA-equivalent/non-SDWA systems would incur the cost of switching from land-based units to tanks. This approach overestimates the true cost for those facilities that choose rather to employ treatment and testing where found to be less costly than replacement with tanks. For certain facilities where replacement with tanks is not an option, however, this approach may not be overestimate. The Agency developed cost functions for replacement with tanks. These detailed assumptions are presented in the "Economic Impact Analysis for the Interim Final Rule in Response to the Third Third Court Case."

For the residuals from thermal treatment (e.g., incineration, reuse as fuel, solvent recovery), the Agency assigned stabilization treatment to the total volume of residual, followed by subtitle D disposal of the stabilized mass. The Agency used a range of stabilization unit costs between $108/ton and $210/ton, to estimate the cost of residuals management under today's rule. However, as the $210/ton cost includes subtitle C disposal, it should be viewed as a high bound cost.

For the last category of wastes addressed under today's rule, the wastes attributed to Class V wells, the Agency used the total volume estimate developed above with a unit cost of $240 per ton of waste treated to produce a total cost estimate for the rule. This approach was required due to the lack of data and time for the analysis of Class V wells. The $240 per ton is for the post-regulatory treatment technology, and is equivalent to many technologies which might be chosen, such as: chemical precipitation, carbon absorption or biological treatment. As the Agency has not been able to focus on the exact volume affected by today's rule, nor does the Agency have knowledge on the possible treatments used in the post-regulatory scenario, this estimate is a high-bound estimate for the Class V wells.

f. Estimation of Costs Incurred--Testing Costs. There could be analytic costs incurred under today's rule for residues from treating D002 wastes, and for D001 wastes not treated by combustion or reclamation technologies. While some managers of potentially affected D001 and D002 wastes and residues may ultimately use professional knowledge to determine whether they meet the treatment standards, testing will likely be necessary for a short period following promulgation of today's rule.

The Agency believes that the testing costs in the long-term will be negligible, as it is believed that facilities will shift to using professional knowledge following initial testing. In addition, the facilities not using a specified method, and thus require testing, may only require testing for the presence of metals. However, the Agency has estimated a high- bound cost for testing assuming that half of the affected facilities would perform testing, rather than using professional knowledge. With the cost of testing for all F039 constituents estimated to be $3000 per test, the Agency determined a total annual testing cost figure of approximately $1 million.

g. Estimation of Costs Incurred--Reporting Requirements. Permitted treatment facilities that have Waste Analysis Plans requiring a permit modification in order to be able to treat underlying hazardous constituents will be impacted by today's rule. As mentioned previously in this preamble, such modifications may be made through a Class 1 permit modification with prior approval. (Also, see amendment to 40 CFR 270.42 promulgated as part of today's rule.)

The Agency, employing standard assumptions of number of burden hours for a Class 1 permit modification with prior approval, estimates the costs incurred as a result of these reporting requirements to be $10,500. A more detailed discussion of the costing procedure for reporting requirements is included in the Economic Impact Analysis background document for today's rule.

h. Methodology for Economic Impact Analysis. As facility-specific cost data are not available for the affected volumes in today's rule, EPA is not able to conduct a quantitative economic impact analysis. However, given the time and data available, the Agency prepared an examination of the costs of today's rule, disaggregated by 2-digit SIC codes, in the Economic Impact Analysis background document prepared for this interim final rule and available in the RCRA docket.

B. Results

a. Results of Affected Volumes Estimation

EPA conservatively estimates an upper bound of 73,000 tons of liquids (not including those sent to Class V wells); 36,000 tons of residuals from treatment; and 15,000 tons of liquids going to Class V wells being affected by today's rule. The volume of liquids is low because most facilities have established systems that utilize exempt units (i.e., tanks) or centralized treatment whose discharge is ultimately regulated under the CWA and SDWA. The volumes attributed to Class V wells are low because the majority of Class V wells are small quantity generators, or do not have wastes which have hazardous constituents at levels above the F039 treatment levels. It should be noted that, the Agency analysis overestimates quantities affected in that it typically does not account for the volumes which would already meet treatment standards and thus not require additional treatment under today's rule (except in the case of Class V wells).

b. Results of Incremental Costs Incurred

In developing its method to assess the cost of today's rule, the Agency has relied on several conservative assumptions. The Agency estimates that the compliance cost of today's rule is between $8 and $13 million annually. Table VI-1 presents the estimates for each category of affected waste.

Table VI-1.--Upper-Bound Compliance Cost of the Rule by Waste Type

Waste type	Quantity affected (tons/yr)	Incremental compliance cost ($ million/yr)
Liquids	73,000	<0.5
Residuals	36,000	3.9 to 7.6
Class V Wells	15,000	3.5

Analytical costs	0 to 1.0
Total	7.9 to 12.6

d. Sensitivity Analysis of Cost Results

The Agency's sensitivity analysis covered only the potentially missing volume of IC waste currently being deactivated and managed as nonhazardous waste. The Agency's sensitivity analysis portrays possible quantities of deactivated IC waste, and the resultant cost ramifications in an order of magnitude approach. A more thorough examination of the limitations in the analysis of today's rule is included in the "Economic Impact Analysis for the Interim Final Rule in Response to the Third Third Court Case" background document, which has been placed in the docket for today's rule.

The Agency believes that all deactivated IC volumes managed as nonhazardous waste would be wastewaters (i.e.: liquids), as sludges and solids are not typically managed through exempt units. The Agency's estimate of quantities of affected liquids, as shown in Table VI-1, is 73,000 tons per year. The resulting incremental cost for this 73,000 tons per year of liquid waste is <$0.5 million per year.

Therefore, if the 73,000 tons per year is doubled as a result of these nonhazardous IC volumes which are not captured in today's analysis, the resulting incremental costs for liquids would be approximately $1.0 million per year. If the quantity was multiplied by 5, the resulting cost would be approximately $2.5 million per year. If the quantity was multiplied by 10 times, the cost would be roughly $5 million per year. And finally, if the volume was multiplied by 50, so that the volume was 3.65 million tons per year, the incremental cost would be approximately $25 million per year.

The Agency emphasizes that the volume and cost estimates presented in Table VI-1 are upper-bound estimates derived by applying a series of conservative assumptions that were useful given the absence of substantial detailed data.

It is acknowledged that some volume of IC waste may exist which is managed as nonhazardous waste currently, and therefore not accounted for in the EPA's estimate. The Agency's sensitivity analysis should be viewed as order-of- magnitude estimates, providing a screening level examination of potential costs for a series of hypothetical volumes.

B. Regulatory Flexibility Analysis

Pursuant to the Regulatory Flexibility Act of 1980, 5 U.S.C. 601 et seq., when an agency publishes a notice of rulemaking, for a rule that will have a significant effect on a substantial number of small entities, the agency must prepare and make available for public comment a regulatory flexibility analysis that considers the effect of the rule on small entities (i.e.: small businesses, small organizations, and small governmental jurisdictions). Under the Agency's Revised Guidelines for Implementing The Regulatory Flexibility Act, dated May 4, 1992, the Agency committed to considering regulatory alternatives in rulemakings when there were any economic impacts estimated on any small entities. Previous guidance required regulatory alternatives to be examined only when significant economic effects were estimated on a substantial number of small entities.

In assessing the regulatory approach for dealing with small entities in today's rule, the Agency considered three factors. First, due to the low

annual incremental cost of $7.9 million estimated for today's rule, the Agency anticipates minimal impacts on small entities. Second, data on potentially affected small entities are unavailable. And third, due to the statutory requirements of RCRA, no legal avenues exist for the Agency to provide relief from the LDR's for small entities. The only relief available for small entities are the existing small quantity generators and conditionally exempt small quantity generator exemptions found in 40 CFR 262.11-12, and 261.5, respectively. These exemptions basically prescribe 100 kilograms (kg) per calendar month generation of hazardous waste as the limit below which one is exempted from complying with the RCRA standards.

Given these three factors, the Agency was unable to frame a series of small entity options from which to select the lowest cost approach; rather, the Agency was legally bound to one approach. It can only be stated that minimal impacts are anticipated for small entities under the approach employed in dealing with the issues in today's rule.

C. Paperwork Reduction Act

With the exception of the requirement to include the underlying hazardous constituents on the notification, the information collection requirements in this rule have been approved by the Office of Management and Budget (OMB) under the Paperwork Reduction Act, 44 U.S.C. 3501 et seq. and have been assigned control number 2050-0085.

The information collection requirements associated with the amended notification requirements, requiring generators and treaters of certain D001 and D002 wastes to include the underlying hazardous constituents on the notification, have been submitted for approval to the Office of Management and Budget (OMB) under the Paperwork Reduction Act, 44 U.S.C. 3501 et seq.
These requirements are not effective until OMB approves them and a technical amendment to that effect is published in the Federal Register. An Information Collection Request document has been prepared by EPA (ICR No. 1442.05) and a copy may be obtained from Sandy Farmer, Information Policy Branch, EPA, 401 M Street, SW. (PM-223Y), Washington, DC 20460 or by calling (202) 260-2740.

Public reporting burden for this collection of information is estimated to average about 3 to 6 hours per response for generators and 3 hours per response for treaters, including time for reviewing instructions, searching existing data sources, gathering and maintaining the required data, and completing and reviewing the collection of information.

Send comments regarding the burden estmate or any other aspect of this collection of information, including suggestions for reducing this burden, to Chief, Information Policy Branch, PM-223Y, U.S. Environmental Protection Agency, 401 M Street, SW., Washington, DC 20460; and to the Office of Information and Regulatory Affairs, Office of Management and Budget, Washington, DC 20503, marked "Attention: Jonathan Gledhill."

VII. Interim Final Rule Justification

EPA finds that there is good cause to issue this rule as an interim final rule, without having first proposed it. (The Agency notes, however that the Notice of Data Availability and the accompanying Supplemental Information

Report did provide substantial notice to affected parties of, and an opportunity to comment on, the types of action the Agency is taking here, and specifically put persons on notice that there might not be any further opportunity for public comment before the Agency took final action. Thus, it is not clear that EPA is required to invoke the good cause exception to the Administrative Procedure Act's notice and comment requirements. (5 U.S.C. 553 (b)(3)(B).) Because the treatment standards for certain ignitable and corrosive wastes were vacated, once the courts mandate issues, a situation will exist whereby those wastes cannot be land disposed (except in no- migration units) unless EPA repromulgates a treatment standard. This creates a bona fide emergency, because without a legal means to dispose of wastes, production would have to stop. It is impractical to follow notice and comment rulemaking procedures in time to avoid this result, and thus the good cause exemption is justified. 5 U.S.C. 553(b)(3)(B).

It has been argued that EPA could stay the prohibition to prevent this situation from arising. The Agency disagrees. In the first place, EPA believes that the prohibition that is operating is not merely regulatory but statutory as well, since it involves wastes that were covered (for this purpose) by RCRA section 3004(g)(5) and the absolute prohibition (generally termed the hard hammer) in RCRA 3004(g)(6)(C).5 See 976 F. 2d at 18-19 ("(Congress) has chosen to enforce (the statutory deadlines) by decreeing that any hazardous waste that is not covered by a valid regulation within the date specified will be denied land disposal" (emphasis added).) Second, even without invoking the hard hammer, EPA does not believe the statute allows a situation whereby a prohibition date has passed, and wastes covered by that prohibition can be land disposed without treatment (unless, of course, the wastes are subject to some type of capacity variance or are being disposed in a no-migration unit). Yet this is the necessary consequence of arguing that EPA may permissibly stay a prohibition once the prohibition date has passed.

Consequently, it is the Agency's view that unless it issues treatment standards to replace those vacated by the court, there would be an absolute prohibition of land disposal of the affected wastes, and that in light of this, there is good cause to issue the present interim final rule restoring treatment standards for those wastes.6

NOTE 5 For reasons discussed below in the preamble text, the Agency reads the hard hammer as applying to characteristic as well as listed wastes. This has been the Agency's position on the issue, see, e.g., 56 FR at 41165 (Aug. 19, 1991), and reflects Congressional intent. H. Rep. No. 1133, 98th Cong. 2d Sess. at 88 (Conference Report). The Agency is aware of arguments that the hard hammer provision need not apply here, either because the Agency has already met its obligations by issuing rules for characteristic wastes, or because the hard hammer can be read as not applying to characteristic wastes.

The Agency does not find these arguments persuasive. In the end, there is no reason that prohibitions should operate differently for characteristic and listed wastes. Furthermore, the necessary consequence of these arguments is that characteristic wastes could be disposed for a relatively indefinite period without having to be treated to satisfy the RCRA 3004(m) standard, even though the section 3004(g)(5) prohibition date has passed. The Agency does not believe that the statute can reasonably be interpreted to give this result.

NOTE 6 At the least, this is a permissible interpretation of the land disposal statutory provisions, which in essence command that prohibited wastes be pretreated before land disposal, and make this a paramount statutory objective (RCRA sections 1002(b)(7) and 1003(a)(6)).

List of Subjects

40 CFR Part 264

Hazardous waste, Packaging and containers, Reporting and recordkeeping requirements.

40 CFR Part 265

Hazardous waste, Packaging and containers.

40 CFR Part 268

Hazardous waste, Reporting and recordkeeping requirements.

40 CFR Part 270

Administrative practice and procedure, Hazardous materials transportation, Hazardous waste, Reporting and recordkeeping requirements.

40 CFR Part 271

Administrative practice and procedure, Hazardous materials transportation, Hazardous waste, Penalties, Reporting and recordkeeping requirements.

Dated: May 10, 1993.

Carol M. Browner,
Administrator.

For the reasons set out in the preamble, title 40, chapter I, of the Code of Federal Regulations is amended as follows:

PART 264--STANDARDS FOR OWNER AND OPERATORS OF HAZARDOUS WASTE TREATMENT, STORAGE, AND DISPOSAL FACILITIES

1. The authority citation for part 264 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6924, and 6925.

2. Section 264.1, paragraph (g)(6) is revised to read as follows:
Sec. 264.1 Purpose, scope and applicability.

* * * * * *

(g) * * *
(6) The owner or operator of an elementary neutralization unit or a wastewater treatment unit as defined in Sec. 260.10 of this chapter, provided that if the owner or operator is diluting hazardous ignitable (D001) wastes (other than the D001 High TOC Subcategory defined in Sec. 268.42, Table 2, of this chapter), or corrosive (D002) waste, to remove the characteristic before land disposal, the owner/operator must comply with the requirements set out in Sec. 264.17(b) of this part.

* * * * *

PART 265-INTERIM STATUS STANDARDS FOR OWNERS AND OPERATORS OF HAZARDOUS WASTE TREATMENT, STORAGE, AND DISPOSAL FACILITIES

3. The authority citation for part 265 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6924, and 6925.

4. Section 265.1, paragraph (c)(10) is revised to read as follows:

Sec. 265.1 Purpose, scope and applicability.

* * * * * *

(c) * * *
(10) The owner or operator of an elementary neutralization unit or a wastewater treatment unit as defined in Sec. 260.10 of this chapter, provided that if the owner or operator is diluting hazardous ignitable (D001) wastes (other than the D001 High TOC Subcategory defined in Sec. 268.42, Table 2, of this chapter), or corrosive (D002) waste, in order to remove the characteristic before land disposal, the owner/operator must comply with the requirements set out in Sec. 265.17(b).

* * * * *

PART 268--LAND DISPOSAL RESTRICTIONS

5. The authority citation for part 268 continues to read as follows:
Authority: 42 U.S.C. 6905, 6912(a), 6921, and 6924.

6. In Sec. 268.1, paragraphs (e) (4) and (5) are added to read as follows:

Sec. 268.1 Purpose, scope /and applicability.

* * * * *

(e) * * *
(4) De minimis losses to wastewater treatment systems of commercial chemical product or chemical intermediates that are ignitable (D001), or corrosive (D002), and that contain underlying hazardous constituents as defined in Sec. 268.2 of this part, are not considered to be prohibited wastes. De minimis is defined as losses from normal material handling operations (e.g. spills from the unloading or transfer of materials from bins or other containers, leaks from pipes, valves or other devices used to

transfer materials); minor leaks of process equipment, storage tanks or containers; leaks from well-maintained pump packings and seals; sample purgings; and relief device discharges.

(5) Land disposal prohibitions do not apply to laboratory wastes displaying the characteristic of ignitability (D001) or corrosivity (D002), that are commingled with other plant wastewaters under designated circumstances: ignitable and corrosive laboratory wastes containing underlying hazardous constituents from laboratory operations, that are mixed with other plant wastewaters at facilities whose ultimate discharge is subject to regulation under the CWA (including wastewaters at facilities which have eliminated the discharge of wastewater), provided that the annualized flow of laboratory wastewater into the facility's headwork does not exceed one percent, or provided that the laboratory wastes' combined annualized average concentration does not exceed one part per million in the facility's headwork.

7. In Sec. 268.2, paragraph (i) is added to read as follows:

Sec. 268.2 Definitions applicable in this part.

* * * * *

(i) Underlying hazardous constituent means any regulated constituent present at levels above the F039 constituent-specific treatment standard at the point of generation of the hazardous waste.

8. In Sec. 268.7, the introductory text of paragraph (a), and paragraphs (a)(1)(ii) and (b)(4)(ii) are revised to read as follows:

Sec. 268.7 Waste analysis and recordkeeping.

(a) Except as specified in Sec. 268.32 if a generator's waste is listed in 40 CFR part 261, subpart D, the generator must test his waste, or test an extract using the test method described in part 261, appendix II of this chapter, or use knowledge of the waste, to determine if the waste is restricted from land disposal under this part. Except as specified in Sec. 268.32, if a generator's waste exhibits one or more of the characteristics set out at 40 CFR part 261, subpart C of this chapter, the generator must test an extract using the test method described in appendix IX of this part, or use knowledge of the waste, to determine if the waste is restricted from land disposal under this part. If the generator determines that his waste displays the characteristic of ignitability (D001) (and is not in the High TOC Ignitable Liquids Subcategory or is not treated by INCIN, FSUBS, or RORGS of Sec. 268.42, Table 1), or the characteristic of corrosivity (D002), and is prohibited under Sec. 268.37, the generator must determine what underlying hazardous constituents (as defined in Sec. 268.2 of this part), are reasonably expected to be present in the D001 or D002 waste.

(1) * * *

(ii) The corresponding treatment standards for wastes F001-F005, F039, wastes prohibited pursuant to Sec. 268.32 or RCRA section 3004(d), and for underlying hazardous constituents (as defined in Sec. 268.2 of this part), in D001 and D002 wastes if those wastes are prohibited under Sec. 268.37 of this part. Treatment standards for all other restricted wastes must either be included, or be referenced by including on the notification the

applicable wastewater (as defined in Sec. 268.2(f)) or nonwastewater (as defined in Sec. 268.2(d)) category, the applicable subdivisions made within a waste code based on waste-specific criteria (such as D003 reactive cyanides), and the CFR section(s) and paragraph(s) where the applicable treatment standard appears. Where the applicable treatment standards are expressed as specified technologies in Sec. 268.42, the applicable five-letter treatment code found in Table 1 of Sec. 268.42 (e.g., INCIN, WETOX) also must be listed on the notification.

* * * * *

(b) * * *
(4) * * *
(ii) The corresponding treatment standards for wastes F001-F005, F039, wastes prohibited pursuant to Sec. 268.32 or RCRA section 3004(d), and for underlying hazardous constituents (as defined in Sec. 268.2 of this part), in D001 and D002 wastes if those wastes are prohibited under Sec. 268.37 of this part. Treatment standards for all other restricted wastes must either be included, or be referenced by including on the notification the applicable wastewater (as defined in Sec. 268.2(f)) or nonwastewater (as defined in Sec.
268.2(d)) category, the applicable subdivisions made within a waste code based on waste-specific criteria (such as D003 reactive cyanides), and the CFR section(s) and paragraph(s) where the applicable treatment standard appears. Where the applicable treatment standards are expressed as specified technologies in Sec. 268.42, the applicable five-letter treatment code found in Table 1 of Sec. 268.42 (e.g., INCIN, WETOX) also must be included on the notification.

* * * * *

9. In Sec. 268.9, paragraph (a) is revised to read as follows:

Sec. 268.9 Special rules regarding wastes that exhibit a characteristic.

(a) The initial generator of a solid waste must determine each EPA Hazardous Waste Number (waste code) applicable to the waste in order to determine the applicable treatment standards under subpart D of this part.
For purposes of part 268, the waste will carry the waste code for any applicable listing under 40 CFR part 261, subpart D. In addition, the waste will carry one or more of the waste codes under 40 CFR part 261, subpart C, where the waste exhibits a characteristic, except in the case when the treatment standard for the waste code listed in 40 CFR part 261, subpart D operates in lieu of the standard for the waste code under 40 CFR part 261, subpart C, as specified in paragraph (b) of this section. If the generator determines that his waste displays the characteristic of ignitability (D001) (and is not in the High TOC Ignitable Liquids Subcategory or is not treated by INCIN, FSUBS, or RORGS of Sec. 268.42, Table 1), or the characteristic of corrosivity (D002), and is prohibited under Sec. 268.37 of this Part, the generator must determine what underlying hazardous constituents (as defined in Sec. 268.2 of this Part), are reasonably expected to be present in the D001 or D002 waste.

* * * * *

10. Section 268.37 is added to read as follows:

Sec. 268.37 Waste specific prohibitions--ignitable and corrosive characteristic wastes whose treatment standards were vacated.

(a) Effective August 9, 1993, the wastes specified in 40 CFR 261.21 as D001 (and is not in the High TOC Ignitable Liquids Subcategory), and specified in Sec. 261.22 as D002, that are managed in systems other than those whose discharge is regulated under the Clean Water Act (CWA), or that inject in Class I deep wells regulated under the Safe Drinking Water Act (SDWA), or that are zero dischargers that engage in CWA-equivalent treatment before ultimate land disposal, are prohibited from land disposal. CWA-equivalent treatment means biological treatment for organics, alkaline chlorination or ferrous sulfate precipitation for cyanide, precipitation/sedimentation for metals, reduction of hexavalent chromium, or other treatment technology that can be demonstrated to perform equally or greater than these technologies.

(b) Effective February 10, 1994, the wastes specified in 40 CFR 261.21 as D001 (and is not in the High TOC Ignitable Liquids Subcategory), and specified in Sec. 261.22 as D002, that are managed in systems defined in 40 CFR 144.6(e) and 146.6(e) as Class V injection wells, that do not engage in CWA-equivalent treatment before injection, are prohibited from land disposal.

11. In Sec. 268.40, paragraph (b) is revised to read as follows:

Sec. 268.40 Applicability of treatment standards.

* * * * *

(b) A restricted waste for which a treatment technology is specified under Sec. 268.42(a), or hazardous debris for which a treatment technology is specified under Sec. 268.45, may be land disposed after it is treated using that specified technology or an equivalent treatment method approved by the Administrator under the procedures set forth in Sec. 268.42(b). For waste displaying the characteristic of ignitability (D001) and reactivity (D003), that are diluted to meet the deactivation treatment standard in Sec. 268.42(a) Tables 1 and 2 (DEACT), the treater must comply with the precautionary measures specified in 40 CFR 264.17(b) and 265.17(b) of this chapter.

* * * * *

12. In Sec. 268.41(a), Table CCWE, the entry for F039 is amended by revising the "Waste code" and the "See also" columns to read as follows:

Sec. 268.41 Treatment standards expressed as concentrations in waste extract.

SUMMARY: The Environmental Protection Agency (EPA or Agency) is amending its hazardous waste regulations under subtitle C of the Resource Conservation and Recovery Act (RCRA) of 1976, as amended, for testing and monitoring activities. These amendments replace the current Second Edition, including Updates I and II, of the EPA approved test methods manual "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods," EPA Publication SW-846, by incorporating by reference the Third Edition (and its first update) into the RCRA regulations. These amendments also revise Appendices II--Method 1311 Toxicity Characteristic Leaching Procedure (TCLP) and III--Chemical Analysis Test Methods to 40 CFR part 261, delete Appendix X--Method of Analysis for Chlorinated Dibenzo-p-dioxins and Dibenzofurans, Method 8280, to 40 CFR part 261, and revise Appendices I--Toxicity Characteristic Leaching Procedure (TCLP) and IX--Extraction Procedure (EP) Toxicity Test, to 40 CFR part 268. This action is necessary to provide better and more complete analytical test methods for RCRA-related testing. The intent of this amendment is to provide up-to-date technologies in order to promote cost effectiveness and flexibility in choosing analytical test methods.

TEXT:

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Parts 260, 261, 264, 265, 268, and 270
(FRL-3981-7)

RIN 2050-AC32

Hazardous Waste Management System; Testing and Monitoring Activities

AGENCY: Environmental Protection Agency.

ACTION: Final rule.

SUMMARY: The Environmental Protection Agency (EPA or Agency) is amending its hazardous waste regulations under subtitle C of the Resource Conservation and Recovery Act (RCRA) of 1976, as amended, for testing and monitoring activities. These amendments replace the current Second Edition, including Updates I and II, of the EPA approved test methods manual "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods," EPA Publication SW-846, by incorporating by reference the Third Edition (and its first update) into the RCRA regulations. These amendments also revise Appendices II--Method 1311 Toxicity Characteristic Leaching Procedure (TCLP) and III--Chemical Analysis Test Methods to 40 CFR part 261, delete Appendix X--Method of Analysis for Chlorinated Dibenzo-p-dioxins and Dibenzofurans, Method 8280, to 40 CFR part 261, and revise Appendices I--Toxicity Characteristic Leaching Procedure (TCLP) and IX--Extraction Procedure (EP) Toxicity Test, to 40 CFR part 268.

This action is necessary to provide better and more complete analytical test methods for RCRA-related testing. The intent of this amendment is to provide up-to-date technologies in order to promote cost effectiveness and flexibility in choosing analytical test methods.

EFFECTIVE DATE: August 31, 1993. The incorporation by reference of certain publications listed in the regulations is approved by the Director of the Federal Register as of August 31, 1993.

ADDRESSES: The official record for this rulemaking (Docket No. F-93-WTMF-FFFFF) is located at the U.S. Environmental Protection Agency, 401 M Street, SW., Washington, DC 20460 (room M-2427), and is available for viewing from 9 a.m. to 4 p.m., Monday through Friday, excluding Federal holidays. The public must make an appointment to review docket materials by calling (202) 260- 9327. The public may copy a maximum of 100 pages of material from any one regulatory docket at no cost; additional copies cost $0.15 per page.

Copies of the Third Edition of SW-846 and of Update I to the Third Edition are part of the official docket for this rulemaking, and also are available from the Superintendent of Documents, Government Printing Office (GPO), Washington, DC 20402, (202) 783-3238. The GPO document number is 955-001-00000-1. New subscriptions to SW-846 may be ordered from GPO at a cost of $319.00. Those persons who have copies of the Third Edition of SW-846 that were purchased from GPO and wish to receive the final version of Update I and future revisions can do so by renewing their subscriptions with GPO for $221.00. There is a 25% surcharge for foreign subscriptions and renewals.

FOR FURTHER INFORMATION CONTACT: For general information contact the RCRA Hotline at (800) 424-9346 (toll free) or call (703) 920-9810; or, for hearing impaired, call TDD (800) 553-7672 or (703) 486-3323. For technical information, contact Kim Kirkland, Office of Solid Waste (OS-331), U.S. Environmental Protection Agency, 401 M Street, SW., Washington, DC 20460, (202) 260-4761.

SUPPLEMENTARY INFORMATION:

Preamble Outline

I. Authority

These regulations are being promulgated under the authority of sections 1006, 2002, 3001, 3002, 3004, 3005, 3006, 3010, and 3014 of the Solid Waste Disposal Act, as amended by the Resource Conservation and Recovery Act of 1976 (commonly known as RCRA), as amended (42 U.S.C. 6905, 6912, 6921, 6922, 6924, 6925, 6926, 6930, and 6935).

II. Background Summary and Regulatory Framework

EPA Publication SW-846, "Test Methods for Evaluating Solid Waste, Physical/ Chemical Methods," contains the analytical and test methods that EPA has evaluated and found to be among those acceptable for testing under Subtitle C of the Resource Conservation and Recovery Act of 1976 (RCRA), as amended. Use of some of these methods is required by specific regulations, as discussed below. All of these methods are intended to promote accuracy, sensitivity, specificity, precision, and comparability of analyses and test results.

Several of the hazardous waste regulations under Subtitle C of RCRA require that specific testing methods described in SW-846 be employed for certain applications. Any reliable analytical method may be used to meet other requirements in 40 CFR Parts 260 through 270. For the convenience of the reader, the Agency lists below a number of sections found in 40 CFR parts 260 through 270 that require the use of a specific method for a particular application, or the use of appropriate SW-846 methods in general:

(1) Section 260.22(d)(1)(i)--Submission of data in support of petitions to exclude a waste produced at a particular facility (i.e., delisting petitions);

(2) Section 261.22(a)(1) and (2)--Evaluation of waste against the corrosivity characteristic;

(3) Section 261.24(a)--Leaching procedure for evaluation of a waste against the toxicity characteristic;

(4) Sections 264.190(a), 264.314(c), 265.190(a), and 265.314(d)--Evaluation of a waste to determine if free liquid is a component of the waste;

(5) Section 266.112(b)(1)--Certain analysis in support of exclusion from the definition of a hazardous waste of a residue which was derived from burning hazardous waste in boilers and industrial furnaces;

(6) Section 268.32(i)--Evaluation of a waste to determine if it is a liquid for purposes of certain land disposal prohibitions;

(7) Sections 268.40(a), 268.41(a), and 268.43(a)--Leaching procedure for evaluation of waste extract to determine compliance with Land Disposal treatment standards;

(8) Sections 270.19(c)(1) (iii) and (iv), and 270.62(b)(2)(i) (C) and (D)-- Analysis and approximate quantification of the hazardous constituents identified in the waste prior to conducting a trial burn in support of an application for a hazardous waste incineration permit; and

(9) Sections 270.22(a)(2)(ii)(B) and 270.66(c)(2) (i) and (ii)--Analysis conducted in support of a destruction and removal efficiency (DRE) trial burn waiver for boilers and industrial furnaces burning low risk wastes, and analysis and approximate quantitation conducted for a trial burn in support of an application for a permit to burn hazardous waste in a boiler and industrial furnace.

In other situations, this EPA publication functions as a guidance document setting forth acceptable, although not required, methods to be implemented by the user, as appropriate, in responding to RCRA-related sampling and analysis requirements.

SW-846 is a document that will change over time as new information and data are developed. Advances in analytical instrumentation and techniques are continually reviewed by the Agency's Office of Solid Waste (OSW) and periodically incorporated into SW-846 to support changes in the regulatory program and to improve method performance. Therefore, EPA solicits any available data and information that may affect the usefulness of SW-846.

III. Response to Comments From the January 23, 1989 NPRM

A. Overview of Proposed Rule

On January 23, 1989 (54 FR 3212-3229), the Agency proposed to amend its hazardous waste testing and monitoring regulations under subtitle C of RCRA

by: (1) Adding new methods to SW-846; (2) revising existing methods in SW-846; (3) requiring the use of the Third Edition, as amended by Update I, for all testing for which SW-846 methods are specifically mandated in current Subtitle C regulations; and (4) requiring the use of minimum Quality Control procedures found in Chapter One of SW-846 for all testing pursuant to Subtitle C of RCRA. The proposal discussed in detail the advantages of the Third Edition over the Second Edition, including the Third Edition's use of a standard method format and the inclusion of a number of new and revised methods in the Third Edition.

The Agency solicited comments on each of these proposed changes. Items B through D of this section summarize the comments that were received and the actions taken by the Agency in response to those comments.**1

**1 Other comments, together with the Agency's response thereto, have been placed in the official record for this rulemaking. (Docket No. F-93-WTMF-FFFFF)

B. Substitution of the Third Edition for the Second Edition Including Addition of New Methods and Revision of Existing Methods

The Agency proposed to replace the Second Edition of SW-846, including Updates I and II of the Second Edition, with methods contained in the Third Edition, as amended by Update I of the Third Edition. The Agency proposed this substitution because the methods contained in the Third Edition as amended by Update I expand the scope of the Second Edition or are improved versions of the methods in the Second Edition.

Except as discussed below and in the background document in the official record for this rulemaking, the Agency did not receive any significant negative comments on the proposal to replace the Second Edition of SW-846 methods with the versions contained in the Third Edition as amended by Update I. Therefore, the Agency has made this replacement by revising 40 CFR 260.11 to incorporate the Third Edition as amended by Update I by reference.

Consistent with that change, a footnote in 40 CFR 260.11 discussing a distinction between the Second and Third Edition has been deleted. A listing of all parts found in the Third Edition of SW-846 as amended by Update I is provided below: **2

**2 A suffix of "A" in the method number indicates revision one (the method has been revised once).

Appendix--Company References

In compiling the Third Edition of SW-846, the Agency revised many methods in the Second Edition, reprinted some methods from the Second Edition unaltered (except for format), and added many new methods. The Agency requested comments specifically on the new and revised methods in its January 23, 1989 proposal.

The comments received by the Agency on the addition of new methods and revision of existing methods were technical in nature. Specific details on these comments and the Agency's response to significant comments may be found in the background document to this rulemaking. The Agency has incorporated the majority of the suggested changes into the final Update I package, as described in detail in the background document. Some of the comments raised issues that resulted in additional proposed technical clarifications set forth in the February 8, 1990, Notice of Data Availability and Reopening of Comment Period. A discussion of the comments received on the February 8 notice is provided in section IV of this preamble.

C. Methods Format

In response to earlier comments, the Agency proposed to adopt a standardized ten-part format for all of its methods. This format was developed by technical experts from within EPA to clarify the methods and ensure uniform application and consideration of technical details in its methods.

The Agency did not receive any substantial comments on this issue and has therefore revised the SW-846 methods according to the proposed format.

D. Mandatory Use of Revised Chapter One

The Agency proposed to replace the existing Chapter One of the Third Edition with a revised version, and to make selected Quality Assurance and Quality Control procedures in the revised Chapter One mandatory for all RCRA testing. This proposal was made to ensure that any data used to make decisions regarding RCRA compliance would be of known and documented quality.

The Agency's proposal to replace Chapter One of SW-846 with a revised Chapter One and to require use of selected sections of Chapter One for all testing pursuant to Subtitle C of RCRA was commented on extensively. In evaluating these comments, the Agency further revised the proposed Chapter One and solicited comments on the revisions on February 8, 1990 (55 FR 4440- 4445). At that time, the Agency declared its intention to make all of Chapter One mandatory for RCRA testing and requested comment on this change. Comments received in response to the February 8, 1990 notice are discussed below in section IV. As stated in section IV, the Agency has decided not to finalize the mandatory use of Chapter One at this time.

IV. Response to Comments From the February 8, 1990 Notice

A. Overview of Notice

On February 8, 1990, a Notice of Data Availability and Reopening of Comment Period was published in the Federal Register (55 FR 4440-4445). Issued with this notice was a revised Chapter One of SW-846 entitled "Report on Minimum Criteria to Assure Data Quality" (document number EPA/530-SW-90-021). The revisions were, to a large extent, based on comments received on the January 23, 1989 proposal. The Agency requested comments on eleven topics generally related to quality control definitions and parameters, which included the deletion of appendices III and X to 40 CFR part 261.

The notice stated that the Agency was considering making the revised Chapter One mandatory for all RCRA testing, with the exclusion of certain reasonable and legitimate exceptions noted within the notice. Items B through K of this section summarize the major comments that were received and the action taken by the Agency as a result of those comments. A complete description of all significant comments and the Agency's responses may be found in the background document to this rulemaking.

B. Revised Chapter One

The Agency received many comments regarding the proposed revisions to Chapter One and the proposal to make all of Chapter One mandatory for RCRA testing. Comments were received regarding two major issues, which included: (1) The mandatory use of Chapter One for all RCRA analyses, and (2) the apparent discrepancy between Agency and regulated community requirements.

Several commenters, primarily analytical laboratories, objected to the mandatory use of Chapter One because they felt it could not be implemented in practical terms. They pointed out that, under Chapter One, each project would require individual Quality Assurance Project Plans (QAPjPs) and that a laboratory taking samples from many clients could not, in any practical way, attempt to meet the different QAPjPs for each client. Furthermore, one commenter argued that the laboratory performing the analyses should not be required to write different QAPjPs for each project.

The Agency has noted some confusion regarding whether it intended that the responsibility for producing the QAPjP lies with the laboratory or the member of the regulated community that provides the samples. The Agency believes that the member of the regulated community should be responsible for ensuring that a QAPjP is prepared because the burden of complying with the analytical requirements in the Agency's hazardous waste regulations is placed upon generators, transporters, and owners and operators of hazardous waste management facilities, not laboratories or consultants they may employ. In addition, the member of the regulated community is the only one in a position to know such things as how the data will be used, what decisions the data will support, and the required precision and accuracy of the measurements.

The laboratory performing the measurements may not be in a position to know these details. Therefore, the Agency believes that the member of the regulated community should be responsible for the preparation of the QAPjP (i.e., selection of the required methods, accuracy, precision, and

sensitivity of the analysis). This is no different from the current situation that prevails in the laboratory services sector. The laboratory is responsible for meeting the requirements established by the client. This might require lower detection limits or better precision for some projects than for others. The Agency recognizes that, in a laboratory production environment, different samples with different analytical requests can present a management problem. The Agency believes, however, that laboratories already face such problems when meeting client needs, and are able to develop appropriate solutions.

Other commenters objected to the mandatory use of the Chapter One QA/QC procedures for all RCRA testing, since the Agency does not require the use of the methods contained in SW-846 for all RCRA testing. They argued that Chapter One of SW-846 should not apply when the methods in SW-846 are not being used.

In addressing this comment, the Agency notes the difference between the mandatory use of an analytical method and the proposed imposition of mandatory QC. These two items are distinct and different. The proposed QC requirements were designed to ensure that, no matter what method was used, the resulting data would be of known and documented quality. The Agency believes that the regulated community should be given as much flexibility as possible in selecting the most cost effective method for data gathering. However, no matter what method is used, the Agency believes that data must be of a quality sufficient to meet the requirements of the application. The proposed QC requirements were designed to achieve that end.

Based upon the above comments, as well as others received concerning whether Chapter One should be mandatory for all testing, the Agency has determined that requiring minimum quality control procedures for all RCRA testing requires further study. Thus, the Agency has decided to finalize the revised Chapter One only as guidance.

