Today's rulemaking finalizes the proposed changes to the hazardous waste recycling regulations, thus slightly broadening the scope of an existing exclusion (and related variance). This modification of the regulatory framework will allow for environmentally beneficial recycling to occur without unnecessary regulatory consequences.

EPA wishes to note that the changes to the definition of solid waste being promulgated today are narrow in scope and will have minor impact. A more broad-ranged evaluation of the regulations applicable to

the recycling of hazardous waste is being conducted by EPA's Definition of Solid Waste Task Force. This Task Force has been administering a public dialogue process to examine the overall impacts of the RCRA program on recycling, and will consider broader changes to the definition of solid waste as part of that process.

B. Modification of the Existing ``Closed-loop'' Recycling Exclusion and Related Case-specific Variance

1. ``Closed-loop'' Recycling Exclusion and Related Variance

In the January 4, 1985 final rule, the **Agency** promulgated an exclusion from the definition of solid waste at Sec. 261.2(e)(1)(iii) for secondary materials that are recycled in a ``closed-loop,'' (i.e., returned to the original production process in which the material was generated (see preamble discussion at 50 FR 639)). To be considered such a ``closed-loop'' process, three conditions must be met. First, the secondary material must be returned to the original process without undergoing significant alteration or reprocessing (i.e., it must be returned without first being reclaimed. See 261.2(e)(3) and Table 1). Second, the production process to which the unreclaimed materials is returned must be a primary production process (i.e., a process that uses raw materials as the majority of its feedstock, as opposed to a secondary process that uses spent materials or scrap metal as the majority of its feedstock). And third, the secondary material must be returned as a feedstock to the original production process and must be recycled as part of that process (as opposed to an ancillary process such as degreasing). EPA believes that these conditions characterize a material that is part of an on-going production process, and as such, the management of the material should not be characterized as waste management (i.e., the material is not part of the waste management problem).

Today's action addresses the second condition--that the production process to which a secondary material is returned be a primary process. This condition was part of the original exclusion due to considerations regarding jurisdiction, as it was understood in 1985, rather than to an evaluation of the potential impacts on the environment from such ``closed-loop'' recycling involving secondary processes. This condition thus was established without a consideration of whether such secondary materials would be part of the waste management problem. By definition, a secondary process uses waste materials as its principal feedstock. The **Agency** therefore concluded that the process residue, which is returned to the original process as a substitute for feedstock that is itself waste, is no less a waste than the waste material originally introduced (see 50 FR 639). (The **Agency** notes that with few exceptions, this condition has no actual impact on the recycling of residues from secondary processes because such residues that exhibit a characteristic of hazardous waste (i.e., characteristic by-products and sludges) are likewise excluded from the definition of solid waste if reclaimed.)

Although the **Agency** continues to believe that the jurisdictional logic behind this condition is sound, the judicial opinions regarding RCRA jurisdiction allow more weight to be given to **environmental** considerations. API v. EPA (API), 906 F.2d at 740-41; AMC v. EPA (AMC II), 907 F.2d 1179, 1186 (D.C. Cir. 1990). Thus, EPA has reevaluated this condition of the exclusion from the definition of solid waste due to its impact on the recycling of residues from secondary processes, in particular secondary lead smelters, and has determined that the condition of a closed-loop involving only primary processes is not

legally compelled, and that this condition is less relevant as an **environmental** consideration, assuming that the secondary material is well-managed prior to reprocessing in the primary or secondary process that generated it.

Comments received on the **Agency**'s proposal to remove this condition from the exclusion were favorable. Although several commenters said that the **Agency** should go further in modifying the existing regulations to encourage the recycling of hazardous wastes, such an action is beyond the scope of this proceeding. Such further action could result from the efforts currently underway to reevaluate the regulations applicable to hazardous waste recycling (i.e., the Roundtable discussions undertaken by the Definition of Solid Waste Task Force). One commenter also urged the **Agency** to make regulatory modifications only as part of the Definition of Solid Waste Task Force. EPA does not view the salutary and relatively modest change to the rules promulgated here as undermining the Task Force effort, and so is adopting the amendment.

Thus, the **Agency** is today removing this condition (i.e., that the process be a primary production process) from the ``closed-loop'' recycling exclusion. By doing this, secondary materials that are recycled back into the secondary production process from which they were generated are excluded from the definition of solid waste.

Following the same reasoning, the **Agency** proposed and is today finalizing a modification to section 260.30(b), a related case-by-case variance for materials that are reclaimed prior to reuse in the original primary production process from which they were generated (see 50 FR 652 (January 4, 1985) for a discussion of the existing variance). This modification similarly expands the variance to make it available for materials that are returned to secondary processes, as well as those returned to primary processes.

2. Storage Prior to Recycling

At proposal, the **Agency** proposed to condition the ``closed-loop'' exclusion (and the related 260.30(b) variance) such that secondary materials recycled back into secondary processes from which they were generated would continue to be managed in an environmentally sound manner. The **Agency** proposed this condition to address concerns that, absent this condition, a listed waste that would otherwise be required to be managed in a protective manner (e.g., without direct placement on the **land**) could begin to be managed in an unprotective manner because, as an excluded secondary material, no regulatory requirements would apply. Storage of hazardous secondary materials on the **land** can be deemed to be a type of discarding (``part of the waste **disposal** problem'' in the words of the D.C. Circuit), and hence provide a basis for classifying the materials as solid and hazardous wastes. AMC II, 907 F.2d at 1187. The only comments received addressing this proposed condition asked for more clarification of what would be considered ``a protective manner.'' The **Agency** is promulgating the condition to the exclusion that such secondary materials be managed in a protective manner such that there is no placement on the **land**, that is no **land disposal** as defined in Sec. 3004(k). See Sec. 261.4(a)(10) and (11) where EPA has attached this same condition to comparable exclusions. Management that is designed to contain the material or otherwise prevent its release to the environment, such as in a containment building (see 40 CFR 264.1100) or tank, is permissible. The **Agency** believes that this condition will not require any changes in how these secondary materials are currently managed and will ensure that providing regulatory relief will not unintentionally increase risk to

human health and the environment.

Additional changes were proposed and are being promulgated in this rule in order to implement and be consistent with the changes in variances discussed above. Previously the Regional Administrator granted variances from classification as a solid waste in 40 CFR 260.30, 260.31, 260.32, and 260.33. Today's rule transfers this authority to grant variances from the Regional Administrator to the Administrator. The changes in Secs. 260.30 and 260.31 are necessary because such variances involve determining RCRA jurisdiction over secondary materials going to secondary processes. The other changes in authority to grant variances in Secs. 260.32 and 260.33 are being made in order to be consistent with the provisions of Secs. 260.30 and 260.31.

X. Compliance Monitoring and Notification

A. Compliance Monitoring

As proposed, the **Agency** is adopting an approach that will allow generators and facilities that manage organic toxicity characteristic (TC) wastes in systems other than those regulated under the Clean Water Act (CWA), those engaged in CWA-equivalent treatment prior to **land disposal**, and those injecting into Class I deep injection wells, to monitor or otherwise determine the presence of underlying hazardous constituents ``reasonably expected to be present'' in their waste. (See definition at 268.2(i).) This means that regulated entities do not have to ascertain the presence of all hazardous constituents for which EPA is promulgating a universal treatment standard. Generators may base this determination on their knowledge of the raw materials they use, the process they operate, and the potential reaction products of the process, or upon the results of a one-time analysis for the entire list of constituents at Sec. 268.48.

The **Agency** solicited comment on whether generators should be required to do some testing of organic TC wastes to determine what underlying hazardous constituents are present and whether they meet UTS. Furthermore, the **Agency** noted that generators who also treat (including generators who decharacterize their waste but do not treat for underlying hazardous constituents) are classified as treaters, and would therefore be required to do some analysis of their wastes pursuant to Sec. 268.7(b) and prepare a treater's certification pursuant to Sec. 268.9(d) (58 FR 48134). A few commenters believed that generators should have to test their organic TC wastes at least once. Most commenters on this issue, however, strongly opposed a generator testing requirement and said that generators should be allowed to use knowledge of their wastes to make such a determination. Based on these comments, and the **Agency**'s reluctance to require generator testing of characteristic wastes but not listed wastes, the **Agency** is not imposing a testing requirement on generators of organic TC wastes at this time.

The **Agency** believes, however, that certifications should identify which hazardous constituents may be present in the waste. This is necessary in order that there be some record that the waste indeed requires treatment of these constituents before it can be **land** disposed. As explained below, existing regulations already require mention of the presence of underlying hazardous constituents in some situations. EPA is slightly amending those regulations today to make the requirement uniform, as discussed below.

If a generator does not treat a prohibited characteristic waste,

then the generator must prepare the standard notification and certification required by Sec. 268.7(a)(1) (for wastes that have not been treated to meet the treatment standard) (see Sec. 268.9(d), first clause). These requirements explicitly require mention of underlying hazardous constituents (Sec. 268.7(a)(1)(ii)).

If a generator partially treats a waste, however, for example by decharacterizing it but not treating the underlying hazardous constituents, there is a slight gap in the existing rules. Those rules require that a one-time notification and certification be prepared (Sec. 268.9(d)) and that the certification ``must state the language found in 268.7(b)(5)'' (Sec. 268.9(d)(2)). The Sec. 268.7(b)(5) certifications, however, do not contemplate the possibility that wastes may require additional treatment for underlying hazardous constituents. To allow for this possibility, EPA is amending Sec. 268.9(d) to state that in the event underlying hazardous constituents in a decharacterized waste have not been fully treated, the certification shall so state. EPA is also adding the following new certification to Sec. 268.7(b)(5) to account for this circumstance:

I certify under penalty of law that the waste has been treated in accordance with the requirements of 40 CFR 268.40 to remove the hazardous toxicity characteristic or the characteristics of ignitability and corrosivity. This decharacterized waste contains underlying hazardous constituents that require further treatment to meet universal treatment standards. I am aware that there are significant penalties for submitting a false certification, including the possibility of fine and imprisonment.

The **Agency** proposed, alternatively, that generators could be required to certify what underlying hazardous constituents are in the organic TC waste and whether they meet treatment standards, in a manner similar to the existing certification requirement for generators of wastes that meet the treatment standards as generated (see 40 CFR 268.7(a)(2)(ii)) (58 FR 48134). This suggestion was generally not supported by commenters, and EPA is not adopting this approach in this final rule. Before considering broader changes, EPA will see if the amended requirement in Sec. 268.9(d)(2)(i) discussed above is sufficient to create an adequate record.

B. LDR Notification

1. Constituents To Be Included on the LDR Notification

EPA solicited comment on how to limit the underlying hazardous constituents that must be monitored in organic TC wastes, and consequently reported on the LDR notification. Commenters on this issue said that the regulated community should only be required to address those constituents which are in the organic TC wastes as generated, prior to any subsequent mixing with other wastes. This is the approach being adopted in this rule. Such an approach is identical to the approach adopted in the May 24, 1993 Interim Final Rule (58 FR 29873) and is supported by commenters.

As a simplifying measure, EPA is also slightly amending the language of Sec. 268.7(a)(1)(ii) and Sec. 268.7(b)(4)(ii). The language in these paragraphs required that the hazardous constituents in F001-F005 spent solvents, F039, wastes subject to the California list provisions of Sec. 268.32 or RCRA section 3004(d), and underlying hazardous constituents in characteristic wastes be listed on the LDR

notification. This language is being changed so that if all the hazardous constituents are present in the waste (and thus the generator/treater will be treating all the constituents), then there is no longer a need to list all the constituents on the notification form. If, however, a subset of constituents are present in the waste (and thus the generator/treater will only be treating these constituents), the constituents in the waste must continue to be listed on the notification form.

2. Management in Subtitle C-Regulated Facilities

The **Agency** has information that many of the organic TC wastes that are not managed in CWA, or SDWA systems are being treated in hazardous waste management units (primarily incinerators) subject to RCRA subtitle C. In such a case, the notification, certification, and recordkeeping requirements set out in 40 CFR 268.7 apply (which includes identification of the underlying hazardous constituents reasonably expected to be present in the organic TC waste). For organic TC wastes, once the waste is no longer hazardous, however, further recordkeeping and documentation requirements are set out in 40 CFR 268.9. Section 268.9 requires that the generator or treater (including generators who treat, see 51 FR 40598, November 7, 1986) prepare a one-time notification which is sent to the EPA Region or authorized state and also kept in the generator's or treater's files. Treaters must certify that they are familiar with the treatment process used at their facility and that the process can successfully treat the waste to meet the treatment standards without impermissible dilution. See Sec. 268.7(b)(5), which applies to persons who treat formerly characteristic wastes (see existing Sec. 268.9(d)(2)). The **Agency** believes that, normally, at least some waste analysis is needed to make a good faith showing for meeting the treatment standards, given the number of hazardous constituents that could be covered by those standards.

3. Potential Management of Decharacterized Wastes at a Subtitle D Waste Management Facility

The **Agency** solicited information on certain potential waste management practices for decharacterized TC wastes to help determine whether new notification requirements are needed. In particular, EPA requested whether generators or treaters, after removing the characteristic, send the decharacterized TC waste off-site to a Subtitle D (nonhazardous waste) treatment facility for further treatment to address the underlying hazardous constituents (58 FR 48134). The **Agency** solicited comment on potential enforcement concerns if there is not a federal requirement that generators notify Subtitle D treatment and **disposal** facilities receiving decharacterized wastes.

One commenter stated that the generator of the waste should be made responsible through an EPA mandate to assure that treatment of underlying hazardous constituents at a subtitle D facility meets LDR treatment standards. Other commenters thought that the generator should notify the subtitle D facility of the underlying hazardous constituents, but they did not specify that a mandated notification should be required. However, other commenters said that existing arrangements between generators and off-site treatment facilities would suffice because EPA already requires generators to notify the EPA Regional office or Authorized State when it is sending decharacterized waste to a subtitle D facility under 40 CFR 268.9. One commenter pointed to the contract between the generator and the subtitle D facility as the mechanism by which generators would notify the treatment facility of what underlying hazardous constituents are in the

waste.

Only one commenter offered information on the extent that the practice of sending decharacterized wastes to a nonhazardous waste treater for treatment of underlying hazardous constituents is actually occurring. This commenter asked generators who send waste to their facilities how often they remove the characteristic prior to sending the decharacterized waste to a nonhazardous waste treatment facility for treatment of underlying hazardous constituents. They found that roughly 2-3 percent of the wastes from their survey group were decharacterized D001 and D002 wastes being sent off-site for further treatment at a nonhazardous waste treatment facility that employs CWA wastewater treatment or stabilization of underlying hazardous constituents. The commenter added, however, that there will be less decharacterized TC wastes going off-site for treatment of underlying hazardous constituents because these wastes require more sophisticated treatment systems to remove the characteristic than do the D001 and D002 wastes.

Based on this information, the **Agency** has decided, for the time being, not to impose new notification requirements in today's final rule (a new certification is being added in this rule to Sec. 268.7(b)(5)(iv) as described above). The **Agency** continues to believe that very little decharacterized TC wastes will be sent to a subtitle D facility for treatment of underlying hazardous constituents. If such a practice should occur, generators and Subtitle D facilities have substantial incentives (such as CERCLA liability) to exchange and verify compliance with treatment standards for underlying hazardous constituents independent of federal notification requirements.

If, however, information becomes available that generators are sending substantial amounts of decharacterized TC wastes off site to subtitle D facilities for treatment of underlying hazardous constituents, or that there is a paperwork loophole that existing arrangements between generators and treatment facilities do not address, today's approach will be revisited to determine whether such tracking is necessary to assure ``cradle to grave'' tracking of wastes and better informing subtitle D treatment and **disposal** companies of the requirements to which these decharacterized wastes remain subject.

XI. Implementation of the Final Rule

This section presents flowcharts of what EPA expects will be the most frequent set of decisions that must be made to implement the regulations for TC organic wastes (including soils), mixtures of TC organic wastes with listed wastes, and mixtures of TC organic wastes with ignitable or corrosive wastes. A flowchart describing the decisions necessary to comply with treatment standards for Phase II newly listed wastes is also included. Additionally, a flowchart is presented that outlines the decisions necessary to comply with treatment standards for debris contaminated with Phase II wastes. And, as a reminder that TC metals are not regulated by today's rule, a flowchart is also included of the decisions that must be made to determine if a characteristic metal waste is subject to the LDRs at this time based on regulation of Extraction Procedure (EP) metals in the Third Third rule in 1990, or is not yet subject to LDR regulation because TC metals will not be addressed until a later rulemaking. These flowcharts present only the major decisions that must be made; a thorough reading of the regulations will be necessary to fully implement the LDRs. There are requirements for specific waste

management scenarios that are not included in these flowcharts because they would have become too complex to be generally useful.

XII. Guidance to Applicants for Treatability Variances for As-Generated Wastes

The **Agency**'s existing regulations provide for variances from treatment standards if a waste cannot be treated to the specified treatment standard or if the treatment technology on which the standard is based is inappropriate for the waste. Section 268.44 (a). For guidance on treatability variances for soil, including site-specific, non-rulemaking variances, see section I.E. ``Treatment Standards for Hazardous Soil'' in this rule. To be granted a treatability variance, a petitioner must show that ``because the physical or chemical properties of the waste differs significantly from wastes analyzed in developing the treatment standard, the waste cannot be treated to specified levels or by the specified methods.'' Id. A demonstration that the waste cannot be successfully treated can be made ``by showing that attempts to treat the waste by available technologies were not successful, or through appropriate analyses of the waste which demonstrate that the waste cannot be treated to the specified levels.'' 51 FR at 40606 (Nov. 7, 1986). EPA evaluates treatability variance requests by ``first look[ing] at the design and operation of the treatment system being used. If EPA determines that the technology and operation are consistent with BDAT, the **Agency** will evaluate the waste to determine if the waste matrix and/or physical parameters are such [that] the BDAT properly reflects treatment of the waste.'' Id. The guidance set out below applies exclusively to treatability variances (for as-generated wastes) evaluated by EPA headquarters and processed pursuant to rulemaking procedures.

In order to settle a lawsuit challenging the **Agency**'s grant of treatability variances to two particular facilities, 56 FR 12351 (March 25, 1991), the **Agency** has agreed to provide some clarifying guidance regarding treatability variances, which essentially restates existing **Agency** practice and does not call into question the validity of any treatability variance the **Agency** has issued. First, as stated in 1986, to support an application for a treatability variance pursuant to Sec. 268.44(a) for process waste, the applicant should collect and

analyze a sufficient number of samples of the untreated waste to accurately characterize it. 51 FR at 40606 (Nov. 7, 1986). In general, the **Agency** would expect the applicant to collect and analyze four samples of its untreated and treated waste. (This corresponds to the minimum number of samples applicants for delisting pursuant to 260.20 must submit.) However, the exact number of samples would be determined by EPA as part of the **Agency**'s evaluation of each treatability variance application (and so could be less than four samples in a particular case).

Second, the applicant should normally investigate and report on demonstrated and reasonably available pretreatment steps that could significantly improve the effectiveness of the treatment the applicant is conducting. 51 FR at 40606. What the **Agency** has in mind is that applicants not overlook potentially simple types of pretreatment to remove an interfering parameter; for example, settling to reduce excess total dissolved solids. The **Agency** does not intend that applicants perform an extensive or expansive engineering analysis. Nor does the **Agency** intend that applicants be required to utilize treatment systems significantly different from those the **Agency** evaluated when promulgating the treatment standard. Rather, the **Agency** wishes to assure that applicants not overlook some relatively obvious means of removing interferences. Again, in particular cases, it may not make sense to conduct this type of analysis, in which case no such evaluation would be necessary.

Third, the applicant should make a good faith effort to explain why the treatment standard is not achievable for its waste. 51 FR at 40606. This good faith effort is to be based on the applicant's knowledge of its process, and is not to entail additional expense (such as a consultant's engineering analysis). As a general matter, the **Agency** simply believes that some thought should be given (and documented) as to what might be causing the problem.

Finally, EPA's general policy has been and will be to publish a notice of its proposed decision on applications for treatability variances in the Federal Register, Sec. 261.44 (e), and to allow a minimum of 30 days for the public to comment on the proposal. 51 FR 40607. All applicants will have the opportunity to comment on the reasonableness of applying one or more of these foregoing statements of guidance to their applications, and, as a result, EPA may decide not to apply them.

EPA notes further that there have been only a handful (fewer than 10) of applications for treatability variances since implementation of the **land** ban (aside from applications relating to contaminated media and debris), of which EPA has granted three. In the applications relating to electroplating wastes cited earlier, the **Agency** inferred that something about the applicants' wastes was making the wastes more difficult to treat than the waste EPA evaluated when promulgating the applicable treatment standard. This inference was based on the fact that the applicants were treating the waste with properly designed and operated BDAT treatment technology, namely the same type of treatment technology on which the treatment standard is based. 56 FR at 12352. EPA emphasizes that this type of inference was, and remains, permissible.

XIII. Clarifications and Corrections to Previous Rules

A. Corrections to the Interim Final Rule Establishing **Land Disposal** Restrictions for Certain Ignitable and Corrosive Wastes

On May 24, 1993, the EPA published an interim final rule establishing treatment standards for ignitable and corrosive characteristic wastes except those disposed in facilities regulated under the Clean Water Act (CWA), or Class I injection wells subject to the Safe Drinking Water Act, or zero-discharge facilities engaged in CWA-equivalent treatment. In today's rule, the **Agency** is clarifying that the provisions of the interim final rule remain in effect unless and until they are superseded in future LDR rules. The **Agency** does not plan to issue a final rule at this time; however, it is using the comments received on the interim final rule in developing future rules concerning the portions of the Third Third **Land Disposal** Restrictions Rule which were remanded by the D.C. Circuit (for discussion of the court ruling, see 58 FR 29861).

Among other things, the interim final rule established treatment standards for the underlying hazardous constituents reasonably expected to be present in the affected wastes at the point of generation. These treatment standards were the concentration levels for the constituents found in F039 (multisource leachate) wastewaters and nonwastewaters. The **Agency** is clarifying here that the universal treatment standards (UTS) established today supersede the F039 standards. Therefore, underlying hazardous constituents in the ignitable and corrosive wastes covered by the interim final rule must meet the 40 CFR 268.48, Table UTS--Universal Treatment Standards, levels before they can be **land** disposed. This change is being made simply so that the references to treatment standards for underlying hazardous constituents in ignitable and corrosive wastes in the interim final rule will be the same as those established for organic TC wastes in today's rule.

Also in the interim final rule, the **Agency** promulgated requirements to address a concern raised by the court about the potential for volatile organic constituent (VOC) emissions to create violent reactions during the dilution of ignitable and reactive wastes (see 58 FR 29873). The regulatory language in Secs. 264.1(g)(6) and 265.1(c)(10), however, inadvertently promulgated requirements for ignitable (D001) wastes and corrosive (D002) wastes. These sections are being corrected in today's rule to indicate, rightly, that the requirements apply to ignitable (D001) and reactive (D003) wastes.

B. Corrections to the Phase I Rule Establishing **Land Disposal** Restrictions for Newly Listed Wastes and Hazardous Debris

Today's rule clarifies several issues from the final rule establishing **Land Disposal** Restrictions for Newly Listed Wastes and Hazardous Debris (57 FR 37194, August 18, 1992).

The first issue being corrected responds to questions over which treatment standards can be used for treating hazardous debris. It was stated clearly in the preamble to the August 18, 1992 rule that debris must be treated by either using one of the specified technologies in Sec. 268.45, or, as an alternative, by meeting LDRs for the specific prohibited listed or characteristic waste with which the debris is contaminated (57 FR 37221). Subsequent comment from the regulated community indicate that this fact was not made completely clear in the regulatory language of that rule. Certain commenters suggested that a revision of the paperwork requirements found in Sec. 268.7 indicating that generators have a choice as to which treatment standards they may use would help alleviate the confusion.

EPA is, therefore, revising Sec. 268.7(a)(1)(iv) and

Sec. 268.7(a)(3)(v) to reflect that it is not mandatory to meet the alternative debris standards in Sec. 268.45, and that generators have the option to meet the treatment standards for the as-generated wastes contaminating the debris. It should be noted that the paperwork requirements for meeting treatment standards for as-generated wastes contaminating debris are the same as those for as-generated wastes. A new paragraph is being added to the regulatory language to indicate this.

In addition, consistent with EPA's effort to simplify LDR paperwork requirements, EPA is shortening the notification statement accompanying prohibited debris. In Sec. 268.7(a)(1)(iv) and Sec. 268.7(a)(3)(v), as promulgated on August 18, 1992, the statement ``This hazardous debris is subject to the alternative treatment standards of 40 CFR 268.45'' was required to be placed on the LDR notification, after listing the contaminants subject to treatment. EPA is revising that particular statement today so that merely referencing Sec. 268.45 after listing the contaminants subject to treatment is all that must be included on the LDR notification.

The second issue the **Agency** wishes to clarify and correct today concerns the language in Sec. 268.45(b)(2) of the August 18, 1992 Federal Register. This section states that the contaminants subject to the alternative treatment standards for hazardous debris, which were promulgated in the August 18, 1992 rule, are those constituents for which BDAT standards are established in Secs. 268.41 and 268.43. The **Agency** has received several letters asking why section 268.42 was not included in that language. Section 268.42 lists those wastes for which EPA established a treatment method as the standard. The reason section 268.42 was not included in the language in Sec. 268.45(b)(2) is that only the wastes themselves, and not waste constituents, are listed in Sec. 268.42.

The **Agency** fully intends, however, that debris contaminated with those wastes be subject to the alternate debris standards. Therefore, Sec. 268.45(b)(2) is being clarified today to read ``The contaminants subject to treatment for debris that is contaminated with a prohibited listed hazardous waste are those constituents or wastes for which BDAT standards are established for the wastes under Secs. 268.41, 268.42, and 268.43.''

The third issue the **Agency** is clarifying concerns exactly when surface impoundments which are newly subject to RCRA section 3005(j)(1) are expected to be in compliance with the requirements of Sec. 265.221 (a), (c), and (d). As is stated in Sec. 268.5(h)(2)(v) (as promulgated at 57 FR 37270, August 18, 1992), such surface impoundments must be in compliance within 48 months after the promulgation of additional listings or characteristics for the identification of hazardous waste. This is the maximum time allowed by RCRA section 3005(j)(6).

EPA mistakenly stated in two separate places in the preamble to the August 18, 1992 rule that the compliance date was 48 months from the effective date of a waste identification or listing (57 FR 37220). The **Agency** wants to make it clear that the compliance date which was promulgated in the regulations, and which is mandated by RCRA 3005(j)(6), is correct (57 FR 37270). These surface impoundments are thus required to be in compliance 48 months from the promulgation date of a new identification or listing. Sec. 268.5(h)(2)(v).

The promulgation date is the date the Administrator signs the rule which lists the new waste(s). The effective date is the date the new waste must come into compliance with hazardous waste management requirements, and may be six months from the promulgation date. The

Agency believes that 48 months to retrofit a surface impoundment is a reasonable amount of time, and believes that effort should begin as soon as the listing of a waste is published in the Federal Register; there is no reason to wait to begin retrofitting until a new listing or identification actually becomes effective. In any case, section 3005(j)(6) allows no other option.

Finally, in Sec. 268.38(a) of this rule, EPA is prohibiting debris that is contaminated with the wastes that were prohibited in the Phase I rule. EPA inadvertently omitted to include such contaminated debris in the August 18, 1992 rule.

C. Amendment of Boiler and Industrial Furnace Rules for Certain Mercury-Containing Wastes

1. The Proposal

The **Agency** proposed a technical clarification to the Boiler and Industrial Furnace (BIF) rules on July 21, 1994 (59 FR 31964), that would exempt certain mercury-bearing hazardous wastes generated by the Chlorine Industry from the provisions of 266.100(c). Under this provision, owners and operators of smelting, melting, and refining furnaces that process hazardous wastes solely for metal recovery are conditionally exempt from regulation. To be exempt, the owner or operator must comply with certain notification, sampling and analysis, and recordkeeping provisions (see 266.100(c)(1)(i)). In addition, as indicated above, the waste must be processed solely for metal recovery; to be processed solely for metal recovery, the waste can not have a heating value greater than 5000 BTU/lb or have a total concentration of organic compounds listed in Appendix VIII of Part 261 greater than 500 ppm by weight. Wastes that have a heating value greater than 5000 BTU/lb or have a total concentration of hazardous organic compounds exceeding 500 ppm are considered by EPA to be burned for energy recovery and destruction, respectively and, thus, are subject to the BIF rules.

The **Agency** generally believes that most wastes that meet these criteria are appropriately subject to the BIF regulations. However, in certain instances, wastes that are burned for legitimate metal recovery can also exceed the 5000 BTU/lb and 500 ppm organic compound limits, in which case standards other than those in the BIF rules are likely more appropriate. (See 59 FR at 29776 (June 9, 1994) proposing CAA MACT standards for secondary lead smelters and indicating why RCRA air emission standards are not needed.) In fact, the **Agency** has specified a set of lead and nickel-bearing hazardous wastes that exceed the energy recovery or destruction limits, but are still conditionally exempt from the BIF rules if these wastes are legitimately burned for metal recovery (see 266.100(c)(3) and Appendices XI and XII to Part 266).

In the proposed technical clarification, the **Agency** defined some additional hazardous wastes--specifically, those generated by the Chlorine Industry and which are suitable for mercury recovery--that could be recovered in mercury retorting units without those units being subject to the BIF rules (provided the owners or operators of these units meet certain conditions). The **Agency** proposed this change based on the fact that these wastes contain high levels of mercury (from hundreds of parts per million to as much as 45%) and, thus are appropriate for recovery; in addition, the retort units in which these wastes are processed must be subject to emissions controls under the Clean Air Act. See Sec. 268.42 (treatment standards for high mercury subcategory wastes that require retorting units to be subject to the

CAA or comparable standards for control of mercury). It should also be noted that the Chlorine Institute, as part of their comments on the Phase II LDR proposal, requested that the **Agency** exempt these wastes from the BIFs rules. The remainder of this section of the preamble discusses the comments received and our response to those comments.

2. Comments and the Final Rule

The **Agency** received comments from five parties, Borden Chemical and Plastics (BCP), Bethlehem Apparatus (BA), PPG Industries (PPG), Olin Chemicals (Olin), and the Chlorine Institute (CI). Their collective comments and the **Agency**'s response follows.

The proposal limited the conditional exemption to certain mercury-bearing hazardous wastes generated by the Chlorine Institute. BCP, BA, and CI argued that the proposed change was too narrow, and that other mercury recovery units may also process combustible materials for legitimate metals recovery. Commenters thus recommended that the exemption should apply to all processors of mercury wastes. The **Agency** generally agrees with this position. Upon reevaluation, EPA believes there is no need to differentiate between units in the Chlorine Industry and similar units outside the Chlorine Industry. Therefore, the **Agency** is promulgating a rule which includes units operated by manufacturers and users of mercury or mercury products.

BCP addressed a second option for broadening the exemption so that devices other than those operated in the Chlorine Industry could process combustible wastes for legitimate metals recovery. BCP suggested EPA define mercury as a precious metal and allow processors to burn mercury laden hazardous wastes subject to the **Agency**'s BIF precious metals exemption (see Sec. 266.100(f)). EPA does not agree with BCP's contention that mercury is a precious metal. Mercury is not considered a precious metal by EPA or other Agencies or organizations. Precious metals are defined by the Bureau of Mines to include gold, silver, platinum, and palladium (Mineral Commodity Summary, 1993), and by EPA at 40 CFR 266.70 to include gold, silver, platinum, palladium, iridium, osmium, rhodium, and ruthenium, all metals whose value assures adequate control. Therefore, EPA rejects the approach suggested by BCP.

BCP, PPG, Olin, and CI also commented that the list of materials in the proposed technical clarification should be broadened to include the following additional items:

Sweepings
Respiratory Cartridge Filters
Cleanup Articles
Plastic Bags and Other Contaminated Containers
Laboratory and Process Control Samples
Wastewater Treatment Plant Sludge and Filter Cake
Mercury cell process sump and tank sludges
Mercury cell process solids
K106
Recoverable levels of mercury contained in soil

Upon evaluation, the **Agency** agrees that of these materials are appropriate for an exemption as long as they have recoverable levels of mercury. However, many mercury units, e.g., retorters, are not combustion devices and organic emissions may not be controlled in these units. Therefore, the **Agency** is concerned that materials with recoverable levels of mercury, but laden with hazardous organics, may not provide adequate destruction of the hazardous organics in exempt retorters, and thus, may not be protective of human health and the

environment. For that reason, the **Agency** is promulgating a broadened list of materials but is limiting the exemption to these wastes specifically identified and that contain less than 500 ppm of part 261, appendix VIII organics.

Finally, there appears to be some confusion by the Chlorine Industry about their status under the BIF rules (collectively, those regulations set forth in 40 CFR Part 266, Subpart H). CI, PPG, and Olin argued that they are not subject to BIF because they do not ``burn'' or ``combust'' anything and the BIF rules are written for combustion devices. The **Agency** agrees that many mercury recovery devices do not ``burn'' or ``combust'' by design; however, these units are Industrial Furnaces as defined in Sec. 260.10 and, thus, are subject to the appropriate BIF rules. In particular, Sec. 260.10 defines Industrial Furnaces as ``devices * * * that use thermal treatment to accomplish recovery of materials'' and that these include ``refining furnaces''. [Emphasis added.] Mercury recovery units raise the temperature of the waste to aid in the recovery and refining of mercury. Therefore, they are refining furnaces. In addition, Sec. 266.100(c) states that ``smelting, melting and refining furnaces * * * that process hazardous waste solely for metals recovery are conditionally exempt * * *.'' [Emphasis added.] This language includes all refining furnaces that process hazardous waste, irrespective of whether the process to achieve this end is combustion or not. Therefore, mercury recovery devices are BIFs, and come within the terms of Sec. 266.100(c). EPA is using the term ``mercury recovery furnace'' in today's amended rule to further clarify this point. (It should be noted that compliance with the BIF rules for these devices are not rigorous. It requires sending a one time written notification to the regional Director and following the provisions set forth in Sec. 266.100(c).)

Mercury recovery operators should note that the changes discussed in this section of the preamble only apply to units which have a metals recovery exemption. Units which process these wastes without the proper exemption are in violation of the BIF rules and subject to enforcement action.

D. Amendment of Rules on Use Constituting **Disposal**

In 1985, EPA created a separate regulatory regime for hazardous wastes that are recycled by being used in a manner constituting **disposal**. Part 266 subpart C.\1\ These rules provide, in essence, that the wastes can be so used without being subject to the RCRA facility standards if the waste-derived product (i.e. the hazardous wastes that is being used by being applied to the **land** (i.e. used in a manner constituting **disposal**)) has been ``produced for the general public's use,'' has undergone a chemical change so as to be inseparable by physical means, and if it meets the applicable LDR treatment standard. See Sec. 266.20(b).

\1\These rules apply, of course, only if the recycling is legitimate, and not a form of surrogate **disposal**. Sec. 266.20(a) applies only to ``recyclable materials'', which are hazardous wastes being recycled. Sec. 261.6(a)(1). This does not include wastes that are abandoned by being disposed of. Sec. 261.2(b)(1).

Hazardous wastes used in a manner constituting **disposal** that do not satisfy these conditions are subject to all of the subtitle C standards. See Sec. 266.23(a). In promulgating this provision in 1985, however, the **Agency** neglected to mention the then newly-enacted **land disposal** restriction requirements as among the standards to which the wastes were subject. The **Agency** obviously was not intending to amend the statute, and cannot override an express statutory requirement by regulation. The **Agency** only recently noticed this omission, and is using this opportunity to correct the error. Consequently, the Part 268 requirements will be added to the list of requirements in Sec. 266.23(a) for those hazardous wastes not satisfying the conditions of Sec. 266.20(b). This amendment is effective 90 days after publication of today's rule.

XIV. Capacity Determinations

This section presents the data sources, methodology, and results of EPA's capacity analysis for today's rule. Section A summarizes the results of the capacity analysis for the wastes covered by this rule; Section B summarizes the analysis of available capacity; Section C summarizes the capacity analysis for those newly identified and listed wastes that are **land** disposed in units other than deep injection wells; Section D summarizes the capacity analysis for wastes mixed with radioactive contaminants; Section E summarizes the results of the capacity analysis for high TOC ignitable and TC pesticide wastes and newly listed and identified wastes injected into Class I deep wells; and Section F presents the results of the capacity analysis for hazardous soil and debris contaminated with the newly listed and identified wastes covered in this rule.

In general, EPA's capacity analysis methodologies focus on the amount of waste currently **land** disposed that will require alternative commercial treatment as a result of the LDRs. **Land**-disposed wastes that do not require alternative commercial treatment (e.g., those that are currently treated using an appropriate treatment technology or that will be treated using an alternative on-site treatment system) are excluded from the quantity estimates. In addition, wastes managed in CWA, SDWA, CWA-equivalent systems are not included in this rule and will be addressed in an upcoming rulemaking.

EPA's decisions on whether to grant a national capacity variance are based on the demand for commercial treatment or recovery technologies. Consequently, the methodology focuses on deriving estimates of the quantity of wastes that will require commercial treatment as a result of the LDRs; quantities of waste that will be treated on-site or by facilities owned by the same company as the generator are omitted from the required commercial capacity estimates.

The major capacity information collection initiative for this rule was an EPA survey of all **land disposal** facilities that manage newly identified TC organic wastes (including TC-contaminated soil and debris) in **land**-based units (TC Survey). The survey, conducted in the spring of 1992, is a census of approximately 140 facilities. EPA identified the universe primarily based on those facilities that had submitted permit modifications or received interim status for managing these wastes. For each facility, EPA requested waste-stream specific data on newly identified TC organic wastes and information on on-site **land disposal** units and treatment and recovery systems.

EPA developed a data set of the information on the TC Survey

results. Specifically, the data set contains information on the quantities of newly-identified organic TC wastes that will require commercial treatment capacity as a result of the LDRs. The data collected and the survey used for the required capacity estimates are part of the docket for today's final rule.

A. Capacity Analysis Results Summary

For the organic TC wastes (D018-D043), EPA estimates that 220,000 tons of newly identified organic TC sludges and solids will require alternative commercial treatment as a result of today's final rule.

EPA estimates that much smaller quantities of the other listed wastes included in today's rule will require alternative commercial treatment. Fewer than 100 tons of chlorinated toluene (K149-K151) nonwastewaters are currently being **land** disposed and will require alternative treatment due to the LDRs. Approximately 4,600 tons of coke by-product (K141-K145, K147 and K148) nonwastewaters are currently being **land** disposed. However, comments to EPA indicate that the majority of the nonwastewaters are recycled or used for energy recovery and, therefore, alternative treatment may not be required. No K141-K145, K147 and K148 wastewaters are currently being **land** disposed. No K149-K151 wastewaters are currently being **land** disposed.

The quantities of radioactive wastes mixed with wastes included in today's final rule and currently being **land** disposed are generated primarily by the U.S. Department of Energy (DOE). EPA estimates that 1,300 m\3\ of high-level waste, 380 m\3\ of mixed transuranic waste, and 1,100 m\3\ of mixed low-level waste containing wastes covered in today's rule will be generated annually by DOE. These estimates exclude mixed wastes currently in storage, **environmental** restoration wastes, and soil and debris. DOE currently faces treatment capacity shortfalls for some high-level wastes and for all projected mixed transuranic waste generation. In addition, although the annual DOE treatment capacity for mixed low-level wastes exceeds the estimated annual generation, most of this capacity is limited to treatment of wastewaters with less than one percent total suspended solids, and is not readily adaptable for other waste forms. Consequently, DOE also faces a treatment capacity shortfall for mixed low-level nonwastewaters. Furthermore, DOE has indicated that it will generally give treatment priority to mixed wastes that are already restricted under previous LDR rules.

With respect to certain wastes being injected into deep wells, EPA has very limited information that differentiates high TOC D001 ignitable wastes from low TOC D001 ignitable wastes, particularly with reference to the type of Class I injection well (i.e., nonhazardous versus hazardous) the wastes are ultimately disposed into. The information the **Agency** does have indicates that both D001 ignitable wastes and D012-D017 TC pesticide wastes are deep well injected into Class I hazardous wells with no-migration exemptions. However, several commenters to the proposed rule, and other industries with Class I injection wells, indicated that it would be extremely difficult to identify, segregate, treat, and/or arrange for **disposal** of these waste streams in a short time frame. Consequently, EPA is granting these wastes a one-year national capacity variance.

The **Agency** also estimates that up to 120,000 tons of hazardous soil and 34,000 tons of hazardous debris contaminated with the newly identified organic TC wastes are expected to require alternative commercial treatment.

Table 1 lists each waste code for which EPA is promulgating LDR standards today. For each code, this table indicates whether EPA is granting a national capacity variance for **land**-disposed wastes. As indicated, EPA is not granting a two-year national capacity variance for the newly identified organic TC wastes, including soil and debris, nor for the listed wastes covered under this rule. Rather, EPA is granting a three-month variance. (This extension does not apply to wastes with a specified longer national capacity variance.) EPA is delaying the effective date because the **Agency** realizes that even where data indicate that sufficient treatment capacity exists, such capacity may not be immediately available. Additional time may be required to determine what compliance entails, redesign tracking documents, possibly adjust facility operations, and possibly segregate waste streams. EPA believes these legitimate delays can be encompassed within a short-term capacity variance because the ability to get wastes to the treatment capacity in a lawful manner is an inherent part of assessing available capacity. However, the **Agency** is granting a two-year national capacity variance for mixed radioactive wastes (i.e., radioactive wastes mixed with newly identified TC organic constituents D018-D043), including soil and debris contaminated with mixed radioactive wastes.

EPA also is granting a one-year national capacity variance to allow the Class I injection facilities an appropriate lead time to identify and then manage their high TOC D001 and D012-D017 waste streams by developing practical and sound treatment and/or **disposal** options and ultimately to come into compliance with today's rule.

Table 1.--Capacity Variances for Newly Listed and Identified Wastes\1\

Waste type	Variance for surface-disposed wastes	Variance for deep well-disposed wastes
High TOC D001 Wastes	No	One year
D012-D017 Wastes\2\	No	One year
D018-D043 Nonwastewaters	No	N/A
K141-K145 Wastes	No	No
K147-K148 Wastes	No	No
K149-K151 Wastes	No	No
Soil (Phase II Wastes)	No	N/A
Debris (Phase II Wastes)	No	N/A
Mixed Radioactive	Two years	N/A
Mixed Radioactive Soil and Debris (with Phase II Wastes).	Two years	N/A

N/A=Not applicable.

\1\EPA is granting a three month national capacity variance for all the newly identified and listed wastes covered in this rule to handle logistical problems associated with complying with the new standards.

\2\Newly identified TC wastes that were not previously hazardous by the old EP Leaching Procedure.

B. Analysis of Available Capacity

The analysis of commercial capacity for newly identified and listed wastes is based primarily on data received in voluntary data submissions. These data include estimates of available capacity at commercial combustion facilities provided by the Hazardous Waste Treatment Council (HWTC) on incinerators and the Cement Kiln Recycling Coalition (CKRC) on cement kilns that burn hazardous wastes. Capacity for other conventional treatment processes (e.g., stabilization) is based on the 1990 TSDR Survey Capacity Data Set, which contains results from the National Survey of Hazardous Waste Treatment, Storage, **Disposal** and Recycling Survey (the TSDR Survey), and required capacity information from prior LDR rules.

Combustion Capacity. Combustion capacity for liquid hazardous wastes has historically been more readily available than capacity for sludges and solids. EPA estimates commercial combustion capacity for TC organic liquids to be about 1,267,000 tons per year. Commercial capacity for combustion of sludges and solids is available at both incinerators and industrial furnaces (primarily cement kilns that are authorized to burn hazardous wastes as fuel).

Cement kiln capacity for hazardous waste is limited by air emission limits (e.g., boiler and industrial furnace (BIF) limits under 40 CFR 266 subpart H), feed system limitations (e.g., particle size and viscosity limits), and product (i.e., cement clinker) quality considerations. For instance, cement quality considerations may require that wastes burned in cement kilns have a heating value of at least 5,000 BTU/lb to ensure adequate temperatures in the kiln. (Comments received by EPA, however, indicate that some kilns accept wastes below this heating value.) Incineration capacity is also limited by air emission limits, other permit limits (such as heat release limits), and feed system limits. EPA has taken these limitations into account in its estimates of available commercial combustion capacity.

Information available to EPA indicates that approximately 438,000 tons/year of commercial combustion capacity are available for newly identified TC organic sludges and solids, including soil and debris.\2\ EPA primarily derived this estimate primarily from survey data compiled by the Hazardous Waste Treatment Council (HWTC) and Cement Kiln Recycling Coalition (CKRC). These surveys contained detailed information on the amount and types of waste burned at each commercial facility in 1992, and the maximum amount of waste that could practically be burned in light of technical, operational, and regulatory constraints. In deriving this estimate, EPA first reviewed each survey response to confirm that the information provided was based on technically valid assumptions. To be conservative in its national estimate, EPA only included facilities and units that are presently capable of operating at or near full capacity under current permit and operational constraints. EPA then derived a national baseline estimate of available capacity by subtracting the amount of waste (hazardous and nonhazardous) burned in 1992 from the maximum practical capacity at each facility. Several cement kilns that burn hazardous waste were not included in the CKRC survey results. For these facilities, EPA obtained maximum practical capacity estimates from other sources (e.g., past data submittals or general trade literature), and derived available capacity estimates by assuming that these kilns are utilized at the average rate of those included in the CKRC survey. EPA's methodology for deriving its baseline capacity estimate is described in greater detail in the capacity background document for today's rule.

\2\This estimate includes solids and nonpumpable sludges, but excludes pumpable sludges. Pumpable sludge capacity in general is grouped with liquid capacity because of its limitations in particle size, solids content, and viscosity, and because pumpable sludges are often fed through the same feed ports that are used for liquids.

Once EPA obtained its baseline available commercial combustion capacity estimate, it estimated available capacity for wastes affected by today's rule by subtracting required capacity for routinely generated F037 and F038 (69,000 tons/year) from its baseline estimate. This adjustment was needed because these wastes were not regulated during most of the 1992 base year (refer to 57 FR 37194, August 18, 1992). EPA did not adjust its capacity estimate to account for one-time generation of F037 and F038 because the **Agency** understands that these wastes were generally removed prior to the June 1994 effective date of the LDR standards or are being left in place when the surface impoundments that contain them are being closed.

EPA's estimate of available capacity takes into account capacity that will be required for Phase I wastes that were granted a national capacity variance, ignitable and corrosive wastes whose treatment standards were vacated (58 FR 29860, May 24, 1993), waste characteristics that affect the ability for a particular facility(s) to treat the wastes, and other factors that may limit capacity.

EPA is also considering the capacity effects of recent court decisions regarding the regulation of hazardous constituents other than those for which the waste fails the TC test. EPA solicited comments on the treatment capacity effects of requiring facilities to treat the underlying hazardous constituents in TC organic hazardous wastes to meet the then-proposed universal treatment standards. Although several commenters submitted comments in support of or in opposition to requirements for treatment of underlying hazardous constituents, few comments were received on the specific issue of the effects of this requirement on treatment capacity. EPA has concluded that sufficient combustion capacity exists to treat underlying hazardous organic constituents. One commenter indicated that few facilities could achieve the universal treatment standards (UTS) for some metals (which may be present as underlying constituents) in incinerator ash without further treatment. However, EPA believes that stabilization should generally be able to achieve the UTS levels for metal underlying constituents present in residuals from the treatment of organic TC wastes.

Stabilization Capacity. Stabilization may be required to treat the residuals of wastes covered in today's rule that contain metal underlying constituents. EPA estimates that over 1 million tons of stabilization capacity is currently available. In analyzing alternative treatment capacity for stabilization of newly identified and listed wastes, the **Agency** built on the capacity analysis conducted for the Third Third LDR rule. This analysis was based on data contained in the TSDR Capacity Data Set.

Innovative (Non-combustion) Technologies. There are several non-combustion technologies for the treatment of soil contaminated with RCRA hazardous wastes, including hydrolysis, vacuum extraction, photolysis, and oxidation. To the extent that these technologies can be

used to treat hazardous soil on-site, the required capacity for combustion will decrease.