In addition, Chapter One provides guidance as to how data generated using QA/QC procedures can be assured through one document, the QAPjP. However, the Agency believes that existing documents (Standard Operating Procedures (SOPs), procedure manuals or other comparable plans) which fulfill the Agency's QA/QC recommendations may be appropriate and more cost-effective to members of the regulated community. Therefore, the Agency does not believe it is necessary for a separate QAPjP to be prepared for routine sampling analyses or activities if comparable documents are available and referenced.

C. Trace Analysis vs. Macroanalysis

The comments on the Agency's proposal to include language in SW-846 allowing the analyst latitude regarding sample size, dilution, concentration and choice of analytical methodology when macroanalysis (i.e., analysis of high concentration samples) is performed were supportive of the Agency's position.

Therefore, the Agency has provided latitude for the sample size and/or sample dilution when macroanalysis is performed, as discussed in the notice.

Macroanalysis refers to the analysis of samples in which the amount of the constituent being tested for exceeds the normal range covered by the analysis method. The methods contained in SW-846 may be used for

macroanalysis if the sample size and/or dilution is adjusted such that the concentration of the final sample is in the range covered by the method. When a smaller sample is used or when a sample is diluted, the detection limit for the method will increase by a corresponding factor. If an instrumental detection limit for a particular compound is 10 nanograms (ng) (i.e., the instrument making the measurement can measure 10 ng of material) and the amount of sample used for the measurement is 1 milliliter (mL), then the corresponding detection limit, for that sample, is 10 ng/mL or 0.01 parts per million (ppm). If the sample is diluted to 100 mL and 1 mL of the diluted material is used for the measurement, the detection limit will correspond to 100 times the original detection limit or 1 ppm. Dilution, therefore, affects detection limits.

Likewise, if a larger amount of sample is used for the analysis, the detection limit is lowered by that factor. However, the instrumental detection limit remains at 10 ng regardless of the sample size used. In the case of macroanalysis, however, this increase in detection limit is of no consequence as long as the concentration of the sample is adjusted to the concentration range covered by the method. Thus, the following paragraphs have been added to Chapter Two, "Choosing the Correct Procedure," to provide guidance in this area and explain the limits to which the analyst must adhere when exercising this latitude:

The methods presented in SW-846 were designed through sample sizing and concentration procedures to address the problem of "trace" analyses (<1000 ppm), and have been developed for an optimized working range. These methods are also applicable to "minor" (1000 ppm--10,000 ppm) and "major" (>10,000 ppm) analyses, as well as to "trace" analyses, through use of appropriate sample preparation techniques that result in analyte concentration within that optimized range. Such sample preparation techniques include:

(1) Adjustment of size of sample prepared for analysis,
(2) Adjustment of injection volumes,
(3) Dilution or concentration of sample,
(4) Elimination of concentration steps prescribed for "trace" analyses,
(5) Direct injection (of samples to be analyzed for volatile constituents).

The performance data presented in each of these methods were generated from "trace" analyses, and may not be applicable to "minor" and "major" analyses.

Generally, extraction efficiency improves as concentration increases.

Caution: Care should be taken when analyzing samples for trace analyses subsequent to analysis of concentrated samples due to the possibility of cross-contamination.

D. Equipment, Standards and Reagent Preparation

The comments on the Agency's proposal to include language in SW-846 explicitly permitting the analyst latitude regarding the choice of glassware, equipment, and preparation of standards and reagents for use in SW-846 test methods were supportive of the Agency's position. Therefore, the Agency has added the following statement to the Disclaimer, at the beginning of SW-846, and to Chapter Two allowing this latitude:

Since many types and sizes of glassware and supplies are commercially available, and since it is possible to prepare reagents and standards in many different ways, those specified in these methods may be replaced by any similar types as long as this substitution does not affect the overall

quality of the analyses.

E. Holding Times

The Agency proposed making changes to SW-846 that will also permit the analyst latitude in the implementation of holding times and to consider the results of samples not analyzed within the specified holding times to be minimum values.

Although most comments indicated agreement with the proposal to allow flexibility for the holding times given in SW-846, several commenters believed that applying the proposed change to the varied matrices and levels of contaminants encountered in environmental samples is inappropriate. Two primary concerns raised by these commenters regarded: (1) Accurately answering the question of whether the threshold was exceeded if the "minimum value" is applied in situations where the measured concentration was just below the regulatory threshold, and (2) abuse of the program if the implementation of holding times was left to the discretion of the analyst.

The Agency agrees with the first comment that one cannot conclude a waste concentration is below a specified level when the holding time for a sample of that waste is exceeded, and the data show the sample concentration is below the regulatory threshold. The data can be viewed as providing a minimum concentration only. If these data show, however, that the minimum concentration is above the regulatory threshold, then one can conclude that the waste is hazardous. Data generated after holding times are exceeded may only be used to prove a waste is hazardous, not that the waste is non-hazardous.

The Agency disagrees with the second comment that, by adopting this approach, the analyst is given too much discretion regarding implementing holding times, since the data can only be used as discussed above.

Based on these comments, the Agency has included in Chapter Two of SW-846 a provision for the use of data from samples after their holding time has been exceeded for the purpose of showing a waste has exceeded a regulatory limit.

The Agency emphasizes that analyses performed after holding times expire will represent minimum values and will not be appropriate for demonstrating that a waste is below a regulatory limit. Holding times must be met whenever one is demonstrating that the concentration is less than a regulatory limit.

Specifically, the following paragraph has been added to Chapter Two:

Samples must be extracted/analyzed within the specified holding times for the results to be considered reflective of total concentrations. Analytical data generated outside of the specified holding times must be considered to be minimum values only. Such data may be used to demonstrate that a waste is hazardous where it shows the concentration of a constituent to be above the regulatory threshold but cannot be used to demonstrate that a waste is not hazardous.

F. Representative Sampling

The Agency received several comments regarding representative sampling.

Specifically, commenters expressed concern that the Agency was redefining representative sampling, that the Agency approach does not take special sampling problems (i.e., mixed radioactive and hazardous waste) into account, and that more guidance is needed concerning sampling of high-volume wastes.

The comments raised by the public are still under consideration by the Agency. In order to address these comments the Agency will need to issue additional guidance. The Agency intends to issue extensive guidance covering all aspects of sampling, including representative sampling. This guidance will replace Chapter Nine of SW-846 and will be proposed and available for public comment in the future.

This effort includes consideration of sampling strategies that can minimize costs without sacrificing acceptable data quality for making RCRA decisions.

The on-going work includes identifying approaches and valid statistical tools for data evaluation and interpretation. Until this guidance is available, appropriate sampling strategies should be decided on a case-by-case basis utilizing as guidance Chapter Nine of SW-846 and the comment responses found in the background document for this rulemaking.

G. Analysis of Nonaqueous Liquids for Elemental Species

Two commenters urged EPA not to adopt Method C--Bomb, Acid Digestion, as found in American Society for Testing and Materials (ASTM) Method E926-88, "Methods of Preparing Refuse-Derived Fuel (RDF) Samples for Analyses of Metals," until data are available on its applicability. A request has been made that, before being proposed or recommended, the method should be tested for all of the matrix types. One commenter, on the other hand, indicated that he or she had evaluated this method for its ability to digest oils for metals and found that "(t)his work demonstrated that the method was appropriate for metals of environmental concern, even though it is not a complete digestion."

In recommending this method the Agency relies, to some extent, on the acceptance procedures used by ASTM. Before ASTM recommends a method for a particular use, it is evaluated by a committee composed of experts in that testing area. If the committee accepts the method, it is adopted and published by ASTM. This review process is scientifically rigorous and ensures the method is suitable for its intended use. While ASTM method recommendations are not binding on the Agency, the Agency may recognize an ASTM method as satisfactory.

Since this method is generally accepted for hydrocarbon materials, the Agency believes that recommending it without a reevaluation or soliciting information on its applicability is proper, given Agency concurrence regarding the respective ASTM recommendation and review procedures. In response to public comment, however, the Agency evaluated this method, and others, for determining metals in a limited number of waste oils. The results of this study indicate that the method is adequate for this purpose. A copy of this study is contained in a background document accompanying this rule.

This study supports the conclusion of the third commenter regarding the applicability of the method for metals in oil analysis.

Furthermore, since waste oil is generally considered one of the most

difficult matrices, the Agency believes this method will be applicable to a very wide range of matrices. No substantive data was submitted showing that the method does not work for its intended application. As a result, the Agency has chosen to promulgate the method. As more information becomes available, the Agency will update the method to include performance data for additional, or more specific, matrices.

The Agency maintains that methods used for RCRA-related testing should be applicable to the specific matrix and analytes of concern. The Agency disagrees with the commenters, however, that testing of the method for additional nonaqueous matrices is necessary before the method is recommended.

It is not possible to validate any method for all matrices of potential interest. The method has been found to produce acceptable results for metals in oil. Users of this method may wish to validate its use for other matrices using the QC guidance set forth in Chapter One of SW-846. (See SW-846, Chapter One, section 4.4.3 "Laboratory Control Procedures.")

Therefore, the Agency is incorporating by reference "ASTM Standard Test Methods for Preparing Refuse-Derived Fuel (RDF) Samples for Analyses of Metals," ASTM Standard E926-88, Test Method C--Bomb, Acid Digestion Method in Sec. 260.11(a) of the RCRA regulations.

H. Method of Standard Additions and Matrix Spikes

The Agency received comments supportive of the Agency's position that the method of standard additions (MSA) be applied when matrix interferences are suspected. The Agency has and continues to require MSA for certain determinations of elemental species in EP Toxicity and TCLP leachates, for certain data provided in support of delisting petitions, for analysis of new matrices, and for analysis when matrix interferences are present. Directions for applying MSA are found in Method 7000, and have been retained in the Third Edition of SW-846 and Update I.

The Agency believes that matrix spikes can be useful in detecting bias and therefore has retained guidance related to matrix spikes in Chapter One and in some methods contained in SW-846.

I. Spike Recovery Correction

In the February 8, 1990 notice, the Agency set out its intent to require that reported values be adjusted for analytical bias using matrix spike recovery as one of the minimum Quality Control procedures required for all RCRA testing. The purpose of this requirement was to provide more accurate data in those situations where there was a significant analytical bias in the data due to low recoveries of the analytes of interest. Many of the commenters to the February 8, 1990 notice indicated that the requirement for spike recovery correction should not be mandatory. In particular, a number of commenters raised questions relative to the practical aspects of implementation of the requirement (e.g., how to add the spike, how many compounds must be spiked, how many samples must be spiked) as well as the burdensome nature of implementation for wastes with matrix interference problems. Wastes with matrix interferences often require dilution in an attempt to reduce or eliminate the interferences. As a result, detection limits could be elevated and one might not be able to determine if a compound of interest is present below the regulatory threshold. In

addition, interferences may not equally affect the sample and the spike. Commenters also expressed concern about bias correction when applied to a constituent that is poorly recovered from a sample matrix. In the case of zero percent recovery, one may not be sure that the laboratory could have detected the presence of the analyte if it were present.

The Agency already has recognized that spike recovery correction is a complex issue and that there is a need for further evaluation and more detailed guidance on the specific implementation procedures. Therefore, in response to public comment received on the February 8, 1990, Federal Register notice, in a Federal Register notice published on November 24, 1992 (57 FR 55114), the Agency has already announced its decision not to proceed with the proposed spike recovery correction requirement in its Subtitle C analytical procedures, and has withdrawn the requirement for bias correction of analytical spiked samples from the TCLP. The November 24, 1992 rule withdrew the spike recovery correction requirement from the TCLP and, except for technical and format changes made in a June 29, 1990, final rule revising the TCLP (55 FR 26986), returned the QA provisions of the TCLP to those promulgated on March 29, 1990 (55 FR 11796). As a result, matrix spike recoveries must be calculated (as set forth in revised section 8.2 of the TCLP) and the method of standard additions must be employed as the quantitation method for metallic contaminants when appropriate as specified in the method (as set forth in revised section 8.4 of the TCLP). In addition, the Agency made a technical correction to the regulatory language in section 8.4 to specify the use of initial calibration quantitation methods for metallic contaminants. The Agency felt this technical correction was appropriate because, at present, the method of standard additions is inapplicable to organic contaminants. Wastes identified as hazardous through TCLP testing utilizing matrix spike recovery correction must be managed as hazardous wastes, unless and until such wastes are reevaluated using recalculations of existing data or the TCLP test procedure as described in November 24, 1992 rule or otherwise reevaluated and found to be non- hazardous.

J. Reagent Grade Water

Several commenters asked that the Agency's definition of Reagent Grade Water be clarified. Specifically, they requested that the Agency adopt objective limits for defining "reagent grade water." In response to these comments the Agency has added definitions of reagent water and organic-free reagent water to Chapter One. Specific details on these definitions may be found in the revised Chapter One which provided that for a method blank to be acceptable, the concentration in the blank of any analyte of concern should be no higher than the highest of the following:

(1) The method detection limit,
(2) Five percent of the regulatory limit for that analyte, or
(3) Five percent of the measured concentration in the sample.

Reagent water and organic-free reagent water will generally provide acceptable method blanks.

K. Appendices III and X to 40 CFR Part 261

The Agency received few comments on the proposal to delete Appendices III and X of 40 CFR part 261. All were in favor of deleting Appendix X, but

several found Appendix III useful as a reference.

The Agency has chosen to proceed with removal of Appendix X of Part 261 as proposed in the Notice. The Agency has also decided to proceed with revising Appendix III of part 261 whereby Tables 1 through 3 are removed and a note is added referencing the reader to SW-846. The information contained in the tables of Appendix III, "Chemical Analysis Test Methods", is provided in SW- 846 Third Edition, Chapter Two, "Choosing the Correct Procedure." This chapter can be used in place of the tables of Appendix III. Removal of the appendix tables does not change the methods that are to be used in a given situation.

Since Appendix III of part 261 is being revised to refer to SW-846 and since Secs. 260.22(d)(1)(i) and 270.19(c)(1)(iii) reference that appendix, those sections are also being revised to instead reference SW-846.

V. Technical Changes

The Agency is taking this opportunity to make several technical changes resulting from adoption of the Third Edition of SW-846 and correcting minor technical errors. These changes include:

** Revising appendix II of part 261 by deleting the Toxicity Characteristic Leaching Procedure (TCLP), and adding a note referencing the TCLP, Method 1311 found in SW-846; and revising Sec. 261.24 by removing the reference to the TCLP found in appendix II, and adding in its place a reference to SW-846 Method 1311.

** Revising appendices I and IX of part 268 by deleting the reference to the TCLP found in appendix II, part 261 from appendix I of part 268 and deleting the EP Toxicity Test, Method 1310 from appendix IX of part 268 and adding notes respectively referencing the TCLP, Method 1311 and the EP, Method 1310 found in SW-846; and revising references to appendix II of part 261 and appendix IX of part 268 in Secs. 268.7(a), 268.40(a) and 268.41(a) to instead reference SW-486 Methods 1311 and 1310.

** Deleting the Liquid Release Test, Method 9096 from SW-846 Third Edition and First Update.

** Removing the 47 analytical test methods incorporated by reference in Sec. 260.11(a).

** Deleting references to equivalent methods in Secs. 261.22(a) (1) and (2) and 261.24(a).

** Deleting the reference to Method 5.2 in Sec. 261.22(a)(1) and adding in its place the reference to Method 9040.

** Adding clarification that references to SW-846 in Secs. 264.190(a), 264.314(c), 265.190(a), 265.314(d), 270.19(c)(1)(iii) and (iv), 270.62(b)(2)(i)(C) and (D), and 270.66(c)(2)(i) and (ii) are to SW-846 as incorporated by reference in Sec. 260.11

** Revising Sec. 270.6 to cross reference Sec. 260.11

Since these are technical changes that do not affect the implementation of the regulations, the Agency is simply providing notice of the changes without opportunity for comment. These changes are discussed in detail below.

A. Revising Appendix II of Part 261 by Deleting the Toxicity Characteristic Leaching Procedure (TCLP), and Adding Reference to the TCLP, SW-846 Method 1311 to Appendix II and Sec. 261.24.

The TCLP is being removed from appendix II of part 261 and replaced with a note referencing SW-846 because this method is contained in the Third Edition of SW-846 (i.e., Method 1311) and there is no need to maintain multiple copies of this method (one in appendix II of part 261 and one incorporated by reference) in the regulations. This technical change is being undertaken to eliminate redundancy and to remove the possibility that a discrepancy might exist between two versions of the method. This revision only changes where the method is found. It does not change the content or intended use of the method. Since this is clearly a technical change, the Agency is making this change without notice and comment.

Since the TCLP is being removed from appendix II and replaced with a note referencing SW-846, and Sec. 261.24 refers to appendix II, Sec. 261.24 is being revised to also refer to Method 1311 in SW-846.

B. Revising Appendices I and IX of Part 268 by Deleting the Reference to the TCLP Found in Appendix II, Part 261, From Appendix I of Part 268 and Deleting the EP Toxicity Test From Appendix IX of Part 268; and Adding References to the TCLP, SW-846 Method 1311 and the EP, SW-846 Method 1310 in the Respective Appendices and in Secs. 268.7(a), 268.40(a) and 268.41(a).

Since the TCLP is being removed from appendix II, part 261 and replaced with a note referencing SW-846 Method 1311, and since appendix I of part 268 and Secs. 268.7(a), 268.40(a) and 268.41(a) refer to appendix II of part 261, appendix I, part 268 and Secs. 268.7(a), 268.40(a) and 268.41(a) are being revised to also refer to Method 1311 in SW-846.

The Extraction Procedure (EP) Toxicity Test is also being removed from appendix IX of part 268 and replaced with a note referencing SW-846 because the method is contained in the Third Edition of SW-846 (i.e., Method 1310), and there is no need to maintain multiple copies of this method (one in appendix IX of part 268 and one incorporated by Reference) in the regulations. This revision only changes where the method is found. It does not change the content or intended use of the method.

Since the EP is being removed from appendix IX of part 268 and replaced with a note referencing SW-846 Method 1310, and since Secs. 268.7(a) and 268.40(a) refer to this appendix, Secs. 268.7(a) and 268.40(a) are also being revised to refer to Method 1310 in SW-846.

C. Deleting the Liquid Release Test, Method 9096 From SW-846 Third Edition and Update I

The Liquid Release Test, SW-846 Method 9096, was included in SW-846 Third Edition and Update I inadvertently. It was not EPA's intention to include the Liquid Release Test in that publication, since Method 9096 has not yet been proposed. EPA is, therefore, deleting Method 9096 from SW-846 Third

Edition and Update I. It is the Agency's intention to propose Method 9096 as part of Update II to SW-846.

D. Removing the 47 Analytical Test Methods Incorporated by Reference in Sec. 260.11(a)

The Agency is today removing the 47 methods incorporated by reference in Sec. 260.11(a). This action is being taken since the 47 methods are contained in the Third Edition of SW-846, which is being incorporated by reference today in its entirety. Therefore, specific reference to the 47 methods is redundant and is being removed.

E. Deleting References to Equivalent Methods in Secs. 261.22(a)(1) and (2) and 261.24(a)

The Agency notes that anyone may petition to add an equivalent testing or analytical method to SW-846 for use in the RCRA program under provisions of Secs. 260.20 and 260.21 of these regulations. Because these provisions have always been available to the public, in today's rule the Agency is removing references to equivalent methods in Secs. 261.24(a).

F. Deleting the Reference to Method 5.2 in Sec. 261.22(a)(1) and Adding in its Place the Reference to Method 9040

The EPA method number for pH is incorrectly referenced in Sec. 261.22(a)(1) as Method 5.2. Therefore, the Agency is deleting the reference to Method 5.2 in that section and replacing it with the correct reference to Method 9040.

G. Adding Clarification that References to SW-846 in Secs. 264.190(a), 264.314(c), 265.190(a), 265.314(d), 270.19(c)(1) (iii) and (iv), 270.62(b)(2)(i) (C) and (D), and 270.66(c)(2) (i) and (ii) are to SW-846 as Incorporated by Reference in Sec. 260.11

Finally, the Agency is today clarifying for the reader references to SW-846 and its methods in Secs. 264.190(a), 264.314(c), 265.190(a), 265.314(d), 270.19(c)(1) (iii) and (iv), 270.62(b)(2)(i) (C) and (D), and 270.66(c)(2) (i) and (ii) by adding the phrase "as incorporated by reference in Sec. 260.11" after "SW-846" in those sections.

H. Revising Sec. 270.6 to cross reference Sec. 260.11

The Agency is modifying Sec. 270.6 to refer to Sec. 260.11. Since Sec. 260.11 applies to 40 CFR parts 260 through 270, revising Sec. 270.6 References is repetitious and unnecessary.

VI. State Authority

A. Applicability of Rules in Authorized States

Under section 3006 of RCRA, EPA may authorize qualified States to administer and enforce the RCRA program within the State. (See 40 CFR part 271 for the standards and requirements for authorization.) Following authorization, EPA retains enforcement authority under sections 3008, 7003 and 3013 of RCRA, although authorized States have primary enforcement responsibility.

Prior to the Hazardous and Solid Waste Amendments of 1984 (HSWA), a State with final authorization administered its hazardous waste program entirely in lieu of EPA administering the Federal program in that State. The Federal requirements no longer applied in the authorized State, and EPA could not issue permits for any facilities in the State that the State was authorized to permit. When new, more stringent Federal requirements were promulgated or enacted, the State was obliged to enact equivalent authority within specified time frames. New Federal requirements did not take effect in an authorized State until the State adopted the requirements as State law.

In contrast, under section 3006(g) of RCRA, 42 U.S.C. 6926(g), new requirements and prohibitions imposed by the HSWA take effect in authorized States at the same time that they take effect in nonauthorized States. EPA is directed to carry out those requirements and prohibitions in authorized States, including the issuance of permits, until the State is granted authorization to do so. While States must still adopt HSWA-related provisions as State law to retain final authorization, the HSWA applies in authorized States in the interim.

B. Effect on State Authorizations

Today's rule promulgates standards that are not effective in authorized States since the requirements are being imposed pursuant to pre-HSWA authority. Therefore, the rule is not immediately effective in authorized States. The requirements will be applicable only in those States that do not have interim or final authorization. In authorized States, the requirements will not be applicable until the State revises its program to adopt equivalent requirements under State law.

As required by 40 CFR 271.21(e)(2), States that have final authorization must modify their programs to reflect Federal program changes and subsequently must submit the modifications to EPA for approval. The deadline by which the State must modify its program to adopt today's rule is determined based on the date of final rule promulgation in accordance with 40 CFR 271.21(e). These deadlines can be extended in certain cases (40 CFR 271.21(e)(3)). Once EPA approves the modification, the State requirements become Subtitle C RCRA requirements.

States with authorized RCRA programs may already have requirements similar to those in today's rule. These State requirements have not been assessed against the Federal regulations being promulgated today to determine whether they meet the tests for authorization. Thus, a State is not authorized to carry out these requirements in fulfillment of the Federal regulations promulgated today until the State program modification is submitted to EPA and approved. Of course, States with existing standards may continue to administer and enforce their standards as a matter of State law.

States that submit their official applications for final authorization

within 12 months after the effective date of today's rule are not required to include in their applications requirements equivalent to the requirements in today's rule. However, the State must modify its program by the deadlines set forth in 40 CFR 271.21(e). States that submit official applications for final authorization 12 months or more after the effective dates of today's rule must include requirements at least as stringent as the requirements in the final rule in their applications. 40 CFR 271.3 sets forth the requirements a State must meet when submitting its final authorization application.

VII. Effective Date

Section 3010 of RCRA provides that regulations promulgated pursuant to Subtitle C of RCRA shall take effect six months after the date of promulgation. However, HSWA amended section 3010 of RCRA to allow rules to become effective in less than six months when the regulated community does not need six months to come into compliance. Since today's rule provides greater flexibility to the regulated community in testing and monitoring solid waste, the Agency believes the regulated community does not need six months to come into compliance. For that same reason, the Agency believes that good cause exists under the Administrative Procedures Act, 5 U.S.C. section 553(d), for not delaying the effective date of this rule under 30 days after its publication in the Federal Register. Therefore, this rule is effective August 31, 1993.

VIII. Regulatory Analyses

A. Regulatory Impact Analysis

Under Executive Order 12291, EPA must determine whether a regulation is "major" and, therefore, subject to the requirement of a Regulatory Impact Analysis. This rule does not increase the number of situations in which SW-846 test methods are required, but rather provides greater flexibility to the regulated community in testing and monitoring solid waste. The rule entails no additional testing or recordkeeping burden. The effects on the economy for incorporating technical corrections and adding new test methods are essentially zero.

For the same reasons, EPA has also determined that this final rule will not cause a major increase in prices and will not have a significant adverse effect on competition or the ability of U.S. enterprises to compete with foreign enterprises. There is no additional economic impact, therefore, due to today's rule. The Agency has determined that today's rule is not a major regulation; thus, no Regulatory Impact Analysis is required.

B. Regulatory Flexibility Act

Pursuant to the Regulatory Flexibility Act (5 U.S.C. sections 601-612, Pub. L. 96-354, September 19, 1980), whenever an agency publishes a General Notice of Rulemaking for any proposed or final rule, it must prepare and make available for public comment a regulatory flexibility analysis (RFA) that describes the impact of the rule on small entities (i.e., small businesses, small organizations, and small governmental jurisdictions). No regulatory flexibility analysis is required, however, if the head of the Agency certifies that the rule will not have a significant impact on a

substantial number of small entities.

This rule will not require the purchase of new instruments or equipment. The regulation requires no new reports beyond those now required. This rule will not have an adverse economic impact on small entities since its effect will be to provide greater flexibility to all of the regulated community, including small entities. Therefore, in accordance with 5 U.S.C. section 605(b), I hereby certify that this rule will not have a significant economic impact on a substantial number of small entities (as defined by the Regulatory Flexibility Act). Thus, the regulation does not require an RFA.

C. Paperwork Reduction Act

There are no additional reporting, notification, or recordkeeping provisions in this rule. Such provisions, were they included, would be submitted for approval to the Office of Management and Budget (OMB) under the Paperwork Reduction Act, 44 U.S.C. 3501 et seq.

List of Subjects in 40 CFR Parts 260, 261, 264, 265, 268, and 270.

Administrative practice and procedure, Hazardous waste, Incorporation by reference, Reporting and recordkeeping requirements.

Dated: August 24, 1993.

Carol M. Browner,
Administrator.

For the reasons set out in the preamble, title 40, chapter I of the Code of Federal Regulations is amended as set forth below:

PART 260--HAZARDOUS WASTE MANAGEMENT SYSTEM: GENERAL

1. The authority citation for part 260 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6921-6927, 6930, 6934, 6935, 6937, 6938, 6939, and 6974.

Subpart B--Definitions

2. Section 260.11(a) is amended by revising the "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods" reference; by adding ASTM Method E926-88 to the end of the list of incorporation by reference publications; by removing the undesignated paragraph following the list of incorporation by reference publications, which refers to the 47 analytical testing methods and its footnote 1, to read as follows:

Sec. 260.11 References.

(a) * * *
"Test Methods for Evaluating Solid Waste, Physical/Chemical Methods," EPA Publication SW-846 (Third Edition (September, 1986), as amended by Update I (July 1992)). The Third Edition of SW-846 and Update I (document number 955- 001-00000-1) are available from the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402, (202) 783-3238. Copies may be inspected at the Library and RCRA Docket No. F-93-WTMF-FFFFF, U.S. Environmental Protection Agency, 401 M Street, SW., Washington, DC 20460.

"ASTM Standard Test Methods for Preparing Refuse-Derived Fuel (RDF) Samples for Analyses of Metals," ASTM Standard E926-88, Test Method C--Bomb, Acid Digestion Method, available from American Society for Testing Materials, 1916 Race Street, Philadelphia, PA 19103.

* * * * *

Subpart C--Rulemaking Petitions

3. Section 260.22(d)(1)(i) is revised to read as follows:
Sec. 260.22 Petitions to amend part 261 to exclude a waste produced at a particular facility.

* * * * *

(d) * * *
(1) * * *
(i) Does not contain the constituent or constituents (as defined in Appendix VII of part 261 of this chapter) that caused the Administrator to list the waste, using the appropriate test methods prescribed in "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods," EPA Publication SW-846, as incorporated by reference in Sec. 260.11; or
* * * * *

PART 261--IDENTIFICATION AND LISTING OF HAZARDOUS WASTE

4. The authority citation for part 261 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6921, 6922, and 6938.

Subpart C--Characteristics of Hazardous Waste

5. Section 261.22 is amended by revising paragraphs (a)(1) and paragraph (a)(2) to read as follows:

Sec. 261.22 Characteristic of corrosivity.

(a) * * *
(1) It is aqueous and has a pH less than or equal to 2 or greater than or equal to 12.5, as determined by a pH meter using Method 9040 in "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods," EPA Publication SW- 846, as incorporated by reference in Sec. 260.11 of this chapter.

(2) It is a liquid and corrodes steel (SAE 1020) at a rate greater than 6.35 mm (0.250 inch) per year at a test temperature of 55 deg.C (130 deg.F) as determined by the test method specified in NACE (National Association of Corrosion Engineers) Standard TM-01-69 as standardized in "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods," EPA Publication SW-846, as incorporated by reference in Sec. 260.11 of this chapter.

* * * * *

6. Section 261.24(a) is revised to read as follows:

Sec. 261.24 Toxicity characteristic.

(a) A solid waste exhibits the characteristic of toxicity if, using the Toxicity Characteristic Leaching Procedure, test Method 1311 in "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods," EPA Publication SW- 846, as incorporated by reference in Sec. 260.11 of this chapter, the extract from a representative sample of the waste contains any of the contaminants listed in table 1 at the concentration equal to or greater than the respective value given in that table. Where the waste contains less than 0.5 percent filterable solids, the waste itself, after filtering using the methodology outlined in Method 1311, is considered to be the extract for the purpose of this section.

* * * * *

7. Appendix II to part 261 is revised to read as follows:

Appendix II to Part 261--Method 1311 Toxicity Characteristic Leaching Procedure (TCLP)

Note: The TCLP (Method 1311) is published in "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods," EPA Publication SW-846, as incorporated by reference in Sec. 260.11 of this chapter.

8. Appendix III to part 261 is revised to read as follows:

Appendix III to Part 261--Chemical Analysis Test Methods

Note: Appropriate analytical procedures to determine whether a sample contains a given toxic constituent are specified in Chapter Two, "Choosing the Correct Procedure" found in "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods," EPA Publication SW-846, as incorporated by reference in Sec. 260.11 of this chapter. Prior to final sampling and analysis method selection, the individual should consult the specific section or method described in SW-846 for additional guidance on which of the approved methods should be employed for a specific sample analysis situation.

9. Appendix X to part 261 is removed.

PART 264--STANDARDS FOR OWNERS AND OPERATORS OF HAZARDOUS WASTE TREATMENT, STORAGE, AND DISPOSAL FACILITIES

10. The authority citation for part 264 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6924, and 6925.

Subpart J--Tank Systems

11. Section 264.190 is amended by revising the last sentence of paragraph (a) to read as follows:

Sec. 264.190 Applicability.

* * * * *

(a) * * * To demonstrate the absence or presence of free liquids in the stored/treated waste, the following test must be used: Method 9095 (Paint Filter Liquids Test) as described in "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods," EPA Publication SW-846, as incorporated by reference in Sec. 260.11 of this chapter.

* * * * *

Subpart N--Landfills

12. Section 264.314 is amended by revising paragraph (c) to read as follows:

Sec. 264.314 Special requirements for bulk and containerized liquids.

* * * * *

(c) To demonstrate the absence or presence of free liquids in either a containerized or a bulk waste, the following test must be used: Method 9095 (Paint Filter Liquids Test) as described in "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods," EPA Publication SW-846, as incorporated by reference in Sec. 260.11 of this chapter.

* * * * *

PART 265--INTERIM STATUS STANDARDS FOR OWNERS AND OPERATORS OF HAZARDOUS WASTE TREATMENT, STORAGE, AND DISPOSAL FACILITIES

13. The authority citation for part 265 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6924, 6925, 6935, and 6936.

Subpart J--Tank Systems

14. Section 265.190 is amended by revising the last sentence of paragraph (a) to read as follows:

Sec. 265.190 Applicability.

* * * * *

(a) * * * To demonstrate the absence or presence of free liquids in the

stored/treated waste, the following test must be used: Method 9095 (Paint Filter Liquids Test) as described in "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods," EPA Publication SW-846, as incorporated by reference in Sec. 260.11 of this chapter.

* * * * *

Subpart N--Landfills

15. Section 265.314 is amended by revising paragraph (d) to read as follows:

Sec. 265.314 Special requirements for bulk and containerized liquids.

* * * * *

(d) To demonstrate the absence or presence of free liquids in either a containerized or a bulk waste, the following test must be used: Method 9095 (Paint Filter Liquids Test) as described in "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods," EPA Publication SW-846, as incorporated by reference in Sec. 260.11 of this chapter.

* * * * *

PART 268--LAND DISPOSAL RESTRICTIONS

16. The authority citation for part 268 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6921, and 6924.

Subpart A--General

17. Section 268.7 is amended by revising paragraph (a) to read as follows:

Sec. 268.7 Waste analysis and recordkeeping.

(a) Except as specified in Sec. 268.32, if a generator's waste is listed in 40 CFR part 261, subpart D, the generator must test his waste, or test an extract using the Toxicity Characteristic Leaching Procedure, Method 1311 in "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods," EPA Publication SW-846, as incorporated by reference in Sec. 260.11 of this chapter, or use knowledge of the waste, to determine if the waste is restricted from land disposal under this part. Except as specified in Sec.
268.32, if a generator's waste exhibits one or more of the characteristics set out at 40 CFR part 261, subpart C, the generator must test an extract using the Extraction Procedure Toxicity Test, Method 1310 in "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods," EPA Publication SW-846, as incorporated by reference in Sec. 260.11 of this chapter, or use knowledge of the waste, to determine if the waste is restricted from land disposal under this part. If the generator determines that this waste displays the characteristic of ignitability (D001) (and is not in the High TOC Ignitable Liquids Subcategory or is not treated by INCIN, FSUBS, or RORGS of Sec. 268.42, Table 1), or the characteristic of corrosivity (D002), and is prohibited under Sec. 268.37, the generator must determine

what underlying hazardous constituents (as defined in Sec. 268.2) are reasonably expected to be present in the D001 or D002 waste.

* * * * *

Subpart D--Treatment Standards

18. Section 268.40 is amended by revising paragraph (a) to read as follows:

Sec. 268.40 Applicability of treatment standards.

(a) A restricted waste identified in Sec. 268.41 may be land disposed only if an extract of the waste or of the treatment residue of the waste developed using Method 1311, the Toxicity Characteristic Leaching Procedure does not exceed the value shown in Table CCWE of Sec. 268.41 for any hazardous constituent listed in Table CCWE for that waste, with the following exceptions: D004, D008, K031, K084, K101, K102, P010, P011, P012, P036, P038, and U136. These wastes may be land disposed only if an extract of the waste or of the treatment residue of the waste developed using either Method 1310, the Extraction Procedure Toxicity Test, or Method 1311, the Toxicity Characteristic Leaching Procedure, does not exceed the concentrations shown in Table CCWE of Sec. 268.41 for any hazardous constituent listed in Table CCWE for that waste. Methods 1310 and 1311 are both found in "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods," EPA Publication SW- 846, as incorporated by reference in Sec. 260.11 of this chapter.

* * * * *

19. Section 268.41 is amended by revising paragraph (a) introductory text to read as follows:
Sec. 268.41 Treatment standards expressed as concentrations in waste extract.

(a) Table CCWE identifies the restricted wastes and the concentrations of their associated constituents which may not be exceeded in the extract of a waste or waste treatment residual extracted using Method 1311, the Toxicity Characteristic Leaching Procedure, for the allowable land disposal of such wastes. Compliance with these concentrations is required based upon grab samples. Method 1311 is found in "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods," EPA Publication SW-846, as incorporated by reference in Sec. 260.11 of this chapter.

* * * * *

20. Appendix I to part 268 is revised to read as follows:

Appendix I to Part 268--Toxicity Characteristic Leaching Procedure (TCLP)

Note: The TCLP (Method 1311) is published in "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods," EPA Publication SW-846, as incorporated by reference in Sec. 260.11 of this chapter.

21. Appendix IX to part 268 is revised to read as follows:

Appendix IX to Part 268--Extraction Procedure (EP) Toxicity Test Method and Structural Integrity Test (Method 1310)

Note: The EP (Method 1310) is published in "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods," EPA Publication SW-846, as incorporated by reference in Sec. 260.11 of this chapter.

PART 270--EPA ADMINISTERED PERMIT PROGRAMS: THE HAZARDOUS WASTE PERMIT PROGRAM

22. The authority citation for part 270 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912, 6924, 6925, 6927, 6939, and 6974.

Subpart A--General Information

23. Section 270.6(a) is revised to read as follows:

Sec. 270.6 References.

(a) When used in part 270 of this chapter, the following publications are incorporated by reference: (See 40 CFR 260.11 References)

* * * * *

Subpart B--Permit Application

24. Section 270.19 is amended by revising the last sentence of paragraph (c)(1)(iii), and by revising paragraph (c)(1)(iv) to read as follows:

Sec. 270.19 Specific part B information requirements for incinerators.

* * * * *

(c) * * *

(1) * * *

(iii) * * * The waste analysis must rely on analytical techniques specified in "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods," EPA Publication SW-846, as incorporated by reference in Sec. 260.11 of this chapter and Sec. 270.6, or their equivalent.

(iv) An approximate quantification of the hazardous constituents identified in the waste, within the precision produced by the analytical methods specified in "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods," EPA Publication SW-846, as incorporated by reference in Sec. 260.11 of this chapter and Sec. 270.6.

* * * * *

Subpart F--Special Forms of Permits

25. Section 270.62 is amended by revising the last sentence of paragraph (b)(2)(i)(C), and by revising paragraph (b)(2)(i)(D) to read as follows:

Sec. 270.62 Hazardous waste incinerator permits.

* * * * *

(b) * * *
(2) * * *
(i) * * *
(C) * * * The waste analysis must rely on analytical techniques specified in "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods," EPA Publication SW-846, as incorporated by reference in Sec. 260.11 of this chapter and Sec. 270.6, or other equivalent.