EPA has limited information on innovative technologies with regard to both available capacity and to limitations of the technologies or constraints on the use of these technologies. EPA solicited comments on the use of innovative technologies for the treatment of soil contaminated with RCRA hazardous wastes. Specifically, EPA requested information regarding constraints on the use of these technologies both on- and off-site, including physical or chemical characteristics of the soils, and logistical constraints such as permitting and scheduling. EPA also solicited data on volumes of contaminated soil currently being treated by these technologies, current available capacity, and estimates of future capacity. EPA received two comments regarding innovative technologies. One commenter noted that to treat soil on-site requires permitting and approval by local, state, and federal agencies, which may be a problem for some innovative technologies. Another commenter stated that the chemical concentration to which a soil can be biotreated is influenced by the particular chemical, the soil type, the age of the contaminated media, and the bioremediation process. EPA encourages the use of innovative technologies when feasible, and realizes that--in some cases--use of these technologies may be limited by technical and non-technical considerations. Sufficient conventional treatment capacity is available, however, such that these limitations do not affect capacity determinations.

C. Surface Disposed Newly Identified and Listed Wastes

1. Required Capacity for Newly Identified TC Organics (D018-D043)

The **Agency** is promulgating treatment standards for TC organic nonwastewaters based primarily on incineration performance data. Treatment standards for some newly identified organic TC wastewaters are also being promulgated in today's rule. (Organic TC wastewaters managed in systems regulated under the CWA, those injected into Class I injection wells as regulated under the SDWA, and those zero discharge facilities that engage in CWA-equivalent treatment prior to **land disposal** will be addressed in future rulemakings. EPA will make variance determinations for these wastes at that time.) For the proposed rule, the **Agency** did not have data indicating that facilities managing organic TC wastewaters would be impacted. Thus, EPA solicited comments in the proposed rule on the quantities of newly identified organic TC wastewaters affected by the rule. However, no comments were received on this issue. The **Agency** has concluded that facilities managing organic TC wastewaters will not be affected by this rule (i.e., no organic TC wastewaters will likely require alternative commercial treatment as a result of today's rule).

EPA developed estimates of the quantities of newly identified TC organic wastes based on current management options to comply with the LDR requirements. EPA did not receive any data in public comments on the quantities of organic TC nonwastewaters containing underlying metal constituents. EPA estimates that approximately 220,000 tons of organic TC nonwastewaters are subject to this rule. (See Table 2 which presents the quantities of TC nonwastewaters (except for liquid nonwastewaters) requiring off-site treatment by waste code.) Even if all this quantity contained underlying metal constituents, the residuals from the treatment of organics could not be higher than 220,000 tons. Underlying metal constituents are, by definition, at levels that are below TC levels for metals. Stabilization is an appropriate technology for

treating low level metal wastes. Given that ample treatment capacity exists for stabilization (over 1 million tons), EPA believes that sufficient treatment capacity exists for residuals of organic TC wastes containing underlying metal constituents.

Table 2.--Quantities of TC Nonwastewaters Requiring Off-Site Commercial Treatment
[Surface disposed wastes in tons]

Nonwastewaters Code	
D018	126,000
D019	8,700
D020	6,300
D021	8,500
D022	8,400
D023	3,900
D024	520
D025	310
D026	1,500
D027	1,200
D028	10,800
D029	3,800
D030	510
D031	200
D032	3,300
D033	450
D034	410
D035	4,200
D036	260
D037	600
D038	3,600
D039	6,900
D040	6,600
D041	110
D042	120
D043	16,500
TOTAL\1\	220,000

\1\Total may not sum due to rounding.

The **Agency** also developed estimates of available commercial treatment capacity. Table 3 summarizes available capacity for each alternative treatment technology required for the newly identified TC nonwastewaters. The table also summarizes the required capacity for each technology. A comparison of required and available treatment capacity indicates that adequate combustion capacity exists for TC nonwastewaters. Therefore, in the proposed rule, EPA indicated they would not be granting a national capacity variance for D018-D043

nonwastewaters. EPA requested comments and any additional data on its assessment that there is adequate treatment capacity for these wastes. EPA received one comment on this issue. The commenter supported EPA's determination that sufficient capacity exists to treat D018-D043 nonwastewaters. Thus, EPA has not changed its assessment and is not granting a variance for these nonwastewaters.

Table 3.--Required and Available Capacity for Newly Identified Organic TC Wastes\1\
[All quantities are in tons]

Treatment technology	Available capacity	Required capacity
Liquid Combustion	1,267,000	\2\11,000
Sludge/Solid Combustion	438,000	220,000
Stabilization	\3\1,127,000	(\4\)

\1\Does not include hazardous soil and debris, mixed radioactive wastes, or deep well injected wastes.
\2\These are liquid nonwastewaters.
\3\Capacity analysis for the Phase I Newly Listed and Newly Identified Waste rule.
\4\Stabilization capacity may be required to treat underlying metal constituents in organic TC wastes after combustion.

2. Used Oil

EPA's capacity assessment does not include specific quantities of used oil which might be subject to this rule. Absent data to the contrary, EPA believes that the quantities of used oil that are **land** disposed and hazardous for TC organics are relatively small. (Used oil that is recycled and that exhibits the TC is not subject to the **land disposal** restrictions. See 261.6(a)(4).)

EPA has requested information and conducted various studies of generation, management and characteristics of used oil. Although the data are not comprehensive, based on all indications, most used oil is either recycled or reused as fuel.

In its May 20, 1992 (57 FR 21524) final listing determination for used oil, the **Agency** concluded that only a small portion of used oil is **land** disposed (less than 10 percent of the amount generated). Although in general used oil could be hazardous for TC organics (benzene) and metals (lead), the **Agency** furthermore observed that the trend of increased recycling and the phase down of lead in gasoline under the Clean Air Act would decrease both the quantity of used oil that is **land** disposed and the proportion of it that is hazardous.

To update and refine its capacity analysis for this rule, EPA requested comments in the September 14, 1993 proposed rule (58 FR 48092) and reviewed available data sources. The **Agency** requested comments on the quantities of used oil that exhibit the toxicity characteristic and is subject to the LDRs. EPA received only one comment from a firm that collected over 113 million gallons of used oil

for re-refining in 1992, but did not receive any comments on the amounts of used oil subject to the LDRs.

To gain a broader perspective of used oil generation and management EPA examined 1991 data from the national Biennial Reporting System (BRS). EPA did not expect to obtain comprehensive total quantities of hazardous used oil generation and management; however, EPA was able to get the proportional management of reported waste oils. The BRS shows that less than one percent of all waste oil reported is landfilled. For example, in the `waste oil from changes' category of the 1991 BRS, approximately 1,400 tons was reported as landfilled. Although EPA believes the proportionate **disposal** (percent) is nationally representative, the total quantity was reported for waste streams from only a few states which indicates that the total is not comprehensive.

We have received preliminary data from the State of New Jersey Hazardous Waste Facilities Siting Commission. New Jersey treats used oil as state hazardous waste and the Commission tracks generation and shipping/manifest data. In the oil category, approximately 1 percent of used oil generated is identified as **land** disposed (landfilled). Of this 1 percent we do not know how much would be hazardous for TC organics.

Therefore, EPA believes that the quantities of used oil that are **land** disposed and are also hazardous for TC organics are small and sufficient reuse-as-fuel, energy recovery, and/or incineration capacity exists. EPA believes that a capacity variance is not warranted for these wastes.

3. Required Capacity for Other Newly Listed Organic Wastes

This section presents EPA's analysis of required capacity for other listed organic wastes including coke by-product wastes and chlorinated toluene production wastes.

a. Surface Disposed Coke By-Product Wastes

K141--Process residues from the recovery of coal tar, including, but not limited to, tar collecting sump residues from the production of coke from coal or the recovery of coke by-products produced from coal. This listing does not include K087 (decanter tank tar sludge from coking operations).
K142--Tar storage tank residues from the production of coke from coal or the recovery of coke by-products produced from coal.
K143--Process residues from the recovery of light oil, including, but not limited to, those generated in stills, decanters, and wash oil units from the recovery of coke by-products produced from coal.
K144--Wastewater sump residues from light oil refining, including, but not limited to, intercepting or contamination sump sludges from the recovery of coke by-products produced from coal.
K145--Residues from naphthalene collection and recovery operations from the recovery of coke by-products produced from coal.
K147--Tar storage tank residues from coal tar refining.
K148--Residues from coal tar distillation, including but not limited to still bottoms.

For coke by-product nonwastewaters, EPA is promulgating concentration-based standards based on incineration. Under the authority of section 3007 of RCRA, EPA collected generation and management information concerning coke by-product wastes; this information was collected in 1985 and 1987. The majority of K141 to K145 nonwastewaters generated during that timeframe were recycled or used for energy recovery. Tar storage tank and tar distillation bottoms

may be removed periodically. The **Agency** identified the following annualized **land**-disposed quantities of wastes: 49 tons of K141 nonwastewaters, 2,750 tons of K142 nonwastewaters, 10 tons of K143 nonwastewaters, 304 tons of K144 nonwastewaters, 1,408 tons of K147 nonwastewaters, and less than 100 tons of K148 nonwastewaters. EPA identified no K145 nonwastewaters that were being **land** disposed. The **Agency** solicited comments on the above estimated quantities that may require alternative treatment as a result of the LDRs. However, no comments were received on this issue. Thus, EPA is using the estimates shown above for the quantities of these wastes that may require treatment capacity as a result of the LDRs.

Current management practices indicate that the majority of the newly listed coke by-product wastes are amenable to recycling, and therefore alternative treatment may not be required as a result of today's final rule. Thus, EPA believes that adequate capacity exists to treat the small amount of wastes that require alternative treatment.

EPA does not have any information that coke by-product wastewaters are currently generated. The quantity of these wastewaters is assumed to be zero. EPA solicited comments on changes of management practices or generation data on these wastes. No comments were received on this issue. Consequently, EPA concludes that the quantity of these wastewaters is zero.

As a result of this analysis, EPA is not granting a national capacity variance to K141, K142, K143, K144, K145, K147, and K148 nonwastewaters and wastewaters; however, the **Agency** is granting a three-month variance as described in Section A for the reason described therein.

b. Surface Disposed Chlorinated Toluene Wastes

K149--Distillation bottoms from the production of alpha (methyl) chlorinated toluene, ring-chlorinated toluene, benzoyl chlorides, and compound with mixtures of these functional groups. (This waste does not include still bottoms from the distillation of benzyl chloride.)
K150--Organic residuals, excluding spent carbon adsorbent, from the spent chlorine gas and hydrochloric acid recovery processes associated with the production of alpha (methyl) chlorinated toluene, ring-chlorinated toluene, benzoyl chlorides and compounds with mixtures of these functional groups.
K151--Wastewater treatment sludges, excluding neutralization and biological sludges, generated during the treatment of wastewaters from the production of alpha (methyl) chlorinated toluene, ring-chlorinated toluene, benzoyl chlorides and compounds with mixtures of these functional groups.

For wastes generated during the production of chlorinated toluene, EPA is promulgating concentration-based treatment standards based on incineration for nonwastewaters. EPA collected generation and management information on wastes generated from the production of chlorinated toluene. EPA collected this information under the authority of section 3007 of RCRA during engineering site visits in 1988. This capacity analysis incorporates data from the section 3007 information request and engineering site visits. EPA identified four facilities that produce chlorinated toluene wastes.

The **Agency** has identified no K149 nonwastewaters, no K150 nonwastewaters, and less than 100 tons of K151 nonwastewaters that were

being **land** disposed. For the capacity analysis, EPA assumes that these quantities are currently being **land** disposed and will require treatment capacity as a result of today's final rule.

EPA solicited comments on management practices and generation data on these wastes. One commenter requested a variance because high concentrations of salt and halogenated compounds make these wastes difficult to incinerate. EPA contacted a commercial incineration facility that stated that with proper management they could treat these wastes. Therefore, EPA believes that a capacity variance is not warranted for these wastes.

EPA does not have any information that chlorinated toluene wastewaters are currently generated. EPA solicited comments on changes of management practices or generation data on these wastes. No comments were received on this issue. Thus, EPA concludes that the quantity of these wastewaters is zero.

Because adequate capacity exists to treat these wastes, EPA is not granting a national capacity variance for K149, K150, and K151 nonwastewaters and wastewaters; however, like the other newly listed and identified wastes, EPA is granting a three-month variance as described in Section A for the reason described therein.

4. Newly Identified TC Wastes That Were Not Previously Hazardous by the Old EP Leaching Procedure

In the Third Third LDR rule (55 FR 22520, June 1, 1990), EPA promulgated treatment standards for D012 through D017 wastes, but only for those wastes that were previously hazardous by the old EP leaching procedure and remain hazardous under the new TCLP. D012 through D017 wastes that were not hazardous by the old EP leaching procedure but are now hazardous using the new TCLP are considered newly-identified D012 through D017 wastes.

In response to the ANPRM (56 FR 55160, October 24, 1991), EPA did not receive any estimates for additional waste quantities (or newly-identified wastes) due to the use of the TCLP rather than the EP leaching procedure. Similarly, no estimates were received in response to the proposed rule. EPA believes that the quantities of the newly-identified D012 through D017 wastes due to the use of the TCLP rather than the EP leaching procedure are small, if any, and, hence, expects little or no additional demand for commercial treatment capacity as a result of the LDRs. Because sufficient capacity exists to treat these wastes, EPA is not granting the newly-identified D012 through D017 wastes a national capacity variance. However, the **Agency** is granting a three-month variance as described in Section A of the preamble.

D. Required and Available Capacity for Newly Listed and Identified Wastes Mixed with Radioactive Components

EPA has defined a mixed RCRA/radioactive waste as any matrix containing a RCRA hazardous waste and a radioactive waste subject to the Atomic Energy Act (53 FR 37045-37046, September 23, 1988). These mixed wastes are subject to RCRA hazardous waste regulations, including the LDRs, regardless of the type of radioactive constituents contained in these wastes.

Radioactive wastes that are mixed with spent solvents, dioxins, California list wastes, First Third, Second Third, or Third Third wastes, and Phase I wastes, are subject to the LDRs already promulgated for these hazardous wastes. EPA granted national capacity variances for all of these mixed wastes because of a lack of national treatment capacity. Today's rule addresses the radioactive wastes that contain

newly listed and identified hazardous wastes being restricted in today's rulemaking.

Based on comments received by EPA in response to the proposed rule, the ANPRM (56 FR 55160, October 24, 1991), and previous rulemakings, the U.S. Department of Energy (DOE) is the primary generator of mixed RCRA/radioactive wastes. A variety of non-DOE facilities also generate mixed wastes, including nuclear power plants, academic and medical institutions, and industrial facilities.

1. Waste Generation

a. Non-soil and Non-debris Mixed Radioactive Wastes

In April 1993, DOE released the Interim Mixed Waste Inventory Report (IMWIR), which included a national inventory of all mixed wastes that were being stored or would be generated over the next five years and a national inventory of mixed waste treatment capacities and technologies. The report provides waste stream-specific and treatment facility-specific information for each site managing DOE wastes. This report is currently being updated; however the Final Mixed Waste Inventory Report (MWIR) Data Base that will be used to develop the Final MWIR was made public in May, 1994. This Data Base was used to determine the quantity of DOE-generated mixed waste requiring treatment.

Based on the MWIR data, EPA estimates that DOE generates 1,700 m<SUP>3/yr of non-soil, non-debris mixed radioactive waste contaminated with TC organic constituents. In addition, DOE currently has 19,000 m<SUP>3 of these wastes in storage. Table 4 lists the quantities of each category of non-soil, non-debris mixed waste that DOE expects to generate annually, as well as the amount currently in storage.

Table 4.--Quantities of DOE Non-soil, Non-debris Newly Identified TC Organic Mixed Radioactive Wastes

Mixed waste category	Current inventory (m<SUP>3)	Annual generation (m<SUP>3/yr)
High-level waste (HLW).....	11,000	1,300
Mixed transuranic waste (MTRU).....	4,700	1
Mixed low-level waste (MLLW).....	3,400	400

b. Mixed Radioactive Soil

EPA derived data on the quantities of DOE mixed radioactive soils using MWIR data. Table 5 lists the quantities of each category of mixed radioactive soil that is expected to be generated annually, as well as the amount currently in storage. The quantity of hazardous soil in storage, or projected to be generated annually, is very small. This can be attributed to the fact that the MWIR Data Base generally does not

include DOE **environmental** restoration wastes. When these wastes are generated they will increase the quantity of newly identified mixed wastes, particularly soil, that require treatment. Although these wastes are not included in the Final MWIR Data Base, the IMWIR estimates that DOE will generate a total of approximately 600,000 m<SUP>3 of mixed **environmental** restoration wastes over the period from 1993 to 1997. Some of these wastes will likely be newly identified organic TC mixed wastes.

Table 5.--Quantities of DOE Newly Identified TC Organic Mixed Radioactive Soils

Mixed waste category	Current inventory (m<SUP>3)	Annual generation (m<SUP>3/yr)
High-level waste (HLW).....	0	0
Mixed transuranic waste (MTRU).....	0	0
Mixed low-level waste (MLLW).....	20	10

c. Mixed Radioactive Debris

EPA derived data on quantities of DOE mixed radioactive debris using MWIR data. Table 6 lists the quantities of each category of mixed radioactive debris that is expected to be generated annually, as well as the quantity currently in storage.

Table 6.--Quantities of DOE Newly Identified TC Organic Mixed Radioactive Debris

Mixed waste category	Current inventory (m<SUP>3)	Annual generation (m<SUP>3/yr)
High-level waste (HLW).....	0	0
Mixed transuranic waste (MTRU).....	18,000	380
Mixed low-level waste (MLLW).....	14,000	650

2. Available Capacity and Capacity Implications

a. Non-soil and Non-debris Mixed Radioactive Wastes

EPA's review of IMWIR data indicates that 4,000 m<SUP>3 of treatment capacity are available annually for HLW at three DOE treatment systems. The available capacity appears sufficient to treat the estimated average annual generation. However, the IMWIR indicates that the current national inventory of HLW is greater than 280,000 m<SUP>3. This quantity dwarfs DOE's annual available treatment capacity for HLW. Consequently, DOE faces a treatment capacity shortfall for high-level radioactive wastes.

DOE is developing the Waste Isolation Pilot Project (WIPP) in New Mexico as a permanent repository for DOE TRU wastes, including MTRU wastes. However, DOE is not yet authorized to begin the placement of TRU wastes in the WIPP. In addition, wastes received at the WIPP must meet DOE's WIPP Waste Acceptance Criteria (WIPP-WAC). DOE is still in the planning stages for facilities designed to prepare MTRU wastes for shipment to the WIPP. As a result, DOE faces a capacity shortfall for treatment of MTRU wastes.

EPA's review of the IMWIR data indicates that 340 m<SUP>3/yr of currently available capacity exists at four DOE treatment systems for the treatment of alpha MLLW (i.e., MLLW with an alpha particle content between 10 and 100 nCi/g). However, the available capacity is greatly exceeded by the estimated quantity of alpha MLLW requiring treatment annually over the next five years, 3,700 m<SUP>3. Consequently, DOE faces a treatment capacity shortfall for non-soil, non-debris alpha MLLW.

According to IMWIR, 1,000,000 m<SUP>3/yr of treatment capacity among 26 systems are currently available to treat non-alpha MLLW. However, IMWIR states that most of DOE's currently available treatment capacity for MLLW is represented by facilities limited to the treatment of wastewaters (defined by DOE as less than 1 percent total suspended solids (TSS)). While these treatment facilities provide excess capacity for MLLW wastewaters, they cannot process wastes with high TSS and are not readily adaptable for other waste forms. Thus, although the quantity of MLLW treatment capacity is greater than the total quantity of mixed wastes, DOE faces a treatment capacity shortfall for nonwastewater MLLW, and thus non-alpha MLLW.

While DOE has provided its best available data on mixed waste generation, uncertainty remains about mixed waste generation at DOE (and non-DOE) facilities. For example, not all DOE Field Organizations responded to DOE's request for information following publication of the ANPRM. In addition, the data submitted to EPA generally did not include DOE **environmental** restoration wastes which, when generated, will increase the quantity of newly identified mixed wastes that require treatment. The IMWIR estimates that DOE will generate a total of 600,000 m<SUP>3 of mixed **environmental** restoration wastes over the period from 1993 to 1997. Although the IMWIR notes that the estimates of DOE **environmental** restoration wastes are preliminary, the quantities noted above will place additional strains on DOE's limited available mixed waste treatment capacity.

Although DOE is in the process of increasing its capacity to manage mixed RCRA/radioactive wastes, information supplied by DOE indicates that a significant capacity shortfall currently exists for the treatment of mixed RCRA/radioactive wastes, much of which are in storage facilities awaiting treatment. DOE has indicated that it will generally give treatment priority to mixed wastes that are already

restricted under previous LDR rules (e.g., radioactive wastes mixed with solvents, dioxins, California list wastes, First Third, Second Third, or Third Third wastes, and Phase I wastes). DOE is also concerned about the availability of treatment capacity for mixed wastes that will be generated as a result of site remediation activities. EPA's review of non-DOE data sources also showed a significant lack of commercial treatment capacity.

In response to the Phase II proposed rule, EPA received six comments concerning the proposal to grant a two-year national capacity variance for non-soil, non-debris TC organic mixed radioactive wastes. All six commenters, including DOE, were in favor of the two-year national capacity variance. Furthermore, none of the commenters identified any additional treatment capacity for the wastes. Thus, despite the uncertainty about the exact quantities of mixed radioactive wastes containing newly listed and identified wastes that will require treatment as a result of today's rule, the quantities appear to exceed available capacity. In addition, any new commercial capacity that does become available will be needed for mixed radioactive wastes that were regulated in previous LDR rulemakings and whose variances have already expired. Therefore, EPA has determined that sufficient alternative treatment capacity is not available for mixed radioactive wastes contaminated with newly listed and identified wastes whose standards are being promulgated today, and thus is granting a two-year national capacity variance for these wastes.

b. Mixed Radioactive Soil

EPA's review of IMWIR data indicates that no available treatment capacity exists at DOE facilities for mixed radioactive soils. As indicated earlier, a preliminary estimate of mixed radioactive soil is approximately 10 m<SUP>3/yr. Therefore, EPA is granting a two-year national capacity variance for mixed radioactive soils.

c. Mixed Radioactive Debris

EPA's review of IMWIR data indicates that less than 2 m\3\/yr of treatment capacity is available that can accept mixed low-level debris, an amount that exceeds the estimated annual generation. In addition, DOE has not yet been authorized to begin placement of MTRU wastes into the WIPP. As a result, DOE faces a treatment capacity shortfall for mixed transuranic debris. Therefore, EPA is granting a two-year national capacity variance to debris contaminated with mixed radioactive wastes.

E. Required and Available Capacity for High TOC Ignitable, TC Pesticide, and Newly Listed Wastes Injected Into Class I Deep Wells

As explained in previous rules concerning **land disposal** restrictions (see e.g., 52 FR 32450, August 27, 1987; 53 FR 30912, August 16, 1988; 55 FR 22520, June 1, 1990), EPA is allocating available capacity first to those wastes disposed in surface units, second to wastes resulting from CERCLA and RCRA clean ups, and finally to underground injected wastes. Based on this hierarchical approach, the **Agency** is promulgating the following effective dates for injected wastes.

EPA still has very limited information which differentiates high TOC D001 ignitable wastes from low TOC D001 ignitable wastes,

particularly with reference to the type of Class I injection well (i.e., nonhazardous versus hazardous) into which the wastes are disposed. The information the **Agency** does have indicates that both D001 ignitable wastes and D012-D017 TC pesticide wastes are deep well injected into Class I hazardous wells with no-migration variances. EPA is concerned that since these wastes are being generated, the potential exists that diluted D001 ignitable wastes and D012-D017 TC pesticide wastes are also being injected into Class I nonhazardous wells. In the proposed rule, EPA estimated that, based on management practices, low volumes of diluted high TOC ignitable waste were injected into Class I nonhazardous wells, and less than 420 tons of D012-D017 pesticide wastes are deep well injected into Class I nonhazardous wells. However, several commenters to the proposed rule, and other industries with Class I injection wells, have indicated that it would be extremely difficult to identify, segregate, treat, and/or arrange for **disposal** of these waste streams in a short time frame. This may be particularly true if waste volumes for high TOC D001 ignitable wastes are discovered to greatly exceed earlier estimates. The facilities, depending on their Class I injection wells, would have to reconfigure their **disposal** systems, which may include the construction or rearrangement of wastelines or piping.

To allow sufficient time to address these logistical problems, EPA is granting a one-year national capacity variance to allow the Class I injection facilities an appropriate lead time to identify their decharacterized high TOC D001 and D012-D017 waste streams and to create an infrastructure that allows their alternative management consistent with today's rule and the statute. This may include installation of equipment to segregate wastes. For operators applying for no-migration petitions, the variance will allow time for conducting the modelling or other analysis, for EPA review, and for the operators to make alternative arrangements if the petitions are not granted.

The following wastes are the newly listed wastes for which numerical standards are being promulgated, and which current data indicate are not being underground injected:

Coke By-Product Wastes: K141, K142, K143, K144, K145, K147, K148
Chlorotoluene Production Wastes: K149, K150, K151

The **Agency** requested further comment on whether any of these wastes are being injected. Comment was also requested on what quantities of wastes are being injected, and on the characteristics of these wastes. However, no comments were received on this issue. EPA is therefore not granting a national capacity variance for coke production wastes (K141-K145, K147, K148) and for chlorotoluene production wastes (K149-K151) injected into Class I deep wells.

F. Required and Available Capacity for Hazardous Soil and Debris Contaminated with Newly Listed and Identified Wastes

This capacity analysis focuses on hazardous soil and debris contaminated with wastes whose treatment standards are promulgated in today's rule.

EPA used several data sources to estimate the total quantity of **land**-disposed hazardous soil and debris. These sources include: responses to the Advance Notice to the Proposed Rulemaking (ANPRM) for the newly identified wastes (56 FR 55160); the TC Survey; information provided during a series of roundtable meetings held by the **Agency** in

May and June of 1991 with representatives of companies involved in the management and **disposal** of hazardous debris and soil; the Biennial Reporting System (BRS); Records of Decision (RODs) of Superfund sites; the TSDR Survey; and the National Survey of Hazardous Waste Generators.\3\

\3\EPA conducted the surveys during 1987 and 1988 to obtain comprehensive data on the nation's capacity for managing hazardous waste and the volumes of hazardous waste being **land** disposed as well as data on waste generation, waste characterization, and hazardous waste treatment capacity in units exempt from RCRA permitting.

---

1. Waste Generation

a. Hazardous Soil

The hazardous soil covered by this rule includes soil contaminated with D018-D043 organic TC wastes, and soils contaminated with coke by-product wastes and chlorinated toluene wastes. The largest quantity of hazardous soil affected by today's rulemaking is hazardous soil contaminated with D018-D043 organic TC wastes. At the time of the proposal, the **Agency** estimated that approximately 233,000 tons per year of TC soils would require off-site treatment and the majority of these TC soils was expected to be generated from surface impoundment closures. Based on new data received from owners/operators concerning surface impoundment closure practices, the **Agency** now estimates that the annual quantities of TC soil that is **land** disposed and subject to the LDRs ranges from 70,000 to 120,000 tons. Because TC soil generation from surface impoundment closures is somewhat discretionary, decisions by owners/operators of facilities concerning closure methods significantly changed the generation rates previously estimated in the TC Survey.

The **Agency** contacted facilities expected to generate TC soils from surface impoundment closures in 1993, 1994, and 1995 to confirm generation rates. Nearly all of the owners/operators revised their estimates for TC soil generation downward. Most owners/operators revised their closure practices to minimize or eliminate TC soil generation. Some facilities closed impoundments prior to today's rulemaking and other facilities are closing their impoundments as landfills. In closing as a landfill, a facility closes the impoundment with the waste in place. The facility owners/operators remove all free liquids, stabilize the sludges, cap the impoundment, and establish a ground water monitoring system. Therefore, for these facilities, no LDR treatment capacity would be necessary for TC soils. Of the facilities that predicted TC soil generation in 1994 and 1995, no facility currently expects to ship TC soils generated from a surface impoundment closure off-site for LDR treatment.

However, for at least two facilities, some uncertainty existed concerning the ability of these facilities to ship all of their TC soils off-site prior to today's rulemaking. Nevertheless, even if these facilities generated all their TC soils after today's rulemaking, the impact on LDR treatment capacity would be minimal because these facilities were expected to generate only 5,300 tons of TC soils.

Therefore, only 5,300 tons of TC soils generated by surface impoundment closures might require off-site treatment.

The **Agency** also reviewed the TC data base and public information on specific facilities to assess the TC soil generation rate from routine and sporadic activities that might require off-site **disposal**. For this analysis, the **Agency** assumed that routine activities and the quantity of soil generated should be considered constant over time when analyzing the generator population as a whole. However, for sporadic activities (e.g. surface impoundment closures), which by their nature occur infrequently, the year in which they occur is critically important in determining the required capacity for soil when the rule becomes effective.

In the TC Survey, some TC wastes were only characterized as a mixture of soil and debris. For the lower bound estimate (70,000 tons), the **Agency** assumed a 50-50 ratio of soil and debris in mixtures characterized as soil and debris. Using this assumption, EPA estimates that approximately 70,000 tons of TC soils generated by routine and sporadic activities will require additional treatment annually. In addition, in this lower bound estimate, the **Agency** assumed that all facilities were able to manage the TC soils generated from surface impoundment closures prior to the effective date of today's rule. Therefore, for the lower bound estimate, no TC soils from surface impoundment closures are expected to require additional treatment capacity. Based on these assumptions, the **Agency** calculates that the lower bound estimate is 70,000 tons of TC soils per year.

For the upper bound estimate, the **Agency** assigned the entire quantity of mixtures of soil and debris reported in the TC survey as TC soils. As a result, the TC soil generation rate for routine and sporadic activities increased by about 20,000 tons. The **Agency** conducted a similar review of facilities that submitted confidential business information (CBI) concerning TC soil generation rates. When assuming a 100 percent of mixtures were TC soils, these facilities were estimated to generate an additional 53,000 tons of TC soils for a total of 143,000 tons.

To verify the accuracy of the upper bound estimate, the **Agency** contacted individual facilities to determine actual TC soil generation rates. Based on these contacts, the TC data base overestimated TC soil generation from routine and sporadic activities. Many facilities stated that actual generation rates were lower or that the estimate included one time wastes from surface impoundment closures that already occurred. Therefore, when the **Agency** revised the upper bound estimates, TC soil generation rates for routine and sporadic activities at all facilities (non-CBI and CBI facilities) were approximately 114,000 tons. After adding the 5,300 tons of TC soils generated by surface impoundment closures, the estimated upper bound quantity of TC soil requiring additional treatment is approximately 120,000 tons per year.

Due to reduced generation of TC soils from surface impoundment closures in 1994 and 1995 and overestimations of TC soil generation rates from routine and sporadic activities, the **Agency** estimates that between 70,000 and 120,000 tons per year of TC soils will require off-site treatment.

At the time of the proposed rulemaking, the **Agency** was uncertain concerning the quantities of TC soil generated from manufactured gas plants (MGP). Most of the soil generated at these plants is expected to be contaminated with benzene. EPA requested updated information on the generation and management of these wastes and on whether there will be sufficient commercial treatment services to treat these wastes on-site.

No comments were received that specified quantities of soil generated or discussed commercial capacity for contaminated soils. While EPA acknowledges that generation of TC-contaminated soil from MGP will occur, the **Agency** expects that most of this quantity will be managed on-site and will not require off-site or commercial treatment capacity. Therefore, EPA has concluded that TC-contaminated soil from MGPs will not significantly affect the required treatment capacity for soil.

Similarly, several commenters to the ANPRM indicated that EPA may have underestimated the annual quantities of hazardous soil generated. Some commenters provided site specific data on the quantities of soil generated during remedial actions. The **Agency** incorporated these data in its analysis of the required capacity for hazardous soil.

In the proposed rule, EPA requested comments on the use of innovative technologies for hazardous soil. Specifically, EPA requested information on constraints to the use of these technologies both on- and off-site, including physical or chemical characteristics of the wastes, and logistical constraints such as permitting and scheduling. One commenter noted that to treat soil on-site requires permitting and approval by local, state, and federal agencies, which may be a problem for some innovative technologies. Another said that the chemical concentration to which a soil can be biotreated is influenced by the particular chemical, the soil type, the age of the contaminated media, and the bioremediation process. EPA has taken these comments into account in estimating the available capacity provided by innovative technologies for the treatment of hazardous soil.

b. Hazardous Debris

This rule covers debris contaminated with the newly listed and identified wastes covered in this rule. As shown in Table 7, data from the TC Survey indicates that approximately 34,000 tons of debris contaminated with D018-D043 wastes may be currently **land** disposed.

2. Current Management Practices

Waste generators and TSDFs report that most of the soils contaminated with D018-D043 newly identified organic TC wastes are currently landfilled without prior treatment. Incineration is the commercial off-site treatment technology reportedly available for these wastes.

Other than incineration for treating organic TC-contaminated soil, EPA has no information on the commercial off-site availability of other treatment technologies (e.g., low temperature thermal desorption, bioremediation, solvent extraction). Although several commenters to the ANPRM mentioned bioremediation as an alternative to incineration for the treatment of TC-contaminated soils, no commenter provided facility specific information on commercially available off-site treatment capacity for this technology. The lack of off-site commercial capacity

for technologies other than incineration was confirmed by responses to EPA's request for voluntary information from vendors of innovative technologies provided in the Vendor Information System for Innovative Treatment Technologies (VISITT). At the time of the proposed rule, EPA had received no information that special-handling problems may limit the quantity of hazardous soil that currently can be treated by incineration, and EPA requested information on special-handling concerns with managing these wastes. No comments were received on this issue. Thus, EPA has concluded that the quantity of hazardous soil that can be treated by incineration will not be limited by special-handling problems.

3. Available Capacity and Capacity Implications

a. Hazardous Soil

EPA is requiring that hazardous soil be treated prior to **land disposal**. EPA has determined that available destruction (e.g., incineration) and immobilization (e.g., stabilization) capacity exists. Some additional capacity also exists from many of the technologies in the extraction family (e.g., soil washing, chemical extraction). However, some of the capacity of extraction technologies currently used to decontaminate soils, such as soil washing, may not have received requisite permits by the effective date of this rule, although EPA is exploring the various opportunities for these technologies to become operational in an expedited manner. (Please contact the appropriate EPA regional office or the state hazardous waste program.) Thus, EPA anticipates that the off-site commercial capacity available to treat hazardous soils at the time this rule becomes effective will be limited to incineration and stabilization.

EPA recognizes that innovative technologies are also available to treat hazardous soil. Performance of these technologies also may be the basis for treatability variances pursuant to Sec. 268.44(h). EPA requested comments on the practicality and current availability of these technologies. EPA received comments that the proposed soil standards cannot be met by bioremediation, but may be met by innovative technologies such as thermal desorption and soil vapor extraction. However, EPA did not receive any comments on the current availability of these technologies. Thus, EPA has concluded that the off-site treatment capacity for hazardous soils will initially be limited to incineration and stabilization.

The **Agency** also solicited comments on the need for a capacity variance and on estimates of available treatment capacity. One commenter opposed the proposed capacity variance for soils and said that EPA should--at the very least--require treatment of ``hot spots.'' Several commenters supported the two-year national capacity variance. However, EPA has determined that a national capacity variance is unnecessary for hazardous soils.

b. Hazardous Debris

EPA estimates that approximately 34,000 tons of debris contaminated with newly identified organic TC wastes are currently **land** disposed and require off-site commercial treatment capacity. The capacity analysis conducted for debris contaminated with Phase II wastes indicates that sufficient capacity exists to treat debris contaminated with organics. Therefore, EPA is not granting a national capacity variance for hazardous debris contaminated with organic TC wastes and other listed

organic wastes covered in this rule.

XV. State Authority

A. Applicability of Rules in Authorized States

Under section 3006 of RCRA, EPA may authorize qualified States to administer and enforce the RCRA program within the State. Following authorization, EPA retains enforcement authority under sections 3008, 3013, and 7003 of RCRA, although authorized States have primary enforcement responsibility. The standards and requirements for authorization are found in 40 CFR part 271.

Prior to the Hazardous and Solid Waste Amendments of 1984 (HSWA), a State with final authorization administered its hazardous waste program in lieu of EPA administering the Federal program in that State. The Federal requirements no longer applied in the authorized State, and EPA could not issue permits for any facilities that the State was authorized to permit. When new, more stringent Federal requirements were promulgated or enacted, the State was obliged to enact equivalent authority within specified time frames. New Federal requirements did not take effect in an authorized State until the State adopted the requirements as State law.

In contrast, under RCRA section 3006(g) (42 U.S.C. 6926(g)), new requirements and prohibitions imposed by HSWA take effect in authorized States at the same time that they take effect in nonauthorized States. EPA is directed to carry out these requirements and prohibitions in authorized States, including the issuance of permits, until the State is granted authorization to do so. While States must still adopt HSWA-related provisions as State law to retain final authorization, HSWA is implemented Federally in authorized States in the interim.

Certain portions of today's rule are being promulgated pursuant to sections 3004 (d) through (k), and (m), of RCRA (42 U.S.C. 6924 (d) through (k), and (m)). These will be added to Table 1 in 40 CFR 271.1(j), which identifies the Federal program requirements that are promulgated pursuant to HSWA and that take effect in all States, regardless of their authorization status. States may apply for either interim or final authorization for the HSWA provisions in Table 1, as discussed in the following section of this preamble. Table 2 in 40 CFR 271.1(j) is also modified to indicate that this rule is a self-implementing provision of HSWA.

B. Effect on State Authorization

As noted above, today's rule, with the exception of the changes in the definition of solid waste (see preamble section IX, and further discussion in this section, below), will be implemented in authorized States until their programs are modified to adopt these rules and the modification is approved by EPA. Because the rule is promulgated pursuant to HSWA, a State submitting a program modification may apply to receive either interim or final authorization under RCRA section 3006(g)(2) or 3006(b), respectively, on the basis of requirements that are substantially equivalent or equivalent to EPA's. The procedures and schedule for State program modifications for either interim or final authorization are described in 40 CFR 271.21. On December 18, 1992, EPA extended the period allowing interim authorization to January 1, 2003 (see 40 CFR 271.24(c) and 57 FR 60129).

Section 271.21(e)(2) requires that States that have final

authorization must modify their programs to reflect Federal program changes and must subsequently submit the modification to EPA for approval. The deadline by which the State would have to modify its program to adopt these regulations is specified in section 271.21(e). Once EPA approves the modification, the State requirements become Subtitle C RCRA requirements.

States with authorized RCRA programs may already have requirements similar to those in today's rule. These State regulations have not been assessed against the Federal regulations being promulgated today to determine whether they meet the tests for authorization. Thus, a State is not authorized to implement these requirements in lieu of EPA until the State program modifications are approved. Of course, states with existing standards could continue to administer and enforce their standards as a matter of State law. In the period between the effective date of today's rule and the approval of state program modifications, the regulated communities in authorized states generally must comply with state regulations in addition to the provisions in today's rule. The regulated community should continue to consult with state agencies authorized to administer LDRs. In implementing the Federal program, EPA will work with States under agreements to minimize duplication of efforts. In many cases, EPA will be able to defer to the States in their efforts to implement their programs rather than take separate actions under Federal authority.

States that submit official applications for final authorization less than 12 months after the effective date of these regulations are not required to include standards equivalent to these regulations in their application. However, the State must modify its program by the deadline set forth in Sec. 271.21(e). States that submit official applications for final authorization 12 months after the effective date of these regulations must include standards equivalent to these regulations in their application. The requirements a state must meet when submitting its final authorization application are set forth in 40 CFR 271.3.

The regulations promulgated today need not affect the State's Underground Injection Control (UIC) primacy status. A State currently authorized to administer the UIC program under the Safe Drinking Water Act (SDWA) could continue to do so without seeking authority to administer the amendments that will be promulgated at a future date. However, a State which wished to implement Part 148 and receive authorization to grant exemptions from the **land disposal** restrictions would have to demonstrate that it had the requisite authority to administer sections 3004 (f) and (g) of RCRA. The conditions under which such an authorization may take place are summarized below and are discussed in a July 15, 1985 final rule (50 FR 28728).

The modifications to the definition of solid waste in this rule (see preamble section IX) are based on non-HSWA authority. This portion of the rule, because it is not based on HSWA authority, will be applicable immediately only in those States that do not have final RCRA authorization. In authorized States, these requirements will not apply until the States revise their programs to adopt equivalent requirements under State law. In addition, this modification broadens the ``closed-loop'' recycling exclusion from the definition of solid waste. The modification to this rule is less stringent, or reduces the scope of, the Federal program. Therefore, although EPA strongly encourages timely adoption, authorized States are not required to modify their programs to adopt regulations consistent with and equivalent to this provision.

XVI. Regulatory Requirements

A. Regulatory Impact Analysis Pursuant to Executive Order 12866

Executive Order No. 12866 requires agencies to determine whether a regulatory action is ``significant.'' The Order defines a ``significant'' regulatory action as one that ``is likely to result in a rule that may: (1) Have an annual effect on the economy of $100 million or more or adversely affect, in a material way, the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities; (2) create serious inconsistency or otherwise interfere with an action taken or planned by another **agency**; (3) materially alter the budgetary impact of entitlements, grants, user fees, or loan programs or the rights and obligations of recipients; or (4) raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in the Executive Order.''

The **Agency** estimated the costs of today's final rule to determine if it is a significant regulation as defined by the Executive Order. The incremental compliance costs for today's rule were estimated as a range from $194 to $219 million per year. Therefore, today's final rule is considered an economically significant rule, having an annual effect on the economy of over $100 million. The **Agency** prepared a regulatory impact analysis which analyzed the costs, economic impacts, and benefits of today's final rule.

This section of the preamble for today's final rule provides a discussion of the methodology used for estimating the costs, economic impacts and the benefits attributable to today's final rule, followed by a presentation of the cost, economic impact and benefit results. Limitations to these estimates are described in the results section. More detailed discussions of the methodology and results may be found in the background document, ``Regulatory Impact Analysis of the **Land Disposal** Restrictions Final Rule for the Phase 2 Newly Listed and Identified Wastes,'' which has been placed in the docket for today's final rule.

1. Methodology Section

In today's final rule, the **Agency** is establishing treatment standards for newly identified and listed wastes, as well as any soils and debris which are contaminated with such wastes. (The **Agency** plans to develop alternative standards for hazardous soils as a part of the Hazardous Wastes Identification Rule (HWIR).) The newly identified wastes covered under today's rule include wastes displaying the organic toxicity characteristic (TC), and pesticide wastes that were not previously hazardous by the EP leaching procedure. The newly listed wastes are Coke By-product wastes and Chlorotoluene wastes.

Of the newly regulated hazardous soil in today's rule, the only existing volumes are soils contaminated with TC wastes. (Any volumes of soil contaminated with F037 and F038 listed wastes which exist are not covered in today's rule, but are being covered in a future **Agency** rulemaking.) Finally, the **Agency** is promulgating new testing and recordkeeping requirements, as well as reducing other recordkeeping requirements.

Furthermore, today's final rule proposes Universal Treatment Standards (UTS) for wastes already regulated under the LDRs. The **Agency**'s analysis includes an analysis of the volumes affected by this change in treatment levels. (In the switch to UTS levels there are

cases where the new UTS level is less stringent than the existing listing levels, as well as cases where the UTS is more stringent than existing levels. Either of these cases would have the potential to change the costs associated with treatment of these wastes.)

a. Methodology for Estimating the Affected Universe

In determining the costs, economic impacts, and benefits associated with today's rule, the **Agency** estimated the volumes of TC nonwastewaters, Coke By-Product wastes, and Chlorotoluene wastes affected by today's rule. For the TC wastes, the **Agency** employed the 1995 volume estimates presented for each affected waste in the **Agency**'s 1992 TC Census Database (hereafter referred to as the ``TC Survey''). (There are several ways in which the volumes employed for the capacity determinations differ from those used in the RIA.) The capacity determinations section of the preamble describes the methods used there to determine volumes. The scope of the RIA differs from that of the capacity determination in the ``time window'' analyzed. The RIA examines the short- and long-term impacts from the rule. Capacity determinations, on the other hand, are made for a two year time frame beginning at the promulgation of today's rule.

The **Agency** employed the volumes of Coke By-Products and Chlorotoluene wastes estimated in their respective listing analyses. For Coke By-Products, current management practices suggest that no volumes will be **land** disposed.

b. Cost Methodology

The cost analysis estimates the national level incremental costs which will be incurred as a result of today's rule. The cost estimates for both the baseline and post-regulatory scenarios are calculated employing: (i) The facility wastestream volume, (ii) the management practice (baseline or post-regulatory) assigned to that wastestream, and (iii) the unit cost associated with that practice. Summing the costs for all facilities produces the total costs for the given waste and scenario. Subtracting the baseline cost from the post-regulatory cost produces the national incremental cost associated with today's rule for the given waste. The unit costs include costs for Subtitle D and Subtitle C **disposal** (as appropriate), and transportation costs where necessary; all dollar estimates are in 1993 dollars (unless otherwise noted.)

Each section below summarizes the baseline and post-regulatory management practices assignments for each waste. The unit costs employed for the management practices are summarized in the RIA background document for today's rule.

The cost methodology section includes three sub-sections: (i) TC organic wastes, (ii) Other newly identified wastes, (iii) Testing, record-keeping, and permit modification costs.

i. Organic Toxicity Characteristic Wastes (D018-D043)

The standards established in today's rule for the organic TC wastes require the treatment of all underlying hazardous constituents. The affected TC wastes can be divided into three groups: TC nonwastewaters, TC soils, and TC debris. While TC wastewaters which are not managed in CWA or CWA-equivalent units are being regulated in today's rule, the current management practices for these volumes do not trigger **land**

disposal (RCRA exempt tanks, etc.), and therefore are not subject to the LDRs. Below, EPA describes the method of estimating the costs incurred in complying with the TC standards in today's rule.

In establishing a baseline for the TC nonwastewaters, TC hazardous soils, and TC hazardous debris affected by today's rule, the **Agency** assumed Subtitle C landfilling as the current management practice. The **Agency** believes that there are TC wastes which are not affected by today's rule because they are already being treated to comply with the standards established in today's rule (e.g.: wastes with high BTU value which are being used as fuel, etc.). The **Agency** assumed that landfilling was occurring on-site for noncommercial (company captive) facilities, and off-site for commercial facilities. Employing today's requirement of treating for all underlying constituents reasonably expected to be present, the **Agency** developed technology assignments for the wastes at each facility. The assignments include a treatment technology (or treatment train where required), and subsequent Subtitle D **disposal**. These assignments were based on waste characterization and constituent concentration data. Where little or no such data were available for a wastestream, the weighted average unit cost was assigned (the weighted average unit cost was calculated separately for nonwastewaters, soils, and debris).

The **Agency** allows a generator of hazardous soil to apply for a treatability variance. The **Agency**, however, has not analyzed the potential short-term savings which could be realized in the management of hazardous soil, and therefore may have overestimated the cost impacts of the rule in the short-term. There is also some uncertainty where certain technologies will be available to treat TC nonwastewaters. The **Agency** performed a sensitivity analysis to characterize this uncertainty, which is included in the RIA Background Document.

ii. Other Newly Identified Wastes

In addition to organic TC wastes, the wastes affected by today's final rule include coke by-product and chlorotoluene wastes. Based on an economic analysis conducted by the **Agency** for the listing of coke by-product waste, generators recycle these wastes rather than disposing of them in Subtitle C landfills. Therefore, EPA estimates that negligible volumes of coke by-product wastes would be affected by this rule. For the chlorotoluene waste volumes, EPA conducted a detailed cost analysis using site specific data.

iii. Testing, Recordkeeping, and Permit Modification Costs

In addition to the costs for treatment of wastes, EPA estimated the incremental costs of the testing and recordkeeping requirements in today's rule. Testing and recordkeeping costs were developed for all wastes addressed in today's rule.

The **Agency** examined the incremental cost of the testing requirements under today's rule. The **Agency** considered the baseline scenario to include testing for waste identification. The post-regulatory scenario would include testing for waste identification, testing to determine the number and concentration of constituents requiring treatment, and testing following treatment to ensure compliance with the standards.

For the analysis of recordkeeping costs, the **Agency** employed the estimates developed in the Information Collection Request (ICR) for

today's rule. These estimates were employed in a facility specific analysis to develop a total incremental cost associated with the testing and recordkeeping requirements in today's rule.