(D) An approximate quantification of the hazardous constituents identified in the waste, within the precision produced by the analytical methods specified in "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods," EPA Publication SW-846, as incorporated by reference in Sec. 260.11 of this chapter and Sec. 270.6, or their equivalent.

* * * * *

26. Section 270.66 is amended by revising the last sentence of paragraph (c)(2)(i), and by revising paragraph (c)(2)(ii) to read as follows:

Sec. 270.66 Permits for boilers and industrial furnaces burning hazardous waste.

* * * * *
(c) * * *
(2) * * *
(i) * * * The waste analysis must be conducted in accordance with analytical techniques specified in "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods," EPA Publication SW-846, as incorporated by reference in Sec. 260.11 of this chapter and Sec. 270.6, or their equivalent.

(ii) An approximate quantification of the hazardous constituents identified in the hazardous waste, within the precision produced by the analytical methods specified in "Test Methods for Evaluating Solid Waste, Physical/ Chemical Methods," EPA Publication SW-846, as incorporated by reference in Sec. 260.11 of this chapter and Sec. 270.6, or other equivalent.

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 268

[FRL-5070-2]

Hazardous Waste Management System; Testing and Monitoring Activities, **Land Disposal Restrictions Correction**

AGENCY: Environmental Protection Agency.

ACTION: Final rule; **correction**.

SUMMARY: This action corrects the final regulations which were published Tuesday, August 31, 1993 (``Hazardous Waste Management System; Testing and Monitoring Activities; Final Rule'', 58 FR 46040). This action corrects the unintended removal of text from 40 CFR 268.7(a), which sets out the generator waste analysis and recordkeeping requirements of the **land disposal restrictions** under Subtitle C of the Resource Conservation and Recovery Act of 1976 (RCRA), as amended.

EFFECTIVE DATE: This action is effective as of August 31, 1993.

FOR FURTHER INFORMATION CONTACT: For further information about this **correction** contact Kim Kirkland at (202) 260-4761, Office of Solid Waste (Mailcode 5304), U.S. Environmental Protection Agency, 401 M Street, SW., Washington, DC 20460. For information about 40 CFR 268.7(a) requirements, contact the RCRA Hotline on (800) 424-9346 (toll-free) or, in the Washington, DC metropolitan area, (703) 412-9810.

SUPPLEMENTARY INFORMATION:

Background

The final regulations that are the subject of this **correction** (August 31, 1993, 58 FR 46040) amended the hazardous waste regulations for testing and monitoring activities by replacing the Second Edition, Updates I and II, of the EPA approved test methods manual ``Test Methods for Evaluating Solid Waste, Physical/Chemical Methods,'' EPA Publication SW-846, by incorporating by reference the Third Edition of SW-846 and its Update I into Sec. 260.11(a) of the RCRA regulations. In addition, the final rule also made a technical amendment to Sec. 268.7(a) (concerning waste analysis and recordkeeping requirements) whereby the reference to the appendix IX of Part 268 was revised to reference SW-846 Methods 1311 and 1310. The Agency intended to revise only the introductory text of Sec. 268.7(a) and to retain without change all of the subparagraphs following the introductory text. However, due to an inadvertent administrative error in incorporating the August 31, 1993 rule into the 1994 edition of the Code of Federal Regulations (CFR), the subparagraphs following the introductory text were unintentionally removed. This action clarifies that subparagraphs 40 CFR 268.7(a)(1)-268.7(a)(10), as set forth in this action, remain in effect, and are regarded by EPA to have been in effect continuously in the form published in the Code of Federal Regulations revised as of July 1, 1993.

It should be noted that 40 CFR 268.7(a) as published in this action, as well as other regulations implementing the **land disposal** restriction (LDR) program, have been amended in a final rule that is published elsewhere in today's Federal Register. The regulatory text set forth in this action does not include the amendments to Sec. 268.7(a) made by that LDR final rule. The purpose of this action is to make clear that the August 31, 1993 rule was intended only to modify the introductory text of Sec. 268.7(a), and was not intended to delete paragraphs (a)(1)-(a)(10). Therefore, the complete version of Sec. 268.7(a) as it should have appeared since the August 31, 1994 Federal Register is set forth in this action. Readers are urged to refer to the LDR final rule, published elsewhere in today's Federal Register, for the full and current text of Sec. 268.7(a).

List of Subjects in 40 CFR Part 268

Environmental protection, Hazardous waste, Reporting and recordkeeping requirements.

Dated: August 30, 1994.
Peter Robertson,
Acting Assistant Administrator, Office of Solid Waste and Emergency Response.

Therefore, for the reasons set forth in the preamble, 40 CFR part 268 is corrected by making the following correcting amendments:

PART 268--**LAND DISPOSAL RESTRICTIONS**

1. The authority citation for part 268 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6921, and 6924.

2. Section 268.7(a) is revised to read as follows:

Sec. 268.7 Waste analysis and recordkeeping.

(a) Except as specified in Sec. 268.32, if a generator's waste is listed in 40 CFR part 261, subpart D, the generator must test his waste, or test an extract using the Toxicity Characteristic Leaching Procedure, Method 1311 in ``Test Methods for Evaluating Solid Waste, Physical/Chemical Methods,'' EPA Publication SW-846, as incorporated by reference in Sec. 260.11 of this chapter, or use knowledge of the waste, to determine if the waste is restricted from **land disposal** under this part. Except as specified in Sec. 268.32 of this part, if a generator's waste exhibits one or more of the characteristics set out at 40 CFR part 261, subpart C, the generator must test an extract using the Extraction Procedure Toxicity Test, Method 1310 in ``Test Methods for Evaluating Solid Waste, Physical/Chemical Methods,'' EPA Publication SW-846, as incorporated by reference in Sec. 260.11 of this chapter, or use knowledge of the waste, to determine if the waste is restricted from **land disposal** under this Part. If the generator determines that his waste displays the characteristic of ignitability (D001) (and is not in the High TOC Ignitable Liquids Subcategory or is not treated by INCIN, FSUBS, or RORGS of Sec. 268.42, Table 1), or the characteristic of corrosivity (D002), and is prohibited under Sec. 268.37 of this Part, the generator must determine what underlying hazardous constituents (as defined in Sec. 268.2), are reasonably expected to be present in the D001 or D002 waste.

(1) If a generator determines that he is managing a restricted waste under this part and the waste does not meet the applicable treatment standards set forth in Subpart D of this part or exceeds the applicable prohibition levels set forth in Sec. 268.32 or RCRA section 3004(d), with each shipment of waste the generator must notify the treatment or storage facility in writing of the appropriate treatment standards set forth in Subpart D of this part and any applicable prohibition levels set forth in Sec. 268.32 or RCRA section 3004(d). The notice must include the following information:

(i) EPA Hazardous Waste Number;

(ii) The corresponding treatment standards for wastes F001-F005, F039, wastes prohibited pursuant to Sec. 268.32 or RCRA section 3004(d), and for underlying hazardous constituents (as defined in Sec. 268.2), in D001 and D002 wastes if those wastes are prohibited under Sec. 268.37. Treatment standards for all other restricted wastes must either be included, or be referenced by including on the notification the applicable wastewater (as defined in Sec. 268.2(f)) or nonwastewater (as defined in Sec. 268.2(d)) category, the applicable subdivisions made within a waste code based on waste-specific criteria (such as D003 reactive cyanides), and the CFR section(s) and paragraph(s) where the applicable treatment standard appears. Where the applicable treatment standards are expressed as specified technologies in Sec. 268.42, the applicable five-letter treatment code found in Table 1 of Sec. 268.42 (e.g., INCIN, WETOX) also must be listed on the notification;

(iii) The manifest number associated with the shipment of waste;

(iv) For hazardous debris, the contaminants subject to treatment as provided by Sec. 268.45(b) and the following statement: ``This

hazardous debris is subject to the alternative treatment standards of 40 CFR 268.45''; and

(v) Waste analysis data, where available.

(2) If a generator determines that he is managing a restricted waste under this Part, and determines that the waste can be **land** disposed without further treatment, with each shipment of waste he must submit, to the treatment, storage, or **land disposal** facility, a notice and a certification stating that the waste meets the applicable treatment standards set forth in subpart D of this part and the applicable prohibition levels set forth in Sec. 268.32 or RCRA section 3004(d). Generators of hazardous debris that is excluded from the definition of hazardous waste under Sec. 261.3(e)(2) of this chapter (i.e., debris that the Director has determined does not contain hazardous waste), however, are not subject to these notification and certification requirements.

(i) The notice must include the following information:

(A) EPA Hazardous Waste Number;

(B) The corresponding treatment standards for wastes F001-F005, F039, and wastes prohibited pursuant to Sec. 268.32 or RCRA section 3004(d). Treatment standards for all other restricted wastes must either be included, or be referenced by including on the notification the applicable wastewater (as defined in Sec. 268.2(f)) or nonwastewater (as defined in Sec. 268.2(d)) category, the applicable subdivisions made within a waste code based on waste-specific criteria (such as D003 reactive cyanides), and the CFR section(s) and paragraph(s) where the applicable treatment standard appears. Where the applicable treatment standards are expressed as specified technologies in Sec. 268.42, the applicable five-letter treatment code found in Table 1 of Sec. 268.42 (e.g., INCIN, WETOX) also must be listed on the notification.

(C) The manifest number associated with the shipment of waste;

(D) Waste analysis data, where available.

(ii) The certification must be signed by an authorized representative and must state the following:

I certify under penalty of law that I personally have examined and am familiar with the waste through analysis and testing or through knowledge of the waste to support this certification that the waste complies with the treatment standards specified in 40 CFR Part 268, Subpart D and all applicable prohibitions set forth in 40 CFR 268.32 or RCRA section 3004(d). I believe that the information I submitted is true, accurate and complete. I am aware that there are significant penalties for submitting a false certification, including the possibility of a fine and imprisonment.

(3) If a generator's waste is subject to an exemption from a prohibition on the type of **land disposal** method utilized for the waste (such as, but not limited to, a case-by-case extension under Sec. 268.5, an exemption under Sec. 268.6, or a nationwide capacity variance under subpart C of this part), with each shipment of waste he must submit a notice to the facility receiving his waste stating that the waste is not prohibited from **land disposal**. The notice must include the following information:

(i) EPA Hazardous Waste Number;

(ii) The corresponding treatment standards for wastes F001-F005, F039, and wastes prohibited pursuant to Sec. 268.32 or RCRA section 3004(d). Treatment standards for all other restricted wastes must

either be included, or be referenced by including on the notification the applicable wastewater (as defined in Sec. 268.2(f)) or nonwastewater (as defined in Sec. 268.2(d)) category, the applicable subdivisions made within a waste code based on waste-specific criteria (such as D003 reactive cyanides), and the CFR section(s) and paragraph(s) where the applicable treatment standard appears. Where the applicable treatment standards are expressed as specified technologies in Sec. 268.42, the applicable five-letter treatment code found in Table 1 of Sec. 268.42 (e.g., INCIN, WETOX) also must be listed on the notification;

(iii) The manifest number associated with the shipment of waste;

(iv) Waste analysis data, where available;

(v) For hazardous debris, the contaminants subject to treatment as provided by Sec. 268.45(b) and the following statement: ``This hazardous debris is subject to the alternative treatment standards of 40 CFR 268.45''; and

(vi) The date the waste is subject to the prohibitions.

(4) If a generator is managing prohibited waste in tanks, containers, or containment buildings regulated under 40 CFR 262.34, and is treating such waste in such tanks, containers, or containment buildings to meet applicable treatment standards under subpart D of this part, the generator must develop and follow a written waste analysis plan which describes the procedures the generator will carry out to comply with the treatment standards. (Generators treating hazardous debris under the alternative treatment standards of Table 1, Sec. 268.45, however, are not subject to these waste analysis requirements.) The plan must be kept on site in the generator's records, and the following requirements must be met:

(i) The waste analysis plan must be based on a detailed chemical and physical analysis of a representative sample of the prohibited waste(s) being treated, and contain all information necessary to treat the waste(s) in accordance with the requirements of this Part, including the selected testing frequency.

(ii) Such plan must be filed with the EPA Regional Administrator (or his designated representative) or State authorized to implement Part 268 requirements a minimum of 30 days prior to the treatment activity, with delivery verified.

(iii) Wastes shipped off-site pursuant to this paragraph must comply with the notification requirements of Sec. 268.7(a)(2).

(5) If a generator determines whether the waste is restricted based solely on his knowledge of the waste, all supporting data used to make this determination must be retained on-site in the generator's files. If a generator determines whether the waste is restricted based on testing this waste or an extract developed using the test method described in Appendix I of this part, all waste analysis data must be retained on-site in the generator's files.

(6) If a generator determines that he is managing a restricted waste that is excluded from the definition of hazardous or solid waste or exempt from Subtitle C regulation, under 40 CFR 261.2 through 261.6 subsequent to the point of generation, he must place a one-time notice stating such generation, subsequent exclusion from the definition of hazardous or solid waste or exemption from RCRA, Subtitle C regulation, and the disposition of the waste, in the facility's file.

(7) Generators must retain on-site a copy of all notices, certifications, demonstrations, waste analysis data, and other documentation produced pursuant to this section for at least five years from the date that the waste that is the subject of such documentation

was last sent to on-site or off-site treatment, storage, or **disposal**. The five year record retention period is automatically extended during the course of any unresolved enforcement action regarding the regulated activity or as requested by the Administrator. The requirements of this paragraph apply to solid wastes even when the hazardous characteristic is removed prior to **disposal**, or when the waste is excluded from the definition of hazardous or solid waste under 40 CFR 261.2-261.6, or exempted from Subtitle C regulation, subsequent to the point of generation.

(8) If a generator is managing a lab pack that contains wastes identified in Appendix IV of this part and wishes to use the alternative treatment standard under Sec. 268.42, with each shipment of waste the generator must submit a notice to the treatment facility in accordance with paragraph (a)(1) of this section. The generator must also comply with the requirements in paragraphs (a)(5) and (a)(6) of this section, and must submit the following certification, which must be signed by an authorized representative:

I certify under penalty of law that I personally have examined and am familiar with the waste and that the lab pack contains only the wastes specified in appendix IV to part 268 or solid wastes not subject to regulation under 40 CFR part 261. I am aware that there are significant penalties for submitting a false certification, including the possibility of fine or imprisonment.

(9) If a generator is managing a lab pack that contains organic wastes specified in Appendix V of this Part and wishes to use the alternate treatment standards under Sec. 268.42, with each shipment of waste the generator must submit a notice to the treatment facility in accordance with paragraph (a)(1) of this section. The generator also must comply with the requirements in paragraphs (a)(5) and (a)(6) of this section, and must submit the following certification which must be signed by an authorized representative: I certify under penalty of law that I personally have examined and am familiar with the waste through analysis and testing or through knowledge of the waste and that the lab pack contains only organic waste specified in Appendix V to Part 268 or solid wastes not subject to regulation under 40 CFR Part 261. I am aware that there are significant penalties for submitting a false certification, including the possibility of fine or imprisonment.

(10) Small quantity generators with tolling agreements pursuant to 40 CFR 262.20(e) must comply with the applicable notification and certification requirements of paragraph (a) of this section for the initial shipment of the waste subject to the agreement. Such generators must retain on-site a copy of the notification and certification, together with the tolling agreement, for at least three years after termination or expiration of the agreement. The three-year record retention period is automatically extended during the course of any unresolved enforcement action regarding the regulated activity or as requested by the Administrator.

ACTION: Final rule
INTERNAL DATA: (FR Doc. 93-32032 Filed 12-30-93; 8:45 am)
Word Count: 9994

SUMMARY: The U.S. Environmental Protection Agency (EPA) is issuing a final hazardous waste listing determination for wastes generated from the use of chlorophenolic formulations in wood surface protection processes. Upon reviewing the public comments received on its proposal of April 27, 1993, the Agency has decided not to list wastes from the use of chlorophenolic formulations in wood surface protection processes. As a result of this determination, EPA is not mandating in this rule any specific operating or information collection requirements for owners/operators of wood surface protection plants. If, however, use of chlorophenolic formulations resumes in the future, the Agency would very likely re-evaluate this decision not to list. This rule also finalizes the proposed amendment of SW-846 ("Test Methods for Evaluating Solid Waste, Physical/Chemical Methods") to include Method 4010 (Immunoassay Test for the Presence of Pentachlorophenol). In addition, the Agency is adding the following four chemicals to 40 CFR part 261, Appendix VIII: Sodium and potassium salts of pentachlorophenol and tetrachlorophenol.

TEXT:

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Parts 260 and 261
(FRL-4804-9)

Hazardous Waste Management System; Identification and Listing of Hazardous Waste; Wastes From Wood Surface Protection

AGENCY: Environmental Protection Agency.

ACTION: Final rule.

SUMMARY: The U.S. Environmental Protection Agency (EPA) is issuing a final hazardous waste listing determination for wastes generated from the use of chlorophenolic formulations in wood surface protection processes. Upon reviewing the public comments received on its proposal of April 27, 1993, the Agency has decided not to list wastes from the use of chlorophenolic

formulations in wood surface protection processes. As a result of this determination, EPA is not mandating in this rule any specific operating or information collection requirements for owners/operators of wood surface protection plants. If, however, use of chlorophenolic formulations resumes in the future, the Agency would very likely re-evaluate this decision not to list. This rule also finalizes the proposed amendment of SW-846 ("Test Methods for Evaluating Solid Waste, Physical/Chemical Methods") to include Method 4010 (Immunoassay Test for the Presence of Pentachlorophenol). In addition, the Agency is adding the following four chemicals to 40 CFR part 261, Appendix VIII: Sodium and potassium salts of pentachlorophenol and tetrachlorophenol.

EFFECTIVE DATE: January 4, 1994.

ADDRESSES: The official record for this rulemaking is identified as Docket Number F-93-F33F-FFFFF and is located in the EPA RCRA Docket, room M2616, 401 M Street, SW., Washington, DC 20460. The public must make an appointment to review docket materials by calling (202) 260-9327. The docket is open from 9 a.m. to 4 p.m., Monday through Friday, excluding holidays. The public may copy up to 100 pages from the docket at no cost. Additional copies cost $0.15 per page.

FOR FURTHER INFORMATION CONTACT: For general information, contact the RCRA/ Superfund Hotline at (800) 424-9346 (toll-free) or (703) 920-9810 in the Washington, DC metropolitan area. The TDD hotline number is (800) 553-7672 or (703) 486-3323. For technical information on specific aspects of this rulemaking, contact Mr. David J. Carver at (202) 260-6775, Office of Solid Waste (Mailcode 5304), U.S. EPA, 401 M Street, SW., Washington, DC 20460. For technical information relating to the amendment of SW-846, contact Ms. Gail Hansen at (202) 260-4761, Office of Solid Waste (Mailcode 5304), at the same address provided above.

SUPPLEMENTARY INFORMATION: The contents of today's preamble are listed in the following outline:

I. Legal Authority

These regulations are being promulgated under the authority of sections 2002(a) and 3001(b) and (e)(1) of the Solid Waste Disposal Act, as amended, 42 U.S.C. 6912(a), 6921(b) and (e)(1), and 6922 (commonly referred to as RCRA).

II. Background & Summary

A. Background

Under section 3001(e) of RCRA, as amended by the Hazardous and Solid Waste Amendments of 1984 (HSWA), EPA is required to make a hazardous waste listing determination for wastes containing chlorinated dioxins and dibenzofurans. As part of this mandate, the Agency began an investigation in 1988 of dioxin- containing wastes from wood preserving and wood surface protection processes.

Three categories of wastes from wood preserving processes were listed as hazardous wastes in 1990, (F032, F034, and F035, see 55 FR 50450). A final listing determination for wood surface protection process wastes were deferred due to lack of data (53 FR 53282). In 1991, the Agency began a separate study of the surface protection industry in an effort to obtain sufficient information upon which to base a hazardous waste listing determination. The Agency, upon obtaining and evaluating information, published a proposed rule on April 27, 1993 which proposed a concentration-based hazardous waste listing option and requested comment on an alternative option not to list these wastes as hazardous (58 FR 25707). Details of the options can be found in the following section to this preamble. A detailed summary of all Agency actions related to wood surface protection wastes was provided in the April 27, 1993 proposal (58 FR 25707). The reader is encouraged to consult that document for more information on the wood surface protection rulemaking history.

In accordance with a proposed consent decree signed by EPA and the Environmental Defense Fund (EDF) in EDF v. Browner (U.S. District Court for the District of Columbia, case no. 89-0591), the Agency has agreed to make a final listing determination for chlorophenolic wastes from wood surface protection processes by December 31, 1993.

B. Summary of the Wood Surface Protection Regulation

After considerable review and study of the rulemaking docket for this action, including comments received on the proposal, the Agency has determined that listing as hazardous wastes from surface protection operations is unnecessary and will not yield the benefits intended by a hazardous waste listing under the RCRA program. This section summarizes elements of the proposed rule of April 27, 1993 (58 FR 25707), and details the conclusions reached in developing this final rule. The reader is cautioned that although some of the highlights brought up in the proposed rule are described below, the majority of information on the industry itself as well as the detailed risk assessment on which the initial proposed rule was based is found in the preamble and background documents to the proposed rule. The information contained in this final rule is primarily concerned with developments subsequent to the proposed rule. This rule describes, in detail, the Agency's justification for not listing wastes from surface protection processes that use chlorophenolic formulations. In addition, it summarizes the Agency's response to comments received on the proposal.

III. Overview of the Proposed Rule

The April 27, 1993 proposal discussed and requested comment on each of the following:

(1) Proposing a concentration-based hazardous waste listing for certain wood surface protection wastes,

(2) Proposing various testing, analysis, recordkeeping requirements and management standards for wood surface protection plants,

(3) Adding six hazardous constituents to appendix VIII of 40 CFR part 261,

(4) Amending of appendix VII of 40 CFR part 261 by adding F033 and the hazardous constituents found in the wastes,

(5) Modifying the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) list of hazardous substances to reflect the newly proposed listing,

(6) Amending SW-846 ("Test Methods for Evaluating Solid Waste, Physical/Chemical Methods") to include Method 4010 (Immunoassay Test for the Presence of Pentachlorophenol), and

(7) An alternative option not listing chlorophenolic wastes as hazardous.

The Agency proposed to list as hazardous at 40 CFR 261.31 only those wastes from wood surface protection processes using a formulation with a pentachlorophenate concentration greater than 0.1 ppm. Under this proposed option, surface protection operations using formulations with pentachlorophenate concentrations equal to or less than 0.1 ppm would not generate F033 listed wastes. The Agency proposed this concentration-based listing because it had information which suggested that many surface protectors who previously used chlorophenolics did not sufficiently clean out equipment prior to abandoning the use of chlorophenolics. Because of this, many formulations from past users of chlorophenolics exhibit "cross-contamination," the contamination of current formulations by dioxins and chlorophenolic compounds from old formulations. The rule proposed the following hazardous waste listing description for the F033 waste code and included the following specific waste streams from process operations:

F033:Process residuals, wastewaters that come into contact with protectant, discarded spent formulation, and protectant drippage from wood surface protection processes at plants that use surface protection chemicals having an in-process formulation concentration of pentachlorophenate (expressed as pentachlorophenol during analysis) exceeding 0.1 ppm. (T)

Along with this option, various testing and recordkeeping requirements were proposed. For an owner/operator to demonstrate that he/she is not generating F033 wastes, EPA proposed formulation testing requirements for all surface protection plants. All owner/operators of wood surface protection plants would be required to test their formulation to determine the concentration of pentachlorophenate if the owner/operators wanted to avoid generating F033 wastes. If the analysis showed a concentration at or below 0.1 ppm, the owner/operator would be required to sign a certification to that effect and maintain records on site related to the testing procedure. This testing proposed an analysis using a method listed within the EPA's Test Methods for Evaluating Solid Waste, Physical/Chemical Methods (SW-846). The Agency proposed to add Method 4010 to SW-846. Method 4010 is an immunoassay test for the presence of pentachlorophenol, which determines whether a sample is above or below a set limit (such as the 0.1 ppm concentration level proposed).

Under the proposal, if analysis showed that a facility's formulation contains pentachlorophenate at levels exceeding 0.1 ppm, then the wastes generated from surface protection at that facility would be F033 wastes and the owner/operator would be subject to additional operating requirements proposed as subpart T of parts 264 and 265. For details on the specific operating requirements, the reader should refer to the proposed notice (58 FR 25706).

A number of the constituents of concern that are present in wastes generated from wood surface protection processes which use chlorophenolic formulations do not appear on the list of hazardous constituents at 40 CFR part 261, appendix VIII. The Agency proposed to add six hazardous constituents to appendix VIII: sodium pentachlorophenate, potassium pentachlorophenate, the sodium salt of 2,3,4,6-tetrachlorophenol, the potassium salt of 2,3,4,6-tetrachlorophenol, octachlorodibenzo-p-dioxin (OCDD) and octachlorodibenzofuran (OCDF).

Sodium and potassium pentachlorophenate are the sodium and potassium salts of pentachlorophenol. These salts were proposed for addition to appendix VIII of 40 CFR part 261 since, as a result of gastric secretions following ingestion, the sodium and potassium salts of pentachlorophenol and 2,3,4,6-tetrachlorophenol are readily converted to the corresponding phenols by acidification. Therefore, the sodium and potassium salts are reasonably expected to elicit the same health effects as the corresponding phenols. For this reason, the Agency proposed to add these four compounds to the list of hazardous constituents in appendix VIII of 40 CFR part 261.

The Agency also requested comment on an option not to list as hazardous wastes generated from surface protection processes. The Agency included the so-called "no-list" option in the proposal because the future generation of chlorophenolic wastes is expected to diminish rapidly to zero and because the results of risk analyses show that the risks from the dominant exposure pathways are relatively modest, assuming the widespread use of chlorophenolic formulations does not resume. The Agency believed at the time of the proposal that reintroduction of chlorophenolic formulations into the market place in the future was not likely to occur. EPA also noted that the Agency would always have the option of reconsidering the listing determination should chlorophenolic surface protection formulations be reintroduced in the future.

IV. Summary of Public Comments and Responses

Comments received on the proposed rule are placed under two separate headings for purposes of this summary. The first addresses the more general comments associated with the proposal, including those relating to: (1) General implementation issues of a listing for wastes generated by the wood surface protection industry; (2) technical approaches discussed in the proposal relating to data sampling methodologies; and (3) various engineering assumptions on which the proposed listing was based. The second part of this section describes the Agency's response to comments dealing with the risk assessment methodology used to support the listing determination for these wastes.

A. General Comments

Several comments were submitted on the proposed listing of F033 wastes. Four commenters supported the listing in general and two commenters supported the concentration-based approach in particular. Three commenters opposed the proposed listing and urged EPA to rely on its authority under FIFRA to control the risks posed by chlorophenolic formulations. One commenter supported an outright ban on the use of chlorophenolics for wood surface treatment.

Two commenters warned that listing F033 wastes would hinder remediation efforts at contaminated wood surface protection sites. The Agency agrees with the commenters' point that a hazardous waste listing may provide a disincentive for owner/operators of surface protection plants to initiate voluntary remediation efforts. The regulation of potentially large amounts of contaminated soil as listed hazardous waste could delay the start of cleanup due to the administrative and economic realities of regulatory compliance.

Three commenters expressed concern over the possibly perceived interchangeability of the proposed 0.1 ppm concentration level and the Toxicity Characteristic (TC) regulatory level for pentachlorophenol. Although the Agency is not finalizing the F033 hazardous waste listing, EPA nevertheless wants to make clear that the concentration level proposed in the F033 listing description was not intended as a regulatory level for any purpose other than defining a waste as F033. The current regulatory level for pentachlorophenol that defines a waste as hazardous under the TC (100 mg/L) would not have been affected by this rulemaking in any way had the F033 listing been promulgated today. Levels set for the TC are obtained by running models which simulate acidic landfill conditions. For the proposed listing, the proposed 0.1 ppm level was calculated using a Maximum Contaminant Level (MCL) of 0.001 ppm and a risk analysis using the Agency's Multi-med model.

Multi-med simulates groundwater contamination from specific sources, and for this proposal, it incorporated variables which are specific to sawmill conditions. The Agency's analysis approximated the dilution of pentachlorophenate from the time the waste contacts the ground to when it reaches a ground water well. The Agency did not arrive at the 0.1 ppm level by applying a dilution attenuation factor (DAF) of 100 (as the Agency has done in other circumstances) to the MCL. Indeed, the Agency did not take a position in the proposal about the use of DAFs in calculating acceptable risk levels for any constituents. A detailed discussion of the Agency's modeling assumptions and actual parameters used to generate risk approximations can be found in the docket for the proposed rule.

One commenter expressed reservations regarding the decontamination procedures promulgated previously for wood preserving equipment (55 FR 50482- 50483, December 6, 1990). The Agency is aware that equipment cleaning will not always prevent cross-contamination. However, it will certainly reduce the amount of contamination that would occur if no equipment cleaning took place.

Although the Agency is not finalizing the proposed F033 hazardous waste listing, EPA encourages owner/operators of surface protection plants to clean or replace any surface-treating equipment that was used previously with chlorophenolic formulations upon a switch to non-chlorophenolic chemicals and properly dispose of the wastes in an environmentally sound manner.

Furthermore, the Agency has obtained information which shows that some new substitute products are more effective if residual chlorophenolic contamination is removed. Hence, removing sludge and cleaning equipment from previous chlorophenolic use will not only be more environmentally sound, but may also enhance the new products effectiveness. Methodology on recommended cleaning and operating practices for surface protectors will be published in the near future by the Agency in a pollution prevention and waste minimization guidance document.

One commenter suggested that the proposed operating standards for surface protection plants be codified in part 262 as opposed to parts 264/265. The commenter reasoned that most surface protection plants are only generators and do not function as treatment, storage, and disposal facilities (TSDFs). However, since the F033 hazardous waste listing is not being promulgated, this issue is moot and there is no need for special generator requirements.

Several commenters had specific concerns about the applicability of the proposed F033 listing. Since the Agency is not finalizing the proposed F033 listing, these concerns are also moot. However, where appropriate, answers specific to each of these comments have been addressed in the background document of this final rule.

One commenter questioned the representativeness of the Agency's data on cross-contamination. The commenter stated that because sites were not randomly selected, there is no true sample representation of the surface protector population. EPA did not choose sampling sites based on their statistical representativeness. Rather, the sites were selected as appropriate from what the Agency considered to be typical operating plants. The Agency visited more than 15 surface protection sites in the Nation (both large and small plants). From the information obtained from these plant tours and interviews, the Agency developed a view of what it considered typical from an engineering standpoint (e.g. size of equipment, production scale, presence of containment systems, size of storage yards, amount of drippage, etc). The sites sampled need not represent the entire surface protection industry in terms of the process used and the degree of cross-contamination present to allow the Agency to demonstrate that wastes from current and previous use of chlorophenolics at surface protection sites were contaminated with the constituents of concern. These sites were chosen from information obtained by a questionnaire sent out under the Agency's 3007 RCRA authority.

B. Comments Regarding Risk Assessment

Five commenters responded to the risk assessment presented in the proposed rule. One commenter stated that the EPA incorrectly converted units of measurement in the record sampling data used for the risk assessment causing the overestimation of incremental risk for the fish/shellfish consumption and soil ingestion pathways by a 1,000-fold. The EPA agrees with the commenter.

The dioxin concentrations in the formulation at one of the affected facilities (Aquasco, MD) were reported in the wrong units, causing a 1,000-fold error to be incorporated into the risk estimates for the fish and shellfish ingestion and soil ingestion scenarios. When this error is corrected, the TCDD-TEQ dioxin levels used as the source concentration (the concentration of formulation dripping onto the ground) for affected facilities (cross-contamination from past use of chlorophenolic

formulations) and used in the lifetime individual risk estimates for the soil ingestion scenario and fish and shellfish ingestion scenario were reduced by a 1,000- fold. The lifetime individual risk values using the corrected data are presented in Table 1.

Table 1.--Individual Risk From Cross-Contamination From Past Usage of Chlorophenolic Formulations From Fish and Shellfish Ingestion

	Recreational fishers		General population	
Population	Central tendency	High end	Central tendency	High end
Constituent:				
2,3,4,7,8-TCDD TEQ /1/	2E-12	3E-11	8E-13	1E-11

/1/ Excess lifetime cancer risk.

The estimated risk to any one individual using the corrected values are 1,000-fold lower than the risk estimated in the proposed rule from cross-contamination due to past use. In this case for the typically exposed individual in the general population, the incremental risk of developing cancer is a chance of 0.8 in a trillion (8E-13); in the recreational fisher person, the risk of developing cancer is increased by only 2E-12. The estimated incremental population risk is also reduced, after correction, approximately by a 1,000-fold, to 0.0002 cases/70 years for the anticipated increase in the development of cancer as a result of exposure to ingestion of fish/shellfish contaminated with wastes from the use of chlorophenolic formulations for wood surface protection. Chart 1 in Section V Part A of this final rule shows the original values reported in the April 27, 1993 proposed notice.

The soil ingestion scenarios also were based on the storage yard soil concentrations. The soil ingestion scenario assumed that children ages 1 to 6 could come into contact with the contaminated soil at the sawmill sites because sawmill sites could be converted to rural residential land use and the child's play area could be located on the area previously used as a storage yard area. The lifetime individual risks, using the corrected formulation concentration values for dioxin, associated with the soil ingestion scenario for cross-contamination from past users of chlorophenolic formulations are presented in Table 2.

Table 2.--Individual Risk From Cross-Contamination From Past Usage of Chlorophenolic Formulations From Direct Soil Ingestion

	Storage yard	
Source	Central tendency	High end
Constituent:		
2,3,7,8-TCDD TEQ /1/	7E-10	2E-9

/1/ Upper bound excess lifetime cancer risk.

The estimates presented in Table 2 show that the incremental risks from direct soil ingestion by children are below what the Agency considers a level of concern. A child exposed to storage yard soils cross-contaminated by past users of chlorophenolics under typical conditions (consumption of 0.1 gram of soil/day for 160 days/year for six years) would be subject to an increased cancer risk of 7E-10 over a lifetime, or a chance of 0.7 in a billion. The estimated incremental population risk is also reduced

approximately 1,000- fold (to 4E-7 cases per year over a 70-year period) for the anticipated increase in the development of cancer as a result of exposure to direct ingestion of soil contaminated with wastes from the use of cross-contaminated formulations for wood surface protection.

One commenter remarked that the EPA failed to specifically address the incremental risks to subsistence fisher persons from consumption of fish/ shellfish contaminated from the use of chlorophenolic formulations for wood surface protection. EPA agrees that the risks to highly exposed sub-populations should be considered. The fish ingestion scenarios developed for the proposed rule considered exposure to a general population and recreational fisher at the outflow of a drainage area containing surface protection facilities.

EPA used the analysis for the high end recreational fisher to approximate the risk to the subsistence fisher. Recent data show that the high end ingestion rate for a subsistence fisher is greater than for a recreational fisher by a factor of approximately 2. Therefore, the incremental risk for a subsistence fisher would not exceed a level of concern, since the projected risk to recreational fishers is much less than 10-6.

The analysis of risks from fish consumption assumes that all fish in the drainage basin are contaminated. The estimates of PCDDs and PCDFs in fish tissue are based on sediment concentrations of these constituents. The sediment concentrations are estimated based on the erosion of contaminated soils from sawmill sites in a river or stream basin and subsequent dilution of contaminant levels by the erosion of uncontaminated soils from the corresponding drainage basin.

The projected risk levels increase as the size of the drainage area decreases, due to the relatively lower amounts of uncontaminated soil in smaller drainage basins. EPA performed an analysis which shows that, even with all exposure parameters set at values which would maximize the overall estimate of exposure, in order to reach a risk level of 10-6, the drainage area would need to be 8,000 hectares or less, which is smaller than the smallest drainage area in the country. The average drainage area is 440,000 hectares, and the lower fifth percentile of the size distribution is 109,000 hectares.

With regard to the fish/shellfish ingestion scenario, one commenter maintained that the fish/shellfish ingestion scenario should have been performed on a site-specific basis (i.e. EPA should have used parameters seen at individual sites), because not all sawmills are located on streams with commercial fisheries. The EPA chose the fish/shellfish ingestion scenario to be protective of the recreational fisher persons and the general population.

The risk analysis was structured so that the hydrologic cataloguing unit (or watershed) was the basic unit of analysis to ensure that the contaminated sediment would be associated with a body of water large enough to support fish hatcheries and recreational fisher persons. When these assumptions were used in the fish/shellfish ingestion scenario using corrected values for dioxin found in formulation for PCDDs and PCDFs, the incremental risk to individuals with high-end exposures remains well below 1x10-6.

With regard to the Universal Soil Loss Equation (USLE), one commenter asserted that the equation is overly conservative for estimating soil

erosion from surface protection sites. This equation models the amount of soil which is dumped into a drainage area containing fish. For a more detailed description of the model, the reader is referred to background document of the proposed rule. The EPA believes that, although this may be a conservative approach, it is the best method currently available. It has been used to support other EPA rulemakings and guidance documents. The most notable example being the Assessment of Risks from Exposure of Humans, Terrestrial and Avian Wildlife, and Aquatic Life to Dioxins and Furans, from Disposal and Use of Sludge from Bleached Kraft and Sulfite Pulp and Paper Mills./1/ Even using these conservative assumptions, the incremental risks from cross- contamination at these sites are not at a level of concern.

Note /1/ Environmental Protection Agency, 1990. Assessment of Risks from Exposure of Humans, Terrestrial and Avian Wildlife to Dioxins and Furans, from Disposal and Use of Sludge from Bleached Kraft and Sulfite Pulp and Paper Mills. Prepared for the Office of Toxic Substances. Washington, DC by Abt Association, Inc. under contract nos. 68-02-4283, Task 3-02, and 68-D9-0169, Task 1-15. EPA 560/5-90-13. July, 1990.