The **Agency** also performed a sensitivity analysis on potential permit modification costs for facilities which may switch to on-site treatment. EPA applied a schedule of payments based on the costs of permit modifications to a group of nine facilities. The results of this analysis are provided in the Background Document RIA.

c. Waste Minimization Methodology

Since reducing waste generation may be less costly than treating these wastes to LDR standards, the **Agency** performed an analysis examining the potential waste minimization alternatives available to facilities. The analysis followed a multi-step methodology which included: (1) Develop a profile of the industries which indicated plans for waste minimization in the 1992 TC Survey Database, (2) select industries to examine which would be representative of the TC waste universe, (3) make telephone data verification calls to facilities within these industries, (4) determine the cost components for the post-regulatory and waste minimization scenarios for all wastestreams for those facilities, (5) estimate whether potential total costs/cost savings for the waste minimization and the post-regulatory (i.e., without waste minimization) scenarios would be a profitable investment for the firms, and (6) extrapolate results to the TC waste universe, and determine overall cost/cost savings.

d. Economic Impact Methodology

The economic effects of today's final rule are defined as the difference between the industrial activity under post-regulatory conditions and the industrial activity in the absence of regulation (i.e., baseline conditions). It should be noted that the volumes used for the economic impacts analysis do not include the reduction in volumes, and thus in costs, from waste minimization practices.

The **Agency** has evaluated the economic impacts for facilities managing organic TC wastes on a facility specific basis, limited only by the extent that data were available. EPA estimated the economic effects by comparing incremental annual compliance costs to a number of company financial measures, such as revenues, cost of operations, operating income, and net income. Financial data were obtained from Standard & Poor's Corporation Descriptions for the last fiscal year reported.

Since EPA believes that no costs will be associated with the treatment standards for coke by-products in the final rule, no economic impacts will be associated with regulation of these wastes. Economic impacts of compliance for facilities currently **land** disposing chlorotoluenes were evaluated in aggregated form, as information relating to these wastes are proprietary.

e. Benefits Methodology

This section discusses the benefit estimates for today's rule. The section includes: i. Analysis of the universal treatment standards, ii. hazardous waste recycling exemption, iii. groundwater pathway benefits, and iv. air pathway benefits.

i. Analysis of the Impact of the Universal Treatment Standards

To determine the cost implications of the Universal Treatment Standards (UTS), the **Agency** compared the UTS levels for each constituent to those levels established for each constituent in each waste code in the **Land Disposal** Restrictions (LDR) program to date.

The **Agency** assumed that there would only be a cost impact when the levels were sufficiently different to require a change in the treatment technology used in order to meet the new UTS levels. The comparison of levels rendered three results: (a) No cost impact because the constituent levels were the same, (b) no cost impact because the constituent levels were within one order of magnitude of each other, or (c) a potential cost impact because the constituent levels were greater than one order of magnitude apart.

Upon identifying those waste code/constituent pairs which were significantly different (i.e., greater than one order of magnitude), the **Agency** developed an estimate of the costs/cost savings based on the incremental difference in the previous technology required and the new technology required to meet the specified levels.

ii. Hazardous Waste Recycling Exemption

The **Agency** also estimated the potential cost savings resulting from the hazardous waste recycling exemption for K069 wastes. Obtaining volumes data from the Biennial Reporting System (BRS), and employing unit cost data, the **Agency** calculated the cost savings associated with the change allowed in management practices. The **Agency** limited the analysis to K069 wastestreams that are not mixed with other hazardous waste codes, since these mixtures may not be amenable or legal for recycling.

iii. Human Health Risk Reduction--Groundwater Pathway

The **Agency** evaluated two types of human health benefits for today's rule: reduction in human health risks via the groundwater pathway, and reduction in human health risks via the air pathway. EPA's analysis of the benefits of today's rule covers TC wastes only. These wastes dominate the other wastestreams covered by today's rule in terms of volume. Moreover, these are the only wastes for which the **Agency** had the data necessary to conduct a benefits assessment, in terms of attributes such as constituent concentrations and facility-specific wastestream volumes.

The fundamental assumption underlying EPA's approach for assessing groundwater risk reduction is that Subtitle C containment is completely effective in the short-term, i.e., over a period of about 30 years, but that in the longer term, containment systems will fail. The benefits analysis performed for today's rule examines this potential long-term risk which would be avoided under today's rule (i.e., only occurring at least 30 years into the future). The difference in risks from the baseline to the post-regulatory condition is the measure of incremental benefit associated with today's rule.

The basic approach involves the following steps (which are elaborated upon in the RIA background document, which has been placed in the docket for today's rule). (1) The **Agency** employed waste concentration data from the TC Survey to represent waste concentrations. (2) EPA calculated the mean concentration of each constituent at each facility, weighted across the volume of all TC

wastes managed at that facility. (3) EPA calculated the risk that would be posed by consumption of leachate, for both cancer and non-cancer effects, at each facility. (4) EPA developed a set of dilution/attenuation factors (DAF) to represent the effect of fate and transport processes in a homogeneous ground-water system. For each facility, the **Agency** divided the risk posed by the consumption of leachate by the DAF (expressed as a probability distribution) to yield the risk posed by predicted concentrations in water from hypothetical exposure wells. (5) EPA then summed the predicted risks across all facilities to develop an estimate of the distribution of individual risk at facilities managing untreated TC wastes. In addition, the **Agency** simulated the post-regulatory scenario, and summed the predicted risks across facilities, and developed the incremental risk reduction attributable to today's rule. (6) EPA subsequently developed an estimate of the potential incremental population risk using 1990 population estimates around each site. The **Agency** used standard assumptions for body weight (70 kg) and water intake (2 liters per day) for 9 years.

v. Human Health Risk Reduction--Air Pathway

Constituents contained in TC waste, soil, and debris may be emitted to air through volatilization and dust entrainment. Reducing the concentrations of TC constituents through the treatment standards set in today's rule reduces the potential for air emissions, and the risks posed by those air emissions. The goal of the air pathway risk analysis was to characterize baseline (pre-LDR) risk and the reduction in baseline risk resulting from regulatory requirements in today's rule.

The **Agency**'s basic approach for the air pathway risk analysis involves the following steps (which are elaborated upon in the RIA background document, which has been placed in the docket for today's rule). (1) EPA used bulk waste concentration data from the TC Survey to represent waste concentrations. (2) the **Agency** calculated the mean concentration of each constituent at each facility, weighted across the volume of all TC wastes managed at that facility. (3) EPA calculated the unit area managing TC wastes. (4) EPA estimated emissions due to volatilization and dust entrainment for each constituent at each facility. (5) The **Agency** evaluated the atmospheric transport for each constituent. EPA then estimated exposure concentrations at several downwind points corresponding to potential exposure locations. The **Agency** employed standard high-end assumptions of body weight (70 kg) and 70-year lifetime. (6) The **Agency** calculated individual cancer risk and non-cancer risk across the facilities, using the modeled exposure assumptions. (7) EPA calculated population risk for exposed populations. (8) The **Agency** then simulated the risk under the regulatory requirements in today's rule, and determined the incremental risk reduction.

2. Results Section

a. Volume Results

The **Agency** has estimated the volumes affected by today's rule. A total of 295,000 tons per year of organic TC wastes (D018-D043) are affected by today's rule; this volume includes 167,000 tons per year of nonwastewaters, 94,000 tons per year of hazardous soil, and 34,000 tons per year of hazardous debris. The volume estimates used in the capacity analysis differ, as described above, from those estimates employed in the regulatory analysis. See the regulatory analysis background

document for a more detailed discussion of these differences.

In addition, there are 30 tons per year of Chlorotoluene wastes affected by today's rule. The **Agency** also estimates that 9,760 tons per year of K069 waste will be affected as a result of the hazardous waste recycling exemption.

b. Cost Results

Exhibit XVI-1 summarizes the results of the cost analysis for today's final rule. In total, today's final rule would have an incremental annual cost of between $194 and $219 million. The lower bound cost estimate represents the effects of waste minimization compliance cost savings. In addition, there is a potential cost savings associated with the UTS standards and the hazardous waste recycling exemption of $2.1 million per year.

Exhibit XVI-1.--Summary of Cost Impacts

Waste type	Post-regulatory cost (million $/yr)	Baseline cost (million $/yr)	Incremental cost (million $/yr)
Organic TC Wastes (D018-D043):			
Nonwastewaters	175	30	145
Soil	52	17	35
Debris	44	8	36
Waste Minimization	.....	.....	(25)
Chlorotoluenes	0.1	<0.1	<0.1
Test & Recordkeeping	.....	.....	3
Subtotal for All Newly Regulated Wastes	272	56	194 to 219
Previously Regulated Wastes Affected by Rule:			
K069 Recycling Wastes	0	2.0	(2.0)
Cyanide Wastes (UTS Analysis)	66.5	66.6	(0.1)
Subtotal for All Previously Regulated Wastes	66.5	68.6	(2.1)

Note: The cost impact shown for waste minimization reflects a potential compliance cost savings, and therefore is shown as a range. See the write up of the waste minimization results for more details.

i. Organic TC Wastes

As described above, EPA conducted a facility specific cost analysis for those facilities managing organic TC waste. The incremental costs for the TC wastes, presented in Exhibit XVI-1, are between $191 and $216 million per year. Sixty-seven percent of the total cost, in the upper bound, is for the treatment of organic TC nonwastewaters, and 16 percent and 17 percent is for the treatment of organic TC contaminated soil and debris, respectively.

ii. Other Newly Regulated Wastes

Since current management practices show that no coke by-product wastes are landfilled, as a result of the coke by-product listing rule (August 18, 1992, at 57 FR 37284), EPA estimates that there are no cost impacts associated with the treatment standards for coke by-product wastes. The incremental cost for chlorinated toluenes is estimated to be less than $0.1 million annually.

iii. Testing, Recordkeeping, Permit Modification Costs

The analysis of the testing requirements in today's rule estimates incremental costs of approximately $3 million per year. The costs for the recordkeeping requirements were estimated to be approximately $490,000 per year. These costs are described in more detail in the Regulatory Impact Analysis background document developed for today's rule, which has been placed in the **Agency**'s docket.

c. Waste Minimization

Through the methodology outlined above, the **Agency** analyzed the cost implications of waste management alternatives involving waste minimization in today's rule. The analysis shows that there is a potential savings of $25 million per year quantifiable in comparing current management practices to waste minimization activities which could be implemented. The **Agency** presents the cost impact of today's rule as a range from $0 to $25 million per year, representing the cost savings possible through waste minimization activities.

In performing the waste minimization analysis, the **Agency** focused on specific process for two industries for which data were available. This approach allowed the analysis to be detailed in nature, providing a close examination of facility compliance alternatives. However, in doing so, the **Agency** believes it has underestimated the potential savings due to waste minimization. In addition, the **Agency** has not attempted to address any further source reduction, waste minimization, or innovative technology development which may result from today's rule.

d. Economic Impact Results

For the 14 companies with non-commercial, or captive, landfills that receive the company's waste (from the TC Survey), only one company would have a ratio of incremental compliance cost to cost of operations greater than one-half percent; all other facilities would experience even lower economic impacts resulting from today's rule.

Since no costs are associated with the treatment standards for coke by-products, no economic impacts are expected. Based on a ratio analysis of incremental cost to total sales, none of the chlorinated

toluene generating facilities is expected to experience significant impacts as a result of the final rule.

e. Benefit Estimate Results

The benefit estimates for today's rule include both reduction in risk to human health, as well as incremental cost savings. Cost savings are estimated for the Universal Treatment Standards (UTS), cost savings resulting from changes to the hazardous waste recycling exemptions. Human health benefits are estimated for cancer and non-cancer risks.

However, there are some benefits which the **Agency** has not attempted to quantify which are potentially attributable to today's rule. For example, the **Agency** has not attempted to quantify any potential non-use value benefits from **protection** of resources through treatment of hazardous wastes.

Furthermore, the risk analysis performed by the **Agency** for today's rule does not account for many other potential benefits from today's rule. Ecological risk reduction from treatment of wastes under today's rule has not been quantified. Nor do the **Agency**'s air and groundwater benefit estimates account for karst terrain, complex flow situations, or other factors which could contribute to underestimates of benefits. These unquantified benefits are discussed at greater length in the regulatory impact background document for today's rule.

i. Universal Treatment Standards Analysis

The **Agency**'s analysis of the cost impacts realized due to the Universal Treatment Standards requiring/allowing a change in treatment technology from that required under the existing standards produced a cost savings of approximately $100,000 per year. The only wastes for which the **Agency** found that the UTS standards required/allowed a change in treatment were the cyanide wastes.

The **Agency** received a number of favorable comments on the adoption of the UTS standards. These commenters stated that the UTS would allow them to save much more in operation costs than the **Agency** has quantified in the above analysis. One commenter stated that they would save approximately $366,000 annually and 1736 hours per year in manhour savings associated with the UTS for F024. And another commenter stated that they would save approximately $740,000 per year as a result of the UTS. A more thorough description of these cost savings is shown in the Regulatory Impact Analysis background document developed for today's rule, which has been placed in the **Agency**'s docket.

ii. Hazardous Waste Recycling Exemption

The analysis performed by the **Agency** for the cost impacts associated with the recycling exemption for K069 produced a savings of approximately $2 million per year. A detailed description of the cost savings for K069 is shown in the Regulatory Impact Analysis background document developed for today's rule, which has been placed in the **Agency**'s docket.

iii. Results--Groundwater Pathway

This section presents results for the baseline and post-regulatory risk analyses. For each case, results for individual cancer and non-cancer risk are presented for both high end (i.e. the 90th percentile

of the distribution) and central tendency (i.e. 50th percentile of the distribution) risk estimates. The section concludes with population risk estimates for cancer risks.

The results, presented in full in the RIA background document which is included in the docket for today's rule, show that the central tendency cancer risk estimate is expected to be zero. The high-end individual cancer risk is 4 x 10<SUP>-7. For the post-regulatory scenario, EPA assumed that all constituents would be treated to universal standards. For the post-regulatory case, the central tendency risk estimate is zero, and the high-end risk estimate is 3 x 10<SUP>-6.

Using the distribution of individual risks, the **Agency** calculated baseline and post-regulatory cancer population risks. Based on these assumptions, EPA estimates the baseline population cancer risk to be 0.24 cases per year in the central tendency. The post-regulatory population cancer risk is about 0.02 cases per year in the central tendency. In other words, the regulatory option reduces 0.22 cases per year in the central tendency.

For the non-cancer risks, the analysis shows that the 99th percentile baseline exposure level is less than the reference dose, using central tendency assumptions. The population risk estimates show 2000 people, in the central tendency scenario, who are exposed to non-cancer risk above the threshold.

There are a number of limitations to the groundwater pathway analysis. The timeframe to which these benefits are attributable begins 30 years following promulgation of the rule. The analysis does not account for any existing regulations which would mitigate risks from groundwater (e.g., Clean Water Act). In addition, one of the wastestreams which contributes a large proportion of the groundwater population risk is made up primarily of PCBs, which are not expected to migrate any appreciable distance in groundwater. The DAF used in the analysis was calculated based on drinking wells being within one mile of the facility, and was not adjusted to accord with the population estimates used in the analysis which are based on a two-mile distance. The DAF distribution is not constituent-specific and accounts only for homogeneous flow situations.

iv. Results--Air Pathway

This section provides results for the air pathway, for the baseline and post-regulatory scenarios.

It should be noted that the high end scenario models hypothetical receptors. Approximately 26 of the 35 modeled facilities (74 percent) have individual cancer risks exceeding 10<SUP>-6 for the high end scenario in the baseline. For the high end scenario, the non-cancer risk ratio exceeds one at one facility.

In the post-regulatory scenario, individual cancer risk is lowered considerably, indicating that at most of the facilities risk is driven by TC constituents. In the high end scenario, eight facility(s) have risks exceeding 10<SUP>-6. Doses of all non-carcinogens are well below reference doses.

For the population risk estimates, the **Agency** determined that the central tendency incremental benefits are approximately 0.037. For the incremental benefits of today's rule, the **Agency** performed a sensitivity analysis, described in the RIA background document, which examines the risk implications of changing volatilization rates under different assumptions of landfill cover and frequency of waste

placement.

There are a number of limitations to the air pathway analysis. Facilities which were modeled in the analysis were assumed to continue to dispose of treated waste on-site, which, for some facilities, may not be the case. In addition, due to limitations in the model employed, wastes were assumed to be disposed of only one time per year. A sensitivity analysis was conducted and is included in the RIA Background Document, which examines the effect on the emissions rate from this assumption. Finally, only wastestreams with all the necessary information were analyzed. This limitation could have the effect of either under- or overestimating the risks from the air pathway.

B. Regulatory Flexibility Analysis

Pursuant to the Regulatory Flexibility Act of 1980, 5 U.S.C. 601 et seq., when an **agency** publishes a notice of rulemaking, for a rule that will have a significant effect on a substantial number of small entities, the **agency** must prepare and make available for public comment a regulatory flexibility analysis that considers the effect of the rule on small entities (i.e.: small businesses, small organizations, and small governmental jurisdictions). Under the **Agency**'s Revised Guidelines for Implementing The Regulatory Flexibility Act, dated May 4, 1992, the **Agency** committed to considering regulatory alternatives in rulemakings when there were any economic impacts estimated on any small entities. Previous guidance required regulatory alternatives to be examined only when significant economic effects were estimated on a substantial number of small entities.

In assessing the regulatory approach for dealing with small entities in today's final rule, for both surface **disposal** of wastes and underground injection control, the **Agency** considered two factors. First, data on potentially affected small entities are unavailable. Second, due to the statutory requirements of the RCRA LDR program, no legal avenues exist for the **Agency** to provide relief from the LDR's for small entities. The only relief available for small entities is the existing small quantity generator provisions and conditionally exempt small quantity generator exemptions found in 40 CFR 262.11-12, and 261.5, respectively. These exemptions basically prescribe 100 kilograms (kg) per calendar month generation of hazardous waste as the limit below which one is exempted from complying with the RCRA standards.

Given these two factors, the **Agency** was unable to frame a series of small entity options from which to select the lowest cost approach; rather, the **Agency** was legally bound to regulate the **land disposal** of the hazardous wastes covered in today's rule without regard to the size of the entity being regulated.

C. Paperwork Reduction Act

The information collection requirements in this rule have been approved by the Office of Management and Budget (OMB) under the Paperwork Reduction Act, 44 U.S.C. 3501 et seq. and have been assigned control number 2050-0085. This rule will reduce the average reporting burden an estimated 0.75 hours per response, due to decreased paperwork requirements. Send comments regarding the burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden to Chief, Information Policy Branch; EPA; 401 M St., S.W. (Mail Code 2138); Washington, DC 20460; and to the Office of Information and Regulatory Affairs, Office of Management and Budget,

Washington, DC 20503, marked ``Attention: Desk Officer for EPA.''

List of Subjects

40 CFR Part 148

Environmental protection, Administrative practice and procedure, Hazardous waste, Reporting and recordkeeping requirements, Water supply.

40 CFR Part 260

Administrative practice and procedure, Hazardous waste.

40 CFR Part 261

Environmental protection, Hazardous waste, Recycling, Reporting and recordkeeping requirements.

40 CFR Part 264

Hazardous waste, Packaging and containers, Reporting and recordkeeping requirements.

40 CFR Part 265

Hazardous waste, Packaging and containers.

40 CFR Part 266

Hazardous waste, Reporting and recordkeeping requirements.

40 CFR Part 268

Hazardous waste, Reporting and recordkeeping requirements.

40 CFR Part 271

Administrative practice and procedure, Hazardous materials transportation, Hazardous waste, Penalties, Reporting and recordkeeping requirements.

Dated: July 29, 1994.

Carol M. Browner,
Administrator.

For the reasons set out in the preamble, title 40, chapter I of the Code of Federal Regulations is amended as follows:

PART 148--HAZARDOUS WASTE INJECTION RESTRICTIONS

1. The authority citation for part 148 continues to read as follows:

Authority: Section 3004, Resource Conservation and Recovery Act, 42 U.S.C. 6901, et seq.

2. Section 148.17 is amended by redesignating paragraph (b) as (d), redesignating paragraph (c) as (e), and by adding paragraphs (b) and (c) to read as follows:

Sec. 148.17 Waste specific prohibitions; newly listed wastes.

* * * * *

(b) Effective December 19, 1994 the wastes specified in 40 CFR 261.32 as EPA Hazardous waste numbers K141, K142, K143, K144, K145, K147, K148, K149, K150, and K151, are prohibited from underground injection.

(c) Effective September 19, 1995 the wastes specified in 40 CFR 261.23 as D001 (High TOC Subcategory as specified at 40 CFR 268.40), and in 40 CFR 261.24 as EPA Hazardous waste numbers D012, D013, D014, D015, D016, and D017 are prohibited from underground injection.

* * * * *

PART 260--HAZARDOUS WASTE MANAGEMENT SYSTEM: GENERAL

3. The authority citation for part 260 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6921-6927, 6930, 6934, 6935, 6937, 6938, 6939, and 6974.

4. In Sec. 260.30, the introductory text and paragraph (b) are revised to read as follows:

Sec. 260.30 Variances from classification as a solid waste.

In accordance with the standards and criteria in Sec. 260.31 and the procedures in Sec. 260.33, the Administrator may determine on a case-by-case basis that the following recycled materials are not solid wastes:

* * * * *

(b) Materials that are reclaimed and then reused within the original production process in which they were generated; and

* * * * *

5. In Sec. 260.31, the introductory text of both paragraph (a) and (b), is revised to read as follows:

Sec. 260.31 Standards and criteria for variances from classification as a solid waste.

(a) The Administrator may grant requests for a variance from classifying as a solid waste those materials that are accumulated speculatively without sufficient amounts being recycled if the applicant demonstrates that sufficient amounts of the material will be recycled or transferred for recycling in the following year. If a variance is granted, it is valid only for the following year, but can be renewed, on an annual basis, by filing a new application. The Administrator's decision will be based on the following criteria:

* * * * *

(b) The Administrator may grant requests for a variance from classifying as a solid waste those materials that are reclaimed and then reused as feedstock within the original production process in which the materials were generated if the reclamation operation is an essential part of the production process. This determination will be based on the following criteria:

* * * * *

6. In Sec. 260.32, the introductory text is revised to read as follows:

Sec. 260.32 Variance to be classified as a boiler.

In accordance with the standards and criteria in Sec. 260.10 (definition of ``boiler''), and the procedures in Sec. 260.33, the Administrator may determine on a case-by-case basis that certain enclosed devices using controlled flame combustion are boilers, even though they do not otherwise meet the definition of boiler contained in Sec. 260.10, after considering the following criteria:

* * * * *

7. Sec. 260.33 is revised to read as follows:

Sec. 260.33 Procedures for variances from classification as a solid waste or to be classified as a boiler.

The Administrator will use the following procedures in evaluating applications for variances from classification as a solid waste or applications to classify particular enclosed controlled flame combustion devices as boilers:

(a) The applicant must apply to the Administrator for the variance. The application must address the relevant criteria contained in Sec. 260.31 or Sec. 260.32.

(b) The Administrator will evaluate the application and issue a draft notice tentatively granting or denying the application. Notification of this tentative decision will be provided by newspaper advertisement or radio broadcast in the locality where the recycler is located. The Administrator will accept comment on the tentative decision for 30 days, and may also hold a public hearing upon request or at his discretion. The Administrator will issue a final decision after receipt of comments and after the hearing (if any).

PART 261--IDENTIFICATION AND LISTING OF HAZARDOUS WASTE

8. The authority citation for Part 261 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6921, 6922, and 6938.

9. Section 261.2 is amended by revising paragraph (e)(1)(iii) to read as follows:

Sec. 261.2 Definition of solid waste.

* * * * *

(e) * * *

(1) * * *

(iii) Returned to the original process from which they are generated, without first being reclaimed or **land** disposed. The material must be returned as a substitute for feedstock materials. In cases where the original process to which the material is returned is a secondary process, the materials must be managed such that there is no placement on the **land**.

* * * * *

PART 264--STANDARDS FOR OWNERS AND OPERATORS OF HAZARDOUS WASTE TREATMENT, STORAGE, AND **DISPOSAL** FACILITIES

10. The authority citation for Part 264 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6924, and 6925.

11. In Sec. 264.1, paragraph (g)(6) is revised to read as follows:

Sec. 264.1 Purpose, scope and applicability.

* * * * *

(g) * * *

(6) The owner or operator of an elementary neutralization unit or a wastewater treatment unit as defined in Sec. 260.10 of this chapter, provided that if the owner or operator is diluting hazardous ignitable (D001) wastes (other than the D001 High TOC Subcategory defined in Sec. 268.40 of this chapter, Table Treatment Standards for Hazardous Wastes), or reactive (D003) waste, to remove the characteristic before **land disposal**, the owner/operator must comply with the requirements set out in Sec. 264.17(b).

* * * * *

PART 265--INTERIM STATUS STANDARDS FOR OWNERS AND OPERATORS OF HAZARDOUS WASTE TREATMENT, STORAGE, AND **DISPOSAL** FACILITIES

12. The authority citation for part 265 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6924, 6925, 6935, and 6936.

13. In Sec. 265.1, paragraph (c)(10) is revised to read as follows:

Sec. 265.1 Purpose, scope, and applicability.

* * * * *

(c) * * *

(10) The owner or operator of an elementary neutralization unit or a wastewater treatment unit as defined in Sec. 260.10 of this chapter, provided that if the owner or operator is diluting hazardous ignitable (D001) wastes (other than the D001 High TOC Subcategory defined in Sec. 268.40 of this chapter, Table Treatment Standards for Hazardous Wastes), or reactive (D003) waste, to remove the characteristic before **land disposal**, the owner/operator must comply with the requirements set out in Sec. 265.17(b).

* * * * *

PART 266--STANDARDS FOR THE MANAGEMENT OF SPECIFIC HAZARDOUS WASTES AND SPECIFIC TYPES OF HAZARDOUS WASTE MANAGEMENT FACILITIES

14. The authority citation for part 266 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6924, and 6934.

Subpart C--Recyclable Materials Used in a Manner Constituting **Disposal**

15. In Sec. 266.23, paragraph (a) is revised to read as follows:

Sec. 266.23 Standards applicable to users of materials that are used in a manner that constitutes **disposal**.

(a) Owners or operators of facilities that use recyclable materials in a manner that constitutes **disposal** are regulated under all applicable provisions of subparts A through N of parts 124, 264, 265, 268, and 270 of this chapter and the notification requirement under section 3010 of RCRA. (These requirements do not apply to products which contain these recyclable materials under the provisions of Sec. 266.20(b) of this chapter.)

* * * * *

Subpart H--Hazardous Waste Burned in Boilers and Industrial Furnaces

16. In Sec. 266.100, the introductory text in paragraphs (c)(1), (c)(3), (c)(3)(i), and (c)(3)(ii); and paragraph (c)(3)(i)(A) are revised to read as follows:

Sec. 266.100 Applicability

* * * * *

(c) * * *

(1) To be exempt from Secs. 266.102 through 266.111, an owner or operator of a metal recovery furnace or mercury recovery furnace, must comply with the following requirements, except that an owner or operator of a lead or a nickel-chromium recovery furnace, or a metal recovery furnace that burns baghouse bags used to capture metallic dusts emitted by steel manufacturing, must comply with the requirements of paragraph (c)(3) of this section:

* * * * *

(3) To be exempt from Secs. 266.102 through 266.111, an owner or operator of a lead or nickel-chromium or mercury recovery furnace, or a metal recovery furnace that burns baghouse bags used to capture metallic dusts emitted by steel manufacturing, must provide a one-time written notice to the Director identifying each hazardous waste burned and specifying whether the owner or operator claims an exemption for each waste under this paragraph or paragraph (c)(1) of this section. The owner or operator must comply with the requirements of paragraph (c)(1) of this section for those wastes claimed to be exempt under that

paragraph and must comply with the requirements below for those wastes claimed to be exempt under this paragraph (c)(3).

(i) The hazardous wastes listed in appendices XI, XII, and XIII, part 266, and baghouse bags used to capture metallic dusts emitted by steel manufacturing are exempt from the requirements of paragraph (c)(1) of this section, provided that:

(A) A waste listed in appendix IX of this part must contain recoverable levels of lead, a waste listed in appendix XII of this part must contain recoverable levels of nickel or chromium, a waste listed in appendix XIII of this part must contain recoverable levels of mercury and contain less than 500 ppm of 40 CFR part 261, appendix VIII organic constituents, and baghouse bags used to capture metallic dusts emitted by steel manufacturing must contain recoverable levels of metal; and

* * * * *

(ii) The Director may decide on a case-by-case basis that the toxic organic constituents in a material listed in appendix XI, XII, or XIII of this part that contains a total concentration of more than 500 ppm toxic organic compounds listed in appendix VIII, part 261 of this chapter, may pose a hazard to human health and the environment when burned in a metal recovery furnace exempt from the requirements of this subpart. In that situation, after adequate notice and opportunity for comment, the metal recovery furnace will become subject to the requirements of this subpart when burning that material. In making the hazard determination, the Director will consider the following factors:

* * * * *

Appendix XIII to Part 266 [Added]

17. Appendix XIII is added to read as follows:

Appendix XIII to Part 266--Mercury Bearing Wastes That May Be Processed in Exempt Mercury Recovery Units

These are exempt mercury-bearing materials with less than 500 ppm of 40 CFR Part 261, appendix VIII organic constituents when generated by manufacturers or users of mercury or mercury products.

1. Activated carbon
2. Decomposer graphite
3. Wood
4. Paper
5. Protective clothing
6. Sweepings
7. Respiratory cartridge filters
8. Cleanup articles
9. Plastic bags and other contaminated containers
10. Laboratory and process control samples
11. K106 and other wastewater treatment plant sludge and filter cake
12. Mercury cell sump and tank sludge
13. Mercury cell process solids
14. Recoverable levels or mercury contained in soil

PART 268--**LAND DISPOSAL** RESTRICTIONS

18. The authority citation for Part 268 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6921, and 6924.

Subpart A--General

19. In Sec. 268.1, paragraphs (c)(3)(ii), (e)(4), and (e)(5) are revised, and paragraph (c)(3)(iii) is added, to read as follows:

Sec. 268.1 Purpose, scope and applicability.

* * * * *

(c) * * *

(3) * * *

(ii) Do not exhibit any prohibited characteristic of hazardous waste at the point of injection; and

(iii) If at the point of generation the injected wastes include D001 High TOC subcategory wastes or D012-D017 pesticide wastes that are prohibited under Sec. 148.17(c) of this chapter, those wastes have been treated to meet the treatment standards of Sec. 268.40 before injection.

* * * * *

(e) * * *

(4) De minimis losses to wastewater treatment systems of commercial chemical product or chemical intermediates that are ignitable (D001), corrosive (D002), or are organic constituents that exhibit the characteristic of toxicity (D012-D043), and that contain underlying hazardous constituents as defined in Sec. 268.2(i), are not considered to be prohibited wastes. De minimis is defined as losses from normal material handling operations (e.g. spills from the unloading or transfer of materials from bins or other containers, leaks from pipes, valves or other devices used to transfer materials); minor leaks of process equipment, storage tanks or containers; leaks from well-maintained pump packings and seals; sample purgings; and relief device discharges; discharges from safety showers and rinsing and cleaning of personal safety equipment; and rinsate from empty containers or from containers that are rendered empty by that rinsing; or

(5) **Land disposal** prohibitions for hazardous characteristic wastes do not apply to laboratory wastes displaying the characteristic of ignitability (D001), corrosivity (D002), or organic toxicity (D012--D043), that are mixed with other plant wastewaters at facilities whose ultimate discharge is subject to regulation under the CWA (including wastewaters at facilities which have eliminated the discharge of wastewater), provided that the annualized flow of laboratory wastewater into the facility's headworks does not exceed one per cent, or provided that the laboratory wastes' combined annualized average concentration does not exceed one part per million in the facility's headworks.

20. In Sec. 268.2, paragraphs (g) and (i) are revised to read as follows:

Sec. 268.2 Definitions applicable in this part.

* * * * *

(g) Debris means solid material exceeding a 60 mm particle size that is intended for **disposal** and that is: A manufactured object; or plant or animal matter; or natural geologic material. However, the

following materials are not debris: Any material for which a specific treatment standard is provided in Subpart D, Part 268, namely lead acid batteries, cadmium batteries, and radioactive lead solids; Process residuals such as smelter slag and residues from the treatment of waste, wastewater, sludges, or air emission residues; and Intact containers of hazardous waste that are not ruptured and that retain at least 75% of their original volume. A mixture of debris that has not been treated to the standards provided by Sec. 268.45 and other material is subject to regulation as debris if the mixture is comprised primarily of debris, by volume, based on visual inspection.
* * * * *

(i) Underlying hazardous constituent means any constituent listed in Sec. 268.48, Table UTS--Universal Treatment Standards, except zinc, which can reasonably be expected to be present at the point of generation of the hazardous waste, at a concentration above the constituent-specific UTS treatment standard.

21. Section 268.7 is amended by revising paragraphs (a) and (b)(4)(ii), and by adding paragraph (b)(5)(iv) to read as follows:

Sec. 268.7 Waste analysis and recordkeeping.

(a) Except as specified in Sec. 268.32, if a generator's waste is listed in 40 CFR part 261, subpart D, the generator must test his waste, or test an extract using test method 1311 (the Toxicity Characteristic Leaching Procedure, described in ``Test Methods for Evaluating Solid Waste, Physical/Chemical Methods,'' EPA Publication SW-846 as incorporated by reference in Sec. 260.11 of this chapter), or use knowledge of the waste, to determine if the waste is restricted from **land disposal** under this part. Except as specified in Sec. 268.32, if a generator's waste exhibits one or more of the characteristics set out at 40 CFR part 261, subpart C, the generator must test an extract using test method 1311 (the Toxicity Characteristic Leaching Procedure, described in ``Test Methods for Evaluating Solid Waste, Physical/Chemical Methods'' (SW-846)), or use knowledge of the waste, to determine if the waste is restricted from **land disposal** under this Part. If the generator determines that his waste exhibits the characteristic of ignitability (D001) (and is not in the High TOC Ignitable Liquids Subcategory or is not treated by CMBST or RORGS of Sec. 268.42, Table 1), or the characteristic of corrosivity (D002), and is prohibited under Sec. 268.37; and/or the characteristic of organic toxicity (D012-D043), and is prohibited under Sec. 268.38, the generator must determine the underlying hazardous constituents (as defined in Sec. 268.2, in the D001, D002, or D012-D043 wastes.

(1) If a generator determines that he is managing a restricted waste under this part and the waste does not meet the applicable treatment standards set forth in Subpart D of this part or exceeds the applicable prohibition levels set forth in Sec. 268.32 or RCRA section 3004(d), with each shipment of waste the generator must notify the treatment or storage facility in writing of the appropriate treatment standards set forth in Subpart D of this part and any applicable prohibition levels set forth in Sec. 268.32 or RCRA section 3004(d). The notice must include the following information:

(i) EPA Hazardous Waste Number;

(ii) The waste constituents that the treater will monitor, if monitoring will not include all regulated constituents, for wastes F001-F005, F039, D001, D002, and D012-D043. Generators must also

include whether the waste is a nonwastewater or wastewater (as defined in Sec. 268.2(d) and (f), and indicate the subcategory of the waste (such as ``D003 reactive cyanide''), if applicable;

(iii) The manifest number associated with the shipment of waste;

(iv) For hazardous debris when using the alternative treatment technologies provided by Sec. 268.45:

(A) The contaminants subject to treatment, as described in Sec. 268.45(b); and

(B) An indication that these contaminants are being treated to comply with Sec. 268.45.

(v) For hazardous debris when using the treatment standards for the contaminating waste(s) in Sec. 268.40: the requirements described in paragraphs (a)(1) (i), (ii), (iii), and (vi) of this section.

(2) If a generator determines that he is managing a restricted waste under this Part, and determines that the waste can be **land** disposed without further treatment, with each shipment of waste he must submit, to the treatment, storage, or **land disposal** facility, a notice and a certification stating that the waste meets the applicable treatment standards set forth in subpart D of this part and the applicable prohibition levels set forth in Sec. 268.32 or RCRA section 3004(d). Generators of hazardous debris that is excluded from the definition of hazardous waste under Sec. 261.3(e)(2) of this chapter (i.e., debris that the Director has determined does not contain hazardous waste), however, are not subject to these notification and certification requirements.

(i) The notice must include the following information:

(A) EPA Hazardous Waste Number;

(B) The waste constituents that the treater will monitor, if monitoring will not include all regulated constituents, for wastes F001-F005, F039, D001, D002, and D012-D043. Generators must also include whether the waste is a nonwastewater or wastewater (as defined in Sec. 268.2 (d) and (f)), and indicate the subcategory of the waste (such as ``D003 reactive cyanide''), if applicable;

(C) The manifest number associated with the shipment of waste;

(D) Waste analysis data, where available.

(ii) The certification must be signed by an authorized representative and must state the following:

I certify under penalty of law that I personally have examined and am familiar with the waste through analysis and testing or through knowledge of the waste to support this certification that the waste complies with the treatment standards specified in 40 CFR Part 268 Subpart D and all applicable prohibitions set forth in 40 CFR 268.32 or RCRA section 3004(d). I believe that the information I submitted is true, accurate and complete. I am aware that there are significant penalties for submitting a false certification, including the possibility of a fine and imprisonment.

(3) If a generator's waste is subject to an exemption from a prohibition on the type of **land disposal** method utilized for the waste (such as, but not limited to, a case-by-case extension under Sec. 268.5, an exemption under Sec. 268.6, or a nationwide capacity variance under subpart C of this part), with each shipment of waste he must submit a notice to the facility receiving his waste stating that the waste is not prohibited from **land disposal**. The notice must include the following information:

(i) EPA Hazardous Waste Number;

(ii) The waste constituents that the treater will monitor, if monitoring will not include all regulated constituents, for wastes F001-F005, F039, D001, D002, and D012-D043. Generators must also include whether the waste is a nonwastewater or wastewater (as defined in Sec. 268.2 (d) and (f)), and indicate the subcategory of the waste (such as ``D003 reactive cyanide''), if applicable;

(iii) The manifest number associated with the shipment of waste;

(iv) Waste analysis data, where available;

(v) For hazardous debris when using the alternative treatment technologies provided by Sec. 268.45:

(A) The contaminants subject to treatment, as described in Sec. 268.45(b); and

(B) An indication that these contaminants are being treated to comply with Sec. 268.45.

(vi) For hazardous debris when using the treatment standards for the contaminating waste(s) in Sec. 268.40: the requirements described in paragraphs (a)(1) (i), (ii), (iii), and (vi) of this section.

(4) If a generator is managing prohibited waste in tanks, containers, or containment buildings regulated under 40 CFR 262.34, and is treating such waste in such tanks, containers, or containment buildings to meet applicable treatment standards under subpart D of this part, the generator must develop and follow a written waste analysis plan which describes the procedures the generator will carry out to comply with the treatment standards. (Generators treating hazardous debris under the alternative treatment standards of Table 1, Sec. 268.45, however, are not subject to these waste analysis requirements.) The plan must be kept on site in the generator's records, and the following requirements must be met:

(i) The waste analysis plan must be based on a detailed chemical and physical analysis of a representative sample of the prohibited waste(s) being treated, and contain all information necessary to treat the waste(s) in accordance with the requirements of this Part, including the selected testing frequency.

(ii) Such plan must be filed with the EPA Regional Administrator (or his designated representative) or State authorized to implement Part 268 requirements a minimum of 30 days prior to the treatment activity, with delivery verified.

(iii) Wastes shipped off-site pursuant to this paragraph must comply with the notification requirements of Sec. 268.7(a)(2).

(5) If a generator determines whether the waste is restricted based solely on his knowledge of the waste, all supporting data used to make this determination must be retained on-site in the generator's files. If a generator determines whether the waste is restricted based on testing this waste or an extract developed using the test method described in Appendix I of this part, all waste analysis data must be retained on-site in the generator's files.

(6) If a generator determines that he is managing a restricted waste that is excluded from the definition of hazardous or solid waste or exempt from Subtitle C regulation, under 40 CFR 261.2 through 261.6 subsequent to the point of generation, he must place a one-time notice stating such generation, subsequent exclusion from the definition of hazardous or solid waste or exemption from RCRA Subtitle C regulation, and the disposition of the waste, in the facility's file.

(7) Generators must retain on-site a copy of all notices, certifications, demonstrations, waste analysis data, and other documentation produced pursuant to this section for at least five years from the date that the waste that is the subject of such documentation

was last sent to on-site or off-site treatment, storage, or **disposal**. The five year record retention period is automatically extended during the course of any unresolved enforcement action regarding the regulated activity or as requested by the Administrator. The requirements of this paragraph apply to solid wastes even when the hazardous characteristic is removed prior to **disposal**, or when the waste is excluded from the definition of hazardous or solid waste under 40 CFR 261.2 through 261.6, or exempted from RCRA Subtitle C regulation, subsequent to the point of generation.

(8) If a generator is managing a lab pack waste and wishes to use the alternative treatment standard under Sec. 268.42(c), with each shipment of waste the generator must submit a notice to the treatment facility in accordance with paragraph (a)(1) of this section, except that underlying hazardous constituents need not be determined. The generator must also comply with the requirements in paragraphs (a)(5) and (a)(6) of this section and must submit the following certification, which must be signed by an authorized representative:

I certify under penalty of law that I personally have examined and am familiar with the waste and that the lab pack contains only wastes which have not been excluded under appendix IV to 40 CFR part 268 or solid wastes not subject to regulation under 40 CFR part 261. I am aware that there are significant penalties for submitting a false certification, including the possibility of fine or imprisonment.

(9) [Reserved]

(10) Small quantity generators with tolling agreements pursuant to 40 CFR 262.20(e) must comply with the applicable notification and certification requirements of paragraph (a) of this section for the initial shipment of the waste subject to the agreement. Such generators must retain on-site a copy of the notification and certification, together with the tolling agreement, for at least three years after termination or expiration of the agreement. The three-year record retention period is automatically extended during the course of any unresolved enforcement action regarding the regulated activity or as requested by the Administrator.

(b) * * *

(4) * * *

(ii) The waste constituents to be monitored, if monitoring will not include all regulated constituents, for wastes F001-F005, F039, D001, D002, and D012-D043. Generators must also include whether the waste is a nonwastewater or wastewater (as defined in Sec. 268.2 (d) and (f), and indicate the subcategory of the waste (such as D003 reactive cyanide), if applicable.

* * * * *

(5) * * *

(iv) For characteristic wastes D001, D002, and D012-D043 that are: subject to the treatment standards in Sec. 268.40 (other than those expressed as a required method of treatment); that are reasonably expected to contain underlying hazardous constituents as defined in Sec. 268.2(i); are treated on-site to remove the hazardous characteristic; and are then sent off-site for treatment of underlying hazardous constituents, the certification must state the following:

I certify under penalty of law that the waste has been treated in accordance with the requirements of 40 CFR 268.40 to remove the

hazardous characteristic. This decharacterized waste contains underlying hazardous constituents that require further treatment to meet universal treatment standards. I am aware that there are significant penalties for submitting a false certification, including the possibility of fine and imprisonment.
* * * * *

22. In Sec. 268.9, paragraph (a), (d)(1)(i), and (d)(1)(ii) are revised, (d)(1)(iii) is removed and (d)(2) (i) and (ii) are added to read as follows:

Sec. 268.9 Special rules regarding wastes that exhibit a characteristic.

(a) The initial generator of a solid waste must determine each EPA Hazardous Waste Number (waste code) applicable to the waste in order to determine the applicable treatment standards under subpart D of this part. For purposes of part 268, the waste will carry the waste code for any applicable listing under 40 CFR part 261, subpart D. In addition, the waste will carry one or more of the waste codes under 40 CFR part 261, subpart C, where the waste exhibits a characteristic, except in the case when the treatment standard for the waste code listed in 40 CFR part 261, subpart D operates in lieu of the treatment standard for the waste code under 40 CFR part 261, subpart C, as specified in paragraph (b) of this section. If the generator determines that his waste displays the characteristic of ignitability (D001) (and is not in the High TOC Ignitable Liquids Subcategory or is not treated by CMBST, or RORGS), or the waste code listed in 40 CFR part 261, subpart D operates in lieu of the treatment standard for the waste code under 40 CFR part 261, subpart C, as specified in paragraph (b) of this section. If the generator determines that his waste displays the characteristic of ignitability (D001) (and is not in the High TOC Ignitable Liquids Subcategory or is not treated by CMBST, or RORGS), or the characteristic of corrosivity (D002), and is prohibited under Sec. 268.37; or that his waste displays the characteristic of toxicity (D012-D043), and is prohibited under Sec. 268.38, the generator must determine the underlying hazardous constituents (as defined in Sec. 268.2), in the D001, D002, or D012-D043 wastes.
* * * * *

(d) * * *

(1) * * *

(i) Name and address of the RCRA Subtitle D facility receiving the waste shipment; and

(ii) A description of the waste as initially generated, including the applicable EPA Hazardous Waste Number(s), treatability group(s), and underlying hazardous constituents (as defined in Sec. 268.2(i) in D001 and D002 wastes prohibited under Sec. 268.37, or D012-D043 wastes under Sec. 268.38.

(2) * * *

(i) If treatment removes the characteristic but does not treat underlying hazardous constituents, then the certification found in Sec. 268.7 (b)(5)(v) apply.

(ii) [Reserved]

Subpart C--Prohibitions on **Land Disposal**

23. In subpart C, Sec. 268.38 is added to read as follows:

Sec. 268.38 Waste specific prohibitions--newly identified organic toxicity characteristic wastes and newly listed coke by-product and chlorotoluene production wastes.

(a) Effective December 19, 1994, the wastes specified in 40 CFR 261.32 as EPA Hazardous Waste numbers K141, K142, K143, K144, K145, K147, K148, K149, K150, and K151 are prohibited from **land disposal**. In addition, debris contaminated with EPA Hazardous Waste numbers F037, F038, K107-K112, K117, K118, K123-K126, K131, K132, K136, U328, U353, U359, and soil and debris contaminated with D012-D043, K141-K145, and K147-K151 are prohibited from **land disposal**. The following wastes that are specified in 40 CFR 261.24, Table 1 as EPA Hazardous Waste numbers: D012, D013, D014, D015, D016, D017, D018, D019, D020, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D031, D032, D033, D034, D035, D036, D037, D038, D039, D040, D041, D042, D043 that are not radioactive, or that are managed in systems other than those whose discharge is regulated under the Clean Water Act (CWA), or that are zero dischargers that do not engage in CWA-equivalent treatment before ultimate **land disposal**, or that are injected in Class I deep wells regulated under the Safe Drinking Water Act (SDWA), are prohibited from **land disposal**. CWA-equivalent treatment means biological treatment for organics, alkaline chlorination or ferrous sulfate precipitation for cyanide, precipitation/ sedimentation for metals, reduction of hexavalent chromium, or other treatment technology that can be demonstrated to perform equally or better than these technologies.

(b) On September 19, 1996, radioactive wastes that are mixed with D018-D043 that are managed in systems other than those whose discharge is regulated under the Clean Water Act (CWA), or that inject in Class I deep wells regulated under the Safe Drinking Water Act (SDWA), or that are zero dischargers that engage in CWA-equivalent treatment before ultimate **land disposal**, are prohibited from **land disposal**. CWA-equivalent treatment means biological treatment for organics, alkaline chlorination or ferrous sulfate precipitation for cyanide, precipitation/ sedimentation for metals, reduction of hexavalent chromium, or other treatment technology that can be demonstrated to perform equally or greater than these technologies. Radioactive wastes mixed with K141-K145, and K147-K151 are also prohibited from **land disposal**. In addition, soil and debris contaminated with these radioactive mixed wastes are prohibited from **land disposal**.

(c) Between December 19, 1994 and September 19, 1996, the wastes included in paragraphs (b) of this section may be disposed in a landfill or surface impoundment, only if such unit is in compliance with the requirements specified in Sec. 268.5(h)(2) of this Part.

(d) The requirements of paragraphs (a), (b), and (c) of this section do not apply if:

(1) The wastes meet the applicable treatment standards specified in Subpart D of this part;

(2) Persons have been granted an exemption from a prohibition pursuant to a petition under Sec. 268.6, with respect to those wastes and units covered by the petition;

(3) The wastes meet the applicable alternate treatment standards established pursuant to a petition granted under Sec. 268.44;

(4) Persons have been granted an extension to the effective date of a prohibition pursuant to Sec. 268.5, with respect to these wastes covered by the extension.

(e) To determine whether a hazardous waste identified in this section exceeds the applicable treatment standards specified in Sec. 268.40, the initial generator must test a sample of the waste extract or the entire waste, depending on whether the treatment standards are expressed as concentrations in the waste extract or the waste, or the generator may use knowledge of the waste. If the waste contains constituents in excess of the applicable Subpart D levels, the waste is prohibited from **land disposal**, and all requirements of part 268 are applicable, except as otherwise specified.

Subpart D--Treatment Standards

24. Section 268.40 is revised to read as follows:

Sec. 268.40 Applicability of Treatment Standards.