One commenter suggested that the population risks attributable to the contaminated fish/shellfish ingestion scenario were too high because the entire U.S. population was considered to be exposed. EPA disagrees and believes it is appropriate to consider the consumption rate of the entire population in estimating risk to the general population from this exposure pathway. However, an adjustment of 0.4 was made to the diet fraction to account for the fact that not all fish are contaminated. Thus, only some percentage of the population would be affected by the contaminated fish. As discussed in the Risk Assessment Background Document for the proposed rule, the 0.4 diet fraction was derived by estimating the percentage of rivers and streams (i.e., cataloguing units) that have at least one sawmill. A second adjustment was made in the calculation of population risk to account for the percentage of sawmills that operate surface protection processes (about 30% of the entire number of sawmills nationally). Population risk for the fish/ shellfish ingestion scenario has been recalculated for the final rule using the corrected incremental storage yard soil TCDD-TEQ concentrations. The corrected estimate of incremental population risk from cross-contamination is three orders of magnitude lower than the risk originally stated in the proposed rule. The corrected number of cancer cases expected in 70 years is now 0.0002.

One commenter asserted that the soil ingestion scenario was overly conservative because all of the soil consumption was attributed to contaminated storage yard soil and no consumption of "indoor dust" was considered. EPA considered only the consumption of storage yard soil in order to be protective of human health. The range of soil ingestion rates for average children aged 1 through 6 is presented in the EPA's Exposure Factors Handbook (1990) as 0.2 to 0.8 grams per day. These estimated values were determined from the clay content of fecal samples taken from children in this age group and thus represent consumption of soil. However, the percent of this consumption that is attributed to house dust is unknown, as is the contaminant concentration in the house dust. The EPA has recalculated the soil ingestion scenario using the corrected incremental TCDD-TEQ concentrations obtained from the formulation sample. The incremental risk estimated is below 1E-6, using the conservative assumptions. The Agency's risk levels are particularly protective with the

use of these conservative assumptions, thereby further lending support to the Agency's decision not to list these wastes.

One commenter stated that children are unlikely to consume sediment at the same rate that they consume soil. The Agency agrees, but notes that sediment consumption by children was not considered as an exposure pathway in the proposed rule. The Agency does not feel that this exposure pathway is a significant one in making a determination whether or not to list chlorophenolic wastes since the exposure areas of concern are relatively small and any land conversion which could take place would most likely require soil testing prior to land development.

One commenter stated that the assumptions used to estimate the exposed population in the soil ingestion population risk scenario greatly overestimate the number of exposed children. EPA believes that the scenario may be conservative, but not implausible. The scenario assumes that all sawmill sites are converted to rural residential land use, that the children's play areas are located on the site of the former storage yards, and that the homes are resold to new families with young children every 25 years. These assumptions include a low population density in these areas. It would take only a limited number of sites to be converted to suburban housing or to daycare or school facilities to cause a substantial increase in the exposed population. The incremental population risk estimated using the corrected incremental value for the storage yard soil TCDD-TEQ concentration is 4E-7 cases in 70 years, three orders of magnitude lower than that in the proposed rule.

One commenter maintained that the soil ingestion scenario was questionable because Superfund liabilities, state laws, and lender requirements make land use changes unlikely without site cleanup activities. The EPA agrees that, in some states, land transfers and subsequent land use changes would be unlikely to occur without cleanup. However, not all states are equally diligent in requiring site investigations at the time of property transfer, making the types of land use changes described in the soil ingestion scenario plausible.
Because of this, EPA believes it is entirely appropriate to assess risk via the soil ingestion pathway, notwithstanding any risk management decisions that may be made at some future time to address the risk.

Two commenters believed that some of the values used as input parameters to the ground-water model (i.e. recharge rate, regional conductivity, and average depth to water) were too conservative and that more appropriate input parameters should be used in this MULTIMED model. One commenter believed that the Agency had used DRASTIC (a name given to a modelling program used to evaluate the potential which may exist resulting from groundwater pollution) to perform its groundwater modeling. First, the EPA did not use the DRASTIC model in this rulemaking effort; it used the MULTIMED model developed by the Agency to perform groundwater models. The Agency did, however, use some soil and hydrogeologic information (on hydrogeologic regions and subregions collected by Aller et al. (1988)) which is used when applying the DRASTIC model. With regard to the parameters felt by the commenter to be too conservative, the EPA supports the values used in the proposed rule (58 FR at 25706 of April 27, 1993). This hydrogeologic information includes many of the input parameters required to run the MULTIMED model, and includes such parameters as depth to water, soil type and hydraulic conductivity, net recharge, aquifer hydraulic conductivity. The EPA selected hydrogeologic subregions in the

northwest and southeast United States, excluding subregions where sawmills were not likely to be sited (e.g., mountain slopes or flanks).

Since the parameter value ranges presented in Aller et al. (1988) are based on compilations of literature values and expert opinion, the values should be viewed as bounding ranges, and are not sufficiently statistically rigorous to estimate true means or parameter distributions. For the average case, "typical" parameter values were obtained by examining the ranges of values in Aller et al. (1988) for the selected subregions only and selecting values representing the central tendency of the reported ranges. Similarly, high-end values were selected to represent the high end of the exposure distribution, using the higher end of the range of parameter values deemed likely to occur by Aller et al. (1988). EPA recognizes that there are limitations to this approach, largely associated with the non-statistical nature of the data. The Agency believes, however, that this data source is the best available at this time for regional and subregional estimates of the hydrogeologic properties necessary to estimate exposures through the ground-water pathway.

Two commenters felt that the Agency's use of input parameter values used for well location and well intake point were too conservative. EPA derived the horizontal distance to wells from the responses reported in the RCRA's 3007 Industry Questionnaires. Because information was not obtained on the well type or construction, all wells described in the questionnaire were assumed to be possible sources of drinking water and were assumed to be screened to the top of the aquifer, that is, well water was assumed to be drawn off the top of the aquifer where organics are assumed to exist in greater concentrations than when water is drawn from the middle of the aquifer. These assumptions are consistent with similar conservative assumptions used to develop other RCRA regulations, such as the Toxicity Characteristic (55 FR 11798, March 29, 1990).

Two commenters contended that neither biodegradation or chemical degradation rates were considered in the ground-water modeling of pentachlorophenol contamination. These commenters submitted studies showing that biological and chemical degradation of PCP can occur and that adequate biological and chemical degradation rates are available or can be estimated from these studies. EPA has reviewed these studies and agrees that they do indicate that biological and chemical degradation of PCP can occur. The information submitted by the commenters are results from laboratory studies, reporting the results from controlled experiments. However, EPA does not agree that there is sufficient information on unassisted field degradation rates, the geochemical factors that affect degradation, or their spatial variability from site-to-site or region-to-region to model degradation in the field at generic or prototypical sites for regulatory purposes. Moreover, the existence of metabolites that would confirm the occurrence of biodegradation in the field has not been firmly established. Therefore, EPA does not believe the data warrant an assumption that biodegradation does occur at significant rates at most sites. In addition, the toxicities of potential degradation products have not been characterized. Therefore, the EPA does not believe it is appropriate to consider these mechanisms in this rulemaking.

One commenter suggested that it would be more appropriate to calculate the average peak concentration of pentachlorophenate in groundwater used to reflect a 9-year exposure duration by producing a breakthrough curve of annual concentrations at a well using the MULTIMED model and calculate a series of 9-year or 10-year moving averages. The moving averages would be sorted in descending order and a paper plot prepared. A preferred

percentile value could then be selected as the concentration of concern. EPA believes the current method of calculating 10-year time-weighted averages by averaging two 5-year concentrations (including the maximum concentration and the highest adjacent 5-year value calculated from each model run) is an appropriate approach for estimating lifetime individual risk and the Agency selected this approach to be conservative and protective of human health. The 30-year exposure duration scenario uses a time-weighted 30-year average concentration that includes the maximum concentration. Population risk estimates aggregated over 70 years were based on a time-weighted 70-year average concentration that includes the maximum concentration.

One commenter believed that the source concentration used by EPA for PCP in the ground-water ingestion scenario was too high because PCP is no longer in use and, thus, the infiltration to ground water would be reduced. The commenter suggested that source reduction also would occur from erosion of surface soil containing PCP, before it is leached and enters the ground water. EPA addressed the fact that PCP is no longer in use at most facilities in its baseline risk estimates in the proposed rule, which have been revised in the final rule based on comments received to reflect source concentrations and pulse durations (estimated time in which pentachlorophenate is expected to be present in substitute wood surface protection product from time of changeover) more representative of the cross-contamination scenario. While surface runoff and erosion may reduce the amount of PCP available for leaching to ground water, EPA has assumed, for the purpose of its analysis, that any reductions are negligible. The EPA adopted this conservative assumption mainly because of lack of data necessary to quantify such a loss and its effects on ground-water concentrations. Furthermore, EPA does not believe that surface water and erosion will significantly reduce source leachate concentrations. As formulation drips onto the soil it will rapidly penetrate the soil until the soil is saturated. Subsequent rain events may wash off contaminated surface soil, but will not erode deeper soil horizons where most of the contaminant mass resides. Thus, EPA does not consider this assumption to be overly conservative.

One commenter noted that the results of the ground-water analysis were not supported by actual resource damage data. The Agency does not expect, nor does it feel that it is needed, that ground water PCP concentrations predicted by MULTIMED would agree precisely with the resource damage data.
The resource damage incidents presented in the background document are intended to illustrate that ground-water contamination from PCP does occur at sawmill facilities, and are not intended as validation points for exposure modeling. Resource damage data were obtained from monitoring and other wells that happened to be in place at a facility when the sampling was conducted.
There are a number of possible reasons why sampling data from the resource damage incidents may not reflect well-water concentrations predicted by the model, in particular the location of the wells with regard to plume centerline and ground-water flow direction, and the timing of peak plume concentrations at the wells.

The latter point is especially important because, depending on patterns of past PCP use and the well location, the peak concentration in the plume may not have reached or may have passed the well(s) sampled. In these resource damage cases, sufficient information was not available to determine the placement and design of these wells with respect to the site's hydrogeology

or possible plume locations and travel time. Thus, it is not possible to use these data points for validation of model results. However, it should be noted that the model-estimated ground-water PCP concentrations in the final rule are similar to those reported from resource damage incidents. When the revised average source concentration was used in the ground-water model, the estimated concentrations for PCP in ground water (average = 0 .005 mg/L; high-end = 288 mg/L) are in a reasonable agreement with the values reported in the resource damage accounts (<0.001 to 45 mg/L).

One commenter disagreed with the use of MULTIMED in that it was not as "robust" or well-tested as the Monte Carlo-based EPACML model used for the TC rule. Another commenter recommends the use of the Monte Carlo approach for all input parameters in the modeling effort. First, it is important to note that the MULTIMED ground-water model is the same model as used in EPACML except for the manner in which input parameters are specified. EPACML can only be run in a probabilistic, Monte Carlo mode, while MULTIMED allows Monte Carlo runs as well as for individual input parameters to be specified and fixed. The ground-water flow and transport model components are the same for MULTIMED and EPACML. Second, the Agency did not pursue a probabilistic, Monte Carlo-based approach when developing input parameters for this modeling effort due to the fact that using this sophisticated technique requires knowledge and proper specification of input parameter distributions, and variable independence or proper specification of joint probability parameter distributions. When these requirements cannot be met, the Monte Carlo approach will not provide better estimates than a scenario-based approach.

EPA has adopted a scenario-based regional modeling approach that uses input parameters developed for regions of the U.S. where sawmills are more prevalent. In this approach, EPA uses average and high-end values for estimating model input parameters on a regional basis because information does not exist on the actual means and distributions of these parameters for the regions modeled. The Agency believes that this approach is an appropriate one and, furthermore, that the resulting model estimates bracket or bound the uncertainty associated with the model input parameters.

Two commenters questioned the use of cancer as the endpoint of concern for 2,3,7,8-TCDD. EPA disagrees. The cancer endpoint for TCDD was selected because it is the most sensitive endpoint for which qualitative dose response data are available. 2,3,7,8-TCDD has been demonstrated to be a potent carcinogen in animals and has been classified as a B2 (potential human) carcinogen. Recently published epidemiological studies of occupationally exposed individuals report significant increases in cancer mortality.

2,3,7,8-TCDD also has potent reproductive and teratogenic endpoints and enough data exist to estimate a reference dose (RfD) based on these alternative short-term effects. (For a detailed discussion of this information, and for references to studies supporting these conclusions, the reader is referred to the background document of the proposed rule.) However, if health-based levels (HBLs) are calculated using the reproductive effect RfD, the exposure level is an order of magnitude higher than the level calculated using the carcinogen slope factor (CSF). Thus, if the cancer end- point is used as the basis for calculating a permissible exposure level, it also will be protective against short-term exposures such as those associated with reproductive effects.

The issue of 2,3,7,8-TCDD toxicity is being reassessed by EPA (outside the framework of this rulemaking) and all endpoints are being considered. TCDD has been observed to express a wide variety of effects including teratogenesis, reproductive effects, and suppression of the immune system function in many species. Mechanistic approaches to understanding and identifying toxic effects levels are also being considered. Until the reassessment process has been completed, the EPA will continue to use the current carcinogenicity endpoint CSF value that has been accepted as the basis for the MCL.

Two commenters noted limitations associated with the use of the Toxicity Equivalence Factors (TEF's) methodology. They argued that the TEF methodology should not be used to justify the addition of appendix VIII in the absence of valid toxicological studies that demonstrate actual health effects associated with exposure to these compounds. One commenter questioned the proposal to add Octachlorodibenzo-p-dioxin (OCDD) and Octachlorodibenzofuran (OCDF) to 40 CFR part 261, appendix VIII. The commenters stated that neither compound has been shown to produce toxic, carcinogenic, mutagenic or teratogenic effects on humans or other life forms. The Agency has decided not to add, at this time, OCDD and OCDF to appendix VIII of 40 CFR part 261. Although the original basis for including these congeners on appendix VIII remains valid (details of which can be found in the background document supporting this final rulemaking), the Agency is investigating further the information submitted by the commenters regarding the effects of OCDD and OCDF reported in the Couture, Elwell, and Birnbaum study used to support the decisions made in the "Interim Procedures for Estimating Risks Associated with Exposures of Mixtures of Chlorinated Dibenzo-p-dioxins and Dibenzofurans and the 1989 Update". OCDD and OCDF are the most prevalent of the PCDD and PCDF congeners accounting for approximately 85 percent of the total CDD and CDF present in five of the six storage yard soil samples. OCDD has been shown to exhibit "dioxin-like" toxicity in male rats when administered in small doses in a sub-chronic toxicity study./2/ These findings have been confirmed by a second sub-chronic study conducted in female rats./3/ OCDD and OCDF have not exhibited toxicity in short term studies; however, acute exposure is not the only concern of EPA. The Agency is currently re-evaluating its original assessment of risks from dioxin. At this point, the Agency wishes to conclude its on-going reassessment before adding OCDD and OCDF to appendix VIII of 40 CFR part 261.

Note 2 Couture, L.A., M. R. Elwell, and L. S. Birnbaum. Dioxin-like effects observed in male rats following exposure to octachlorodibenzo-p-dioxin (OCDD) during a 13-week study. Toxicology and Applied Pharmacology, Vol. 93, pp 31- 46, 1988.

Note 3 Hermelinger, N., N. Poiger, and C. Schlatter. Results of a 9-month feeding study with OCDD and OCDF in rats, Organohalogen Compounds, Vol. 1, 1990, pp. 221-224.

One commenter questioned the conclusion that soil contamination presents no risk to wildlife. The EPA recognizes that concentrations that are protective of human health may not necessarily always be protective of wildlife.

However, in view of the relatively small areas occupied by sawmills and the low concentration of TCDD-TEQ in storage yard soil from cross contamination, the EPA believes the incremental risks to wildlife will be

below a level of concern.

V. Overview of the Final Rule

This final rule makes final the Agency's hazardous waste listing determination for chlorophenolic wastes generated at wood surface protection plants. EPA believes that listing as hazardous chlorophenolic wastes from surface protection operations is unnecessary for reasons described in Part A of this preamble.

This document also amends SW-846 (Test Methods For Evaluating Solid Waste, Physical/Chemical Methods) by adding Method 4010 (Immunoassay Test for the Presence of Pentachlorophenol). This action is discussed in Section VI of this preamble.

This final rule also adds four chemicals to the list of hazardous constituents at 40 CFR part 261, appendix VIII. These four chemicals are: (1) Sodium pentachlorophenate, (2) potassium pentachlorophenate, (3) sodium tetrachlorophenate, and (4) potassium tetrachlorophenate. A discussion of this action is found in part C of this section.

A. Basis for the Determination Not To List as Hazardous Wastes From Wood Surface Protection Operations

As discussed in the proposed rule, in making a hazardous waste listing determination, the Agency applies a "weight-of-evidence" approach. In doing this, the Agency examines the risks associated with all potential human health and environmental exposure pathways, analyzes trends in the current industry, researches past damage incidents, as well as other factors found in 40 CFR 261.11.

Upon reviewing and responding to comments received on the proposed rule, the Agency has decided not to list as hazardous wastes from the use of chlorophenolic formulations in the wood surface protection industry for several reasons.

First, chlorophenolic formulations are no longer being produced in the United States and the Agency believes it is very unlikely they will be produced in the future. The only remaining producer of chlorophenolics in the U.S., Chapman Chemicals, stopped production in January of 1992 and sometime later applied for voluntary cancellation of its FIFRA product registration. A notice describing this action was published in the Federal Register on June 3, 1992 (57 FR 23401), and a final cancellation order was sent to Chapman Chemicals with an effective date of September 14, 1992. This cancellation notice applies to the following products produced by Chapman Chemicals: Permatox 181, 10S, and 101, and Mitrol G-ST. Any manufacturer wishing to resume production of chlorophenolics would have to obtain a new FIFRA registration before these chemicals could be re-introduced and made available for use in wood surface protection. Currently, there remains only one known user of chlorophenolics in the U.S. out of an estimated 1000 previous users and the remaining plant's existing stock is believed to be very limited. A major element in the decision not to list as hazardous chlorophenolic wastes generated from the surface protection industry is the fact that use of chlorophenolic formulations has ceased. EPA believes it is highly unlikely that a manufacturer will seek

reregistration for this product for many reasons, including the availability of effective substitute products and the potentially high financial and administrative burdens imposed by the FIFRA registration process. Additional justification to support non-future production is the fact that European countries do not want to accept dioxin- containing wood products which have affected large export mills who will not use chlorophenolic formulations in the future in part for this reason. Use of chlorophenolics for surface protection has declined steadily (even without the influence of RCRA) from over 1,000 users to one user over the past decade. Should a new registration of this product be sought, EPA will consider this surface protection risk analysis for full strength application when determining whether a new listing determination under RCRA should be initiated. Currently, the Agency is aware of nine available substitute products currently being used by surface protectors in place of chlorophenolics. The substitute products are for a large part satisfactory to their users (as mentioned on various site trips), and the Agency does not feel as though a switch back to chlorophenolics is likely.

A second reason why the Agency has decided not to list these wastes is because the risk to human health and the environment from on-going operations which previously used chlorophenolics is shown to tail off quickly because chlorophenolic concentrations diminish to a near zero concentration within a short period of time following switchover to an alternate product. The Agency has determined that the use of full-strength chlorophenolic formulations generates wastes that result in unacceptable risk to human health and the environment. As before mentioned, should the use of chlorophenolics for surface protection applications resume, for any reason, the Agency will most likely re-evaluate its current position. However, dealing with the current situation, there remains only one known user of chlorophenolics with a limited supply remaining.

Although the Agency believes the use of full-strength chlorophenolics will be phased out in the very near future, there was concern at the time of proposal that there may be unacceptable risks posed by the use of substitute products that become cross-contaminated from previous chlorophenolic use.

Particularly, the proposal cited possible ground water risks of 2x10-4 for individuals and a broad but very low potential exposure risk due to surface run-off contributing to dioxin levels in fish. The Agency received several comments addressing these potential impacts. In response to these comments, the Agency conducted additional ground-water modeling using new pulse assumptions developed from commenter-submitted information. The Agency developed what it believed to be better pulse assumptions in an effort to determine how long pentachlorophenate will be present in on-going operations which have switched over from its past use. This new data was obtained from performing mass balance iterations using typical tank volumes found at both large and small facilities. These mathematical calculations showed that cross-contamination from previous use of chlorophenolics will be present in a substitute products for only two to six years from the time a plant stops using chlorophenolics. The Agency found that the highest estimated risk to an individual from drinking ground water for nine years at peak concentrations in the two- or six-year pulse resulting from cross contamination, is significantly diminished and the broad effect on dioxin levels in fish is reduced by several orders of magnitude. This new analysis shows that the risks associated with cross-contamination do not justify a hazardous waste listing to capture cross-contaminated wastes. In the proposed rule, EPA addressed the fact that PCP is no longer in use at most

facilities in its baseline risk estimates, which have been revised in the final rule to reflect source concentrations and pulse durations more representative of the cross- contamination, incremental-risk scenario. Chart 1 below compares the incremental risks from cross-contaminated wastes as calculated for the proposed rule to the values obtained using the new approach.

Chart 1.--Incremental Risks /1/ Due to Cross Contaminated Wastes

Line No.	Constituent pathway	Significant threat	Population	Central tendency	High end	risk
1.	Proposed in NPRM Pentachlorophenate (assumed 30 year Ground water pulse)			5x10 -7	2x10 -4	.005
2.	Dioxin fish and shellfish consumption (general population and recreational fisher)	Soil		18x10 -10 (general population)	4x10 -7, rec fisher	0.2
3.	Dioxin soil ingestion	Soil		7x10 -7	2x10 -5	.0004
4.	Revised Pentachlorophenate (2 year pulse, Ground water for large facilities)			6x10 -7	2x10 -5	.007
5.	Pentachlorophenate (6 year pulse, Ground water for small facilities)			2x10 -6	6x10 -5	0.02
6.	Dioxin fish & shellfish consumption (recreational fisher)	Soil		2x10 -12	3x10 -11	NR
7.	Dioxin fish & shellfish consumption (general pop.)	Soil		8x10 -13	1x10 -11	.0002
8.	Dioxin soil ingestion	Soil		7x10 -10	2x10 -9	4x10 -7

(...Table continues...)

/1/ Excess lifetime cancer risk.

As shown in Chart 1, population risk is lower than that presented in the proposal for both fish/shellfish consumption and the soil ingestion pathway, due to a unit conversion error in expressing dioxin concentration. The dioxin concentrations in the formulation at one of the affected facilities (Aquasco, MD) were reported using incorrect units, causing a 1,000-fold error to be incorporated into the risk estimates for the fish and shellfish ingestion and soil ingestion scenarios. When this error was corrected, the TCDD-TEQ levels used as the source concentration for affected facilities (cross-contamination from past use of chlorophenolic formulations) and used in the lifetime individual risk estimates for the soil/fish and shellfish ingestion scenarios also were reduced 1,000-fold.

The incremental population risk was revised for the ground-water scenario from an original 0.005 value to between 0.007 and 0.02 cancer cases. This range of 0.007 to 0.02 cancer cases was obtained because two different modelling scenarios were run to generate the extremes of this range. One

model run used input parameters which would simulate decay for a small production plant. The input information was obtained from a mass balance iteration which showed that it would take a small plant approximately 6 years to decrease cross-contamination levels to near zero; likewise, the second model used input parameters for large facilities which predicted a two year decline to near zero levels of cross-contamination. The details of the mass balance approach and the resulting change in population risk can be found in the background document for this final rule. The Agency believes that these revised risk levels do not warrant a hazardous waste listing.

Based on the above two main factors (i.e. (1) chlorophenolic production stoppage and subsequent chlorophenolic use decline and (2) revised risk due to cross contamination), the Agency looked closely at any potential environmental benefits that may accrue from a hazardous waste listing. Given the market trend, the Agency cannot identify any tangible benefits to be gained from listing wastes generated from the use of chlorophenolic formulations for wood surface protection. Environmental damages caused by previous use of chlorophenolics have already occurred. A listing of these wastes cannot mitigate past damages nor can it force the clean-up of these damages. Such potential jurisdiction exists under current programs. Authority under CERCLA and RCRA 3007 exists even if a decision is made not to list as is the case for this final rule.

Damage to the environment of this magnitude from previous use of chlorophenolic formulations within this industry are not expected to occur in the future unless use of full-strength chlorophenolics resumes. Furthermore, sampling data collected at surface protection sites indicate that dioxin concentrations in storage yards (the largest area of a plant) are below 1 ppb. The heavier contamination that occurs in the process area is confined to a small area and likely will not migrate off-site to environmental receptors.

Therefore, the Agency finds that the risks posed by this residual contamination are limited and that a hazardous waste listing would likely simply result in these limited areas of contamination being left in place and not produce an environmental benefit. Thus the effect on past contamination does not justify a hazardous waste listing.

B. Operating Requirements for Surface Protection Plants

Because the Agency is not listing F033 wastes, the operating standards for surface protection plants proposed in the April 27, 1993 notice are not applicable and, thus, are not being finalized. Furthermore, surface protection plants are not required to follow any specific waste management requirements regarding previous use of chlorophenolics as a result of this rule.

C. Addition of Chemicals to Appendix VIII of 40 CFR Part 261

Although this final rule does not list any wastes from wood surface protection processes as hazardous, the Agency believes that certain constituents contained in these wastes warrant inclusion in appendix VIII of part 261. 40 CFR 261.11 provides that "(s)ubstances will be listed on appendix VIII only if they have been shown in scientific studies to have toxic, carcinogenic, mutagenic or teratogenic effects on humans or other life forms." In the April 27 notice, EPA proposed to add six hazardous

constituents of concern found in surface protection wastes to appendix VIII of 40 CFR part 261. Based on the information gathered during this listing investigation, the following four are being added to the list: sodium pentachlorophenate, potassium pentachlorophenate, the sodium salt of 2,3,4,6- tetrachlorophenol, and the potassium salt of 2,3,4,6-tetrachlorophenol. The Agency presented information in the proposed rule and supporting background documents on the adverse effects of these compounds. For those reasons, EPA is finalizing the addition of four of these constituents to appendix VIII of part 261. The Agency is not at this time finalizing the addition of OCDD and OCDF to Appendix VIII. As mentioned before, the Agency is investigating further the information submitted by the commenters regarding the effects of OCDD and OCDF reported in the Couture, Elwell, and Birnbaum study used to support the decisions made in the "Interim Procedures for Estimating Risks Associated with Exposures of Mixtures of Chlorinated Dibenzo-p-dioxins and Dibenzofurans and the 1989 Update".

VI. Amendment of SW-846 (Test Methods for Evaluating Solid Waste, Physical/ Chemical Methods)

In the notice of proposed rulemaking, the Agency proposed to add Method 4010 (Immunoassay Test for the Presence of Pentachlorophenate) to the Second and Third Editions of SW-846. The purpose behind this proposal was to aid owners/operators of wood surface protection plants with the proposed formulation testing requirement.

With respect to requiring the use of SW-846 methods for testing for the presence of pentachlorophenate in wood surface protection "in-process" formulation, the issue is moot since EPA is not listing any wood surface protection wastes as hazardous. Nonetheless, EPA believes that although no comments were received on Method 4010, Method 4010 is an appropriate method, in general, for testing for the presence of pentachlorophenate or pentachlorophenol and can, therefore, be used in other applications other than for wood surface protection formulation testing. The Agency is, therefore, adding Method 4010 to the Third Edition of SW-846 as Update IIA. We are not adding Method 4010 to the Second Edition of SW-846 since the Third Edition has replaced the Second Edition on August 31, 1993 for use in mandatory applications (58 FR 46040). Method 4010, including its protocol and documentation supporting this action can be found in the docket for this rulemaking. See the "For Further Information" Section in front of this preamble for the EPA contact person for further information or with questions on Method 4010.

VII. Pollution Prevention and Waste Minimization

The Agency is preparing a separate guidance manual recommending voluntary pollution prevention and waste minimization techniques for the lumber industry. Since it has studied the surface protection industry in making a listing determination for wastes generated from the use of chlorophenolic formulations, EPA has gained a broad perspective on the best ways to reduce wastes generated by this wood surface protection industry. The ideas gained from the study are presented in this manual. Some recommended strategies for pollution prevention in the surface protection industry are described in this section. Further information can be found in the manual.

The ultimate goal of pollution prevention is to reduce present and future threats to human health and the environment. Pollution prevention (also referred to as source reduction) is the use of materials, processes, or practices that reduce or eliminate the quantity and/or toxicity of wastes at the source of generation. Pollution prevention is the first step in a hierarchy of options for reducing the generation of waste. The first recommended pollution prevention option is to replace chemical treatment with another type of treatment to achieve surface protection. One alternate is to dry the wood to reduce water content (high water content leads to sapstain).

The Agency is aware that this option may not be economically viable for a smaller mill. If such a system cannot be feasibly employed, it would be preferable for a user of chlorophenolic-containing formulations to switch to an alternate formulation.

Other pollution prevention strategies for use within the surface protection industry include: (1) Providing local and general ventilation within the cutting process area to reduce dust that can accumulate on wood; (2) blowing wood with air to reduce the amount of sawdust on wood prior to surface protection; and (3) using drainage collection devices like gutters on rooftops to keep precipitation away from process wastes. The pollution prevention practices described here can be critical to reduce the amount of waste generated. Although the Agency is not listing these chlorophenolic wood surface protection wastes, the pollution prevention practices described in the guidance manual are applicable to any waste generating process. For wastes that cannot be reduced at the source, generators may consider recycling as the next best option.

VIII. Analysis of Potential Costs and Benefits

A. Executive Order Requirements

Executive Order 12866

Under Executive Order 12866, (58 FR 51735 (October 4, 1993)) the Agency must determine whether the regulatory action is "significant" and therefore subject to OMB review and the requirements of the Executive Order. The order defines "significant regulatory action" as one that is likely to result in a rule that may:

(1) Have an annual effect on the economy of $100 million or more adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or state, local, or tribal governments or communities;

(2) Create a serious inconsistency or otherwise interfere with an action taken or planned by another agency;

(3) Materially alter the budgetary impact of entitlements, grants, user fees, or loan programs or the rights and obligations of recipients thereof; or

(4) Raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in the Executive Order.

It has been determined that this rule is not a "significant regulatory action" under the terms of Executive Order 12866 and is therefore not subject to OMB review. Nevertheless, the Agency prepared an abbreviated RIA or "Economic Assessment" (EA) in order to examine costs and benefits likely to occur as a result of that action.

B. Description of Costs and Benefits of This Rule

Because the Agency has decided not to list wastes generated from the use of chlorophenolic formulations in surface protection operations, no specific action is required under this Rule. Facilities, however, may choose to take some remedial action as a result of publicity surrounding this action. A detailed analysis of work performed is described in the background document for this final rule.

IX. State Authority

Under section 3006 of RCRA, EPA may authorize qualified States to administer and enforce the RCRA program within the State. (See 40 CFR part 271 for the standards and requirements for authorization.) Following authorization, EPA retains enforcement authority under sections 3007, 3008, 3013, and 7003 of RCRA, although authorized States have primary enforcement responsibility.

Before the Hazardous and Solid Waste Amendments of 1984 (HSWA) amended RCRA, a State with final authorization administered its hazardous waste program entirely in lieu of the Federal program in that State. The Federal requirements no longer applied in the authorized State, and EPA could not issue permits for any plants located in the State with permitting authorization. When new, more stringent Federal requirements were promulgated or enacted, the State was obligated to enact equivalent authority within specified time frames. New Federal requirements did not take effect in an authorized State until the State adopted the requirements as State law.

By contrast, under section 3006(g) of RCRA, 42 U.S.C. 6926(g), new requirements and prohibitions imposed by the HSWA take effect in authorized States at the same time that they take effect in non-authorized States. EPA is directed to implement those requirements and prohibitions in authorized States, including the issuance of permits, until the State is granted authorization to do so. While States must still adopt HSWA-related provisions as State law to retain final authorization, the Federal HSWA requirements apply in authorized States in the interim.

Although this final rule does not list, as hazardous, chlorophenolic wastes from the wood surface protection industry, it does add four constituents to appendix VIII of 40 CFR part 261. These additions will not be effective in authorized States since the requirements are not being imposed pursuant to HSWA. These requirements will be effective only in those States that do not have final authorization. In authorized States, these requirements will not be applicable until the States revise their programs to adopt equivalent requirements under State law.

Section 271.21(e)(2) of EPA's state authorization regulations (40 CFR part 271) requires that States with final authorization must modify their programs to reflect Federal program changes and submit the modifications to EPA for approval. The deadline by which the States must modify their programs to adopt this proposed regulation, if it is adopted as a final rule, will be determined by the date of promulgation of a final rule in accordance with Sec. 271.21(e)(2). If the proposal is adopted as a final

rule, Table 1 at 40 CFR 271.1 will be amended accordingly. Once EPA approves the modification, the State requirements become RCRA Subtitle C requirements.

States with authorized RCRA programs already may have regulations similar to what is being finalized in this rule. These State regulations have not been assessed against the Federal regulations being proposed today to determine whether they meet the tests for authorization. Thus, a State would not be authorized to implement these regulations as RCRA requirements until State program modifications are submitted to EPA and approved, pursuant to 40 CFR 271.21. Of course, States with existing regulations that are not less stringent than current Federal regulations may continue to administer and enforce their regulations as a matter of State law.

It should be noted that authorized States are required to modify their programs only when EPA promulgates Federal standards that are more stringent or broader in scope than existing Federal standards. Section 3009 of RCRA allows States to impose standards more stringent than those in the Federal program. For those Federal program changes that are less stringent or reduce the scope of the Federal program, States are not required to modify their programs. (See 40 CFR 271.1(i).) This proposed rule, if finalized, is neither less stringent than nor a reduction in the scope of the current Federal program and, therefore, states would be required to modify their programs to retain authorization to implement and enforce these regulations.

X. Regulatory Flexibility Analysis

This final rule amends the hazardous waste regulations by adding four chemicals to appendix VIII of 40 CFR part 261 and amending SW-846 by adding Method 4010. These are impacts with negligible effects to small entities. Therefore, there is no need to consider its impacts on small entities by preparing a Regulatory Flexibility Analysis.

XI. Paperwork Reduction Act

This rule does not contain any information collection requirements subject to OMB review under the Paperwork Reduction Act of 1980, 44 U.S.C. 3501 et seq.

List of Subjects

40 CFR Part 260

Environmental protection, Administrative practice and procedure, Confidential business information, Hazardous waste.

40 CFR Part 261

Hazardous materials, Waste treatment and disposal, Recycling.

Dated: December 23, 1993.

Carol M. Browner,
Administrator.

For the reasons set out in the preamble, chapter I of title 40 of the Code of Federal Regulations is amended as follows:

PART 260--HAZARDOUS WASTE MANAGEMENT SYSTEM: GENERAL

1. The authority citation for part 260 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6921-6927, 6930, 6934, 6935, 6937, 6938, 6939, and 6974.

2. Section 260.11 is amended by revising the "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods" reference in paragraph (a) to read as follows:

Sec. 260.11 References.

(a) * * *
"Test Methods for Evaluating Solid Waste, Physical/Chemical Methods," EPA Publication SW-846 (Third Edition (November, 1986), as amended by Updates I, II and IIA). The Third Edition of SW-846 and Updates I, II, and IIA (document number 955-001-00000-1) are available from the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402, (202) 783-3238.

PART 261--IDENTIFICATION AND LISTING OF HAZARDOUS WASTE

3. The authority citation for part 261 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6921, 6922, and 6938.

4. Appendix VIII of part 261 is amended by adding the following hazardous constituents in alphabetical order by common name to read as follows:

Appendix VIII to Part 261--Hazardous Constituents

Common name	Chemical abstracts name	Chemical abstracts No.	Hazardous waste No.
* * * * * * *			
Potassium pentachlorophenate	Pentachlorophenol, potassium salt	7778736	None
* * * * * * *			
Sodium pentachlorophenate	Pentachlorophenol, sodium salt	131522	None
* * * * * * *			
2,3,4,6-tetrachlorophenol, potassium salt	same	53535276	None

2,3,4,6-tetrachlorophenol, sodium salt	same	25567559	None

TEXT:

40 CFR Parts 264 and 265

(FRL-4852-9)

Recordkeeping Instructions

Agency: Environmental Protection Agency.

Action: Technical amendment.

Summary: EPA is amending recordkeeping instructions in order to match those unit of measurement codes and handling codes used by hazardous waste treatment, storage and disposal facilities to report to EPA on the Part A Permit Application Form with the codes used to maintain records on-site by these facilities. This technical amendment also adds additional handling codes to allow for the proper recording of those processes relating to Boilers and Industrial Furnaces and Miscellaneous Units (subpart X) facilities. This amendment will encourage the consistent recordkeeping and reporting of information by hazardous waste treatment, storage and disposal facilities.

Effective Date: March 24, 1994.

Addresses: All comments concerning this technical amendment should be addressed to Jeffrey Gaines, Assistance Branch, Permits and State Program Division (5303W), Office of Solid Waste, U.S. EPA, 401 M Street, SW., Washington, DC 20460.

For Further Information Contact: Liza Hearns, (202) 260-3393.

Supplementary Information: For several years, the disposal process codes listed in Appendix I of 40 CFR parts 264 and 265 have been different from those listed on the Part A Permit Application form. In consultation with State, Regional and Headquarters personnel, it was determined that changing the CFR to match the forms was the appropriate step to take. Therefore, the Office of Solid Waste has prepared this technical amendment to appendix I of 40 CFR parts 264 and 265 to modify those process codes (also referred to as handling codes) listed in the CFR so that they match those codes used on the Part A Permit Application form.

List of Subjects in 40 CFR Parts 264 and 265

Hazardous waste, Reporting and recordkeeping requirements.

Dated: March 15, 1994.

Elliott P. Laws,
Assistant Administrator, Office of Solid Waste and Emergency Response.

For the reasons set out in the preamble, title 40, chapter I of the Code of Federal Regulations is amended as follows:

PART 264--STANDARDS FOR OWNERS AND OPERATORS OF HAZARDOUS WASTE TREATMENT, STORAGE AND DISPOSAL FACILITIES

1. The authority citation for part 264 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6924 and 6925.

2. Appendix I is amended by revising Table 1 to paragraph (2) and Table 2 to paragraph (3) to read as follows:

SUMMARY: This notice contains corrections to the final regulation (FRL-4804- 9) which was published Tuesday, January 4, 1994 ("Hazardous Waste Management System; Identification and Listing of Hazardous Wastes; Wastes from Wood Surface Protection; Final Rule", 59 FR 458). This notice corrects inaccurate references in that Final Rule to the EPA Publication SW-846, "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods".

TEXT:

40 CFR Part 260

(FRL-4889-7)

Hazardous Waste Management System; Identification and Listing of Hazardous Wastes; Wastes From Wood Surface Protection; Correction

AGENCY: Environmental Protection Agency.

ACTION: Final rule; correction.

SUMMARY: This notice contains corrections to the final regulation (FRL-4804- 9) which was published Tuesday, January 4, 1994 ("Hazardous Waste Management System; Identification and Listing of Hazardous Wastes; Wastes from Wood Surface Protection; Final Rule", 59 FR 458). This notice corrects inaccurate references in that Final Rule to the EPA Publication SW-846, "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods".

EFFECTIVE DATE: June 2, 1994.

FOR FURTHER INFORMATION CONTACT: Kim Kirkland at (202) 260-4761, Office of Solid Waste (Mailcode 5304), U.S. Environmental Protection Agency, 401 M Street, SW., Washington, DC 20460.

SUPPLEMENTARY INFORMATION:

Background

The final regulation that is the subject of this correction (January 4, 1994, 59 FR 458) amended the hazardous waste regulations by adding the sodium and potassium salts of pentachlorophenol and tetrachlorophenol to appendix VIII of 40 CFR part 261. The final regulations also amended EPA Publication SW-846, "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods," by adding Method 4010 to the Third Edition of SW-846 as Update IIA. SW-846 contains the analytical and test methods that EPA has evaluated and found to be among those acceptable for testing under Subtitle C of the Resource Conservation and Recovery Act of 1976 (RCRA), as amended. The Agency added Method 4010 to SW-846 as an appropriate method, in general, for testing for the presence of the sodium and potassium salts of pentachlorophenol and tetrachlorophenol which, as noted above, were added by the final rule to appendix VIII of 40 CFR part 261.

In the final regulation of January 4, 1994 (59 FR 458), the Agency amended 40 CFR 260.11(a) to incorporate by reference both Update IIA (Method 4010) and Update II of SW-846; and to indicate that these updates are available from the U.S. Government Printing Office (GPO). These amendments to 40 CFR 260.11 contain two technical errors: (1) Update II of SW-846 is still being developed by EPA and was not promulgated by the final regulations of January 4, 1994, or by any other regulation to date, and is not available from GPO; and (2) Update IIA (Method 4010), although promulgated by the January 4, 1994 rule, is also not available from the GPO.

Need for Correction

As published, the final regulations of January 4, 1994 were in advertent error with respect to the incorporation by reference of Update II of SW-846, Third Edition, into the hazardous waste regulations at 40 CFR 260.11(a). The regulations were also in inadvertent error with respect to the availability of Updates II and IIA from the U.S. Government Printing Office. These errors, therefore, need correction. Because this action is a technical correction, prior notice and opportunity for comment is unnecessary, and good cause exists for this change to take effect immediately (see 5 U.S.C. 553(6)).
Accordingly, the Agency is not seeking any comments based on today's notice.

Correction of Publication

Accordingly, the publication on January 4, 1994 of the final regulation, 59 FR 458, "Hazardous Waste Management System; Identification and Listing of Hazardous Wastes; Wastes from Wood Surface Protection; Final Rule" (FRL-4804- 9), which was the subject of FR Doc. 93-32032, is corrected. Specifically, on page 468, in the third column, Sec. 260.11(a) is corrected to read as follows:

Sec. 260.11 References (corrected).

(a) * * *

"Test Methods for Evaluating Solid Waste, Physical/Chemical Methods," EPA Publication SW-846 (Third Edition (November, 1986), as amended by Updates I and IIA). The Third Edition of SW-846 and Update I (document number 955-001- 00000-1) are available from the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402, (202) 783-3238; and Update IIA is available from the Office of Solid Waste (Mailcode 5304), U.S. EPA, 401 M Street, SW., Washington, DC 20460 or by calling the Methods Information Communication Exchange (MICE) Service at (703) 821-4789. Copies may be inspected at the Library, U.S. Environmental Protection Agency, 401 M Street, SW., Washington, DC 20460.

ACTION: Technical correction amendment
INTERNAL DATA: (FR Doc. 94-14535 Filed 6-17-94; 8:45 am)
Word Count: 840

SUMMARY: The Environmental Protection Agency today is correcting the listing for "beryllium" in the list of commercial chemical products that are hazardous wastes when discarded or intended to be discarded. The listing description is corrected to read "Beryllium powder." Conforming changes also are being made to the RCRA list of hazardous constituents, the RCRA land disposal restrictions technology-based treatment standards, and to the CERCLA list of hazardous substances.

TEXT:

40 CFR Parts 261, 268, and 302

(FRL-4999-1)

Hazardous Waste Management System; Correction of Listing of P015--Beryllium Powder

AGENCY: Environmental Protection Agency.

ACTION: Technical correction amendment.

SUMMARY: The Environmental Protection Agency today is correcting the listing for "beryllium" in the list of commercial chemical products that are hazardous wastes when discarded or intended to be discarded. The listing description is corrected to read "Beryllium powder." Conforming changes also are being made to the RCRA list of hazardous constituents, the RCRA land disposal restrictions technology-based treatment standards, and to the CERCLA list of hazardous substances.

EFFECTIVE DATE: The amendment is effective June 20, 1994.

ADDRESSES: The Office of Solid Waste (OSW) RCRA Docket is located at the following address: EPA RCRA Docket Clerk, room 2616 (5305), U.S. Environmental Protection Agency, 401 M Street SW., Washington, DC 20460.

The docket is open from 9 a.m. to 4 p.m. Monday through Friday, excluding Federal holidays. The public must make an appointment to review docket materials by calling 202-260-9327. The public may copy 100 pages from the docket at no charge; additional copies are $0.15 per page.

FOR FURTHER INFORMATION CONTACT: The RCRA/Superfund Hotline at 1-800-424 9346. For technical information contact Wanda L. Levine, Office of Solid Waste (5304), U.S. Environmental Protection Agency, 401 M Street, SW., Washington, DC 20460, 202-260-7458.

SUPPLEMENTARY INFORMATION: On April 22, 1988, EPA published a technical corrections notice to make a number of corrections to 40 CFR 261.33(e) and (f) and to appendix VIII of 40 CFR part 261 (53 FR 13383). In that notice, the word "dust" was inadvertently omitted from the 40 CFR 261.33(e) listing, "P015--Beryllium dust," which was the original listing promulgated on May 19, 1980. There have been a number of inquiries since the April 22, 1988 correction notice as to the intent of this listing, and EPA has responded in each case by explaining that the word "dust" was mistakenly omitted, but the intent of the listing (i.e., to list as hazardous the commercial chemical product, beryllium dust, when discarded or intended to be discarded) has remained. In fact, the land disposal restrictions refer to P015 as "Beryllium dust."

In addition, the sole manufacturer of the commercial chemical product has indicated that "beryllium powder" is the actual term used to describe their product. The term dust is not used by industry to describe the commercial chemical product.

For the purpose of clarification, EPA is adding the word "powder" to the P015 listing description. Since this change is only a clarification, the scope of the P015 hazardous waste listing is neither increased, diminished or otherwise affected by this technical correction amendment.

In order to rectify this confusion in the regulated community, the Agency today is correcting the Code of Federal Regulations by adding the word "powder" to the P015 listing for beryllium. Conforming changes also are being made to the RCRA list of hazardous constituents, the RCRA land disposal restrictions technology-based treatment standards, and to the CERCLA list of hazardous substances.

Because this action is a technical correction, prior notice and opportunity for comment is unnecessary, and good cause exists for this change to take effect immediately (see 5 U.S.C. 553(b)). Accordingly, the Agency is not seeking any comments based on today's notice.

List of Subjects

40 CFR Part 261

Environmental protection, Hazardous wastes, Recycling, Reporting and recordkeeping requirements.

40 CFR Part 268

Hazardous waste, Reporting and recordkeeping requirements.

40 CFR Part 302

Air pollution control, Chemicals, Emergency Planning and Community Right-to-Know Act, Extremely hazardous substances, Hazardous chemicals, Hazardous materials, Hazardous materials transportation, Hazardous substances, Hazardous wastes, Intergovernmental relations, Natural resources, Pesticides and pests, Reporting and recordkeeping requirements, Superfund, Waste treatment and disposal, Water pollution control, Water supply.

Dated: June 8, 1994.

Elliott P. Laws,
Assistant Administrator, Office of Solid Waste and Emergency Response.

For the reasons set out in the preamble, Chapter I, of title 40 of the Code of Federal Regulations is amended as follows:

PART 261--IDENTIFICATION AND LISTING OF HAZARDOUS WASTE

1. The authority citation for part 261 continues to read as follows:
Authority: 42 U.S.C. 6905, 6912(a), 6921, 6922, 6938.

Sec. 261.33 (Amended)

2. In Sec. 261.33 (e), the listing for P015 is revised to read as follows:

Hazardous waste No.	Chemical abstracts No.	Substance
* * * * *		
P015	7440-41-7	Beryllium powder
* * * * *		

Appendix VIII (Amended)

3. In appendix VIII, the listing for Beryllium is revised to read as follows:

Common name	Chemical abstracts name	Chemical abstracts No.	Hazardous waste No.
* * * * *			
Beryllium powder	Same	7440-41-7	P015
* * * * *			

PART 268--LAND DISPOSAL RESTRICTIONS
1. The authority citation for part 268 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6921, 6924.

Sec. 268.42 (Amended)

2. In Sec. 268.42 revise the "Wastes descriptions and/or treatment subcategory" entry for Waste Code P015 to read "Beryllium powder."

PART 302--DESIGNATION, REPORTABLE QUANTITIES, AND NOTIFICATION

1. The authority citation for part 302 continues to read as follows:

Authority: 42 U.S.C. 9602, 9603, and 9604; 33 U.S.C. 1321 and 1361.

Sec. 302.4 (Amended)

2. In Sec. 302.4, in the table in paragraph (b), the listing for "Beryllium" is removed and under the column heading "Hazardous substances", "Beryllium dust" is revised to read "Beryllium powder".

Appendix A (Amended)

3. In appendix A the listing for 7440417 is revised to read "Beryllium powder".

SUMMARY: The Environmental Protection Agency (EPA or Agency) is today amending Sec. 266.20, which contains provisions for conditionally exempting hazardous waste-derived products used in a manner constituting disposal (i.e., applied to or placed on land) from the Resource Conservation and Recovery Act (RCRA) Subtitle C regulations. The proposed amendment to Sec. 266.20 was published on February 23, 1994 (59 FR 8583). As specified in the proposal, EPA is amending Sec. 266.20 so that certain

uses of slag residues produced from the high temperature metal recovery (HTMR) treatment of electric arc furnace dust (EPA Hazardous Waste No. K061), steel finishing pickle liquor (K062), and electroplating sludges (F006) are not exempt from RCRA Subtitle C regulations. EPA's proposal also contained a definition for "non-encapsulated" uses of HTMR slags. Following a review of the public comments, EPA is clarifying the definition of non-encapsulated uses of HTMR slags by specifying these uses to be the anti-skid/deicing uses.

This action partially implements a settlement agreement entered into by EPA on August 13, 1993 with the Natural Resources Defense Council (NRDC) and Hazardous Waste Treatment Council (HWTC). This action will effectively prohibit anti-skid/deicing uses of HTMR slags derived from K061, K062, and F006, as waste-derived products placed on the land, since such uses will be allowed only if there is compliance with all Subtitle C standards applicable to land disposal. This rule does not prohibit other uses of these slags that meet Sec. 266.20(b) requirements. The rule also does not prevent the disposal of HTMR slags in a Subtitle D unit if the residuals can meet the risk-based exclusion levels specified in Sec. 261.3(c)(2). EPA plans to propose a regulatory determination on the remaining uses of HTMR slags by December, 1994.

TEXT:

40 CFR Parts 266 and 268

(SW-FRL-5057-8)

Standards for the Management of Specific Hazardous Wastes; Amendment to Subpart C--Recyclable Materials Used in a Manner Constituting Disposal; Final Rule

AGENCY: Environmental Protection Agency.

ACTION: Final rule and response to comments.

SUMMARY: The Environmental Protection Agency (EPA or Agency) is today amending Sec. 266.20, which contains provisions for conditionally exempting hazardous waste-derived products used in a manner constituting disposal (i.e., applied to or placed on land) from the Resource Conservation and Recovery Act (RCRA) Subtitle C regulations. The proposed amendment to Sec. 266.20 was published on February 23, 1994 (59 FR 8583). As specified in the proposal, EPA is amending Sec. 266.20 so that certain uses of slag residues produced from the high temperature metal recovery (HTMR) treatment of electric arc furnace dust (EPA Hazardous Waste No. K061), steel finishing pickle liquor (K062), and electroplating sludges (F006) are not exempt from RCRA Subtitle C regulations. EPA's proposal also contained a definition for "non-encapsulated" uses of HTMR slags. Following a review of the public comments, EPA is clarifying the definition of non-encapsulated uses of HTMR slags by specifying these uses to be the anti-skid/deicing uses.

This action partially implements a settlement agreement entered into by EPA on August 13, 1993 with the Natural Resources Defense Council (NRDC) and Hazardous Waste Treatment Council (HWTC). This action will effectively prohibit anti-skid/deicing uses of HTMR slags derived from K061, K062, and F006, as waste-derived products placed on the land, since such uses will be allowed only if there is compliance with all Subtitle C standards applicable to land disposal. This rule does not prohibit other uses of these slags that meet Sec. 266.20(b) requirements. The rule also does not prevent the disposal of HTMR slags in a Subtitle D unit if the residuals can meet the risk-based exclusion levels specified in Sec. 261.3(c)(2). EPA plans to propose a regulatory determination on the remaining uses of HTMR slags by December, 1994.

EFFECTIVE DATE: This final rule is effective on February 24, 1995.

ADDRESSES: The official record for this rulemaking is identified as Docket Number F-94-SSHF-FFFFF, and is located in the EPA RCRA Docket, room 2616 (Mail Code 5305), 401 M Street, SW., Washington, DC 20460. The docket is open from 9:00 a.m. to 4:00 p.m., Monday through Friday, except on Federal holidays. The public must make an appointment to review docket materials by calling (202) 260-9327. A maximum of 100 pages may be copied at no cost. Additional copies cost $0.15 per page.

FOR FURTHER INFORMATION, CONTACT: For general information contact the RCRA

Hotline, toll free at (800) 424-9346, or at (703) 412-9810. For specific questions concerning this notice, contact Narendra Chaudhari, Office of Solid Waste (Mail Code 5304), U.S. Environmental Protection Agency, 401 M Street, SW., Washington, DC 20460, (202) 260-4787.

SUPPLEMENTARY INFORMATION:

I. Background

The regulations under 40 CFR 266.20(b), promulgated in 1985, conditionally exempt hazardous waste-derived products used in a manner constituting disposal (i.e., applied to or placed on land) from the RCRA Subtitle C regulations. To be eligible for this exemption, the waste-derived products must meet treatment standards based on Best Demonstrated Available Technology (BDAT) developed under the Land Disposal Restrictions (LDR) program for the original hazardous wastes (see Sec. 266.20(b)). Residuals ("slags") generated from the high temperature metals recovery (HTMR) treatment of hazardous waste K061 (electric arc furnace dust) and, to a limited extent, hazardous wastes K062 (steel finishing pickle liquor) and F006 (electroplating sludges), are eligible for this conditional exemption (assuming that legitimate recycling is occurring). Section 266.20(b) is applicable because the slags are processed into products which are used in highway construction (e.g., as road-base) or applied directly to road surfaces (i.e., as anti-skid/deicing agents).

In August 1991, EPA finalized a generic exclusion for K061 HTMR slags (extended to K062 and F006 HTMR slags in August 1992). Under this exclusion, these slags are excluded from hazardous waste regulations provided they meet designated concentration levels for 13 metals, are disposed of in a Subtitle D unit, and exhibit no characteristics of hazardous waste (Sec. 261.3(c)(2)).

The Natural Resources Defense Council (NRDC) and Hazardous Waste Treatment Council (HWTC) filed a petition for review challenging EPA's decision not to apply "generic exclusion levels"-- levels at which K061 slags are deemed nonhazardous-- to K061 slags used as waste-derived "products" and applied to or placed on land. The generic exclusion levels established for some metals in the K061 HTMR slags are lower than the BDAT standards that apply to K061.

Therefore, while the generic exclusion requires nonhazardous K061 slags meeting exclusion levels to be disposed of in a Subtitle D unit, K061 slags that may exhibit metal levels above the exclusion levels (but below BDAT) may be used as products in a manner constituting disposal under the exemption in Sec. 266.20(b). The petitioners pointed out the anomaly of the slag used in an uncontrolled manner being effectively subject to lesser standards than slag disposed in a controlled landfill.

On August 13, 1993, EPA entered into a settlement agreement with the petitioners which would address their concerns through two separate notice-and-comment rulemakings. EPA agreed to propose the first rule within 6 months of the settlement date (and issue a final rule within 12 months) to either establish generic exclusion levels for "non-encapsulated" uses of K061 slags, or effectively prohibit such uses of K061 slags on the land. EPA also agreed to propose a second rule within 16 months of the settlement date (and issue a final rule within 28 months) to establish generic exclusion levels for "encapsulated" uses of K061 slags on the land. The

agreement specified that the generic exclusion levels will be based on an evaluation of the potential risks to human health and the environment from the use of K061 slags as waste-derived products, taking into account all relevant pathways of exposure.

II. Summary of Proposed Rule

On February 23, 1994, EPA published in the Federal Register a proposed rule to prohibit (by amending Sec. 266.20) non-encapsulated uses of slag residues derived from HTMR treatment of hazardous wastes K061, K062, and F006, as waste-derived products placed on land, unless there is compliance with all RCRA Subtitle C standards applicable to land disposal. EPA defined non- encapsulated uses to be uses in which the HTMR slag is not "contained, controlled, covered, or capped in a manner that eliminates or significantly reduces its mobility and potential for release into the environment (e.g., uses as anti-skid or deicing materials)."
EPA solicited comments on whether the necessary data are available to establish risk-based generic exclusion levels for HTMR slags used in non-encapsulated manners. EPA also solicited all available information on product uses of HTMR slags.

EPA did not seek to prohibit encapsulated uses of HTMR slags derived from K061, K062, and F006 that meet Sec. 266.20 requirements. EPA also did not seek to prevent the disposal of HTMR slags in a Subtitle D unit if the residuals can meet the risk-based exclusion levels specified in Sec. 261.3(c)(2).

III. Public Comments on the Proposed Rule

EPA received comments on the proposed rule from thirteen interested parties. Three commenters supported the Agency's proposal to effectively prohibit non-encapsulated uses of HTMR slags derived from K061, K062, and F006. One commenter, a citizen of a town where HTMR slag material is used as an anti-skid agent, strongly urged EPA to finalize the proposed prohibition on non-encapsulated uses of HTMR slags because of its lead content. Another commenter, the Department of Environmental Resources of a State with several HTMR facilities, stated that it agreed with the prohibition on non- encapsulated uses of HTMR slags because of the many potential pathways of exposure to this material and its unknown health risks. A third commenter, representing the Palmerton Citizens for Clean Environment, provided results of recent lead analysis for HTMR material supplied to a town as anti-skid material. The results, which were not accompanied by any quality assurance/ quality control information, showed total concentrations of lead in the anti- skid material to be in the range of 1,800 ppm to 2,200 ppm (which agrees with waste characterization data obtained by EPA).

Because the above commenters are in agreement with the content of the proposed rule, EPA does not believe any response is necessary. The remaining commenters disagreed and/or were concerned about the proposed rule. These commenters also wanted EPA to provide certain clarifications if it planned to finalize the proposed rule.

In this preamble, EPA is presenting a summary of comments received on the proposed definition of non-encapsulated uses because it was the most significant issue for many of the commenters. EPA's response to these comments, as discussed below, resulted in a modification of the proposed rule (i.e., clarification regarding non-encapsulated uses which are prohibited). A summary of all major comments received that criticized the proposal, and EPA's responses to these comments, are provided in a "Response to Comments Document," which is in the public docket for this rule.

Five commenters strongly urged the Agency to limit the definition of non-encapsulated uses of HTMR slags to its uses as anti-skid/deicing materials (the uses specifically enumerated in the proposed rule). The commenters believed that EPA's proposed definition for "non-encapsulated" uses of HTMR slags ("those uses in which the HTMR slag is not contained, controlled, covered, or capped in a manner that eliminates or significantly reduces its mobility and potential for release into the environment") was vague and required a significant degree of interpretation.

EPA agrees with the commenters that the proposed definition for non-encapsulated uses lacked clarity and should be modified. EPA indicated in the proposal that the non-encapsulated uses of HTMR slags that it is most concerned about are its uses as anti-skid/deicing materials (59 FR 8583; February 23, 1994). This is because anti-skid/deicing uses involve frequent spreading of the HTMR slag materials on road surfaces (an apparently uncontrolled use), which may lead to many potential pathways of exposure to these materials. EPA believes that, if necessary, the second rulemaking required under the settlement agreement (which is to focus on "encapsulated" uses and is due to be proposed in December 1994) will be the appropriate place to address any other uses of concern. As a result, EPA has decided in this final rule to limit the prohibition on non-encapsulated uses of HTMR slags to its uses as anti-skid/deicing materials.

EPA solicited comments in the proposed rule on possible generic exclusion levels for HTMR slags used in non-encapsulated manners, and on the basis for setting these exclusion levels. No comments were received on ways to establish generic exclusion levels that adequately account for multiple potential exposure pathways. EPA, however, notes that it is developing a risk assessment for all major HTMR slag uses to support the second rulemaking required in the settlement agreement. EPA will consider results from this risk assessment (and any other relevant data which become available) to propose possible generic exclusion levels for encapsulated uses of HTMR slags. In addition, if the results of this assessment warrant, EPA may reconsider the prohibition for certain uses of HTMR slags finalized in this rulemaking.

IV. Final Agency Decision

This rule prohibits anti-skid/deicing uses of HTMR slags derived from K061, K062, and F006, as waste-derived products placed on the land, unless there is compliance with all Subtitle C standards applicable to land disposal.

In the proposal (59 FR 8583, February 23, 1994), EPA stated that it would prohibit non-encapsulated uses of HTMR slags derived from K061, K062, and F006, as waste-derived products placed on the land, unless there is compliance with all Subtitle C standards applicable to land disposal. EPA proposed to define the term "non-encapsulated" uses rather broadly to be "those uses in which the HTMR slag is not contained, controlled, covered, or capped in a manner that eliminates or significantly reduces its mobility and potential for release into the environment (e.g., uses as anti-skid or deicing materials)". As discussed above, EPA agreed with commenters that this proposed definition was too vague, and instead has effectively prohibited uses of HTMR slags as anti-skid/deicing materials (which are believed to be the uses of greatest potential environmental concern).

Accordingly, EPA is amending the existing regulations under Sec. 266.20 that conditionally exempt hazardous waste-derived products used in a manner constituting disposal from RCRA Subtitle C regulations to reflect this change. EPA is also including a cross-reference in Sec. 268.41 (the Land Disposal Restriction treatment standards) which notes the restrictions placed on use of slags in Sec. 266.20. The language of Sec. 266.20 is revised to prohibit uses of HTMR slags as anti-skid/deicing materials, unless they comply with all of the applicable Subtitle C standards (i.e., permitting, minimum technology standards for land disposal units, financial responsibility, etc.). Since these requirements cannot realistically be met by entities that would use the HTMR slag in this fashion (i.e., entities are unlikely to seek land disposal permits for the placement of anti-skid/deicing materials on the roads), EPA is effectively prohibiting uses of HTMR slags as anti-skid/deicing materials. As noted earlier, EPA plans to propose a regulatory determination on the remaining uses of HTMR slags in the near future, and may also examine possible risk-based standards for these non- encapsulated uses.

V. Effective Date

This final rule is effective February 24, 1995. (See RCRA section 3010(a)). The Agency believes that this will provide sufficient time for affected parties to come into compliance.

VI. State Authority

Under section 3006 of RCRA, EPA may authorize qualified States to administer and enforce the RCRA program within the State. Following authorization, EPA retains enforcement authority under sections 3008, 3013, and 7003 of RCRA, although authorized States have primary enforcement responsibility. The standards and requirements for authorization are found in 40 CFR part 271.

Prior to the Hazardous and Solid Waste Amendments (HSWA) of 1984, a State with final authorization administered its hazardous waste program in lieu of EPA administering the Federal program in that State. The Federal requirements no longer applied in the authorized State, and EPA could not issue permits for any facilities that the State was authorized to permit. When new, more stringent Federal requirements were promulgated or enacted, the State was obliged to enact equivalent authority within specified time frames. New Federal requirements did not take effect in an authorized State

until the State adopted the requirements as State law.

In contrast, under RCRA section 3006(g), new requirements and prohibitions imposed by HSWA take effect in authorized States at the same time that they take effect in nonauthorized States. EPA is directed to carry out these requirements and prohibitions in authorized States, including the issuance of permits, until the State is granted authorization to do so. While States must still adopt HSWA-related provisions as State law to retain final authorization, HSWA applies in authorized States in the interim.

B. Effect on State Authorization

EPA views this final rule as a HSWA regulation. The rule can be viewed as part of the process of establishing land disposal prohibitions and treatment standards for K061, K062, and F006 hazardous wastes. (See 56 FR 41175; August 19, 1991.) The ultimate goal of the land disposal prohibition provisions is to establish standards, "if any", which minimize short-term and long-term threats to human health and the environment posed by hazardous waste land disposal. (See RCRA section 3004(m)(l).) In this case, the Agency is uncertain what level of treatment would assure that these threats are minimized when HTMR slag is used for anti-skid/deicing purposes, and consequently is effectively prohibiting this use. (See 57 FR at 37237, August 18, 1992, interpreting "if any" clause in section 3004(m)(l)). Thus, as noted above, EPA will implement this rule in authorized States until their programs are modified to adopt the new prohibition and the modification is approved by EPA.

This final rule will result in more stringent Federal standards. Section 271.21(e)(2) requires that States that have final authorization must modify their programs to reflect Federal program changes and must subsequently submit the modifications to EPA for approval.

States with authorized RCRA programs may already have requirements similar to those in this final rule. These State regulations have not been assessed against the Federal regulations being finalized today to determine whether they meet the tests for authorization. Thus, a State is not authorized to implement these requirements in lieu of EPA until the State program modifications are approved. Of course, States with existing standards could continue to administer and enforce their standards as a matter of State law.

In implementing the Federal program, EPA will work with States under agreements to minimize duplication of efforts. In many cases, EPA will be able to defer to the States in their efforts to implement their programs rather than take separate actions under Federal authority.

VII. Regulatory Impact

A. Executive Order 12866

Under Executive Order 12866 (see 58 FR 51735, October 4, 1993), EPA must determine whether the regulatory action is "significant" and therefore subject to OMB review and the requirements of the Executive Order. The order defines "significant regulatory action" as one that is likely to result in a rule that may:

(1) have an annual effect on the economy of $100 million or more or adversely affect in a material way the economy, a sector of the economy,

productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities;

(2) create a serious inconsistency or otherwise interfere with an action taken or planned by another agency;

(3) materially alter the budgetary impact of entitlements, grants, user fees, or loan programs or the rights and obligations of recipients thereof; or

(4) raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in the Executive Order.

Pursuant to the terms of Executive Order 12866, it has been determined that this rule is not a "significant regulatory action" and is therefore not subject to OMB review.

B. Regulatory Flexibility Act

Under the Regulatory Flexibility Act, 5 U.S.C. 601 et seq., whenever an Agency is required to issue a general notice of rulemaking for any proposed or final rule, it must prepare and make available for public comment a regulatory flexibility analysis that describes the impact of the rule on small entities (i.e., small businesses, small organizations, and small governmental jurisdictions). No regulatory flexibility analysis is required, however, if the head of the Agency certifies that the rule will not have any impact on any small entities.

As noted in the proposal, this amendment will not have any significant impact on any small entities, since the regulated community will continue to have other readily available options for using and managing HTMR slags and small users will have readily available substitutes. This conclusion is supported by the economic analysis performed by the Agency in response to comments. The Agency estimated that the increase in annual cost for a small user as a result of this amendment would range between $8,325 to $15,300. (See the Response to Comments Document contained in the public docket for this rule for details of Agency's economic analysis.) Therefore, pursuant to section 605(b) of the Regulatory Flexibility Act, the Administrator certifies that this regulation will not have a significant economic impact on a substantial number of small entities. This regulation, therefore, does not require a formal regulatory flexibility analysis.

C. Paperwork Reduction Act

The Agency has determined that there are no additional reporting, notification, or recordkeeping provisions associated with this proposed rule. Such provisions, were they included, would be submitted for approval to OMB under the Paperwork Reduction Act, 44 U.S.C. 3501 et seq.

List of Subjects in 40 CFR Parts 266 and 268

Environmental protection, Energy, Hazardous waste, Petroleum, Recycling, Reporting and recordkeeping requirements.

Dated: August 9, 1994.

Carol M. Browner,
Administrator.

PART 266--STANDARDS FOR THE MANAGEMENT OF SPECIFIC HAZARDOUS WASTES AND SPECIFIC TYPES OF HAZARDOUS WASTE MANAGEMENT FACILITIES

1. The authority citation for Part 266 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6924, and 6934.

Subpart C--Recyclable Materials Used in a Manner Constituting Disposal

2. Section 266.20 is amended by adding a new paragraph (c) to read as follows:

Sec. 266.20 Applicability.

* * * * *

(c) Anti-skid/deicing uses of slags, which are generated from high temperature metals recovery (HTMR) processing of hazardous waste K061, K062, and F006, in a manner constituting disposal are not covered by the exemption in paragraph (b) of this section and remain subject to regulation.

PART 268--LAND DISPOSAL RESTRICTIONS

3. The authority citation for Part 268 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6921, and 6924.

4. Table CCWE in Sec. 268.41(a) is amended by redesignating footnote 2 as footnote 3 at the end of the table and in the text at waste code FO2O-FO23, and by adding a new footnote 2 at the end of the table and in the last column in the table, "Nonwastewaters/Notes", for waste codes F006, K061, and K062 to read as follows:

Sec. 268.41 Treatment standards expressed as concentrations in waste extract.

(a) * * *

/2/ See also restrictions on use of slags for anti-skid/deicing purposes in Sec. 266.20(c).

Land Disposal Restrictions Phase II--Universal Treatment Standards, and Treatment Standards for Organic Toxicity Characteristic Wastes and Newly Listed Wastes

AGENCY: **Environmental Protection Agency** (EPA).

ACTION: Final rule.

SUMMARY: As part of the **Agency**'s **Land Disposal** Restrictions (LDR) program, EPA is today promulgating treatment standards for the newly identified organic toxicity characteristic (TC) wastes (except those managed in Clean Water Act (CWA) systems, CWA- equivalent systems, or Class I Safe Drinking Water Act (SDWA) injection wells), and for all newly listed coke by-product and chlorotoluene production wastes. The required treatment standards for these wastes must be met before they are **land** disposed. EPA is also requiring ignitable characteristic wastes with a high total organic carbon (TOC) content and toxic characteristic pesticide wastes, that are being disposed in Class I nonhazardous waste injection wells, to either be injected into a well that is subject to a no-migration determination, or be treated by the designated LDR treatment method. Promulgation of these treatment standards for the newly identified and listed wastes and promulgation of the dilution prohibitions for high TOC ignitables and pesticides fulfills requirements of a proposed consent decree between EPA and the **Environmental** Defense Fund, and a settlement agreement between EPA, the Hazardous Waste Treatment Council, and a number of **environmental** groups including the Natural Resources Defense Council.

EPA is also making a major improvement in the **Land Disposal** Restrictions program in order to simplify and provide consistency in the requirements. EPA is establishing a single set of requirements, referred to as universal treatment standards, that apply to most hazardous wastes. EPA is also simplifying the **Land Disposal** Restrictions program by reducing paperwork for the regulated community, and improving guidance to make compliance easier. EPA is also publishing clarifying guidance regarding treatability variances, which largely restates previous **Agency** statements. Finally, EPA is modifying the hazardous waste recycling regulations which will allow streamlined regulatory decisions to be made regarding the regulation of certain types of recycling activities.

DATES: Effective date: The final rule is effective on December 19, 1994. Section 266.100 and Appendix VIII are effective September 19, 1994.

Applicability dates: For high TOC D001 (40 CFR 148.17) and halogenated pesticides wastes (40 CFR 148.17) disposed in Class I nonhazardous injection deep wells, the compliance date is September 19, 1995. For radioactive waste mixed with the newly listed or identified wastes, or soil and debris contaminated with such mixed wastes (40 CFR 268.38), the compliance date is September 19, 1996. Although the effective date of today's rule is December 19, 1994, facilities will be in compliance if they meet the universal treatment standards (UTS) before the 90-day period ends.

ADDRESSES: The official record for this rulemaking is identified as Docket Number F-94-CS2F-FFFFF, and is located in the EPA RCRA Docket, U.S. **Environmental Protection Agency**, Room 2616, 401 M Street, SW., Washington, DC 20460. The RCRA Docket is open from 9 am to 4 pm Monday through Friday, except for Federal holidays. The public must make an appointment to review docket materials by calling (202) 260-9327. The public may copy a maximum of 100 pages from any regulatory document at no cost. Additional copies cost $.15 per **page**. The mailing address is EPA RCRA Docket (5305), U.S. **Environmental Protection Agency**, 401 M Street, SW., Washington, DC 20460.

FOR FURTHER INFORMATION CONTACT: For general information, contact the RCRA Hotline at (800) 424-9346 (toll-free) or (703) 412-9810 locally. For technical information about mercury and radioactive mixed waste, contact Shaun McGarvey on (703) 308-8603; for technical information about lab packs and metal Universal Treatment Standards, contact Anita Cummings on (703) 308-8303; for technical information about organic Universal Treatment Standards, contact Lisa Jones on (703) 308-8451; for technical information about Toxicity Characteristic wastes, contact Mary Cunningham on (703) 308-8453; for technical information about petroleum refining wastes, contact Jose Labiosa on (703) 308-8464; for other information, contact Richard Kinch on (703) 308-8414; of the Waste Treatment Branch, Office of Solid Waste (5302W), U.S. **Environmental Protection Agency**, 401 M Street, SW., Washington, DC 20460, phone (703) 308-8434. For technical information on capacity analyses, contact Bengie Carroll of the Capacity Programs Branch, Office of Solid Waste (5302W), phone (703) 308-8440. For technical information on Hazardous Waste Recycling, contact Mitch Kidwell of the Regulation Development Branch, Office of Solid Waste (5304), phone (202) 260-8551.

SUPPLEMENTARY INFORMATION:

Table of Contents

I. Background

A. Summary of the Statutory Requirements of the 1984 Hazardous and Solid Waste Amendments, and Requirements of the 1993 Settlement Agreement With the **Environmental** Defense Fund

The Hazardous and Solid Waste Amendments (HSWA) to the Resource Conservation and Recovery Act (RCRA), enacted on November 8, 1984, largely prohibit the **land disposal** of untreated hazardous wastes. Once a hazardous waste is prohibited from **land disposal**, the statute provides only two options for legal **land disposal**: meet the treatment standard for the waste prior to **land disposal**, or dispose of the waste in a **land disposal** unit that has been found to satisfy the statutory no-migration test. A no-migration unit is one from which there will be no migration of hazardous constituents for as long as the waste remains hazardous. RCRA sections 3004 (d), (e), (g)(5).

The treatment standards may be expressed as either constituent concentration levels or as specific methods of treatment. These

standards must substantially diminish the toxicity of the waste or substantially reduce the likelihood of migration of hazardous constituents from the waste so that short-term and long-term threats to human health and the environment are minimized. RCRA section 3004(m)(1). For purposes of the restrictions, **land disposal** includes any placement of hazardous waste in a landfill, surface impoundment, waste pile, injection well, **land** treatment facility, salt dome formation, salt bed formation, or underground mine or cave. RCRA section 3004(k).

The **land disposal** restrictions are effective upon promulgation. RCRA section 3004(h)(1). However, the Administrator may grant a national capacity variance from the immediate effective date and establish a later effective date (not to exceed two years) based on the earliest date on which adequate alternative treatment, recovery, or **disposal** capacity which protects human health and the environment will be available. RCRA section 3004(h)(2). The Administrator may also grant a case-by-case extension of the effective date for up to one year, renewable once for up to one additional year, when an applicant successfully makes certain demonstrations. RCRA section 3004(h)(3). See 55 FR 22526 (June 1, 1990) for a more detailed discussion on national capacity variances and case-by-case extensions.

In addition, Congress prohibited the storage of any waste which is prohibited from **land disposal** unless such storage is to allow for the accumulation of such quantities of hazardous waste as are necessary to facilitate proper recovery, treatment or **disposal**. RCRA section 3004(j). For storage up to one year, EPA has taken the position that the **agency** bears the burden of proving that such storage was not solely for the purpose of accumulation of quantities necessary to facilitate proper recovery, treatment or **disposal**. 40 CFR 268.50(b). For storage beyond one year, however, the burden of proof shifts to the generator or owner/operator of a treatment, storage or **disposal** facility to demonstrate that such storage was solely for the purpose of accumulation of quantities necessary to facilitate proper recovery, treatment or **disposal**. 40 CFR 268.50(c). The provision applies, of course, only to storage which is not also defined in section 3004(k) as **land disposal**.

EPA was required to promulgate **land disposal** prohibitions and treatment standards by May 8, 1990 for all wastes that were either listed or identified as hazardous at the time of the 1984 amendments, RCRA sections 3004 (d), (e), and (g), a task EPA completed within the statutory timeframes. EPA was also required to promulgate prohibitions and treatment standards for wastes identified or listed as hazardous after the date of the 1984 amendments within six months after the listing or identification takes effect. RCRA section 3004(g)(4).