(a) A waste identified in the table ``Treatment Standards for Hazardous Wastes'' may be **land** disposed only if it meets the requirements found in the table. For each waste, the table identifies one of three types of treatment standard requirements:

(1) All hazardous constituents in the waste or in the treatment residue must be at or below the values found in the table for that waste (``total waste standards''); or

(2) The hazardous constituents in the extract of the waste or in the extract of the treatment residue must be at or below the values found in the table (``waste extract standards''); or

(3) The waste must be treated using the technology specified in the table (``technology standard''), which are described in detail in Sec. 268.42, Table 1--Technology Codes and Description of Technology-Based Standards.

(b) For wastewaters, compliance with concentration level standards is based on maximums for any one day, except for D004 through D011 wastes for which the previously promulgated treatment standards based on grab samples remain in effect. For all nonwastewaters, compliance with concentration level standards is based on grab sampling. For wastes covered by the waste extract standards, the test Method 1311, the Toxicity Characteristic Leaching Procedure found in ``Test Methods for Evaluating Solid Waste, Physical/Chemical Methods'', EPA Publication SW-846, as incorporated by reference in Sec. 260.11, must be used to measure compliance. An exception is made for D004 and D008, for which either of two test methods may be used: Method 1311, or Method 1310, the Extraction Procedure Toxicity Test. For wastes covered by a technology standard, the wastes may be **land** disposed after being treated using that specified technology or an equivalent treatment technology approved by the Administrator under the procedures set forth in Sec. 268.42(b).

(c) When wastes with differing treatment standards for a constituent of concern are combined for purposes of treatment, the treatment residue must meet the lowest treatment standard for the constituent of concern.

(d) Notwithstanding the prohibitions specified in paragraph (a) of this section, treatment and **disposal** facilities may demonstrate (and certify pursuant to 40 CFR 268.7(b)(5)) compliance with the treatment standards for organic constituents specified by a footnote in the table ``Treatment Standards for Hazardous Wastes'' in this section, provided the following conditions are satisfied:

(1) The treatment standards for the organic constituents were established based on incineration in units operated in accordance with the technical requirements of 40 CFR part 264, subpart O, or based on combustion in fuel substitution units operating in accordance with applicable technical requirements;

(2) The treatment or **disposal** facility has used the methods referenced in paragraph (d)(1) of this section to treat the organic constituents; and

(3) The treatment or **disposal** facility may demonstrate compliance with organic constituents if good-faith analytical efforts achieve detection limits for the regulated organic constituents that do not exceed the treatment standards specified in this section by an order of magnitude.

(e) For characteristic wastes (D001, D002, and D012-D043 that are subject to treatment standards in the following table ``Treatment Standards for Hazardous Wastes,'' all underlying hazardous constituents (as defined in Sec. 268.2(i)) must meet Universal Treatment Standards, found in Sec. 268.48, Table UTS, prior to **land disposal**.

(f) The treatment standards for F001-F005 nonwastewater constituents carbon disulfide, cyclohexanone, and/or methanol apply to wastes which contain only one, two, or three of these constituents. Compliance is measured for these constituents in the waste extract from test Method 1311, the Toxicity Characteristic Leaching Procedure found in ``Test Methods for Evaluating Solid Waste, Physical/Chemical Methods'', EPA Publication SW-846, as incorporated by reference in Sec. 260.11. If the waste contains any of these three constituents along with any of the other 25 constituents found in F001-F005, then compliance with treatment standards for carbon disulfide, cyclohexanone, and/or methanol are not required.

Treatment Standards for Hazardous Wastes

Note: The treatment standards that heretofore appeared in tables in Secs. 268.41, 268.42, and 268.43 of this part have been consolidated into the table ``Treatment Standards for Hazardous Wastes'' in this section.

BILLING CODE 6560-50-C

25. Section 268.41 is revised to read as follows:

Sec. 268.41 Treatment standards expressed as concentrations in waste extract.

For the requirements previously found in this section and for treatment standards in Table CCWE--Constituent Concentrations in Waste Extracts, refer to Sec. 268.40.

26. Section 268.42 is amended by removing Table 2 and Table 3; revising paragraphs (a) introductory text, (c)(2), and (d); adding a note before paragraph (a); and adding the entry ``CMBST'' into Table 1.--Technology Codes and Description of Technology-Based Standards in alphabetical order, to read as follows:

Sec. 268.42 Treatment standards expressed as specified technologies.

Note: For the requirements previously found in this section in Table 2--Technology-Based Standards By RCRA Waste Code, and Table

3--Technology-Based Standards for Specific Radioactive Hazardous Mixed Waste, refer to Sec. 268.40.

(a) The following wastes in paragraphs (a)(1) and (a)(2) of this section and in the table in Sec. 268.40 ``Treatment Standards for Hazardous Wastes,'' for which standards are expressed as a treatment method rather than a concentration level, must be treated using the technology or technologies specified in paragraphs (a)(1) and (a)(2) and Table 1 of this section.

* * * * *

Table 1.--Technology Codes and Description of Technology-Based Standards

Technology code	Description of technology-based standards
	*****
CMBST.....	Combustion in incinerators, boilers, or industrial furnaces operated in accordance with the applicable requirements of 40 CFR part 264, subpart O, or 40 CFR part 266, subpart H.
	*****

* * * * *

(c) * * *

(2) The lab pack does not contain any of the wastes listed in Appendix IV to part 268.

* * * * *

(d) Radioactive hazardous mixed wastes are subject to the treatment standards in Sec. 268.40. Where treatment standards are specified for radioactive mixed wastes in the Table of Treatment Standards, those treatment standards will govern. Where there is no specific treatment standard for radioactive mixed waste, the treatment standard for the hazardous waste (as designated by EPA waste code) applies. Hazardous debris containing radioactive waste is subject to the treatment standards specified in Sec. 268.45.

28. Section 268.43 is revised to read as follows:

Sec. 268.43 Treatment standards expressed as waste concentrations.

For the requirements previously found in this section and for treatment standards in Table CCW--Constituent Concentrations in Wastes, refer to Sec. 268.40.

29. Section 268.45(b)(2) is revised to read as follows:

Sec. 268.45 Treatment standards for hazardous debris.

* * * * *

(b) * * *

(2) Debris contaminated with listed waste. The contaminants subject to treatment for debris that is contaminated with a prohibited listed hazardous waste are those constituents or wastes for which treatment standards are established for the waste under Sec. 268.40.

30. Section 268.46 is revised to read as follows:

Sec. 268.46 Alternative treatment standards based on HTMR.

For the treatment standards previously found in this section, refer to Sec. 268.40.

31. In Subpart D, Sec. 268.48 is added to read as follows:

Sec. 268.48 Universal Treatment Standards

(a) Table UTS identifies the hazardous constituents, along with the nonwastewater and wastewater treatment standard levels, that are used to regulate most prohibited hazardous wastes with numerical limits. For determining compliance with treatment standards for underlying hazardous constituents as defined in Sec. 268.2(i), these treatment standards may not be exceeded. Compliance with these treatment standards is measured by an analysis of grab samples, unless otherwise noted in the following Table UTS.

Sec. 268.48 Table UTS--Universal Treatment Standards

Regulated constituent--common name	CAS\1\ No.	Wastewater standard. Concentration in mg/kg\3\ unless noted as ``mg/l TCLP''	Nonwastewater standard. Concentration in mg/\2\

\1\CAS means Chemical Abstract Services. When the waste code and/or regulated constituents are described as a combination of a chemical with its salts and/or esters, the CAS number is given for the parent compound only.

\2\Concentration standards for wastewaters are expressed in mg/l are based on analysis of composite samples.

\3\Except for Metals (EP or TCLP) and Cyanides (Total and Amenable) the nonwastewater treatment standards expressed as a concentration were established, in part, based upon incineration in units operated in accordance with the technical requirements of 40 CFR part 264, subpart O or 40 CFR part 265, subpart O, or based upon combustion in fuel substitution units operating in accordance with applicable technical requirements. A facility may comply with these treatment standards according to provisions in 40 CFR 268.40(d). All concentration standards for nonwastewaters are based on analysis of grab samples.

\4\Both Cyanides (Total) and Cyanides (Amenable) for nonwastewaters are to be analyzed using Method 9010 or 9012, found in ``Test Methods for Evaluating Solid Waste, Physical/Chemical Methods'', EPA Publication SW-846, as incorporated by reference in 40 CFR 260.11, with a sample size of 10 grams and a distillation time of one hour and 15 minutes.

\5\Zinc is not an ``underlying hazardous constituent'' in characteristic wastes, according to the definition at

268.2(i).
Note: NA means not applicable.

Appendix IV to Part 268 [Revised]

32. Appendix IV to part 268 is revised to read as follows:

Appendix IV to Part 268--Wastes Excluded From Lab Packs Under the Alternative Treatment Standards of Sec. 268.42(c)

Hazardous waste with the following EPA Hazardous Waste Codes may not be placed in lab packs under the alternative lab pack treatment standards of Sec. 268.42(c): D009, F019, K003, K004, K005, K006, K062, K071, K100, K106, P010, P011, P012, P076, P078, U134, U151.

Appendix V to Part 268 [Removed]

33. Appendix V to part 268 is removed and reserved.

Appendix X to Part 268 [Added]

34. Appendix X to part 268 is added to read as follows:

Appendix X to Part 268--Recordkeeping, Notification, and/or Certification Requirements

Recipient of Entity	Scenario	Recordkeeping, notification, and/or certification requirements	Frequency
I. Generator..... Treatment or storage facility.	A. Waste does not meet applicable treatment standards or exceeds applicable prohibition levels (see Sec. 268.7(a)(1)).	Notice must include: <bullet>EPA hazardous waste number. <bullet>Constituents of concern. <bullet>Treatability group. <bullet>Manifest number. <bullet>Waste analysis data (where available).	Each shipment.....

	B. Waste can be disposed of without further treatment (meets applicable treatment standards or applicable prohibition treatment levels.	Each shipment.....	**Land disposal** facility. actions or as requested

by the Administrator.

II. Treatment Facility.	A. Waste shipped from treatment facility.	Each shipment.....	**Land disposal** facility (see Sec. 268.7(b)(4), (b)(5)).	Notice must include: <bullet>EPA hazardous waste number. <bullet>Constituents of concern. <bullet>Treatability group. <bullet>Manifest number. <bullet>Waste analysis data (where available). Applicable certification, in accordance with Sec. 268.7(b)(5)(i), (ii) or (iii), stating that the waste or treatment residue has been treated in compliance with applicable treatment standards and prohibitions.
	B. Waste treatment Receiving facility.	Each shipment.....	Treatment, storage, or **disposal** facility must comply with all notice and certification requirements applicable to generators.	Treatment, storage, or residue from a treatment or storage facility will be further managed at a different treatment or storage facility

	(see Sec. 268.7(b)(6)).		
	C. Where wastes are recyclable materials used in a manner constituting **disposal** subject to Sec. 266.20(b) (see Sec. 268.7(b)(7)).	Each shipment.....	Regional Administrator (or delegated representative).
	No notification to receiving facility required pursuant to Sec. 268.7(b)(4).		
Certification as described in Sec. 268.7(b)(5) and notice with information listed in Sec. 268.7(b)(4), except manifest number. Recycling facility must keep records of the name and location of each entity receiving hazardous waste-derived products.			
III. **Land Disposal** Facility.	A. Wastes accepted by **land disposal** facility (see Sec. 268.7(c)).	N/A.....	N/A.....
	Maintain copies of notice and certifications specified in Sec. 268.7(a) and (b).		

Certification Statements

A. I certify under penalty of law that I personally have examined and am familiar with the waste through analysis and testing or through knowledge of the waste to support this certification that the waste complies with the treatment standards specified in 40 CFR part 268, subpart D and all applicable prohibitions set forth in 40 CFR 268.32 or RCRA section 3004(d). I believe that the information I submitted is true, accurate and complete. I am aware that there are significant penalties for submitting a false certification, including the possibility of fine and imprisonment. (Sec. 268.7(a)(2)(ii))

B. I certify under penalty of law that I personally have examined and am familiar with the waste and that the lab pack does not contain any wastes identified at Sec. 268.42(c)(2). I am aware that there are significant penalties for submitting a false certification, including the possibility of fine or imprisonment. (Sec. 268.7(a)(8))

C. I certify under penalty of law that I have personally examined and am familiar with the treatment technology and operation of the treatment process used to support this certification and that, based on my inquiry of those individuals immediately responsible for obtaining this information, I believe that the treatment process has been operated and maintained properly so as to comply with the performance levels specified in 40 CFR part 268, subpart D, and all applicable prohibitions set forth in 40 CFR 268.32 or RCRA section 3004(d) without impermissible dilution of the prohibited waste. I am aware that there are significant penalties for submitting a false certification, including the possibility of fine and imprisonment. (Sec. 268.7(b)(5)(i))

D. I certify under penalty of law that the waste has been treated in accordance with the requirements of 40 CFR 268.42. I am aware that there are significant penalties for submitting a false certification, including the possibility of fine and imprisonment. (Sec. 268.7(b)(5)(ii))

E. I certify under penalty of law that I have personally examined and am familiar with the treatment technology and operation of the treatment process used to support this certification and that, based on my inquiry of those individuals immediately responsible for obtaining this information, I believe that the nonwastewater organic constituents have been treated by incineration in units operated in accordance with 40 CFR part 264, subpart O or 40 CFR part 265, subpart O, or by combustion in fuel substitution units operating in accordance with applicable technical requirements, and I have been unable to detect the nonwastewater organic constituents, despite having used best good faith efforts to analyze for such constituents. I am aware that there are significant penalties for submitting a false certification, including the possibility of fine and imprisonment. (Sec. 268.7(b)(5)(iii))

F. I certify under penalty of law that the waste has been treated in accordance with the requirements of 40 CFR 268.40 to remove the hazardous characteristic. This decharacterized waste contains underlying hazardous constituents that require further treatment to meet universal treatment standards. I am aware that there are significant penalties for submitting a false certification, including the possibility of fine and imprisonment. (Sec. 268.7(b)(5)(iv))

G. I certify under penalty of law that the debris have been treated in accordance with the requirements of 40 CFR 268.45. am aware that there are significant penalties for making a false certification, including the possibility of fine and imprisonment. (Sec. 268.7(d)(3)(iii))

PART 271--REQUIREMENTS FOR AUTHORIZATION OF STATE HAZARDOUS WASTE PROGRAMS

35. The authority citation for Part 271 continues to read as follows:

Authority: 42 U.S.C. 9602; 33 U.S.C. 1321 and 1361.

Subpart A--Requirements for Final Authorization

36. Section 271.1(j) is amended by adding the following entries to Table 1 in chronological order by date of publication in the Federal Register, and by adding the following entries to Table 2 in chronological order by effective date in the Federal Register:

Sec. 271.1 Purpose and scope.

Land Disposal Restrictions Phase II--Universal Treatment Standards, and Treatment Standards for Organic Toxicity Characteristic Wastes and Newly Listed Wastes; Final Rule

[[Page 242]]

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 268

[FRL-5129-2]

Land Disposal Restrictions Phase II--Universal Treatment Standards, and Treatment Standards for Organic Toxicity Characteristic Wastes and Newly Listed Wastes

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule; technical amendments.

SUMMARY: On September 19, 1994, EPA published regulations promulgating congressionally-mandated prohibitions on land disposal of certain hazardous wastes. This notice corrects errors and clarifies the language in the preamble and regulation of the September 19, 1994 final rule.

EFFECTIVE DATE: This rule is effective on December 19, 1994.

ADDRESSES: Copies of the rule can be obtained from the RCRA Docket (5305), U.S. Environmental Protection Agency, Room 2616, 401 M Street, S.W., Washington, D.C. 20460. The RCRA Docket is open from 9:00 am to 4:00 pm Monday through Friday, except for federal holidays. The public must make an appointment to review docket materials by calling (202)

260-9327. The public may copy a maximum of 100 pages from any regulatory document at no cost. Additional copies cost $0.15 per page.

FOR FURTHER INFORMATION CONTACT: For general information contact the RCRA Hotline at (800) 424-9346 (toll free) or (703) 920-9810 in the Washington, DC metropolitan area. For technical information contact Doug Heimlich (5302W), Office of Solid Waste, 401 M Street, S.W., Washington, DC 20460, (703) 308-8489.

SUPPLEMENTARY INFORMATION:

I. Reasons and Basis for Today's Amendment

The Agency has received comments from the regulated community and State agencies requesting clarification on certain aspects of the September 19, 1994 Phase II final rule (59 FR 47982). Today's amendment responds to these comments.

II. Amendments to the Phase II Final Rule

A. Section 268.2

Like zinc, vanadium is not considered to be an ``underlying hazardous constituent'' in characteristic wastes. In the definition of underlying hazardous constituent at 268.2(i), vanadium was inadvertently left out as an exception to the definition. It is being placed as an exception in the definition at 268.2(i) in today's amendment.

B. Section 268.7

In the preamble of the Phase II final rule, EPA stated that, as a simplifying measure, it was amending the LDR notification requirements to minimize the amount of information that must be placed on the LDR notification in certain circumstances (see 59 FR 48004). Prior to promulgation of the Phase II rule, the hazardous constituents in F001-F005 spent solvents, F039, wastes subject to the California list provisions of Sec. 268.32 or RCRA section 3004(d), and underlying hazardous constituents in certain characteristic wastes had to be listed on the LDR notification. In Phase II, this language was changed

so that if the generator/treater monitors for all the hazardous constituents in F001-F005 spent solvents, F039, and underlying hazardous constituents in certain characteristic wastes, then there would be no need to list any of the constituents on the LDR notification. If, however, the generator/treater is monitoring for a subset of these constituents, the subset of constituents in the waste (or, in the case of underlying hazardous constituents in certain characteristic wastes, the ones reasonably expected to be present at point of generation) would be required to be listed on the LDR notification. In making this change, EPA inadvertently left out language in Secs. 268.7(a)(1)(ii), 268.7(a)(2)(i)(B), and 268.7(b)(4)(ii) applying this provision to California list wastes prohibited pursuant to Sec. 268.32 or RCRA section 3004(d). A reference to these California list wastes is therefore being added to the sections mentioned above in today's amendment.

An error was also found in Sec. 268.7(a)(1). In this section, EPA explained that before the Phase II final rule a generator managing a restricted waste that did not meet the applicable treatment standards set forth in Subpart D of Part 268, or exceeds the prohibition levels set forth in Sec. 268.32 or RCRA section 3004(d), was required, with each shipment of waste, to notify the treatment or storage facility in writing of the appropriate treatment standards set forth in Subpart D of this part and any applicable prohibition levels set forth in Sec. 268.32 or RCRA section 3004(d).

As explained on page 48004 of the Phase II preamble, EPA dropped the requirement to include the treatment standard or the reference to the treatment standard on the LDR notification. EPA overlooked the regulatory language above (in italics) when modifications were made in the Phase II rule. Thus it is being removed in this technical amendment. The statement is changed to read, ``* * * notify the treatment or storage facility in writing.''

Another error was made in Sec. 268.7(a)(1). Paragraph (v) should have been redesignated as paragraph (vi), and a new paragraph (v) added. Although paragraph (v) was revised with the new language, the existing language that should have been included in paragraph (vi) was inadvertently deleted. Paragraph (vi), with the language that appeared as paragraph (v) before the Phase II rule, is being added in today's amendments. Also, in order for the new paragraph to read properly, paragraph (iv) was changed to delete the final word ``and,'' and paragraph (v) was changed to add the word ``and'' at the end.

The same error described in the previous paragraph was also made in Sec. 268.7(a)(3): paragraph (vi) should have been redesignated as paragraph (vii), and a new paragraph (vi) added. Paragraph (vii), with the language that appeared as paragraph (vi) before the Phase II rule, is being reinserted today. Also, paragraph (a)(3)(vi) is being revised today because it had been merely reproduced (incorrectly) from paragraph (a)(1)(v).

In addition, in Sec. 268.7(a)(8), EPA modified the alternative treatment standards for lab packs from identifying the wastes that can be included in lab packs to specifying those wastes that are prohibited from being placed in lab packs. EPA made this change in order to simplify and clarify this provision. The certification language required under this section is being changed in this technical amendment to say that the lab pack ``contains only wastes which have not been excluded under appendix IV to 40 CFR part 268.'' The

certification language that reads ``or solid wastes not [[Page 243]] subject to regulation under 40 CFR part 261'' is being removed and is no longer considered necessary, because the regulated community has in appendix IV a list of wastes that are prohibited from placement in a lab pack. The Agency believes that deleting this statement is not a substantive change, but rather alleviates unnecessary language.

Finally, in the introductory paragraph of Sec. 268.7(d) and in Sec. 268.7(d)(1), generators or treaters who claim an exemption for hazardous debris from the definition of hazardous waste under Sec. 261.3(e) are subject to notification and certification requirements that, previously, were to be submitted to the ``Director or authorized State.'' EPA recognizes that this designation is vague, and is specifying in today's amendment that the notification and certification requirements of Sec. 268.7(d) be submitted to the Regional Administrator (or his designated representative) or State authorized to implement Part 268 requirements, and in Sec. 268.7(d)(1) to be submitted to the EPA Regional hazardous waste management division director (or his designated representative) or State authorized to implement part 268 requirements.

C. Section 268.9

A typesetting error was made in Sec. 268.9(a), which repeated language that already was in the paragraph. The paragraph is located in the middle column of 59 FR 48045, starting with, If the generator determines that his waste displays the characteristic of ignitability * * * and finishes with, as specified in paragraph (b) of this section. This redundant portion of the paragraph is deleted in today's amendment. Additionally, in section 268.9(d)(2)(i), it states that in treating wastes that exhibit a characteristic, the underlying hazardous constituents must also be treated, and if not, the certification in Sec. 268.7(b)(5)(v) applies. There is no section 268.7(b)(5)(v), and instead the intent was to reference the certification under section 268.7(b)(5)(iv). The erroneous reference is changed in today's amendment.

D. Section 268.40

EPA established that for certain characteristic wastes managed in non-Clean Water Act (CWA) wastewater treatment systems, non-CWA-equivalent systems, or non-Class I injection wells, the underlying hazardous constituents reasonably expected to be present in the waste at point of generation should be treated as well as the hazardous characteristic. For D018-D043, characteristic wastes, this applies to both wastewaters and nonwastewaters. While in the consolidated treatment table in Sec. 268.40 it is noted that the D018-D043 nonwastewaters need to meet Sec. 268.48 standards, this is not indicated for the wastewaters. The corrected table will include the requirements for wastewaters that are managed in non-CWA wastewater treatment systems, non-CWA-equivalent systems, or non-Class I deep injection wells.

An improvement in the Phase II final rule was the simplification of

two equivalent technology-specific combustion standards in: Table 1--Technology Codes and Description of Technology-Based Standards in 40 CFR 268.42. The Agency consolidated the descriptions of INCIN

(incineration) and FSUBS (fuel substitution), by combining them into one term, CMBST (combustion). In prior rulemakings, the treatment standard for both wastewaters and nonwastewaters of Acetaldehyde (U001) was listed as ``FSUBS or INCIN;'' In the Phase II final rule, a typographical error left out ``FSUBS'' and only listed the treatment standard, ``INCIN.'' The treatment standard for U001 is thus changed from ``FSUBS or INCIN'' to ``CMBST.''

The following changes are also made:

<bullet> For Ethyl acetate, under F001, F002, F003, F004, and F005, the CAS number is corrected to read, ``141-78-6;''

<bullet> For Tetrachloroethylene under K043, the CAS number is corrected to read, ``127-18-4;''

<bullet> For Diphenylamine under K022 and K083, the CAS number is corrected to read, ``122-39-4;''

<bullet> For bis(2-Chloroisopropyl)ether under U027, the CAS number is corrected to read, ``39638-32-9.''

<bullet> For Phthalic anhydride under K023, K024, K093, K094, and U190, it is clarified that Phthalic anhydride is measured as ``Terephthalic acid,'' or ``Phthalic acid,'' which are synonymous terms for the same substance.

These changes are all made in the consolidated treatment table in section 268.40 in today's amendment.

E. Section 268.42

The definition of combustion (CMBST), as stated in Sec. 268.42 Table 1, is: ``combustion in incinerators, boilers, or industrial furnaces operated in accordance with the applicable requirements of 40 CFR part 264 subpart O, and part 266, subpart H.'' The definition inadvertently deleted the management of hazardous waste during the period of interim status, covered in part 265, subpart O. At 59 FR 48003, EPA affirmed that combining INCIN (incineration) and FSUBS (fuel substitution) into one term, CMBST (combustion) made no substantive change to the promulgated standards, and, therefore, did not require notice and comment. The Agency's leaving out part 265, subpart O in the definition of CMBST (combustion), therefore, was an oversight that is being corrected in today's amendment. Furthermore, the parenthetical statement on page 48002 about part 265 interim status standards was not intended to be in the preamble, and should be disregarded.