The **Agency** did not meet this latter statutory deadline for all of the wastes identified or listed after the 1984 amendments. As a result, a suit was filed by the **Environmental** Defense Fund (EDF). EPA and EDF signed a consent decree (lodged with but not entered by the District Court) that establishes a schedule for adopting prohibitions and treatment standards for newly identified and listed wastes. (EDF v. Reilly, Civ. No. 89-0598, D.D.C.) This proposed consent decree was recently modified as a result of the court decision on the Third Third final rule (Chemical Waste Management v. EPA, 976 F.2d 2 (D.C. Cir. 1992), cert. denied 113 S. Ct. 1961 (1993) (CWM v. EPA)). Today's rule fulfills several provisions of the proposed consent decree. The rule establishes treatment standards for newly listed coke by-product and chlorotoluene production wastes, and for the D018-D043 TC wastes (TC

wastes identified as hazardous because of the presence of organic hazardous constituents) when these wastes are managed in systems other than those wastewater treatment systems whose discharge is regulated under the Clean Water Act (CWA), by zero-dischargers that do not engage in CWA-equivalent treatment prior to **land disposal**, and by injection into other than underground injection control (UIC) Class I deep injection wells regulated under the Safe Drinking Water Act (SDWA). Soils contaminated with these newly identified and listed wastes are also covered by this rule.

Finally, this rule prohibits injection into deep wells of high Total Organic Carbon ignitable wastes (D001) and Toxic Characteristic organic pesticides (D012-D017) unless they are treated to meet applicable treatment standards, or the deep well has received a no-migration variance. This last prohibition is in partial fulfillment of the settlement agreement following the D.C. Circuit's decision in CWM v. EPA.

EPA is also modifying a number of the existing **land disposal** restrictions rules. Although not required by the settlements discussed above, these changes reflect EPA's updated technical knowledge, simplify implementation of the program, and provide greater programmatic consistency. In today's notice, EPA is establishing a set of treatment standards (called universal treatment standards) that apply to most hazardous wastes, changing requirements for **land disposal** of lab packs containing prohibited hazardous wastes, and simplifying paperwork requirements.

B. Pollution Prevention Benefits

EPA's progress over the years in improving **environmental** quality through its media-specific pollution control programs has been substantial. Over the past two decades, standards for pollution control concentrated to a large extent on ``end-of-pipe'' treatment or **land disposal** of hazardous and nonhazardous wastes. Although none of the treatment standards in today's rule require waste minimization or recovery, these are viable options for facilities to choose to use to comply with universal treatment standards. For example, facilities may choose to reduce the generation of wastes and/or treat certain metal-containing wastes by using high temperature metal recovery (HTMR), which has been shown to be effective for treating many metal bearing wastes.

C. Relationship of Best Demonstrated Available Technology (BDAT) Treatment Standards to Initiatives To Strengthen Federal Controls Governing Hazardous Waste Combustion Devices

On May 18, 1993, EPA Administrator Browner announced additional steps that would be pursued to protect public health and the environment by further encouraging reduction in the amount of hazardous wastes generated in this country and strengthening federal controls governing hazardous waste incinerators and other combustion devices. With the announcement, the Draft Hazardous Waste Minimization and Combustion Strategy (also referred to as the Draft Strategy) was released, upon which the **Agency** has sought broad national dialogue. Among other things, the Draft Strategy called for a national review of the relative roles of hazardous waste combustion and source reduction in hazardous waste management.

Since release of the Draft Strategy, the **Agency** has pursued a wide

variety of activities. For example, EPA released in May 1994 a draft technical report entitled ``Combustion Emissions Technical Resource Document''. This report provides EPA's preliminary technical analysis of best operating practices and achievable emission levels with regards to emissions of dioxin and particulate matter from existing hazardous waste incinerators, and boilers and industrial furnaces (BIFs) burning hazardous wastes, based on data already submitted to EPA. The report was also released to provide for early pre-proposal dialogue on the types of additional controls and emission limits that should be adopted for hazardous waste combustion units. In another action, the **Agency** announced its proposed permitting and public participation rule. This rule would amend EPA's RCRA regulations to provide earlier and more effective opportunities for public participation in the RCRA permitting process. The rule also proposes tighter standards for the interim period immediately after a facility trial burn is completed but before a final permit determination is made.

Today's rule provides the **Agency** with another opportunity to address the objectives of the Draft Strategy. In particular, this rule specifies a series of new treatment standards that must be met before hazardous wastes are **land** disposed. As in previous LDR rules, the standards for hazardous organic constituents are, in many cases, based on the performance of combustion technology. In the proposed rule, the **Agency** solicited comments and data on whether other treatment technologies, especially recycling technologies, can achieve these or comparable treatment levels. EPA also solicited comment on whether the levels should be modified so as to allow and encourage the use of non-combustion treatment technologies.

It remains EPA's primary objective in hazardous waste management to reduce the amount of hazardous waste that is generated so as to minimize the need to treat and dispose of hazardous waste. A wide range of waste minimization activities are underway, including development of the National Plan for Hazardous Waste Minimization released in draft on May 23, 1994 as part of the Draft Strategy. However, for those hazardous wastes that are still produced and are disposed, the waste must be treated (see RCRA section 3004(m)).

While the **Agency** has concerns with combustion devices that are not properly designed and operated, particularly if they do not fully control toxic metals and organics (including products of incomplete combustion (PICs)), the **Agency** also believes that combustion technologies, if properly designed and operated, do minimize threats to human health and the environment for many waste streams. Several commenters agree with the **Agency** on this point. In fact, these commenters (including **environmental** groups) argue that relaxing the treatment standards to reduce the amount of treatment otherwise achieved via combustion could actually increase threats to human health and the environment, and thus violate EPA's statutory requirements under 3004(m). In addition, it has also been argued that loosening the treatment standards will not necessarily result in less combustion because the regulated community may still choose to rely on combustion to meet the standards. Commenters also suggested that loosening the treatment standards will actually act as a disincentive to seek pollution prevention alternatives. This latter point seems to have merit in that based on some preliminary analysis of the **land disposal** restrictions program by the **Agency**, the existing treatment standards have raised the cost of hazardous waste management substantially and have been a factor in reducing the amount of hazardous waste generated.

To address those combustion facilities that are not operated

properly, the **Agency** will continue its aggressive inspection and enforcement program to bring the facilities back into compliance with all requirements and to impose penalties. In addition, the **Agency** is actively engaged with all interested parties in discussions on upgrading combustion regulations. EPA is considering, as part of this upcoming rulemaking, revising the controls on dioxin and furan emissions, particulate matter, and toxic metals. In the course of the rulemaking, the public will have the opportunity to comment on the **Agency**'s proposals. As noted earlier, EPA is already seeking public comment on its preparatory work for this rulemaking to upgrade combustion regulations through release of the Combustion Emissions Technical Resource Document, this past May.

Several commenters indicated that the LDR treatment standards should not be based on combustion performance because this will encourage combustion over other treatment alternatives. Although the **Agency** is willing to look at alternative technologies, such technologies must still achieve levels of performance that satisfy the dictates of RCRA section 3004(m). Also, we must have some assurance that any alternative treatment method is done safely. No information or data was provided by these commenters on the issues of the effectiveness or safety of the alternative treatment technologies or limits, or that such alternatives would be equally or more protective of human health and the environment. (As EPA has stated many times, the **Agency** specifies concentration levels as the treatment standards rather than mandated methods of treatment because this provides maximum flexibility in the selection of treatment technology that may be used.)

Several commenters also asserted that only combustion technologies can achieve the levels specified as treatment standards for organics. However, no treatability data were provided to support their general assertions. On the other hand, limited data were provided on specific alternative treatment technologies that can also achieve the treatment standards in today's rule. Therefore, the **Agency** is not convinced that the treatment standards for organics in today's rule require modification to be achievable by technologies other than combustion, and such other technologies may be used to meet these standards.

D. Relationship of LDR Treatment Standards to Risk-based Treatment Standards

The principal objection to the proposed UTS was that the values do not reflect risk, that is, the standards are based on performance of a treatment technology rather than on assessment of risks to human health and the environment posed by the waste. The debate over technology- versus risk-based treatment standards has continued throughout the development of the **land disposal** restrictions. EPA's ultimate policy preference is to establish risk-based levels that truly minimize threats to both human health and the environment. 55 FR at 6641 (Feb. 26, 1990). Such standards would cap the extent of hazardous waste treatment. RCRA section 3004(m)(1). The difficulties involved in this task, however, are formidable and very controversial. The technical issues include assessing exposure pathways other than migration to groundwater, taking **environmental** risk into account, and developing adequate toxicological information for the hazardous constituents controlled by the hazardous waste program.

The **Agency** is currently working on a rulemaking that will define hazardous constituent concentration levels below which a waste is no longer designated under RCRA subtitle C as ``hazardous.'' Discussions

concerning these levels are taking place in the Federal Advisory Committee on the Hazardous Waste Identification Rule (HWIR). The HWIR Committee is discussing issues and providing recommendations for two rulemakings: as-generated waste and contaminated media.

The HWIR Committee is made up of industry, environmentalists, treaters and disposers, and state implementing officials. The HWIR Committee has begun discussions by focusing on concentrations below which waste mixtures and treatment residuals would no longer be subject to the hazardous waste regulations (``exit criteria''), while also discussing whether there is a regulatory approach to bring under regulation clearly hazardous waste not now controlled by the hazardous waste regulations (an ``entry'' rule). In addition, EPA is working with the Committee to consider whether risk-based exit criteria or other risk-based values based on the same exposure modeling could also serve as minimize threat levels to potentially cap treatment standards for the **land disposal** restrictions.

In Hazardous Waste Treatment Council v. EPA, 886 F. 2d 355 (D.C. Cir. 1989), cert. denied 111 S. Ct 139 (1990), the court held that the statute can be read to allow either technology-based or risk-based standards, and further held that technology-based standards are permissible so long as they are not established ``beyond the point at which there is no `threat' to human health or the environment.'' Id. at 362. The court further held that the particular technology-based standards at issue were not established below this ``minimize threat'' level, notwithstanding that (in some cases) the standards were below Maximum Contaminant Levels used for drinking water under the Safe Drinking Water Act, and were below the RCRA characteristic level. Id. at 361-62. In the court's view, the RCRA section 3004(m) minimize threat standard was more stringent than that used to establish either drinking water standards or characteristic levels. EPA finds, for purposes of this rule, that none of the treatment standards are established below levels at which threats to human health and the environment are minimized. This finding stems from the **Agency**'s inability at the present time, as explained above, to establish concentration levels for hazardous constituents which represent levels at which threats to human health and the environment are minimized. Unless the **Agency** determines risk-based concentration levels that achieve the ``minimized threat'' requirement for a particular wastestream, the **Agency** believes that BDAT treatment (as reflected by the UTS levels) fulfills the statutory charge.

E. Treatment Standards for Hazardous Soil

As stated in the September 14, 1993 proposal (58 FR 48124), EPA recognizes that the treatment standards promulgated for as-generated hazardous waste may not always be achievable or appropriate for soil contaminated with that waste. EPA therefore proposed less stringent alternative treatment standards that would specifically apply to hazardous soils. In addition, EPA proposed to codify the ``contained-in'' policy for contaminated media (see 58 FR 48127). Subsequent to the proposal, the **Agency** received a number of comments from the varied constituencies (industry, **environmental**, waste treatment and state) involved in the Hazardous Waste Identification Rule (HWIR) effort for addressing contaminated media, urging the **Agency** to await the results of that effort before developing soil-specific treatment standards. Thus, EPA has decided not to promulgate alternative treatment standards for hazardous soil and the codification of the contained-in policy as

part of this rulemaking, but rather will address it as part of the HWIR effort for contaminated media. EPA announced this decision on November 12, 1993 (see 58 FR 59976) and again on March 8, 1994 (see 59 FR 10778).

The Hazardous Waste Identification Rule for Contaminated Media, which is being developed by EPA in concert with the States and with affected stakeholders, is intended to create a comprehensive regulatory framework within RCRA Subtitle C that will apply to the management of contaminated media that are managed as part of remediation activities. Through the public dialogue process, a conceptual framework has been developed for HWIR for media. As currently envisioned, the HWIR media rule will establish mandatory treatment requirements for soils (and possibly other media) that are highly contaminated, while less contaminated soils would be subject to management requirements of the overseeing regulatory **agency**. The HWIR media rule is expected to encourage national consistency in the management of higher risk media, while providing management flexibility for a significant volume of lower risk contaminated media, thereby facilitating more timely and less costly cleanups.

Although the HWIR rule for contaminated media is being developed on a different schedule than the LDR rules, EPA believes (and is supported by many commenters) that it is appropriate to address the issue of setting treatment standards for soils within the broader framework of the HWIR rule, since such treatment requirements are expected to be an integral part of that rule. In addition, EPA believes that the contained-in policy is one of the key issues that must be addressed in the development of a comprehensive regulatory framework for management of contaminated media.

In the meantime, hazardous soils are generally subject to the LDR treatment standards that apply to the hazardous wastes with which the soils are contaminated, including those addressed in today's rule.

The **Agency** has stated a presumption, however, that the treatment standards for as-generated wastes are generally inappropriate or unachievable for soils contaminated with hazardous wastes, within the meaning of 40 CFR 268.44(a) (see 55 FR 8759-60, March 8, 1990). It has been the **Agency**'s experience that contaminated soils are significantly different in their treatability characteristics from the wastes that have been evaluated in establishing the BDAT standards, and thus, will generally qualify for a treatability variance under 40 CFR 268.44. For guidance on treatability variances for soils, see the EPA Fact Sheet entitled ``Regional Guide: Issuing Site-Specific Treatability Variances for Contaminated Soils and Debris from **Land Disposal** Restrictions (OSWER Publication 9839.3-08FS). For RCRA actions, the Regional Administrator was delegated the authority to deny or grant these variances in a non-rulemaking procedure under 40 CFR 268.44(h) on April 22, 1991. These variances may be granted by State agencies in States authorized for Sec. 268.44. Variance authority for CERCLA actions is discussed in LDR Guides 6A (revised Sept. 1990) and 6B (OSWER 9347.3-06FS and 9347.3-06BFS).

As previously noted, EPA chose not to develop separate treatment standards for soils in this rulemaking, and currently plans to address treatment standards for contaminated soils in the context of the Hazardous Waste Identification Rule (HWIR) for contaminated media, which is currently under development. If, however, the HWIR Contaminated Media rule does not sufficiently address treatment standards for contaminated soils in a timely manner, the **Agency** may promulgate such standards in a separate rulemaking. Information on the

HWIR Contaminated Media rule may be obtained by contacting Carolyn Loomis, at (703) 308-8626.

Until LDR standards specific to soils are promulgated, EPA believes that treatability variances will generally be appropriate when hazardous soils are managed as part of site remediation activities. The **Agency** recognizes, however, that in some cases obtaining a treatability variance as provided under Sec. 268.44 could cause delays in implementing remedial actions. The **Agency** is currently considering whether changes to the existing variance or authorization procedures should be made as a means of expediting cleanup actions that are conducted under RCRA or other Federal or State authorities, or other cleanups initiated by responsible parties. Such changes, if necessary, will be addressed in a future rulemaking.

II. Summary of Rule

A. Treatment Standards for Newly Identified Organic Toxicity Characteristic (TC) Wastes

On March 29, 1990, EPA promulgated a rule that identified organic constituents (in addition to existing EP metals and pesticide constituents) and levels at which a waste is considered hazardous based on the characteristic of toxicity (55 FR 11798). Because these wastes were identified as hazardous after the enactment date of HSWA in 1984, they are ``newly identified wastes'' for purposes of the LDR program. Included are wastes identified with the codes D018 through D043 based on the toxicity characteristic leaching procedure (TCLP), i.e., TC wastes. EPA is establishing treatment standards for each of these constituents if they are managed in systems other than those regulated under the Clean Water Act (CWA), those engaging in CWA-equivalent treatment prior to **land disposal**, and those injected into Class I deep injection wells regulated under the Safe Drinking Water Act (SDWA). (For an explanation of these qualifications, see the May 24, 1993 Interim Final Rule (58 FR 29860).) In addition, because wastes exhibiting the toxicity characteristic (TC) can contain treatable levels of other hazardous constituents, EPA is establishing treatment standards for the underlying hazardous constituents, as defined in 268.2(i). These rules are consistent with the court's opinion in Chemical Waste Management v. EPA, 976 F.2d 2, 17-8 (D.C. Cir. 1992), cert. denied 113 U.S. 1961 (1993), which held that all hazardous constituents in characteristic wastes must meet the levels of performance satisfying the requirements in RCRA 3004(m) before **land disposal**, and that treatment standards cannot be achieved by dilution (provided, of course, that treatment standards are not established below the level at which threats to human health and the environment are minimized).

B. Prohibition of Dilution of High TOC Ignitable and of TC Pesticide Wastes Injected Into Class I Deep Wells

In its ruling on the Third Third LDR Rule, the D.C. Circuit Court of Appeals remanded the portion of the **Agency**'s rule allowing treatment standards for characteristic wastes to be achieved by dilution. The **Agency** is continuing to develop a regulatory response to implement the court's ruling. As part of that response, EPA is today requiring that hazardous constituents in two types of characteristic wastes, high total organic carbon (TOC) ignitable liquids (D001), and halogenated

pesticide wastes that exhibit the toxicity characteristic (D012-D017), be fully treated before those wastes are disposed unless the wastes are disposed in an injection well that has a no-migration variance.

The **Agency** believes that treatment of these particular wastestreams is warranted. (See Section VIII--Deep Well Injection Issues for further discussion.) The D001 wastes are ignitable with potentially high concentrations of hazardous constituents, and the pesticide wastes contain particularly toxic constituents. Further, the organics in D001 high TOC liquids can be recovered, destroyed, or used as a fuel and occur in only small volumes so that segregation and treatment should not prove difficult.

C. Treatment Standards for Newly Listed Wastes

EPA has promulgated a number of hazardous waste listings since the enactment of HSWA in 1984, referred to as ``newly listed wastes'' under the LDR program. This rule describes the treatment technologies (recycling is a type of treatment) identified as BDAT for several of these newly listed wastes, and establishes treatment standards based on these BDATs. Newly listed wastes included in today's rule are K141-K145, K147-K148, and K149-K151 (coke by-product production wastes and chlorotoluene wastes) (see 40 CFR 261.32 for a description of these wastes).

D. Universal Treatment Standards

Today's rule promulgates universal treatment standards (UTS) for organic, metal, and cyanide constituents--one set for wastewaters and a different set for nonwastewaters--that replace existing treatment standards for hazardous wastes. (``Replace'' is something of a misnomer, as explained more fully below, since many of the standards actually remain at current levels, and the rule does not require treatment of hazardous constituents not already regulated under current standards.) Currently, facilities managing hazardous wastes must meet LDR treatment standards established for many different listed and characteristic hazardous waste codes before the waste may be **land** disposed. In some cases, a constituent regulated under the treatment standard for one waste was also regulated in another waste at different concentration levels. Today's rulemaking eliminates these differences in concentration limits for the same constituent to provide a better assessment of treatability, reduce confusion, and ease compliance and enforcement. Promulgation of UTS does not change the constituents of concern regulated in listed wastes--that is, if only cadmium, lead and chromium have been regulated in a listed waste, only cadmium, lead and chromium are subject to regulation now that UTS are promulgated. However, the concentration levels for cadmium, lead and chromium now are numerically identical with UTS for those constituents.

E. Modifications to Hazardous Waste Recycling Regulations

The **Agency** is modifying the regulatory framework to the definition of solid waste to allow environmentally beneficial recycling operations to continue without the regulatory impediments imposed by full RCRA Subtitle C requirements. In turn, this will allow EPA and the states to streamline their efforts and better focus on operations that are part of the nation's waste **disposal** problem, rather than on those that are not, while the **Agency** continues to look at the overall definition.

These modifications will broaden the 40 CFR 261.2(e)(1)(iii) ``closed-loop'' recycling exclusion from the definition of solid waste such that the residues of a secondary process are excluded from being a solid waste if they are reinserted into the process without prior reclamation (and also similarly broaden the related 40 CFR 260.30(b) variance for materials that are reclaimed prior to reinsertion). These provisions will put secondary recovery operations that recycle residues which they generated on the same regulatory footing as primary recovery operations. The modifications are based, in part, on two Court opinions (American Petroleum Institute v. EPA, 906 F.2d 726 (D.C. Cir. 1990) (API) and American Mining Congress v. EPA, 907 F. 2d 1179 (D.C. Cir. 1990) (AMC II)) which indicate that the **Agency** has some discretion to consider the manner in which a secondary material is managed in determining RCRA jurisdiction (i.e., RCRA jurisdiction may be determined, at least in part, by consideration of whether the material is part of the waste management problem, as indicated by the potential for the material to pose a hazard to human health and the environment when recycled).

III. Improvements to the Existing **Land Disposal** Restrictions Program

A. Background

``Our goal is to make the entire federal government both less expensive and more efficient . . . we intend to redesign, to reinvent, to reinvigorate the entire national government.''

President Bill Clinton Remarks Announcing the National Performance Review, March 3, 1993

``We are searching for ways to change--to work better and smarter so that the **Agency** can deliver high quality results at a reduced cost. Our aim is to treat citizens as customers, improve the service and delivery of our programs, and eliminate waste and inefficiency.''

From ``Creating A U.S. **Environmental Protection Agency** that Works Better And Costs Less'' (EPA's National Performance Review Phase I Report)

In the past several years, the EPA has embarked on major efforts to improve the quality of its work in protecting human health and the environment. Coincident with this emphasis on improvement in the way its work is done, the **Agency** is striving to help reinvent government, in part by streamlining its organization and its work in order to be more efficient and save public resources. In that spirit, a major part of today's rule is designed to improve the quality and efficiency in the **Land Disposal** Restrictions Program. The measures promulgated today to improve the Program received widespread support from commenters when they were proposed.

The universal treatment standards, described in detail in the next section, greatly simplify both compliance and enforcement with the LDRs, without sacrificing **protection** of the environment or human health. In particular, the rule replaces the myriad constituent concentration levels in the LDR treatment standards for most hazardous wastes with a uniform set of constituent levels. Thus, the treatment standard concentration for a constituent in waste A will be the same concentration as for that constituent in waste B. As a result,

hazardous waste generators and treaters should be able to save money and effort in treating hazardous wastes. These facilities will be able to operate more efficiently by consolidating treatment activities. One facility, for example, estimated an annual savings of $750,000 from not having to campaign treat their wastes with varying limits. The consistency provided by universal treatment standards will make it easier to comply with the LDRs. Likewise, the universal treatment standards will make the job of enforcement easier for state governments. With universal treatment standards in place, it will also be easier and quicker for EPA to set standards for hazardous wastes identified in the future (assuming those standards are feasible and appropriate for newly identified and listed wastes). The end result for the regulated community, states, and the EPA will be to save resources for other pressing tasks.

While establishment of universal treatment standards is the primary improvement, other improvements are also included in today's rule. In particular, the **Agency** is:

<bullet> Consolidating three separate tables containing treatment standards into a single consolidated table;

<bullet> Reducing the information required on notification forms;

<bullet> Simplifying the regulations for treatment of lab packs;

<bullet> Providing easy-to-read flowcharts and a simple guide to paperwork requirements in order to make the rule's requirements clearer and easier to implement.

Although today's rule takes significant steps in improving the **Land Disposal** Restrictions program, the **Agency** recognizes that further, in fact continuing, improvement is necessary. Some of the universal treatment standards (such as cyanide) will need to be reassessed upon completion of **Agency** efforts to improve the analytic test method. HWIR will need to be integrated into the **Land Disposal** Restrictions. The **Agency** is also on a firm track of pursuing other avenues for continuous quality improvement in the program. Ideas and suggestions for improvements have, and will, come from: (1) Advance Notices of Proposed Rulemaking published by EPA in order to acquire as much information as possible from the public about treatment options; (2) communications between EPA and its customers representing **environmental** groups, generators, and treaters; and, (3) the LDR Program evaluation that is currently being conducted, which was initiated by a public roundtable discussion with a large number of customers. Consequently, the **Agency** will continue to take advantage of opportunities to streamline and improve the LDR program.

B. Universal Treatment Standards

The EPA is promulgating a single universal treatment standard (UTS) for each constituent in nonwastewater form and a single UTS for each constituent in wastewater form, regardless of the hazardous waste containing the constituent.

1. Identification of Wastes to Which Universal Treatment Standards Apply

The universal treatment standards apply to all listed and characteristic wastes for which treatment standards have been promulgated, with two exceptions. The first exception is the TC metal wastes (D004-D011). These metal wastes will be addressed in the future Phase IV LDR rule. (It should be noted that the mineral processing wastes which were formerly excluded from RCRA Subtitle C regulation under the Bevill Amendment are considered to be newly identified and

will also be addressed in Phase IV.) The second exception is those for which the treatment standard is a specified method of treatment. Most of these wastes must continue to be treated using those required technologies. For a small number of wastes with previously specified methods of treatment, the universal standards are an alternative, i.e. either use of the specified method or the universal standard will satisfy the LDR requirement. For those few situations where a mixture of wastes may be subject to different standards for the same constituent, the more stringent standard continues to apply. See Sec. 268.41(b).

Although the proposed rule excluded F024 from the UTS, EPA is applying UTS to F024 in today's rule. The existing standards, which were unique among standards set for F- or K-listed wastes, incorporated numerical treatment standards and also mandated a specific technology--incineration. The original F024 numerical standards for metals were also exceptionally low, reflecting the fact that F024 contains only low levels of metals.

However, comments from Dow Freeport indicated that the low F024 metal limit needlessly prevented them from co-treating wastes, a process that could save the facility $750,000/year, and that application of UTS solved this problem without diminishing the extent of treatment. EPA agrees, and is applying UTS to F024 in this rule while continuing to require incineration.

UTS apply to underlying hazardous constituents in characteristic wastes that are subject to LDRs. Apparent confusion in several comments leads the **Agency** to clarify that UTS will apply to the F039 waste code, the code for multi-source leachate. EPA used the F039 levels in the May 1993 Interim Final Rule as treatment standards for underlying hazardous constituents in certain decharacterized D001 and D002 wastes (58 FR 29885). Consequently, UTS levels and F039 standards are identical, with the exception of those few constituents regulated in F039 but not in UTS. This means that the Interim Final Rule requirement that underlying hazardous constituents in certain D001 and D002 wastes meet F039 levels is now one and the same thing with the requirement that underlying hazardous constituents meet UTS. (The term ``underlying hazardous constituents'' is defined at 268.2(i)).

2. Differences in Universal Treatment Standards and Previous Treatment Standards

In most cases (59%), UTS are the same as the previous treatment standards. Thirty three percent of the standards went up or down within a factor of ten of the original standard, while 8% underwent larger changes (3% of the total number of UTS becoming significantly more stringent). The following table lists the differences between the UTS and previous standards.

Table 3.--Comparison of Universal Treatment Standards to Previously Promulgated Treatment Standards

Parameter	Wastewater forms	Nonwastewater forms
Total Number of Constituent/Waste Code Combinations	938	924
Number of Combinations Unchanged by the		

Universal Treatment Standards.....	677	416
Number of Combinations for which the Universal Treatment Standards are Slightly Less Stringent\1\.....	138	209
Number of Combinations for which the Universal Treatment Standards are Slightly More Stringent\1\.....	76	199
Number of Combinations for which the Universal Treatment Standards are Significantly Less Stringent\2\.....	17	80
Number of Combinations for which the Universal Treatment Standards are Significantly More Stringent\2\.....	30	20

\1\The change is less than a factor of ten greater or less than the previously promulgated standard.
\2\The change is a factor of ten or more greater or less than the previously promulgated standard.

This numerical comparison somewhat exaggerates the degree of change. The changes in numerical values for many of the organic constituents reflect adjustments in the limits of analytic detection. Actual treatment will consequently likely continue to destroy or remove organics to nondetectable levels. It also is important to note that even in those cases where numerical limits have changed, the technology basis has not. Treatment technology used to comply with the previous standards should also be able to comply with UTS. Again, because most treatment technologies cannot be so precisely calibrated as to achieve, for instance, 3.5 ppm rather than 2.7 ppm, the likely result is that the same amount of treatment will occur. The main impact of UTS will be in simplifying compliance.

EPA also notes that very few of the commenters who complained about treatment standards being unachievable provided data to support their claims. Because most of the wastes subject to UTS are already subject to LDR treatment requirements, there should be data documenting treatment performance of these wastes that commenters could have submitted. EPA believes, therefore, that the absence of substantiating data cannot be attributable to commenters' inability to generate treatment data. (The situation differs from the state of affairs at the beginning of the **land disposal** restrictions program when there was little existing treatment data to draw upon, because many hazardous wastes were being disposed untreated, and there was little time to generate such data.)

For discussion of comparison between the UTS and previous standards for nonwastewater metal constituents, see section III.B.5.a. of this preamble.

3. Universal Treatment Standards for Organic Hazardous Constituents

EPA is today promulgating UTS for nonwastewater and wastewater forms of organic hazardous constituents, as found in the two tables in this section.

a. Analyte Combinations

Motivated by concern for analytical feasibility, EPA proposed that several groups or pairs of analytically similar organic compounds be regulated as the sum of their concentrations rather than as individual

analytes. Commenters supported these proposals as a simplification of analytical procedures, particularly the proposed total PCB standards for arochlors. Thus, today's rule regulates each of these groups or pairs collectively by setting wastewater and nonwastewater numbers representing their sums rather than individual concentrations. Specific analytes to be regulated with one wastewater and nonwastewater number are: PCBs (arochlors), xylenes, benzo(b)fluoranthene/ benzo(k)fluoranthene and diphenylamine/diphenylnitrosamine.

PCBs: Today's approach for PCBs is consistent with the regulations of other EPA offices, such as those promulgated pursuant to the Toxic Substance Control Act (TSCA). This approach will also eliminate analytical difficulties in quantifying each of the individual arochlors.

The ``Total PCB'' standards include seven arochlors that represent hundreds of isomers of polychlorinated biphenyls. Earlier LDR regulations addressed individual arochlors and required recognition of a gas chromatograph pattern which is often difficult to differentiate. Furthermore, regulation of individual arochlors may be difficult for wastes subject to degradation or treatment. EPA recommends SW-846 methods 8080 or 8081 (which use a gas chromatograph/electron capture detector) for measurement of total PCBs.

Xylenes: Similarly, today's rule regulates the sum of several xylene isomer analytes in both wastewaters and nonwastewaters. The three xylenes included on the BDAT list of hazardous constituents are ortho-, meta-, and para-xylene. Meta- and para-isomers co-elute in gas chromatograph analysis. Two methods exist in SW-846 for the measurement of total xylenes: 8020 and 8240. Method 8020 detects xylenes using a photoionization detector and 8240 uses a mass spectrometer. Total xylenes concentration is determined from the addition of the ortho-xylene concentration and the meta-/para-xylene concentration.

Benzo(b)fluoranthene/Benzo(k)fluoranthene and Diphenylamine/ Diphenylnitrosamine: EPA is also regulating two pairs of analytically problematic constituents, benzo(b)fluoranthene/ benzo(k)fluoranthene and diphenylamine/diphenylnitrosamine with a single wastewater and nonwastewater number for each pair.

b. Organics--Nonwastewaters

i. The Universal Treatment Standards Promulgated in Today's Rule

EPA is promulgating UTS for organics in nonwastewaters as proposed with the exception of the standards for m- and p-cresols. These are the only organic constituents for which commenters provided data supporting changes to the proposed UTS. Although organic nonwastewater UTS differ in some cases from the previously promulgated standards, the same technology basis, combustion, can meet the limits. In the previous standards as well as the UTS, the organic standards are based on a detection level in a combustion residue (adjusted upward by a variability factor accounting for analytic and process variability). Differences between UTS and previous standards reflect a more consistent assessment of achievable detection levels for various constituents in combustion residues, and continue to be achievable using BDAT, combustion. Because the essential technical issue at the heart of these adjustments is the value of the detection limit, most of these changes reflect analytical artifacts rather than absolute differences in the quantities of toxics available for release following **land disposal**.

ii. Modifications to Universal Treatment Standards Made in Response to Comments

A petroleum refiner involved in building a biological treatment system submitted data on organic nonwastewaters, and indicated their concern about the lower treatment standards for certain organic constituents that were proposed as UTS. The **Agency** evaluated the commenter's data and found, in some cases, the commenter was requesting that UTS levels be set at levels higher than the maximum levels in their untreated wastes. Furthermore, the commenter's data did not represent proper monitoring. The **Agency** was able to determine from their data, however, that one limit, the proposed m- and p-cresol limit, should be raised from 3.2 mg/kg to 5.6 mg/kg. This adjustment is based on other factors described below.

The proposed UTS for m- and p-cresol was 3.2 mg/kg, which differed from the proposed UTS for o-cresol, which was 5.6 mg/kg. Today's rule promulgates 5.6 mg/kg for both o-cresol and m- and p-cresol. The proposed limits for cresols were based on a detection limit of 2 mg/kg for o-cresol and 1 mg/kg for m- and p-cresol from an incinerator ash study used to develop nonwastewater standards in the Third Third rulemaking. The differences in detection limits occurred because EPA used different treatment tests to set the limits for o- versus m- and p-cresol. Examination of the same test runs revealed that where o-cresol had a detection level of 2 mg/kg, the detection level for m- and p-cresol was also 2 mg/kg. In addition, where the detection level for m- and p-cresol was 1 mg/kg, the detection level for o-cresol was also 1 mg/kg. Upon further review of other data, the **Agency** observed that within a test, o-cresol and m- and p-cresols had the same detection levels. The numbers for o-cresol and m- plus p-cresol promulgated in today's rule were calculated with the same detection limit, as justified by the data review, and the same recovery factor. The resulting identical treatment standards reflect the fact that incineration treats both of these isomer groups to the same level, within the existing analytical constraints.

iii. Use of Alternative Treatment Technologies to Combustion

In establishing numerical treatment standards, the **Agency** allows the use of any technology (other than impermissible dilution) to comply with the limits. Some previous standards, namely those for petroleum refining wastes, were based on combustion as well as thermal desorption and solvent extraction. Under UTS, organic nonwastewater standards are based on and achievable by combustion. As for other technologies, EPA assessed whether the changes in limits disrupted commitments made to use these other technologies. With regard to thermal desorption, EPA examined comments on the proposed levels by three 'vendors of thermal desorption units (Seaview Thermal Systems (STS), Separation and Recovery Systems, Inc. (SRS), and Ecova (formerly Waste Tech Services)), BDAT Background Development Documents for treatment standards applicable to petroleum wastes, the Marathon delisting petition, and other available literature.

These data demonstrate the achievability of UTS by thermal desorption for petroleum refining wastes. This was an expected result, given the comments on the Phase I LDR rule which addressed F037 and F038 petroleum refining wastes. In these comments, a thermal desorption company called for limits lower than today's UTS limits (these data

reflected lower detection levels, not necessarily better treatment than today's UTS). Also important in the use of thermal desorption are the operating conditions: raising the temperature, and/or the detention time increases the amount of hazardous organic constituents desorbed.

As for solvent extraction, the data used for development of the K048-K052 treatment standards achieved UTS levels for about half of the demonstration runs. Operating conditions, such as solvent selection, solvent to waste ratios, detention time, and number of treatment passes significantly affect treatment results, and the **agency** believes these parameters can be adjusted to comply with the UTS. There may, however, be other factors which result in this technology not being selected, and based on information available to the **Agency**, no petroleum refining facilities are utilizing solvent extraction.

EPA requested comments on the achievability of the proposed UTS for petroleum refining wastes when treated via noncombustion technologies. (See 58 FR 48106-48107.) EPA also requested comments on whether the industry has invested in non-combustion technologies, including those designated as BDAT in previous rules that cannot meet the UTS. In particular, EPA requested information on the type of treatment, performance data, and an explanation of why existing treatment could not be adjusted and operated more efficiently to comply with the UTS. EPA also pointed out it was willing to revise the proposed UTS, if data indicated that appropriate noncombustion technologies could achieve slightly higher levels than those proposed for UTS.

Only one commenter, Valero, Inc., submitted comments with regard to a contractual agreement for the construction of a full scale bioslurry reactor and data from a bench scale treatability study. None of the other petroleum refining commenters indicated they had invested in noncombustion technologies. Valero, Inc., and two remediation companies, Retec Technologies and OHM Corporation, submitted data on biotreatment of organic constituents. They reported treatment efficiencies from 40 to 60 percent for some PNAs and questioned whether the proposed treatment standards can be routinely achieved by biotreatment technologies. EPA does not generally consider such treatment efficiencies adequate for organic constituents. As indicated previously, facilities can use any technology other than impermissible dilution to comply with the treatment standards. If design and operating conditions can be adjusted to meet the limits, this could be full compliance. If not, the technology may still be appropriate for remediation wastes, for which standards are currently being revised in the development of HWIR.

\1\CAS means Chemical Abstract Services. When the waste code and/or regulated constituents are described as a combination of a chemical with it's salts and/or esters, the CAS number is given for the parent compound only.
\2\All concentration standards for nonwastewaters are based on analysis of grab samples.
\3\4.8 mg/l TCLP.
\4\0.75 mg/l TCLP.
\5\0.75 mg/l TCLP.
Note: NA means not applicable.

c. Organics--Wastewaters

i. The Universal Treatment Standards Promulgated in Today's Rule

The set of wastewater UTS proposed in September 1993 was virtually identical to the F039 wastewater standards promulgated in the Third Third Rule. Applying UTS to F- and K- listed wastes changes organic constituent wastewater standards in a handful of codes (F024, K001, K011/13/14, K015, K040, K038, K036, K037, K060, K099, K103/104, and U051). Commenters raised specific concerns with three of the organic wastewater treatment standards, and EPA is revising the proposed standards for two of the three constituents: the wastewater standard proposed for carbon disulfide will change from 0.014 mg/l to 3.8 mg/l, and the proposed wastewater universal treatment standard for 1,4-dioxane has been withdrawn. Changes to the treatment standards for these two constituents is explained in the following section. The third constituent was acetonitrile. Monsanto, Dupont, Cytec and other acrylonitrile producers, together with the Chemical Manufacturing Association's Acrylonitrile Group, objected to EPA extending the UTS to acrylonitrile production wastes K011, K013 and K014. Their comments stated that the acetonitrile wastewater UTS was unachievably low in acrylonitrile wastes. The **Agency** is promulgating an acetonitrile UTS of 5.6 based on steam stripping performance data. This level also appears achievable by WAO (wet air oxidation) followed by PACT@ (a combination of powdered activated carbon treatment and activated sludge).

ii. Treatment Standard Modification Made in Response to Comments

Carbon Disulfide. In response to data submitted by the Chemical Manufacturer's Association's Carbon Disulfide Task Force, EPA is promulgating a treatment standard of 3.8 mg/l based on data submitted by several facilities which generate high concentrations of carbon disulfide in wastewaters. The proposed wastewater treatment standard (0.014 mg/l) was based on one data point for biological treatment. After receiving substantially more treatment data representative of more significant influent concentrations, EPA is promulgating a carbon disulfide wastewater number of 3.8 mg/l, based on the performance of activated sludge at one of the facilities generating carbon disulfide.

1,4-Dioxane. Eastman Chemical reported that serious analytical problems, namely wide variation in detection limits, precluded reliable and accurate quantification of 1,4-dioxane. After reviewing detection limit data, EPA decided to withdraw the wastewater treatment standard for 1,4-dioxane pending technical resolution in a later rule. This decision changes the treatment standard for U108 (1,4-dioxane) wastewaters. Formerly the wastewater treatment standard was 0.12 mg/l; today's rule promulgates a method of treatment as a standard for U108 wastewaters, namely wet air oxidation or chemical oxidation followed by carbon adsorption or incineration.

\1\CAS means Chemical Abstract Services. When the waste code and/or regulated constituents are described as a combination of a chemical with its salts and/or esters, the CAS number is given for the parent compound only.
\2\Concentration standards for wastewaters are expressed in mg/l are based on analysis of composite samples.
Note: NA means not applicable.

5. Universal Treatment Standards for Metal Hazardous Constituents

EPA is promulgating UTS for both the nonwastewater and wastewater forms of each of the 14 BDAT list metal constituents. The standards are found in the table ``Universal Treatment Standards for Metal Constituents'' at the end of this preamble section. These UTS will replace the existing metal constituent treatment standards for all listed wastes, and will constitute applicable levels for underlying hazardous metal constituents in ignitable, corrosive and TC organic wastes. They do not apply to wastes exhibiting the toxicity

characteristic due to metal constituents, i.e., waste codes D004-D012, nor do they replace the treatment standards promulgated in the Third Third rule for EP metals. Wastecodes D004-D012 will be addressed in an upcoming rulemaking.

a. Nonwastewaters

The nonwastewater UTS for 12 of the 14 metal constituents are based on the performance of high temperature metal recovery (HTMR) or stabilization. The remaining two metals are arsenic for which the standard is based on vitrification, and mercury, which standard requires recovery by roasting or retorting for certain highly concentrated mercury wastes. As always, when the **Agency** develops concentration-based treatment standards, the use of other technologies to achieve those standards is allowed.

The following table presents a comparison of the previously promulgated standards with the UTS.

Comparison of UTS Nonwastewater TCLP Concentrations Versus Previous Standards for Metals

Previous standards being replaced	Final UTS NWW standards (TCLP)	Old level	Waste codes
Antimony	2.1	2.1	K061

Note: Constituents are actually regulated only if the treatment standard specifically requires it (for listed wastes, or constituents are reasonably expected to be present (underlying hazardous constituents in characteristic wastes).

Commenters objected to the proposed levels and provided treatment data for only two metal limits, chromium and mercury. The **Agency** revised the proposed treatment standards for chromium and mercury as described later in this section. For the other UTS metal constituents the **Agency** promulgated standards as proposed.

For four of these metals beryllium, thallium, vanadium and zinc, the previous standards limited the metal at one level, which was proposed and promulgated for UTS.

For four other metals, antimony, cadmium, nickel and silver, the **Agency** proposed and promulgated the UTS level at the highest of the previous standards. This occurred based on the best data for the most difficult to treat wastes. Commenters did not submit new data supporting lower limits for these constituents. While the limits for some waste codes are raised, EPA considered the following factors:

(1) A broader assessment of the treatment data;

(2) Some of the low/previous metal standards simply reflected low levels in the untreated wastes;

(3) Regulation of other metals for a waste code, namely those that are present in significantly high concentrations, will control design and operations of the treatment technology.

For the remaining four metals, arsenic, barium, lead and selenium, the **Agency** did not propose or promulgate the UTS at the highest previous standard. Commenters did not submit data on these metals. The justification for rejecting lower levels are the same as those presented for antimony, cadmium, nickel and silver in the preceeding discussion. For these metals, EPA did not choose the highest previous standard; rather, the standard for the most difficult to treat waste was selected and it achieved a lower standard than the highest previous standard.

In addition to the above consideration, the **Agency** considered matrix effects. In setting the nonwastewater metal limits, EPA has examined the most difficult to treat wastes; therefore, if a matrix relationship exists, other wastes should more easily meet the limits. If there exists a waste that can not meet the limits, the **Agency** has a treatability variance process to address those instances. It appears that HTMR is matrix independent, consistently achieving the same level of treatment performance as measured in the residuals, regardless of the influent matrix composition. With regard to matrix effects on stabilization, adjustments to the type and quantity of stabilizing agents can greatly compensate for matrix effects.

The UTS standard for chromium (Total) was proposed to be 0.33 mg/l in the TCLP extract based upon the K061-HTMR treatment standard data. One commenter (Occidental Chemical), objected to the proposed limits and supplied stabilization data for chromium. They indicated through 85 data points that they could achieve a level of 0.58 mg/kg. The **Agency** evaluated treatability data from various sources, including Occidental Chemical and previously promulgated waste codes. These evaluations compared analyses of performance data between untreated and treated concentrations of metal waste. From this treatability data the **Agency** selected the most difficult to treat waste. It was determined that the waste criteria selected was submitted by Cyanokem for F006 during the promulgation of the Third Third rule (June 1, 1990). This waste was a composition of stripping liquids, plating operations, pelletizing operations, and clean out wastes from plating tanks. The data sets involving the most difficult to treat waste were used to calculate the limit of 0.86 mg/l TCLP. The other data sets, including those from the comments, generally achieved the 0.86 mg/l TCLP. The treatment results that did not meet the levels may be due to treatment being designed to only meet the characteristic levels. It is the **Agency**'s belief that with the use of a more effective stabilization process, a lower level could be achieved, as demonstrated by the fact that a more difficult to treat waste attained the level of 0.86 mg/l TCLP. Therefore, the **Agency** is promulgating the treatment standard of 0.86 mg/l TCLP.

EPA proposed UTS for low mercury subcategory nonwastewaters (containing less than 260 mg/kg total mercury) at 0.009 mg/l TCLP. Many commenters expressed concern over this standard. EPA has reconsidered the proposed UTS for mercury and is promulgating standards as follows: 0.200 mg/l TCLP for low subcategory retort residues, and 0.025 mg/l TCLP for other low subcategory nonwastewaters. (The existing treatment standard for high subcategory mercury nonwastewaters (concentration greater than 260 mg/kg) is already RMERC, i.e., recovery of mercury by retorting or roasting. This treatment standard is unaffected by today's rule.) Comments and EPA's responses are summarized below.

Several commenters expressed the belief that the current treatment

standards for K106, D009, and K071 wastes should remain in effect. These commenters submitted data from the analysis of retorted mercury waste to support the claim that the proposed UTS for mercury is not achievable by retorting, the recognized BDAT for K106 and D009 wastes. These data consisted of total and TCLP analyses of 109 residue samples from retorted K106 and D009 wastes. Although 23 of these samples contained greater than 260 mg/kg total mercury and would therefore require further retorting, of the remaining 86 samples, 18 contained greater than 0.009 mg/l mercury by TCLP, the proposed UTS for mercury nonwastewaters. All 86 samples contained less than 0.15 mg/l mercury by TCLP. These data support the commenters' position that the proposed UTS for mercury is not achievable by properly operated BDAT treatment technology (e.g., RMERC).

Further examination of available data has convinced the **Agency** that the proposed nonwastewater standard was too low. The basis for the proposed UTS for metal nonwastewaters, which was data from the treatment of K061 by high temperature metal recovery (HTMR), is not appropriate for mercury wastes. K061 waste does not typically contain large quantities of mercury and HTMR facilities do not accept wastes containing high concentrations of mercury. EPA has therefore decided not to promulgate the proposed nonwastewater standards, and instead to apply the existing treatment standards for K071, K106, P065, P092, and U151 as the UTS for mercury nonwastewaters. This is appropriate, since mercury is the most significant constituent in these wastes, and BDAT for these wastes is particularly directed to treating mercury. The **Agency** continues to believe that the revised limits for mercury and 12 other metal constituents in K061 provide adequate assurance that BDAT will occur for K061. Thus, the universal treatment standards for low subcategory mercury wastes will be 0.20 mg/l mercury by TCLP for retort residue nonwastewaters, and 0.025 mg/l mercury by TCLP for other low subcategory nonwastewaters.

The following table is a compilation of the final metal universal standards for nonwastewaters.

Universal Treatment Standards for Metal\1\ Hazardous Constituents
[Nonwastewaters]

Regulated constituent	Maximum for any single grab sample TCLP (mg/l)
Antimony	2.1
Arsenic	5.0
Barium	7.6
Beryllium	0.014
Cadmium	0.19
Chromium (Total)	0.86
Lead	0.37
Mercury--retort residues	0.20
Mercury--not retort residues	0.025
Nickel	5.0
Selenium	0.16

Silver	0.30
Thallium	0.078
Vanadium	0.23
Zinc	5.3

\1\Treatment standards for cyanide wastes are discussed in the next preamble section.

b. Wastewaters

The metal UTS for wastewaters are based on chemical precipitation as BDAT. Depending on the initial concentration of metal constituents in the wastewater, operating conditions such as retention time, flocculating agents, reagent concentrations such as iron to affect solubility of other metals, and mixing may need to be adjusted to comply with the standards.

The following table presents the UTS metal wastewater limits, and the previous limits. Changes to the proposed metal standards occurred in two areas: use of Office of Water Metal Finishing limits, and an adjustment of the proposed vanadium limit. These changes are explained following the table.

Comparison of UTS Wastewater Concentrations Versus Previous Standards for Metals

	Final	Previous standards	
	UTS	Old level	Waste codes
Antimony	1.9	.....	K061
		0.60	K021
		1.9	F039

Zinc	2.61	1.0	F039

In the proposal, EPA solicited comments on changing the limits for cadmium, chromium, lead, nickel, silver, and zinc to those used in the Office of Water's Metal Finishing Effluent Guidelines. These standards represented a more comprehensive database, addressed many more facilities, and represented the most difficult to treat waste. Although none of the commenters submitted data, they (commenters) supported the use of the Metal Finishing standards as the UTS wastewater treatment numbers. We are adopting the metal wastewater limits used for the Effluent Guidelines for the Metal Finishers Point Source category for cadmium, chromium, lead, nickel, silver and zinc for the reasons outlined above.

The **Agency** received comments, but no data, that the proposed vanadium limit of 0.042 was unachievably low. At the proposed level, vanadium would be the most stringent regulated metal. With little data supporting the proposed level, the **Agency** tried to follow up with commenters and other sources to obtain data. Wastewater with significant vanadium is rare, and EPA's efforts yielded limited data supporting a level of 4.3 mg/l. This level is within the range of other metal limits, and is achievable, based on the data availability. While the **Agency** would have preferred having more data for vanadium, the UTS is set at 4.3 mg/l. If the few facilities that have significant vanadium wastewaters can not meet this limit, EPA's treatability variance process is available. Also, the **Agency** would be willing to reassess this limit in a future rule, if data are submitted which

supports a change in this standard.

For all other metal wastewater UTS--antimony, arsenic, barium, beryllium, mercury, selenium and thallium--EPA is promulgating limits as proposed. The data used for UTS reflect, for each of these metals, the best data available. With the possibility of more wastewaters being treated to comply with LDR standards--particularly characteristic wastewaters that heretofore have been decharacterized and whose underlying hazardous constituents may not have been treated, EPA has made a determined effort in this rulemaking to base treatment standards on the best data available, which data reflects a wide variety of wastewaters. Although the UTS are in some cases higher than existing limits, EPA believes that these existing lower limits, in many cases, reflected low levels of metals in untreated wastes. In addition, wastewater standards, to date, have not had direct effect on many wastes, because most hazardous wastewaters are either treated in tanks and discharged, managed in Sec. 3005(j)(ii) impoundments, injected into Class I hazardous deep wells which have received no-migration variances, or decharacterized, and so are not subject to these lower standards.

The following table is a compilation of final metal universal treatment standards for wastewaters.

Universal Treatment Standards for Metal\1\ Hazardous Constituents
[Wastewaters]

Regulated constituent	Maximum for any single grab sample (mg/l)
Antimony	1.9
Arsenic	1.4
Barium	1.2
Beryllium	0.82
Cadmium	0.69
Chromium (Total)	2.77
Lead	0.69
Mercury	0.15
Nickel	3.98
Selenium	0.82
Silver	0.43
Thallium	1.4
Vanadium	4.3
Zinc	2.61

\1\Treatment standards for cyanide wastes are discussed in the next preamble section.

6. Universal Treatment Standards for Cyanide Wastes

For the nonwastewater forms of cyanide wastes, EPA is promulgating the UTS as proposed: 590 mg/kg (total cyanide) and 30 mg/kg (amenable cyanide). For wastewaters, EPA is promulgating the UTS: 1.2 mg/l (total cyanide) and 0.86 mg/l (amenable cyanide). These wastewater standards differ from those that were proposed (see section b of the cyanide UTS discussion below). The cyanide wastewater and nonwastewater UTS are based on the treatment of wastewaters via alkaline chlorination.

EPA is also codifying in 40 CFR 268.40 that compliance with the cyanide nonwastewater UTS requires the use of EPA SW-846, Test Methods 9010 and 9012, along with a specified sample size of 10 grams, and a distillation time of 75 minutes. Most commenters, in particular those from the hazardous waste treatment industry, welcomed and supported this part of EPA's proposal. These kind of provisions eliminate variabilities that can result from the analyses of different sample sizes and distillation times. A detailed discussion of these treatment standards follows.

a. Cyanide Nonwastewaters

EPA proposed three options for cyanide in nonwastewater forms (a standard based on total and amenable cyanide concentrations, a standard based on TCLP concentrations, and a standard that specifies treatment methods) at 58 FR 48104. EPA is promulgating the first option.

EPA is discussing in this preamble only the major comments on the first option. Please see the Response to Comments Document in the docket for this rule for EPA's responses to all the comments received on the proposed three options.

EPA requested comments on its rationale for setting a common cyanide UTS for all nonwastewater forms of cyanide. Two primary issues were emphasized in the proposal: (1) the establishment of a cyanide UTS that is less stringent for wastes that contain little to no cyanide; and, (2) standardized sample size and distillation time for compliance monitoring.

EPA believes that by basing a universal treatment on the cyanide matrix that is most difficult to treat, the universal treatment standard will indeed be uniformly achievable. EPA has determined that electroplating wastes with high concentrations of iron represent the most difficult to treat of all the cyanide wastes. The available performance data for treating electroplating wastes support the establishment of a UTS of 590 mg/kg (total cyanide) and 30 mg/kg (amenable cyanide).

EPA noted that although other cyanide wastes were required to meet lower treatment standards, the establishment of this higher UTS was not likely to discourage effective treatment of these other wastes. Examples of the other wastes of concern include multi-source leachate, pigments, petroleum, coking, ink solvents and organo-nitrogen wastes. These wastes generally have very little cyanide in the untreated waste, have cyanide along with organic constituents which are routinely incinerated, or have cyanide in a free form which is easier to treat by conventional treatment methods (alkaline chlorination). Because these wastes are routinely treated by incineration or a cyanide destruction technology, EPA believes further subcategorization of the cyanide UTS standard is not warranted at this time. (Put another way, the **Agency**

does not believe as a practical matter that more cyanide will be **land** disposed as a result of UTS, and therefore that the interest in simplified standards warrants against further subcategorization of cyanide wastes.)

The majority of the commenters supported EPA's proposed rationale for developing a cyanide UTS and believe EPA's proposed approach is appropriate for setting UTS. Two commenters, however, urged EPA to withdraw the proposed UTS and to promulgate instead a lower cyanide UTS, as described below.

The first commenter believes that EPA should set two categories of cyanide UTS: (1) organic, which would include all those cyanide wastes with regulated organics; and, (2) inorganic, which include all cyanide wastes with regulated metals. For organics, they suggested a UTS of 30 mg/kg (total cyanide) and 1.8 mg/kg (amenable cyanide). For inorganics, the commenter suggested a UTS of 400 mg/kg (total cyanide) based on rejecting three data points used to calculate the 590 mg/kg limits.

The other commenter believes that it is inappropriate for EPA to raise the standards for all nonwastewater forms of cyanide wastes. They said that existing treatment technologies can treat cyanide wastes to levels below the proposed UTS, and they asked EPA to promulgate lower cyanide levels such as those promulgated for nonwastewater forms of F011 and F012.

EPA is not persuaded by these comments. First, a separate lower treatment standard for cyanide in organic wastes is currently unnecessary because combustion of these wastes to comply with organic treatment standards effectively destroys cyanides. Second, EPA believes that the three data points queried in CyanoKem's comment are in fact representative. None of these three data points fail a statistical Outlier test. Furthermore, the description of the design and operating conditions make it appear that treatment was conducted properly. Third, the limit for F011 and F012 (which had a treatment standard for cyanide below the UTS) has not been previously subject to the 1 hour and 15 minute distillation time and 10 gram sample requirements, which can greatly influence results and are required conditions for the UTS.

CyanoKem's comment, in fact, amounts to a request that EPA reopen the technology basis for the cyanide standard, an issue not opened for public comment. The treatment standards for cyanide are based on performance of alkaline chlorination technology. 54 FR at 26610-611 (June 23, 1989). CyanoKem has upgraded that technology with certain proprietary modifications. 56 FR at 12355 (March 25, 1991). EPA has already indicated that this adapted technology is not, and need not serve as the basis for the treatment standard. Id.

In any case, EPA does not believe that this is an appropriate time to undertake major changes to the cyanide standards. This is because the cyanide analytic method, although improved by the changes in this rule which are the best available at the present time, continues to have shortcomings. EPA is working to develop a different analytic method. It may be that after the new method is developed, further investigation of cyanide standards will be warranted.

Universal Treatment Standards for Cyanide\1\
[Nonwastewaters]

	Maximum for any single

Regulated constituent	composite sample (mg/kg)
Cyanide (Total).....	590
Cyanide (Amenable).....	30

\1\Cyanide nonwastewaters are analyzed using SW-846 Method 9010 or 9012, sample size 10 grams, distillation time, one hour and 15 minutes.

b. Cyanide Wastewaters

EPA is promulgating 1.2 mg/l (total cyanide) and 0.86 mg/l (amenable cyanide) as UTS for wastewater forms of cyanide wastes. In the proposed rule, EPA pointed out that a total cyanide concentration of 1.9 mg/l, regardless of process waste type, is widely used in wastewater discharge regulations--namely those for the Metal Finishing Industry and the Organic Chemicals, Plastics and Synthetic Fibers (OCPSF) Industry; however, the concentration of 1.9 mg/l was a typographical error. The **Agency** intended to propose a concentration 1.2 mg/l of total cyanide. (The 1.2 mg/l level is supported by EPA's OCPSF regulations and the background information in the record to the proposed rule supporting the proposed total cyanide UTS applicable to cyanide wastewaters.) The majority of commenters from the pharmaceutical and waste treatment industry commented on the proposed UTS cyanide for wastewaters assuming a standard of 1.2 mg/l total cyanide level was proposed.

Commenters pointed out that the proposed level of 1.2 mg/l (total cyanide) is not always applied to OCPSF discharges. EPA has authorized permit writers or control authorities to exempt a source from OCPSF's total cyanide (discharge) limit, and to establish a Best Professional Judgement (``BPJ'') amenable cyanide limit. The BPJ limit must be based on a determination that the cyanide limits are not achievable due to elevated levels of non- amenable cyanide that result from the unavoidable complexing of cyanide at the process source (40 CFR 414.11(g), 414.91, and 414.101). As with the CWA regulations, EPA provides facilities with a RCRA treatability variance process in the 40 CFR 268.44 regulations that would allow a facility to achieve an alternate treatment standard (see discussion of treatability variance at section XII of this preamble). EPA believes that this provision provides a mechanism for establishing an alternative cyanide limit for OCPSF facilities in appropriate cases.

These commenters also reported that CWA regulations for the Pharmaceutical Industry specify cyanide limitations as high as 33.5 mg/l total cyanide. EPA looked into these concerns; in particular, whether the proposed standard of 1.2 mg/l can be achieved universally. Treatment performance data, however, were not submitted by the commenters. Contrary to the commenters' arguments, the literature and the performance data on cyanide treatment clearly show that cyanide wastewaters are treatable to 1.2 mg/l total cyanide. While the CWA cyanide limit is 33.5 mg/l for the pharmaceutical industry, that limit was established in 1983 and is currently being investigated for possible revision. Data were obtained from these ongoing efforts,

confirming that pharmaceutical wastes can achieve the 1.2 mg/l cyanide level.

Other commenters emphasized that because EPA's proposed universal wastewater standard of 1.2 mg/l total CN could not be routinely met by cyanide destruction technologies available at their site, EPA should only set a treatment level of 0.86 mg/l (amenable cyanide). Another commenter added that in the Third Third rule (see 55 FR 22550-22553, June 1, 1990), EPA already set a level of 0.86 mg/l for amenable cyanide in characteristic wastewaters which is routinely met by their modified wastewater treatment system. The proposed UTS treatment standard of 0.86 mg/l (amenable cyanide) is based on the treatment of complex-iron wastewaters from the electroplating industry by alkaline chlorination (a cyanide destruction technology, and BDAT). The commenter urged EPA to set this level as the sole cyanide UTS.

In the first place, the **Agency** views the issue of requiring treatment for both total and amenable CN to be settled in past rules, and did not intend to reopen it. See 54 FR at 26609 (June 23, 1989). If further response is deemed necessary, EPA remains unpersuaded by these arguments. Clean Water Act effluent limitations could technically be met by adding ferro-sulfate or other sulfate reagents to wastewaters. These chemical reagents do not destroy cyanides in the effluent wastewater but instead, they leave behind iron-cyanide complexes or thiocyanates. By requiring compliance for both amenable and total cyanide, facilities must pursue treatment practices that can effectively destroy cyanides. EPA is thus promulgating 1.2 mg/l (total cyanide) and 0.86 mg/l (amenable cyanide) as UTS for wastewater forms of cyanide wastes.

EPA had previously reserved the treatment standard for total cyanide in wastewater forms of D003 reactive cyanide wastes. In today's rule, EPA is applying the UTS of 1.2 mg/l to this waste. EPA sees no reason that the limit is not generally achievable, and commenters supplied no reasons.

Universal Treatment Standard for Cyanide
[Wastewaters]

Regulated constituent	Maximum for any single composite sample (mg/l)
Cyanide (Total)	1.2
Cyanide (Amenable)	0.86

C. Consolidation of Equivalent Technology-Specific Combustion Standards

Another improvement to the existing **Land Disposal** Restrictions program that is being made in today's rule is the simplification of two equivalent technology-specific combustion standards in: Table 1--Technology Codes and Description of Technology-Based Standards in 40

CFR 268.42. The **Agency** is consolidating the descriptions of INCIN (incineration) and FSUBS (fuel substitution), by combining them into one term, CMBST (combustion). The definition of CMBST, as stated in Sec. 268.42 Table 1, is: ``combustion in incinerators, boilers, or industrial furnaces operated in accordance with the applicable requirements of 40 CFR part 264 subpart O, and part 266, subpart H.'' (Because the Part 265 interim status standards for incinerators are largely nonsubstantive, EPA does not view facilities operating pursuant to these standards to be performing BDAT treatment. This is not true of boilers and industrial furnaces, where the interim status standards are nearly as stringent as those for permitted units.)

This definition includes a specific reference to boilers and industrial furnaces in order to clarify that combustion in these units is (and always has been) allowed as a means of complying with FSUBS. The **Agency** is also clarifying that any future regulations, such as potential emission limits on metals or halogenated organic content, established in part 264 subpart O, and part 266 subpart H, shall also apply automatically to the standard of CMBST (or INCIN) in part 268. The consolidation of INCIN with FSUBS to read CMBST does not represent any change to the promulgated standards and additional notice and comment was, therefore, not required.

All of the K-, U-, and P-listed wastes that have technology-specific standards contain chemicals that are very difficult to quantify in treatment residues. The chemicals representing the waste codes for which the **Agency** has promulgated CMBST as a standard are, for the most part, thermally labile and are expected to be destroyed relatively easily in any type of combustion unit. EPA originally set up the two separate standards of INCIN and FSUBS (Final Rule for Third Third Wastes, June 1, 1990), because the **Agency** did not have in place the operating requirements for boilers and industrial furnaces (i.e., the requirements for FSUBS). See 52 FR at 17021 (May 6, 1987). Because these requirements have been promulgated (56 FR 7134 (February 21, 1991), both sets of standards should assure equally efficient combustion of hazardous waste. For the same reason, there is no need to distinguish between the types of units that are allowed to handle each specific waste code. (EPA is, however, actively reviewing current regulations for combustion units to assure the rules' protectiveness, and may propose more stringent standards for such units. See EPA's Draft Combustion Strategy of May 18, 1993).

As a result of today's action the standards for the following waste codes are modified to read ``CMBST'':

(1) Two treatment subcategories of D001 wastes
(2) Six source-specific wastes listed in Sec. 261.32: K027, K039, K113, K114, K115, K116
(3) Seventeen wastes listed in Sec. 261.33(e): P001, P003, P005, P009, P040, P041, P043, P044, P062, P068, P081, P085, P088, P102, P105, P109, P112
(4) Forty-one wastes listed in Sec. 261.33(f): U008, U016, U023, U053, U055, U056, U057, U058, U064, U085, U086, U087, U089, U090, U094, U096, U098, U099, U103, U109, U113, U122, U123, U124, U125, U126, U133, U147, U154, U160, U166, U182, U186, U197, U201, U213, U221, U248, U328, U353, U359

Other technology-specific standards and/or numerical standards that have been promulgated for the above listed codes remain unchanged. In particular, the promulgated standards of CHRED and CHOXD (i.e.,

chemical reduction and chemical oxidation) remain unchanged as alternatives to CMBST for fourteen of the above U and P waste codes. These standards were established because the chemicals represented by these wastes hydrolyze relatively rapidly (i.e., react with water) and both of the technologies represented by these standards are typically performed under aqueous conditions. These waste codes include: P009, P068, P081, P105, P112, U023, U086, U096, U098, U099, U103, U109, U133, U160.

Today's rule does not affect the existing standards for waste codes where INCIN was specified, but FSUBS was not. For those waste codes, the standard remains identified as INCIN, rather than CMBST.

The **Agency** is further investigating potential modifications to the presentation in 40 CFR 268.40 of all of the technology-specific standards in order to simplify and clarify the promulgated treatment standards, and may propose additional changes in the future.

D. Incorporation of Newly Listed Wastes Into Lab Packs and Changes to Appendices

On June 1, 1990 (55 FR 22629), EPA promulgated alternative treatment standards under 40 CFR 268.42(c) for waste codes listed in 40 CFR 268 Appendix IV and V that are placed in lab packs. These alternative standards are legally constructed, in part, as ``specified methods of treatment'' because of physical difficulties in measuring compliance with numerical standards for these multi-coded waste forms (i.e., compliance is complicated by the fact that many lab packs are comprised of hundreds of small containers, each with different organic or organo-metallic chemicals in them, making it difficult to accurately sample treatment residues for those organics). In the January, 1991, correction notice and again in the May 30, 1991, Advance Notice of Proposed Rulemaking (56 FR 24453), the **Agency** requested comment on potential improvements to these alternative standards.

EPA's original intent in establishing two separate appendices was to distinguish between those lab packs containing organo-metallics (Appendix IV) and those containing only organics (Appendix V). As such, lab packs containing organo-metallics (Appendix IV) were expected to need stabilization after performing the specified method of treatment, INCIN (i.e., incineration), while Appendix V lab packs only needed to be incinerated. However, under 40 CFR 268.42(c)(4), all treatment residues of either type of lab pack also had to comply with the standards for the extraction procedure (EP) for metals, i.e., D004, D005, D006, D007, D008, D010, and D011. (D009 is not included in this list because most mercury-bearing wastes were excluded from the use of the alternative standards in both of these Appendices.) As such, if metals were concentrated in the residues from the incineration of an Appendix V lab pack and the resultant residues then exhibited one of the characteristics for EP metals, these residues would also have had to be stabilized to comply with the appropriate treatment standard for metals. In such a case, there was no practical difference between Appendix IV and Appendix V lab packs in terms of the treatment that was needed.

The majority of the comments received from the regulated community supported the **Agency**'s proposed approach. In this final rule EPA is, therefore, replacing Appendix IV and Appendix V with a new Appendix IV. In order to simplify the new Appendix IV it only contains those wastes excluded from lab packs. The following wastes are excluded from lab packs (and appear in new Appendix IV) for the purpose of using the

alternative lab pack treatment standard in 40 CFR 268.42(c): D009, F019, K003, K004, K005, K006, K062, K071, K100, K106, P010, P011, P012, P076, P078, U134, U151.

In today's rule, EPA is also stating that the alternative treatment standard for lab packs applies to the following additional waste codes that were previously not included in Appendix IV or V: wastes for which treatment standards were promulgated in the LDR Phase I rule August 1, 1992 (57 FR 37194), and wastes (including TC organic wastes) for which treatment standards are promulgated in this final rule. Today's rule does not list these as excluded waste codes in the new Appendix IV.

As a matter of clarification, the alternative treatment standard for lab packs is INCIN. This required combustion technology combined with the requirements of 40 CFR 268.42(c)(4) (ash residues are treated to meet the characteristic metals treatment standards), will ensure that all underlying hazardous constituents present in characteristic wastes (other than those excluded in the new Appendix IV), will be treated. The use of this alternative lab pack standard negates the requirement to monitor for, or comply with, the UTS for underlying hazardous organic constituents.

For reasons outlined in the June 1, 1990 final rule, mercury wastes were excluded from this alternative standard for lab packs. Mercury is considered a ``volatile metal'' which may lead to excessive air emissions in some combustion devices when present in large quantities. Mercury is also very difficult to stabilize if present in ash residues in large quantities. Commenters did not provide any justifiable technical reason for EPA to modify its position with respect to mercury wastes, and thus these wastes shall remain excluded from this alternative lab pack treatment standard.

E. Changes in the LDR Program in Response to the LDR Roundtable

EPA convened a roundtable meeting on January 12-14, 1993 to discuss the LDR program. The purpose of the roundtable was for EPA to hear suggestions on improvements to the LDR program from persons who implement it. Participants included representatives of hazardous waste generators, treaters, and disposers; public interest groups; state **environmental** agencies; EPA regional offices; and other federal agencies. EPA is today promulgating several recommendations made by roundtable participants. The **Agency** is consolidating the three existing treatment standard tables into one table, and is simplifying notification requirements and reducing paperwork, as discussed below. In addition, as discussed in an earlier section of this preamble, the **Agency** is also promulgating universal treatment standards. Furthermore, the **Agency** is committed to continue to identify ways the LDR program can be simplified. Additional opportunities for such streamlining will be explored in future LDR rulemakings.

1. Consolidated Treatment Table

Several of the groups present at the LDR roundtable expressed an interest in having a consolidated treatment standard table in the regulations. Participants stated that the existing system of three separate tables at 40 CFR 268.41-268.43 was too complex and burdensome. In its September 14, 1993 notice, EPA proposed a single consolidated table of treatment standards. Comments on the table were favorable.

Today, EPA is replacing the three existing treatment standard tables with the consolidated table, called ``Treatment Standards for Hazardous Waste'' and placing it at Sec. 268.40 along with much of the text found currently in Secs. 268.41-268.43. Section 268.42 continues

to describe the technology codes, to regulate California list PCBs and HOCs, to set out exemptions from the required methods, and to provide procedures for equivalency determinations. The numerical treatment standards in the consolidated table are identical to the UTS promulgated in today's rule with the exception of characteristic metal wastes.

Reformatting Secs. 268.40-268.43 also corrects a confusing aspect of the way the Code of Federal Regulations (CFR) has appeared for some time. The ``No **Land Disposal**'' treatment standards that have appeared at Sec. 268.43 will be deleted from the regulations and should no longer appear in the CFR. These treatment standards have not been in effect since 1990, when the LDR Third Third rule set treatment standards for these wastes that were expressed as either methods of treatment or numerical standards that now appear in the consolidated treatment standard table Sec. 268.40. It was only a drafting oversight that made these ``No **Land Disposal**'' standards continue to appear in the regulations, and today's rule corrects this mistake.

2. Simplified LDR Notification Requirements

Comments on LDR notification requirements at the roundtable ranged from suggestions that EPA should eliminate notifications altogether to suggestions that EPA modify or delete data items on the notification. In response, EPA proposed to eliminate the requirement at 40 CFR 268.7(a)(1)(ii) and at 268.9(d)(1) that the notification include treatment standards or references to those standards. It was argued that such a simplification makes particular sense in conjunction with EPA's proposal to consolidate the treatment standard tables. Commenters on this issue all supported this proposed simplification. EPA is thus dropping the treatment standard or reference to the treatment standard from the LDR notification in this final rule.

Today's action does not eliminate the existing requirement to identify the constituents in F001-F005 spent solvent wastes, F039 wastes, or the underlying hazardous constituents in D001, D002, and in TC organic wastes, unless the generator/treater is going to monitor for all hazardous constituents in the waste. However, the regulatory language is made clearer, and there is no longer any requirement that the corresponding constituent level be included with the constituents identified on the LDR notification for these wastes.

IV. Treatment Standards for Toxicity Characteristic Waste

A. Introduction--Content and Scope

EPA is promulgating treatment standards for the newly identified toxicity characteristic (TC) organic wastes (D018-D043) as proposed. These are identical to the UTS in today's rule. The UTS apply to the underlying hazardous constituents in the TC waste as well as the individual constituent responsible for the TC designation. Underlying hazardous constituents are any constituents in Sec. 268.48 which are reasonably expected to be present at levels above the UTS at the point of generation of the TC waste. (See definition at Sec. 268.2(i).) Although the intent of today's regulations is to require treating all underlying hazardous constituents present plus the TC constituent, today's rule calls for generators to monitor only the TC constituent and those underlying hazardous constituents ``reasonably expected to be present'' in their waste at its point of generation. Today's rule is promulgating the compliance monitoring provisions that were proposed. Section X of this preamble (Compliance Monitoring and Notification)

discusses them in detail.

Several commenters suggested that EPA promulgate alternative standards of incineration (INCIN), fuel substitution (FSUBS) and recovery of organics (RORGS) for these wastes. These commenters pointed to the Interim Final Rule of May 24, 1993 (58 FR 29867) where EPA extended the use of these methods of treatment to all D001 wastes disposed outside CWA or CWA-equivalent impoundments or Safe Drinking Water Act regulated Class I underground injection wells. EPA is not adopting this approach in today's rule for TC organic wastes. First, EPA does not believe that methods of treatment intended to address organic constituents will always adequately address any underlying metal constituents present in these wastes. In addition, the **Agency** has not yet been able to completely evaluate the appropriateness of requiring specified treatment technologies for TC wastes and other wastes.

1. Waste Management Systems Affected by Today's Rule

In terms of waste management systems, today's rule applies to those TC wastes which are managed in systems other than: (1) wastewater treatment systems which include surface impoundments whose ultimate discharge is subject to the Clean Water Act (CWA); (2) zero dischargers who, before permanent **land disposal** of the wastewater, treat the wastewaters in a CWA-equivalent wastewater treatment system; or, (3) Class I underground injection wells subject to the Safe Drinking Water Act (SDWA) Underground Injection Control (UIC) program. CWA-equivalent treatment means biological treatment for organics, reduction of hexavalent chromium, precipitation/sedimentation for metals, alkaline chlorination or ferrous sulfate precipitation of cyanide (to the extent these constituents are present in the untreated influent to wastewater treatment systems), or treatment that the facility can show performs as well or better than these enumerated technologies. See Sec. 268.37(a), 58 FR at 29885 (May 24, 1993). Organic TC wastes managed in these types of systems will be regulated in the next LDR rule.

Additionally, ``decharacterizing'' the TC wastes regulated under this rule by rendering them noncharacteristic does not remove them from the scope of these regulations. Chemical Waste Management v. EPA, 976 F. 2d at 14-15. Consequently today's final rule will apply to some injection practices, in particular, those involving Class V injection wells. These typically are wells injecting nonhazardous wastes above or into underground sources of drinking water. (If, however, the TC wastes injected into non-Class I wells were to be treated by CWA-equivalent means before injection, today's treatment standards would not apply. This is an example of the type of zero discharger referred to above.)

2. Categories of TC Wastes Affected by Today's Rule

The following TC wastes are subject to UTS: (1) all wastes identified as D018 through D043 (described in the proposed rule as ``new organic constituents); (2) D012 through D017 organic pesticide wastes whose TCLP extract composition meets the concentration criteria of 40 CFR 261.24, Table A but whose EP extract composition does not; (3) D012 through D017 pesticide wastes whose TCLP extract composition meets the concentration criteria of 40 CFR 261.24 Table A, as does the EP extract composition, and (4) soil and debris contaminated with the preceeding three sets of wastes. The first two categories are newly identified wastes, i.e. wastes not yet identified as hazardous at the time of the 1984 amendments and therefore not covered by the original statutory schedule. (The March 29, 1990 rule extended the list of chemicals defined as TC and changed the extraction step to a more sensitive procedure which may potentially identify more pesticide

wastes than did the EP.) For soil contaminated with the TC wastes, the variance process is available (see discussion in the Background section of this rule under the heading ``E. Treatment Standards for Hazardous Soil'').

As noted in the proposed rule, regulating **land disposal** of newly identified TC wastes by addressing underlying hazardous constituents is the same approach as EPA adopted in the recent interim final rule for ignitable (D001) and corrosive (D002) characteristic wastes, promulgated on May 10, 1993 (published on May 24, 1993, 58 FR 29860) in response to the court's decision in Chemical Waste Management v. EPA, 976 F. 2d 2. That case vacated and remanded certain **Agency** regulations (commonly referred to as the Third Third rule) establishing prohibitions and treatment standards for characteristic wastes, and also established rules as to when the prohibitions and standards would not apply. A summary of the court's decision, an overview of the interim final rule published on May 24, 1993, and a discussion of how the **Agency** proposed to apply this approach to the TC wastes can be found in the text of the proposed rule at 58 FR 48092.

Today's rule regulates underlying hazardous constituents in the D018-D043 as well as in newly identified D012-D017 and in the rest of the universe of D012-D017 wastes. (The definition of ``underlying hazardous constituents'' is contained at 268.2(i) in this rule.) For those D012-D017 nonwastewaters originally regulated in the Third Third rule, today's rule changes the numerical value of the previously applicable treatment standards to the UTS.

3. Soil Contaminated by Underground Storage Tanks

Soil which is contaminated with petroleum and is managed during corrective action of releases from a RCRA Subtitle I underground storage tank (UST) is not subject to the treatment standards promulgated today for the TC organic wastes (D018-D043). Such soil that fails the TC for one or more of the newly identified organic wastes (D018-D043) has been temporarily deferred from regulation as a hazardous waste (55 FR 26986). In addition, the **Agency** has proposed to permanently exempt UST petroleum-contaminated soils from the TC rule (58 FR 8504). However, any Subtitle I petroleum-contaminated soil identified as D001 through D017 would not be subject to the deferral and would be subject to all applicable RCRA **land disposal** restriction requirements.

The **Agency** reminds the regulated community that any soil contaminated by a release from a hazardous substance UST (Subtitle I) as well as from all non-Subtitle I USTs (including petroleum tanks) will continue to be subject to applicable RCRA hazardous waste requirements, including the **land disposal** restrictions. Likewise, petroleum-contaminated soils from non- UST sources that exhibit a hazardous characteristic are also subject to applicable Subtitle C requirements.

4. Metal TC Wastes Are Not Affected by Today's Rule

Today's rule does not affect TC metal wastes at all; this rule leaves the Third Third final treatment standards (which apply to EP metals) in place. Furthermore, today's rule does not affect the mineral processing wastes which were formerly exempt from Subtitle C regulation under the Bevill Amendment but which recently lost that exemption. Included in that set of wastes are wastes from the remediation of historic manufactured gas plant or coal gasification sites. EPA will address TC metal wastes and the former Bevill mineral processing wastes in a future rulemaking.

B. Background

1. Legal and Policy Basis for Today's TC Standards

Today's rule applies the UTS to underlying hazardous constituents in D012-D043 wastewaters and nonwastewaters. Commenters' principal objection to the proposed standards for TC wastes was that the September 1992 Circuit Court decision did not authorize EPA to regulate underlying hazardous constituents in TC wastes.

Most of these comments asserted that organic TC wastes were fundamentally different from ignitable or corrosive wastes and therefore EPA's decision to apply the standards promulgated in the May 24, 1993 Interim Final Rule for ignitable and corrosive wastes was inappropriate. These commenters said that TC wastes were unlikely to pose a threat to human health and the environment once treatment removed the single constituent, partly because such treatment would remove other similar hazardous components of the waste. None of these commenters submitted process data demonstrating these claims. On the other hand, some commenters argued that merely deactivating characteristic wastes might well leave hazardous components intact.

The **Agency** is regulating in this rule underlying hazardous constituents in TC wastes when they are managed in non-CWA/non-CWA equivalent/non-Class I injection well waste management systems. If, as commenters assert, treatment of the TC constituent effectively treats underlying hazardous constituents, then regulating the underlying hazardous constituent poses no further burden. Additionally, EPA believes that the compliance monitoring provisions requiring the generator to address only those underlying constituents ``reasonably expected to be present in the wastes'' relieves generators and treaters from an undue regulatory burden.

Several commenters objected that extending the requirement to treat underlying hazardous constituents from ignitable and corrosive wastes, as promulgated in the May 24, 1993 Interim Final Rule, to TC wastes was unnecessary. The numerical treatment standard for the constituent present at the TC level, the commenters reasoned, meets RCRA's section 3004(m) ``minimize threat'' requirement. EPA is not persuaded by such reasoning. 55 FR 22542, 22652 (June 1, 1990); Chemical Waste Management, 976 F.2d at 14; HWTC III, 886 F. 2d at 362. The TC level identifies wastes that are clearly hazardous, and does not evaluate presence of underlying hazardous constituents, non-groundwater exposure pathways, or adverse **environmental** effects.

2. Ongoing Management Practices for TC Wastes

The proposed rule solicited comments and data on volumes of TC wastes managed in Class V injection wells, and on waste management practices employed prior to such injection. EPA received little substantive comment and consequently has no basis for changing the proposed approach.

The proposed rule also solicited information about industrial generation patterns in order to allow the **Agency** to assess the potential for source reduction or recycling for these TC wastes in light of their wide diversity. However, EPA received no comments describing current industry practices upon which the **Agency** could act.

The **Agency** is to consider opportunities for source reduction and recycling of these wastes, and ways treatment standards could reflect such types of waste minimization. The **Agency** notes that the subtitle C rules generally, and the LDR rules in particular, have already resulted in substantial volumes of hazardous waste no longer being generated, because these rules impose waste management costs on hazardous waste

generators, and thus create a financial incentive to generate less waste.

Finally, several commenters expressed concerns about achievability of UTS for underlying hazardous constituents in complex matrices and about the appropriateness of numerical standards based on incineration. See the discussion of UTS in section III.A of this preamble for more information on these comments.

C. Treatment Standards for New TC Organic Constituents (D018-D043)

1. Nonwastewaters

The **Agency** is also promulgating concentration-based treatment standards for TC organic constituents in nonwastewaters, that are identical to the levels promulgated as UTS in a separate section of this preamble. These standards are based on treatment data that were used to establish UTS for these same constituents in listed wastes. These standards are primarily based on incineration data and are presented at the end of this section.

EPA believes that a variety of treatment technologies, combustion and non-combustion, can achieve these treatment standards. EPA reiterates that any technology that does not constitute impermissible dilution can be used to meet these concentration levels.

BDAT Standards for TC Organic Wastes
[Nonwastewaters]

Code	Regulated constituent	Maximum for any single grab sample. Total composition (mg/kg)
D018	Benzene	10
D019	Carbon tetrachloride	6.0
D020	Chlordane	0.26
D021	Chlorobenzene	6.0
D022	Chloroform	6.0
D023	o-Cresol	5.6
D024	m-Cresol	\1\5.6
D025	p-Cresol	\1\5.6
D026	Cresol	5.6
D027	1,4-Dichlorobenzene	6.0
D028	1,2-Dichloroethane	6.0
D029	1,1-Dichloroethylene	6.0
D030	2,4-Dinitrotoluene	140
D031	Heptachlor	0.066
D031	Heptachlor epoxide	0.066
D032	Hexachlorobenzene	10

D033	Hexachloro-1,3-butadiene	5.6
D034	Hexachloroethane	30
D035	Methyl ethyl ketone	36
D036	Nitrobenzene	14
D037	Pentachlorophenol	7.4
D038	Pyridine	16
D039	Tetrachloroethylene	6.0
D040	Trichloroethylene	6.0
D041	2,4,5-Trichlorophenol	7.4
D042	2,4,6-Trichlorophenol	7.4
D043	Vinyl Chloride	6.0

\1\m- and p-cresol are regulated together as the sum of their concentrations.

2. Wastewaters

The **Agency** is today promulgating concentration-based treatment standards for the TC organic constituents in wastewaters, that are identical to the levels promulgated as UTS in a separate part of today's rule. These standards were based on existing treatment data that were used to establish UTS for these same constituents in the broad array of listed wastes. Today's standards are based on data representing a variety of wastewater treatment units and are presented at the end of this section.

These wastewater treatment standards apply to newly identified TC wastewaters that are managed in systems other than those regulated under the CWA, those regulated under the SDWA that inject TC wastewaters into Class I injection wells, and those zero discharge facilities that engage in CWA-equivalent treatment prior to **land disposal**. The treatment standards promulgated today for newly identified TC organic (D018-D043) wastewaters require treatment to meet the UTS for the TC constituent and for the underlying hazardous constituents in the TC waste as generated.

BDAT Standards for TC Organics
[Wastewaters]

Constituent	Maximum for any single grab sample. Total composition (mg/l)
D018--Benzene	0.14
D019--Carbon tetrachloride	0.057
D020--Chlordane	0.0033
D021--Chlorobenzene	0.057
D022--Chloroform	0.046

D023--o-Cresol	0.11
D024--m-Cresol	0.77
D025--p-Cresol	0.77
D026--Cresol	0.88
D027--1,4-Dichlorobenzene	0.09
D028--1,2-Dichloroethane	0.21
D029--1,1-Dichloroethylene	0.025
D030--2,4-Dinitrotoluene	0.32
D031--Heptachlor	0.0012
D031--Heptachlor epoxide	0.016
D032--Hexachlorobenzene	0.055
D033--Hexachloro-1,3-butadiene	0.055
D034--Hexachaloroethane	0.055
D035--Methyl ethyl ketone	0.28
D036--Nitrobenzene	0.068
D037--Pentachlorophenol	0.089
D038--Pyridine	0.014
D039--Tetrachloroethylene	0.056
D040--Trichloroethylene	0.054
D041--2,4,5-Trichlorophenol	0.18
D042--2,4,6-Trichlorophenol	0.035
D043--Vinyl Chloride	0.27

3. Radioactive Mixed Waste

Radioactive mixed wastes are those wastes that satisfy the definition of radioactive waste subject to the Atomic Energy Act (AEA) that also contain waste that is either listed as a hazardous waste in Subpart D of 40 CFR Part 261, or that exhibit any of the hazardous waste characteristics identified in subpart C of 40 CFR Part 261. Since the hazardous portions of the mixed waste are subject to RCRA, the **land disposal** restrictions apply. This means that the RCRA hazardous portion of all mixed waste must meet the appropriate treatment standards for all applicable waste codes before **land disposal**. Therefore, any radioactive waste mixed with organic TC wastes that are managed in non-CWA/non-CWA-equivalent/non-Class I SDWA facilities must meet the treatment standards being promulgated today for the TC wastes.

The standards that were proposed for the TC wastes were also proposed for TC radioactive mixed wastes. Prior to this proposal, however, the Department of Energy (DOE) had expressed some concerns about meeting certain treatment standards and stated that they were collecting data from their facilities on mixed TC wastes. EPA stated in the proposed rule that, for the most part, the low concentrations of radioactive compounds should not interfere with the treatability of the hazardous constituents in the waste, and requested data on instances when the radioactivity prevented the waste from meeting the LDR treatment standard.

One commenter suggested that EPA postpone its decision on appropriate methods for treating mixed waste until information currently being collected profiling commercially generated low- level radioactive mixed waste has been submitted and reviewed by EPA. This commenter claimed that the results of this profile contradict EPA's statement that radioactive material concentrations in mixed waste are low and should not interfere with the treatment of the mixed waste. Another commenter expressed the belief that the presence of radioactive

components within the limits of operator exposure and safety should not interfere with the treatment of hazardous constituents in waste.

Neither commenter submitted any data or other supporting information to substantiate their assertions regarding the treatability of radioactive mixed waste; therefore, EPA has decided to promulgate the standards for newly identified TC radioactive mixed wastes as proposed. However, if data is submitted to EPA indicating that the presence of radioactive components prevents a waste from meeting the LDR treatment standards, the **Agency** will evaluate the data and amend the standards as appropriate. The **Agency**'s variance provisions of 40 CFR 268.44 can also be used to obtain alternate limits in the meantime.

D. Treatment Standards for Pesticide Wastes Exhibiting the Toxicity Characteristic

D012--Endrin
D013--Lindane
D014--Methoxychlor
D015--Toxaphene
D016--2,4-D
D017--2,4,5-TP (Silvex)

The **Agency** is promulgating treatment standards for these wastes essentially as proposed with the additional requirement that underlying hazardous constituents be treated in nonwastewater forms of these wastes. Today's standards apply to all D012-D017 wastes managed in non-CWA/non-CWA-equivalent/non-Class I injection well waste management facilities. These are the toxic pesticide wastes which are identified as toxic following application of the TCLP. The TCLP is more sensitive than the EP analysis, possibly bringing more wastes into the toxicity characteristic category than did the EP.

1. Newly Identified Pesticide Nonwastewaters

EPA is today regulating newly identified D012-D017 nonwastewaters plus D012-D017 nonwastewaters regulated earlier in the Third Third rule. Treatment standards for both sets of D012-D017 nonwastewaters include the UTS value for the TC constituents plus UTS values for underlying hazardous constituents. The changes between the Third Third standards and today's rule are that the numerical value of the toxaphene nonwastewater standard rises from 1.3 to 2.6 and the standard for D013, lindane, incorporates numbers for the four BHC isomers. (It should be noted that EPA determined that the amount of D012-D017 waste subject to the treatment standards is very small. 55 FR at 22634, 22646. Based on this determination, it is very unlikely that newly identified D012-D017 are being generated.)

Today's rule also prohibits dilution of D012-D017 nonwastewaters injected into Class I deep injection wells. Consequently, these pesticide wastes must be treated to meet the treatment standards before they can permissibly be injected into such units, unless that unit has been granted a no-migration determination. Section VIII of this preamble discusses this and other deepwell injection issues presented in today's rule in more detail.

BDAT Standards for Pesticides
[Nonwastewaters]

Code	Regulated constituent	Maximum for any single grab sample. Total composition (mg/kg)
D012	Endrin	0.13
D012	Endrin aldehyde	0.13
D013	alpha-BHC	0.066
D013	beta-BHC	0.066
D013	gamma-BHC	0.066
D013	delta-BHC	0.066
D014	Methoxychlor	0.18
D015	Toxaphene	2.6
D016	2,4-D	10
D017	2,4,5-TP (Silvex)	7.9

2. Pesticide Wastewaters

EPA set treatment standards expressed as required methods of treatment for the EP toxic pesticide wastewaters in the Third Third final rule (55 FR 22554). Today's rule extends these treatment standards to those pesticide wastewaters covered in today's rule. (See 268.40)

E. Exemptions for De Minimis Losses of Commercial Chemical Product or Chemical Intermediates That Exhibit the Toxicity Characteristic (TC), and for TC Laboratory Wastes Discharged to CWA Wastewater Treatment Systems

In the Interim Final Rule published May 24, 1993, EPA established de minimis exemptions for commercial chemical product or chemical intermediates that are ignitable or corrosive hazardous wastes and that contained underlying hazardous constituents (58 FR 29875). The **Agency** proposed in Phase II to extend the exemptions in 40 CFR 268.1 to commercial chemical products or chemical intermediates that are TC organic wastes when disposed (58 FR 48118). Commenters expressed support for this approach.

This action is necessary to avoid situations where minor leaks of organic TC commercial chemical products or chemical intermediates to a wastewater treatment system would potentially trigger all of the potential consequences of treating all underlying hazardous constituents that might be in the waste. As EPA noted in originally determining that the mixture rule should not apply in such situations, such small losses are as a practical matter unavoidable; responsible management involves channeling these minor losses to a centralized

wastewater treatment system. In addition, there is a natural incentive to minimize the losses because the materials would otherwise be commercial chemical products or intermediates (46 FR 56583, Nov. 17, 1981). Moreover, allowing de minimis losses of TC materials to trigger all of the LDR treatment consequences would be anomalously stringent because de minimis losses of listed wastes (i.e., the commercial chemical products listed in Sec. 261.33), which tend to be more concentrated (see generally 58 FR at 29875), would not be regulated because of the exception to the mixture rule found at Sec. 261.3(a)(iv)(D).

This same type of exception is needed for TC laboratory wastes that are commingled with other plant wastewaters under designated circumstances: TC laboratory wastes containing underlying hazardous constituents from laboratory operations, that are mixed with other plant wastewaters at facilities whose ultimate discharge is subject to regulation under the CWA (including wastewaters at facilities which have eliminated the discharge of wastewater), provided that the annualized flow of laboratory wastewater into the facility's headwork does not exceed one part per million (the same condition that applies to the existing exemption in Sec. 261.3(a)(2)(iv)(E)).

Thus de minimis losses of commercial chemical product or chemical intermediates that are TC organic wastes, and TC organic laboratory wastes discharged to CWA wastewater treatment systems, are not subject to the requirements of 40 CFR 268. De minimis losses are those occurring from normal material handling, minor leaks of equipment tanks or containers, and similar small but, for practical purposes, unavoidable losses. See Sec. 261.3(a)(2)(iv)(D) and 268.1(e)(4) as promulgated at 58 FR 29884 (May 24, 1993). The definition of de minimis loss is the same as EPA used in the May 24, 1993 rule. This definition mirrors the parallel language in Sec. 261.3(a)(iv)(D) except that it also includes discharges from safety showers and rinsing and cleaning of personal safety equipment and rinsate from empty containers or from containers that are rendered empty by that rinsing. When the Sec. 268.1(e)(4) definition was originally promulgated in the May 24, 1993 rule, it seemed unlikely that ignitable or corrosive wastes would be generated from safety showers or rinsate. The **Agency** believes it is more likely that TC wastes could be generated in such a manner, therefore, the definition is being expanded to include this language in this rule.

EPA also notes that the characteristic commercial chemical products exempted under this rule and the May, 1993 rule are not limited to products in which a particular chemical is ``the commercially pure grade of the chemical, any technical grades of the chemical, and all formulations in which the chemical is the sole active ingredient.'' (See Sec. 261.33(d) comment). Rather, the exemption extends to de minimis losses (as defined) of in-process materials such as intermediates and materials that would be products if they were not inadvertently discarded. 55 FR at 2869 (Jan. 31, 1991). The citation in the comment to Sec. 261.33(d), quoted above, is necessary to define the scope of the listing, but as just explained, does not apply to losses of characteristic materials.

V. Treatment Standards for Newly Listed Wastes

A. Treatment Standards for Coke By-product Production Wastes

K141--Process residues from the recovery of coal tar, including but

not limited to tar collecting sump residues from the production of coke from coal or the recovery of coke by-products produced from coal. This listing does not include K087, decanter tank tar sludge from coking operations.
K142--Tar storage tank residues from the production of coke from coal or the recovery of coke by-products produced from coal.
K143--Process residues from the recovery of light oil, including but not limited to those generated in stills, decanters, and wash oil recovery units from the recovery of coke by-products produced from coal.
K144--Wastewater treatment sludges from light oil refining, including but not limited to intercepting or contamination sump sludges from the recovery of coke by-products produced from coal.
K145--Residues from naphthalene collection and recovery operations from the recovery of coke by-products produced from coal.
K147--Tar storage tank residues from coal tar refining.
K148--Residues from coal tar distillation, including but not limited to still bottoms.

EPA is promulgating the treatment standards that were proposed for coke by-product production wastes. These treatment standards also apply to soil and debris contaminated with these wastes, although a variance process is available for such soils (see discussion on variances in the Background section of this rule under the heading ``E. Treatment Standards for Hazardous Soil''). The preamble of the proposed rule describes the generation and characteristics of the newly listed wastes in greater detail (58 FR 48119). Today's standards are concentration-based limits for wastewaters and nonwastewaters, numerically identical to the UTS promulgated elsewhere in this rule for the nine constituents regulated in these wastes.

The American Coke and Coal Chemicals Institute requested that EPA allow the use of these wastes as fuels in blast furnaces and other applications where coke, coal and coal tar are used as fuels. The commenters were requesting EPA to extend the existing recycling exclusion--which allows these wastes to be combined with coal feedstock residue as it is charged to the coke oven, added to the coal recovery process or mixed with coal tar before this coal tar is sold as a product or further refined. Extending this exclusion is beyond the scope of this regulation; it was not included in the September proposal as an option for managing these wastes. The Definition of Solid Waste Task Force is examining the broad range of these types of issues.

The other comments received concerning the proposed treatment standards for coke products' wastes came from the waste treatment industry. Several waste treatment companies supported applying universal standards to these waste streams and the UTS concept in general. However, one commenter provided data in support of extending the standards originally applied to K087 to these wastes. EPA evaluated these data but found no reason not to apply UTS to these wastes. EPA's evaluation of these data is presented in the Background Document for these wastes. In separate comments, two waste treatment companies objected to the benzene nonwastewater standards as unnecessarily high and pointed out that their facilities could achieve benzene limits below that proposed in the UTS. EPA does not believe these data really reflect better treatment. Rather, the commenters appear to have generated a waste matrix in which benzene is detectable at lower levels. EPA is promulgating the benzene nonwastewater standard as proposed, believing that it reflects an appropriate and broader

assessment of benzene detection limits in combustion residues.

B. Treatment Standards for Chlorotoluenes

K149--Distillation bottoms from the production of alpha (methyl) chlorinated toluenes, ring-chlorinated toluenes, benzoyl chlorides, and compounds with mixtures of these functional groups. (This waste does not include still bottoms from the distillation of benzyl chloride.)

K150--Organic residuals, excluding spent carbon adsorbent, from the spent chlorine gas and hydrochloric acid recovery processes associated with the production of alpha (methyl) chlorinated toluenes, ring-chlorinated toluenes, benzoyl chlorides, and compounds with mixtures of these functional groups.

K151--Wastewater treatment sludges, excluding neutralization and biological sludges, generated during the treatment of wastewaters from the production of alpha (methyl) chlorinated toluenes, ring-chlorinated toluenes, benzoyl chlorides and compounds with mixtures of these functional groups.

EPA is promulgating the treatment standards that were proposed for chlorotoluene wastes. The preamble of the proposed rule describes the generation and characteristics in greater detail (58 FR 48121). Today's standards are concentration-based limits for wastewaters and nonwastewaters, numerically identical to the UTS promulgated elsewhere in this rule for the thirteen constituents regulated in these wastes.

Comments received concerning the proposed treatment standards for chlorotoluene wastes came from the waste treatment industry; they were similar to those received concerning the treatment standards for coking wastes. Several waste treatment companies supported applying universal standards to these waste streams and the UTS concept in general. Two waste treatment companies objected to the benzene nonwastewater standards as unnecessarily high and pointed out that their facilities could achieve benzene limits below that proposed in the UTS. EPA, however, believes that the UTS for benzene nonwastewaters reflects an appropriate and broad assessment of benzene detection levels in combustion residues.

VI. Debris Contaminated With Newly Listed or Identified Wastes

Debris contaminated with the hazardous wastes included in today's rule must be treated prior to **land disposal**. The hazardous debris may be treated to meet the treatment standards promulgated today for the constituents which are contaminating the debris, or it may be treated to meet the alternative debris standards promulgated in the LDR for Newly Listed Wastes and Hazardous Debris (57 FR 37194, August 18, 1992).

A. Debris Treated To Meet the Phase II Treatment Standards

Debris that is treated to meet the treatment standards promulgated in today's rule for newly listed wastes would remain subject to the hazardous waste management regulations (subtitle C) for as long as the debris ``contains'' the hazardous waste (see 57 FR 37625-26, August 18, 1992). On the other hand, debris that is treated to meet the treatment standards promulgated in today's rule for newly identified TC organic wastes, including any underlying hazardous constituents the generator reasonably expects to be present in the waste, could be disposed in a nonhazardous waste (subtitle D) landfill because the characteristic identifying the waste as hazardous is removed through meeting the LDR treatment standards.

B. Debris Treated To Meet the Alternative Debris Treatment Standards

The alternative treatment standards require the use of specific technologies from one or more of the following categories: extraction technologies, destruction technologies, or immobilization. Treatment must be performed in accordance with specified performance standards

found in the regulations at 40 CFR 268.45. If one of the extraction or destruction technologies is used, and the debris does not display any characteristic of hazardous waste, then EPA would consider the treated debris to no longer contain hazardous waste. Such treated debris could, therefore, be reused, returned to the natural environment, or disposed in a nonhazardous waste (subtitle D) facility. Nondebris residuals generated from the treatment of debris contaminated with listed wastes would still be hazardous wastes by virtue of the derived-from rule and would be subject to the hazardous waste management system, including the treatment standards for newly listed wastes in today's rule.

VII. Response to Comments Regarding Exclusion of Hazardous Debris That Has Been Treated by Immobilization Technologies

A. Background

The final Phase I **Land Disposal** Restrictions (LDR) rule promulgated on June 30, 1992 (57 FR 37194, August 18, 1992), excludes from Subtitle C control hazardous debris that is treated using an extraction or destruction technology provided the treated debris meets the performance standards specified in Sec. 268.45 Table 1. Our basis for doing this is that the debris no longer contains the hazardous waste. On the other hand, hazardous debris treated by an immobilization technology is still subject to the hazardous waste regulations because the **Agency** has insufficient data or information to support that such treated debris would not leach Appendix VIII constituents over time in a manner that would be protective to human health and the environment. In our proposal to the Phase I LDR rule, the **Agency** solicited comment on whether immobilized hazardous debris should be excluded from Subtitle C control. While the **Agency** received favorable comments on excluding such treated debris from the hazardous waste regulations, no information or data was provided to support such a position. Therefore, the final rule requires that immobilized hazardous debris continue to be managed as a hazardous waste.

The **Agency** decided to revisit the issue of whether immobilized hazardous debris, if treated in certain ways or is treated to meet certain limits, should be excluded from Subtitle C control. As a result, since the promulgation of the Phase I LDR rule, the **Agency** has undertaken a number of activities.

B. Roundtable Discussion

In an attempt to gather information on the issue, the **Agency** sponsored a roundtable discussion on August 3, 1992. Participants at the meeting included persons who commented on the Phase I LDR rule, debris treatment vendors, hazardous waste treaters and disposers, state officials, and officials from the Department of Energy (see Docket for specific list of attendees). Representatives from the **environmental** interest groups were also invited but were unable to attend. The purpose of the meeting was to gather information and discuss various regulatory approaches that would allow the **Agency** to exclude immobilized hazardous debris from Subtitle C control. While no specific data was gathered, there was a general discussion on the types of standards that could be applied such as design and operating standards, leach test, structural integrity test, permeability test for encapsulating material, so as to exclude immobilized hazardous debris from hazardous waste control. Additionally, the following points were

also made by one or more participants at the roundtable.

<bullet> A number of the attendees indicated that even if immobilized hazardous debris were excluded from hazardous waste control, it would continue to be managed as a hazardous waste due to CERCLA liability concerns.

<bullet> There was some question whether a specific exclusion for immobilized hazardous debris was necessary or whether the Hazardous Waste Identification Rule (HWIR) may be a more appropriate mechanism for addressing this issue.

<bullet> A representative from the glass industry suggested that glass cullet and vitreous materials should have a separate treatment standard. He indicated that the glass matrix would not leach lead at a higher rate than would an immobilized product--that is, it made little sense to grind up the glass material and then to stabilize it when the original matrix is just as sound.

While no consensus was reached, the following principles were generally arrived at by most of the participants at the meeting.

Microencapsulation: Participants at the meeting seem to believe that using a leach test may be more appropriate to demonstrate effective microencapsulation immobilization over an approach of developing design and operating standards. It was noted that treatment of hazardous debris is very waste and debris specific; if one could define design and operating standards that were generally applicable, they would likely be too burdensome in many cases.

Macroencapsulation/Sealing: The participants seem to indicate that the grinding requirement in the TCLP leach test made it inappropriate for predicting performance of macroencapsulation/sealing immobilization technologies. These technologies rely on an impermeable coating applied to the outside of the debris. Rather, the participants suggested a structural test to determine whether the given debris/technology combination was sufficient to maintain the coating or a permeability test for the coating media. While the participants conceptually believed that such an approach was workable, no one was able to suggest a specific test or standard. In addition, it was felt by some of the participants that the development of such a test could be difficult to develop.

While no data or information was provided at the meeting, it was indicated that if such information was submitted to the **Agency**, the **Agency** would consider such information in making its decision.

C. EPA Investigations

In addition to the above roundtable discussions, EPA has also been reviewing the literature and talking to vendors in an effort to obtain sufficient information on how to propose standards that could allow the exclusion of immobilized hazardous debris. At the time the Phase II LDR rule was proposed, no useful insights had been gained on how to specify design and operating standards that would ensure that immobilized hazardous debris was nonhazardous; the reason for this was the paucity of experience in immobilizing hazardous debris. Nevertheless, the **Agency** expressed interest in pursuing this area and specifically sought assistance from the regulated community on this issue.

D. Specific Questions for Which Comments Were Solicited

While the **Agency** had a better sense of the types of standards that may be appropriate for excluding immobilized hazardous debris from

Subtitle C control at the time of the Phase II proposal, the **Agency** still did not have the data to propose specific exclusions. For microencapsulation in particular, if a leach test were the most appropriate mechanism for determining whether such treated debris is nonhazardous, the **Agency** expressed the belief that HWIR may be the most appropriate rulemaking to address this issue. The **Agency** had a series of studies underway, was evaluating comments, but was not in a position to determine what such levels were at that time. With respect to macroencapsulation/sealing, additional data or information needed to be gathered before the **Agency** would be in a position to exclude this type of immobilized hazardous debris. To assist the **Agency** in this effort, we specifically solicited comment on the following questions:

Microencapsulation:

<bullet> Is the use of a leach test for excluding immobilized hazardous debris more appropriate than specification of design and operating standards?

<bullet> Is exclusion of immobilized hazardous debris using design and operating standards workable?

Macroencapsulation/Sealing:

<bullet> What type of structural or other test could be used?

<bullet> What type of criteria should be applied in determining whether such debris is nonhazardous?

The **Agency** is also considering allowing stabilization for soils containing low levels of organic constituents, and solicited comment on whether similar stabilization techniques or tests to ensure the effectiveness of such stabilization would be appropriate for excluding debris from Subtitle C control.

In addition, the **Agency** specifically solicited comment on any available data or information to demonstrate that immobilized hazardous debris (if treated properly) would not pose a substantial hazard to human health and the environment, stating that if such information were submitted to the **Agency**, the **Agency** would exclude such debris from Subtitle C control.

E. Comments Received and Conclusions

Microencapsulation: One commenter stated that specifying design and operating standards is appropriate for excluding immobilized hazardous debris from subtitle C, asserting that nothing is gained in performing a leach test on hazardous debris. Other commenters suggested that EPA consider a combination of a structural test combined with a leaching test conducted on a representative intact sample of the encapsulated waste. None of these commenters submitted any supporting information to substantiate these conflicting claims. However, the commenters did agree that if a leach test is used, the TCLP as it is now defined is inappropriate for immobilized debris.

Macroencapsulation/Sealing: Several commenters claimed that the TCLP test is inappropriate for immobilized material because the size reduction required by the test protocol destroys the encapsulant, thereby defeating the purpose of the technology. These commenters suggested that EPA instead consider a combination of a structural test (a 50 psi standard was suggested) combined with a leaching test conducted on a representative intact sample of the encapsulated waste. These commenters did not submit any data to verify that a 50 psi standard would insure the integrity of the immobilized waste, and although some commenters recommended that a new leach test protocol be developed, they did not suggest any specific protocols for a leach test

on the intact debris waste.

Exclusion of Immobilized Debris from Subtitle C Regulation: Several commenters maintained that debris treated with an immobilization technology should be excluded from Subtitle C regulation. However, these commenters did not submit any supporting data to verify this claim.

Two commenters claimed that a careful reading of 40 CFR 268.7(b) indicates that waste which is treated using a specified treatment technology is not subject to further testing to exit Subtitle C and claimed that the rules for debris treated in accordance with the alternative treatment standards specified in 40 CFR 268.45 should be the same. Their interpretation of this section of the CFR is incorrect. With regard to wastes for which technologies have been specified as the treatment standard, 40 CFR 268.7(b) contains the wording of the certification stating that the waste has been treated in accordance with Sec. 268.42; this certification must be signed before the waste may be **land** disposed. 40 CFR 268.7(b) does not say that this waste is no longer subject to subtitle C regulation.

One commenter suggested that, at a minimum, EPA should establish health based numerical standards for exclusion of hazardous debris from subtitle C. This commenter made no suggestion as to what test method should be used. The issue of basing LDR standards on the basis of risk rather than technology performance is addressed in Section III A 2 a of this rule, ``Risk-based Universal Treatment Standards.''

Finally, one commenter suggested that EPA allow the use of stainless steel as an encapsulant, claiming that its performance would be superior to that of other encapsulants, such as polymeric organics, which allegedly fail due to the radiation effects to their chemical bonds.

Conclusions: Although commenters were in general agreement on a number of issues (e.g. inappropriateness of the TCLP for debris, use of a 50 psi structural test as a performance standard, use of a leach test performed on intact debris), no supporting data or other information was submitted to support their claims and requests. Therefore, the **Agency** is not promulgating any modifications to the debris rule at this time. The **Agency** is evaluating exclusions as part of the HWIR process and will reassess appropriate action on debris if HWIR does not adequately address debris.

VIII. Deep Well Injection Issues

A. Prohibition of Dilution of High TOC Ignitable and of TC Pesticide Wastes Injected Into Class I Deep Wells

Today's rule prohibits the **disposal** of two types of waste into deep-well injection via Class I Underground Injection Control (UIC) wells unless the wastes first meet the **land disposal** restrictions promulgated in today's rule for these wastes, or the wastes are injected into a well that is subject to a no-migration determination. These wastes are nonwastewaters exhibiting the characteristic of ignitability at the point of generation and containing greater than 10 percent Total Organic Carbon (``high TOC ignitable liquids subcategory'') and also TC toxic halogenated pesticide wastes (DO12-D017). Thus, EPA is promulgating, as proposed, regulations excluding these two wastes from the portion of the rule at 40 CFR 268.1(c)(3) that allows a waste to be injected into a Class I deep injection well if the waste no longer exhibits a characteristic at the point of

injection. Today's rule also includes a one-year capacity variance for these injected waste streams.

For D001 High TOC ignitables, the treatment standard is expressed as methods of treatment that must be used prior to **land disposal**: combustion (i.e. incineration or fuel substitution) or recovery of organics. The preamble to the proposed rule stated that high TOC ignitable nonwastewaters contain high concentrations of organics that can either be recovered directly for reuse, or can be burned in combustion devices. These wastes are not injected in significant volumes, so that redirection of the wastes to treatment technologies will not have significant impact on well operators. 58 FR 48118-48119. EPA received no information to the contrary from commenters.

The treatment standards for TC pesticide wastewaters are also expressed as methods of treatment: biodegradation or incineration. On the other hand, the treatment standards for EP pesticide nonwastewaters are expressed as levels that may be achieved by using any treatment technology, other than impermissible dilution. (The Third Third rule had already disqualified these wastes from the exception that allowed dilution of characteristic wastes that were to be managed in Clean Water Act treatment systems including surface **land disposal** units, Sec. 268.3(b) and 55 FR 22657.)

As discussed at length in the preamble to the proposed rule, the **Agency**'s initial reading of the D.C. Circuit Court's decision is that wastes that are characteristically hazardous at the point of generation must typically be treated to destroy or remove hazardous constituents before **land disposal**, or be disposed of in a no-migration unit. 976 F.2d at 24. This is certainly a permissible interpretation of the opinion. Furthermore, the decision encompasses underground injection wells, specifically Class I deep wells, since they are permanent **land disposal** units. 976 F.2d at 25. Thus, under this reading of the court's opinion, these ignitable and pesticide wastes would have to be treated to remove hazardous constituents before injection.

EPA's decision to prohibit injection of these untreated wastes, however, is based not only on its initial interpretation of the Chemical Waste Management opinion (which, as noted below, may still evolve), but also on the particular wastes involved here. The wastes at issue are ignitable wastes with potentially very high concentrations of hazardous constituents, and pesticide wastes containing very toxic constituents.

Treatment is also warranted to reduce the amounts of these toxic wastes being **land** disposed. RCRA section 1003(a)(6) (``statutory goal of minimizing the . . . **land disposal** of hazardous waste by encouraging . . . properly conducted recycling and reuse, and treatment''); Steel Manufacturers' Association v. EPA, _____ F.3d _____, (D.C. Cir. July 9, 1994) (``We conclude that minimizing the overall volume of slag that is to be disposed is by itself, a sufficient justification for the zinc treatment standard . . .'') (slip op. at 13). Finally, only small volumes of these wastes are injected, and segregation of the wastes should not prove to be unduly difficult. For all of these reasons, the **Agency** believes it appropriate to prohibit injection of these wastes at this time, unless the wastes are treated to satisfy section 3004(m) or are disposed in a no-migration unit. In this regard, the **Agency** emphasizes that no-migration petitions for Class I nonhazardous wells receiving decharacterized wastes may be submitted to EPA or the Authorized States for evaluation at this time. The petitions may encompass not only the pesticide and high-TOC ignitable wastes prohibited in this rule, but other types of decharacterized wastes

(which are not yet prohibited but are scheduled to be addressed in Phase III) as well.

Most comments to the proposed rule requested independent consideration of Class I injection wells, because they believed that underground injection differs from other forms of **land disposal**, such as landfills and impoundments. Other comments questioned EPA's interpretation of the Third Third court decision and the **Agency**'s belief that treatment of these waste streams should be the preferred management approach for them. These commenters indicated that aggregation of waste streams meets the minimize threat standard and expressed their opinion that segregation of these wastes for treatment poses substantial risks to the environment and that underground injection is an inherently safer waste management practice. The **Agency** intends to consider all the above arguments (e.g., risks posed by wastes going to deep well injection) in the identification of alternatives for **land disposal** standards. The **Agency** will continue to investigate any and all information received concerning these comments, and intends to address **land disposal** standards for underground injection of characteristic wastes in a comprehensive manner in the Phase III rulemaking. Until these treatment standards become effective one year from the date of publication of this rule, they may continue to be injected into Class I injection wells without prior treatment.

B. Request for Comment on Petition From Chemical Manufacturer's Association Regarding Deep Well Injection of Ignitable and Corrosive Characteristic Wastes

The proposed rule solicited comments on a request from the Chemical Manufacturer's Association (CMA) that EPA develop separate treatment standards intended for those wastes disposed in Class I deep injection wells. CMA requested a separate set of treatment standards for ignitable and corrosive wastes managed by deep well injection that, in view of the unique circumstances of deep well injection, meet the statutory ``minimize threats'' standard. Many comments received by EPA urged the **Agency** to develop so-called UIC-specific treatment standards in light of this petition. However, EPA received virtually no technical information to support these comments.

Therefore, the **Agency** is not issuing a final response to CMA's request in today's rule. EPA continues to solicit information necessary to enable EPA to act on this petition in the future. These requests are documented in the rulemaking docket for today's rule. In particular, the **Agency** particularly requests data concerning waste volumes, waste transport, injection system integrity or the fate of disposed pollutants throughout the course of the injection procedure.

IX. Modifications to Hazardous Waste Recycling Regulations

A. Introduction