F. Section 268.48

In the table of Universal Treatment Standards, it was footnoted that zinc was not considered an ``underlying hazardous constituent'' in characteristic wastes, according to the definition at 268.2(i). Vanadium also is not considered an underlying hazardous constituent in characteristic wastes, and thus, is appropriately footnoted in this
table in today's amendment.

G. Appendix X to Part 268

As was mentioned in the amendment for 268.7(a)(8), EPA modified the alternative treatment standards for lab packs from identifying the wastes that can be included in lab packs to specifying those wastes that are prohibited from being placed in lab packs. As explained earlier in this rule, the language of the Sec. 268.7(a)(8) certification is being changed in today's rule. Appendix X is also being changed to include the revised certification language for the convenience of the reader.

III. Clarifications

A. Clarification of State Authority Policy for UTS

The Universal Treatment Standards (UTS) were promulgated in the Phase II final rule pursuant to HSWA authority. In most cases UTS are the same levels as the previous LDR treatment standards, while about forty percent of the levels went up or down. In most of these cases, the change in the limits actually reflect adjustments in the limits of analytical detection, thus actual treatment will likely continue to destroy or remove organics to nondetectable levels. Even in those cases where the level has changed, the technology basis of the treatment standard has not. Therefore the changes to the treatment standards should not be viewed as more or less stringent.

Concern has been raised regarding how the UTS should apply in States authorized for the LDRs; specifically, what treatment standards must be met [[Page 244]] by a facility located in a LDR-authorized State: the Phase II UTS levels, or the treatment standards in a State's authorized RCRA program? An additional concern is whether the authorized States would lose their ability to implement their LDR treatment standards if they were superseded by the UTS.

A memorandum from Michael Shapiro, Director of the Office of Solid Waste, to the EPA Regional Waste Management Division Directors, announced that the new UTS are neither more nor less stringent than the previous standards. Therefore, the new standards do not supersede existing standards in States authorized. States authorized for the LDRs for some or all waste streams would continue to implement the treatment standards for the streams for which they are authorized. The new UTS do not apply, for those waste streams, until the State has incorporated them into State law. EPA strongly urges States to implement the new UTS standards as soon as possible, both for simplicity of implementation and national consistency. In any case, State law (as interpreted by the State) would determine which standards applied. This approach would avoid the dual regulatory problem which would occur during the time before new HSWA requirements are adopted and authorized in the State.

EPA has a strong interest in uniformity and consistency of regulations and believes that the improvements in the UTS meet these objectives. Thus, States are encouraged to adopt and apply for authorization of the Phase II LDR rule. States that are currently authorized for portions of the LDRs may submit an abbreviated authorization revision application for the UTS. Details about what would be required for this abbreviated authorization are in the memorandum, which can be obtained by calling the RCRA docket.

It should be noted that the Agency, generally, is not relinquishing its statutory responsibility to implement significant new HSWA rules in States as soon as the rules become effective. The new approach set out

in the memorandum is reserved only for areas of the hazardous waste program already authorized and regulated by the States, not new areas of the HSWA regulations. For example, the Phase II rule established
treatment standards for several newly listed wastes; these new requirements are immediately effective in the States and will be enforced by EPA.

B. Flowchart Clarification

EPA is clarifying in today's amendment the Phase II flowchart entitled, ``Implementation of Key Phase II LDRs,'' at 59 FR 48018. The second block from the bottom left poses the question, ``Is the waste a mixture of a newly identified TC organic waste (D012-43) with a prohibited listed waste . . .'' This language is not correct and should read in full: ``Is the waste a prohibited listed waste, or one of the newly listed Phase II wastes, that also exhibits an organic toxicity
characteristic?''

Another clarification is being made on page 48021, in the first diamond. Questions have been raised as to whether the ``constituents'' mentioned there include underlying hazardous constituents. No, ``constituents'' does not include UHCs. The wording inside the diamond should say ``Does the treatment standard for the listed waste include the treatment standard for the constituent that causes the waste to exhibit the characteristic?''

C. Telephone Number Correction

At 59 FR 47983, Richard Kinch's name appeared as an EPA contact for ``other information'' about the Phase II final rule. The phone number provided in the Phase II rule, (703) 308-8414, is incorrect; Mr. Kinch's telephone number is (703) 308-8434.

IV. Rationale for Immediate Effective Date

Today's notice does not create any new regulatory requirements; rather, it restates and clarifies requirements already in effect by correcting a number of errors in the September 19, 1994 final rule (59 FR 47982). For these reasons, EPA finds that good cause exists under section 3010(b)(3) of RCRA, 42 U.S.C. 9903(b)(3), to provide for an immediate effective date. In addition, there already was full opportunity to comment on all of these issues during the rulemaking so that further comment is unnecessary. For the same reasons, EPA finds that there is good cause under 5 U.S.C. 553(b)(3) to promulgate today's corrections in final form and that there is good cause under 5 U.S.C. 553(b)(3) to waive the requirement that regulations be published at
least 30 days before they become effective. Finally, EPA notes that although it is not withdrawing any existing regulatory language, all of today's revisions operate prospectively.

V. Executive Order 12866

Under Executive Order 12866, EPA must judge whether a regulation is ``significant'' and, therefore, subject to review under the Executive Order. Due to the nature of this regulation (technical correction), it

is not ``significant''; therefore, no Executive Order 12866 review is required.

List of Subjects in 40 CFR Part 268

Environmental protection, Hazardous waste, Reporting and recordkeeping requirements.

Dated: December 16, 1994.
Peter Roberts,
Acting Assistant Administrator for Solid Waste and Emergency Response.

For the reasons set out in the preamble, title 40 chapter I of the Code of Federal Regulations is amended to read as follows:

PART 268--LAND DISPOSAL RESTRICTIONS

1. The authority citation for part 268 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6921, and 6924.

Subpart A--General

2. In Sec. 268.2, paragraph (i) is revised to read as follows:

Sec. 268.2 Definitions applicable in this part.

* * * * *

(i) Underlying hazardous constituent means any constituent listed in Sec. 268.48, Table UTS--Universal Treatment Standards, except vanadium and zinc, which can reasonably be expected to be present at the point of generation of the hazardous waste, at a concentration above the constituent-specific UTS treatment standards.

3. Section 268.7 is amended by revising the introductory text of paragraphs (a)(1) and (d); revising paragraphs (a)(1)(ii); (a)(1)(iv), (a)(1)(v), (a)(2)(i)(B); (a)(3)(vi); (a)(8); (b)(4)(ii); and (d)(1); and by adding paragraphs (a)(1)(vi) and (a)(3)(vii) to read as follows:

Sec. 268.7 Waste analysis and recordkeeping.

(a) * * *

(1) If a generator determines that he is managing a restricted waste under this part and the waste does not meet the applicable treatment standards set forth in subpart D of this part or it exceeds the applicable prohibition levels set forth in Sec. 268.32 or RCRA section 3004(d), with each shipment of waste the generator must notify the treatment or storage facility in writing. The notice must include the following information:

* * * * *

(ii) The waste constituents that the treater will monitor, if monitoring will not include all regulated constituents, [[Page 245]] for wastes F001-F005, F039, D001, D002, D012-D043 and in Sec. 268.32 or RCRA section 3004(d). Generators must also include whether the waste is a nonwastewater or wastewater (as defined in

Sec. 268.2 (d) and (f)), and indicate the subcategory of the waste (such as ``D003 reactive cyanide''), if applicable;
* * * * *

(iv) For hazardous debris, the contaminants subject to treatment as provided by Sec. 268.45(b) and the following statement: ``This hazardous debris is subject to the alternative treatment standards of 40 CFR 268.45;''

(v) The waste analysis data, where available; and,

(vi) The date the waste is subject to the prohibitions.

(2) * * *

(i) * * *

(B) The waste constituents that the treater will monitor, if monitoring will not include all regulated constituents, for wastes F001-F005, F039, D001, D002, D012-D043 and Sec. 268.32 or RCRA section 3004(d). Generators must also include whether the waste is a nonwastewater or wastewater (as defined in Sec. 268.2 (d) and (f)), and indicate the subcategory of the waste (such as ``D003 reactive cyanide''), if applicable;
* * * * *

(3) * * *

(vi) For hazardous debris when using the treatment standards for the contaminating waste(s) in Sec. 268.40: the requirements described in paragraphs (a)(3) (i), (ii), (iii), (iv), and (vii) of this section; and,

(vii) The date the waste is subject to the prohibitions.
* * * * *

(8) If a generator is managing a lab pack that contains none of the wastes specified in appendix IV of part 268, and wishes to use the alternative treatment standard under Sec. 268.42(c), with each shipment of waste the generator must submit a notice to the treatment facility in accordance with paragraph (a)(1) of this section, except that underlying hazardous constituents need not be determined. The generator must also comply with the requirements in paragraphs (a)(5) and (a)(6) of this section and must submit the following certification, which must be signed by an authorized representative:

I certify under penalty of law that I personally have examined and am familiar with the waste and that the lab pack does not contain any wastes identified at Appendix IV to part 268. I am aware that there are significant penalties for submitting a false certification including possibility of fine or imprisonment.
* * * * *

(b) * * *

(4) * * *

(ii) The waste constituents to be monitored, if monitoring will not include all regulated constituents, for wastes F001-F005, F039, D001, D002, D012-D043 and in Sec. 268.32 or RCRA section 3004(d). Generators must also include whether the waste is a nonwastewater or wastewater (as defined in Sec. 268.2 (d) and (f), and indicate the subcategory of the waste (such as D003 reactive cyanide), if applicable.
* * * * *

(d) Generators or treaters who first claim that hazardous debris is excluded from the definition of hazardous waste under Sec. 261.3(e) of this chapter (i.e., debris treated by an extraction or destruction technology provided by Table 1, Sec. 268.45, and debris that the EPA Regional Administrator (or his designated representative) or State authorized to implement part 268 requirements has determined does not

contain hazardous waste) are subject to the following notification and certification requirements:

(1) A one-time notification, including the following information, must be submitted to the EPA Regional hazardous waste management division director (or his designated representative) or State authorized to implement part 268 requirements, or State authorized to implement part 268 requirements:

* * * * *

4. Section 268.9 is amended by revising paragraph (a) and paragraph (d)(2)(i) to read as follows:

Sec. 268.9 Special rules regarding wastes that exhibit a characteristic.

(a) The initial generator of a solid waste must determine each EPA Hazardous Waste Number (waste code) applicable to the waste in order to determine the applicable treatment standards under subpart D of this part. For purposes of part 268, the waste will carry the waste code for any applicable listing under 40 CFR 261, subpart D. In addition, the waste will carry one or more of the waste codes under 40 CFR 261, subpart C, where the waste exhibits a characteristic, except in the case when the treatment standard for the waste listed in part 261, subpart D operates in lieu of the treatment standard for the waste under part 261, subpart C, as specified in paragraph (b) of this section. If the generator determines that his waste displays the characteristic of ignitability (D001) (and is not in the High TOC Ignitable Liquids Subcategory or is not treated by CMBST, or RORGS), or the characteristic of corrosivity (D002), and is prohibited under Sec. 268.37; or that his waste displays the characteristic of toxicity (D012-D043), and is prohibited under Sec. 268.38, the generator must determine the underlying hazardous constituents (as defined in Sec. 268.2), in the D001, D002, or D012-D043 wastes.

* * * * *

(d) * * *

(2) * * *

(i) If treatment removes the characteristic but does not treat underlying hazardous constituents, then the certification found in Sec. 268.7(b)(5)(iv) applies.

* * * * *

Subpart D--Treatment Standards

5. Section 268.40 is amended by revising the table ``Treatment Standards for Hazardous Wastes'' to read as follows:

Sec. 268.40 Applicability of Treatment Standards.

Notes to Table

\1\ The waste descriptions provided in this table do not replace waste descriptions in 40 CFR part 261. Descriptions of Treatment/ Regulatory Subcategories are provided, as needed, to distinguish between applicability of different standards.

\2\ CAS means Chemical Abstract Services. When the waste code and/or regulated constituents are described as a combination of a chemical with it's salts and/or esters, the CAS number is given for the parent compound only.

\3\ Concentration standards for wastewaters are expressed in mg/ l are based on analysis of composite samples.

\4\ All treatment standards expressed as a Technology Code or combination of Technology Codes are explained in detail in 40 CFR part 268.42, Table 1--Technology Codes and Descriptions of Technology-Based Standards.

\5\ Except for Metals (EP or TCLP) and Cyanides (Total and Amenable) the nonwastewater treatment standards expressed as a concentration were established, in part, based upon incineration in units operated in accordance with the technical requirements of 40 CFR part 264, subpart O, or part 265, subpart O, or based upon combustion in fuel substitution units operating in accordance with applicable technical requirements. A facility may comply with these treatment standards according to provisions in 40 CFR 268.40(d). All concentration standards for nonwastewaters are based on analysis of grab samples.

\6\ Where an alternate treatment standard or set of alternate standards has been indicated, a facility may comply with this alternate standard, but only for the Treatment/Regulatory Subcategory or physical form (i.e., wastewater and/or nonwastewater) specified for that alternate standard.

\7\ Both Cyanides (Total) and Cyanides (Amenable) for nonwastewaters are to be analyzed using Method 9010 or 9012, found in ``Test Methods for Evaluating Solid Waste, Physical/Chemical Methods'', EPA Publication SW-846, as incorporated by reference in 40 CFR 260.11, with a sample size of 10 grams and a distillation time of one hour and 15 minutes.

Note: NA means not applicable.

* * * * *

6. Section 268.42 is amended by revising the entry, ``CMBST'' in Table 1 to read as follows:

Sec. 268.42 Treatment standards expressed as specified technologies.

* * * * *

Table 1.--Technology Codes and Description of Technology-Based Standards

Technology code	Description of technology-based standards
*	* * * *
CMBST	Combustion in incinerators, boilers, or industrial furnaces operated in accordance with the applicable requirements of 40 CFR part 264, subpart O; 40 CFR part

265, subpart O; or 40 CFR part 266, subpart H.

7. Section 268.48 is amended by adding footnote 5 to the entry for Vanadium and revising the footnote to read as follows:

Sec. 268.48 Universal Treatment Standards.

* * * * *

Sec. 268.48 Table UTS--Universal Treatment Standards

* * * * *

\5\ Vanadium and zinc are not ``underlying hazardous constituents'' in characteristic wastes, according to the definition
at 268.2(i).

Note: NA means not applicable.

8. Appendix X to part 268 is amended by revising Certification Statement B to read as follows:

Appendix X to Part 268--Recordkeeping, Notification, and/or Certification Requirements.

* * * * *

Certification Statements

* * * * *

B. I certify under penalty of law that I personally have examined and am familiar with the waste and that the lab pack does not contain any wastes identified at Appendix IV to part 268. I am aware that there are significant penalties for submitting a false certification including possibility of fine or imprisonment.

40 CFR Part 148, et al.

Land Disposal Restrictions Phase III; Final Rule and Partial Withdrawal and Amendment of Final Rule

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Parts 148, 268, 271, and 403

RIN 2050–AD38

[EPA # 530–Z–96–002; FRL–5438–3]

Land Disposal Restrictions Phase III—Decharacterized Wastewaters, Carbamate Wastes, and Spent Potliners

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: EPA is promulgating treatment standards for hazardous wastes from the production of carbamate pesticides and from primary aluminum production under its Land Disposal Restrictions (LDR) program. The purpose of the LDR program, authorized by the Resource Conservation and Recovery Act (RCRA), is to minimize short- and long-term threats to human health and the environment due to land disposal of hazardous wastes.

The Agency is also amending the treatment standards for hazardous wastes that exhibit the characteristic of reactivity. The rule also begins the process of amending existing treatment standards for wastewaters which are hazardous because they display the characteristic of ignitability, corrosivity, reactivity, or toxicity. These wastes are sometimes treated in lagoons whose ultimate discharge is regulated under the Clean Water Act, and sometimes injected into deepwells which are regulated under the Safe Drinking Water Act. Prior to today's rule, the treatment standard for these wastes required only removal of the characteristic property. Today's revised treatment standards require treatment, not only to remove the characteristic, but also to treat any underlying hazardous constituents which may be present in the wastes. Therefore, these revised treatment standards will minimize threats from exposure to hazardous constituents which may potentially migrate from these lagoons or wells.

Finally, EPA is codifying as a rule its existing Enforcement Policy that combustion of inorganic wastes is an impermissible form of treatment because hazardous constituents are being diluted rather than effectively treated.

EFFECTIVE DATE: This final rule is effective on April 8, 1996, except:

Sections 148.18(a), 268.39(a), (b), and (f), which are effective on July 1, 1996; and

Sections 148.18(b) and 268.39(c), which are effective on January 8, 1997; and

Sections 148.1 (a), (b), and (d), 148.3, 148.4, 148.18 (c) and (d), 148.20(a), 268.1(e), 268.2 (k) and (l), 268.3 (a) and (b), 268.9 (d), (e), (f), and (g), 268.39 (d) and (e), 268.44(a), and 403.5 (c) and (d), which are effective on April 8, 1998.

ADDRESSES: Supporting materials are available for viewing in the RCRA information Center (RIC), located at Crystal Gateway One, 1235 Jefferson Davis Highway, First Floor, Arlington, VA. The Docket Identification Number is F–96–PH3F–FFFFF. The RCRA Docket is open from 9 a.m. to 4 p.m. Monday through Friday, except for Federal holidays. The public must make an appointment to review docket materials by calling (703) 603–9230. The public may copy a maximum of 100 pages from any regulatory document at no cost. Additional copies cost $0.15 per page.

FOR FURTHER INFORMATION CONTACT: For general information on the LDR program, contact the RCRA Hotline at 800–424–9346 (toll-free) or 703–412–9810 locally. For general information on today's rule, contact Peggy Vyas in the Office of Solid Waste, phone 703–308–8594.

SUPPLEMENTARY INFORMATION:

Glossary of Acronyms

BAT—Best Available Technology
BDAT—Best Demonstrated Available Technology
BIFs—Boilers and Industrial Furnaces
CAA—Clean Air Act
CWA—Clean Water Act
EP—Extraction Procedure
HON—Hazardous Organic NESHAPs
HSWA—Hazardous and Solid Waste Amendments
HWIR—Hazardous Waste Identification Rule
ICR—ignitable, corrosive, and reactive wastes, or, Information Collection Request (in section IX.D.)
ICRT—ignitable, corrosive, reactive, and TC wastes
LDR—Land Disposal Restrictions
NESHAPs—National Emission Standards for Hazardous Air Pollutants
NPDES—National Pollutant Discharge Elimination System
POTW—Publicly-Owned Treatment Works
PSES—Pretreatment Standards for Existing Sources
PSNS—Pretreatment Standards for New Sources
RCRA—Resource Conservation and Recovery Act
RIA—Regulatory Impact Analysis
SDWA—Safe Drinking Water Act
TC—toxicity characteristic
TCLP—Toxicity Characteristic Leaching Procedure
TRI—Toxic Release Inventory
UIC—Underground Injection Control
UTS—Universal Treatment Standards

Outline

I. Background

A. Summary of the Statutory Requirements of the 1984 Hazardous and Solid Waste Amendments, and Requirements of the 1993 Consent Decree With the Environmental Defense Fund

The Hazardous and Solid Waste Amendments (HSWA) to the Resource Conservation and Recovery Act (RCRA), enacted on November 8, 1984, largely prohibit the land disposal of untreated hazardous wastes that do not meet treatment standards established by EPA under section 3004(m). Once a hazardous waste is prohibited, the statute provides only two options for legal land disposal: meet the treatment standard for the waste prior to land disposal, or dispose of the waste in a land disposal unit that has been found to satisfy the statutory no migration test. A no migration unit is one from which there will be no migration of hazardous constituents for as long as the waste remains hazardous. RCRA sections 3004 (d), (e), (f), (g)(5).

The amendments also require the Agency to set levels or methods of treatment, if any, which substantially diminish the toxicity of the waste or substantially reduce the likelihood of migration of hazardous constituents from the waste so that short term and long term threats to human health and the environment are minimized. RCRA section 3004(m)(1). To date, the Agency has implemented this provision by establishing treatment standards for chemical constituents in hazardous wastes based on the performance of the best demonstrated available technology (BDAT) to treat the waste. EPA may establish treatment standards as specified technologies, as constituent concentration levels in treatment residuals, or both. When treatment standards are set as levels, the regulated community may use any technology not otherwise prohibited (such as impermissible dilution) to treat the waste.

It should be noted that the Agency has proposed risk-based exit levels—levels at which wastes are no longer considered hazardous for purposes of RCRA subtitle C—for the majority of hazardous constituents found in listed hazardous wastes in the Hazardous Waste Identification Rule (HWIR) (60 FR 66344, December 21, 1995). Wastes meeting these levels either before or after treatment consequently could be disposed in units not subject to RCRA hazardous waste management requirements (e.g., landfills without subtitle C permits). A consent decree approved by the U.S. District Court for the District of Columbia requires EPA to finalize the HWIR exit levels by December 15, 1996. In the same notice, the Agency proposed to allow the exit levels for some constituents to serve as alternative, risk-based LDR treatment standards satisfying the ''minimize threat'' standard of section 3004(m). Where these risk-based levels are higher (less restrictive) than current BDAT treatment standards, they will effectively supersede the BDAT requirements. See *Hazardous Waste Treatment Council* v. *EPA,* 886 F.2d 355, 362–63 (D.C. Cir. 1989).

EPA was required to promulgate land disposal prohibitions and treatment standards by May 8, 1990 for all wastes that were either listed or identified as hazardous at the time of the 1984 amendments (RCRA sections 3004 (d), (e), and (g)(5)), a task EPA completed within the statutory timeframe. EPA was also required to promulgate prohibitions and treatment standards for wastes identified or listed as hazardous after the date of the 1984 amendments within six months after the listing or identification takes effect (RCRA section 3004(g)(4)).

The Agency did not meet this latter statutory deadline for all of the wastes identified or listed after the 1984 amendments. As a result, a suit was filed by the Environmental Defense Fund (EDF). EPA and EDF signed a consent decree that establishes a schedule for adopting prohibitions and treatment standards for newly identified and listed wastes. (*EDF* v. *Reilly*, Cir. No. 89–0598, D.D.C.). EPA also entered into a settlement agreement with the environmental petitioners in *Chemical Waste Management* v. *EPA*, 976 F.2d 2 (D.C. Cir. 1992), cert. denied 113 S. Ct. 1961 (1993) regarding the procedural effect of the mandate entered in that case. This settlement calls for EPA to take action to implement the portions of the opinion dealing with centralized management of wastewaters that initially exhibit a hazardous waste characteristic within specified timeframes.

Today's rule fulfills several provisions of the settlement agreement and proposed consent decree. First, the rule amends the treatment standards for initially characteristic wastewaters managed in centralized wastewater management systems containing land disposal units. Three specific fact patterns are covered by the rule: (1) Where the wastewaters are ultimately discharged and are subject to limitations or standards established under the Clean Water Act (CWA) and the treatment system preceding discharge includes a surface impoundment; (2) where a facility with initially characteristic wastes treats those wastes with CWA-equivalent treatment but ultimately uses a form of land disposal (such as spray irrigation) that is not regulated under the CWA as the final means of disposing of the treated wastewaters; and (3) the initially characteristic wastes are injected into Class 1 non-hazardous deep wells subject to regulation under the Safe Drinking Water Act (SDWA). In all cases, the wastewaters no longer exhibit a characteristic at the point of land disposal. The amended treatment standards require treatment that destroys, immobilizes, or removes the hazardous constituents present in the initially characteristic wastewaters (referred to as ''underlying hazardous

constituents'' because these constituents are not typically the reason the waste is classified as hazardous). Treatment of the underlying hazardous constituents is nevertheless required in order to minimize the long-term threats land disposal of these wastes can cause. 976 F.2d at 16–17.

EPA is fulfilling provisions of the consent decree by promulgating prohibitions and treatment standards for two ''newly listed wastes'' wastes from production of carbamate pesticides, and spent aluminum potliners from primary aluminum production.

That being said, the risks addressed by the portion of the rule dealing with centralized wastewater management, particularly UIC wells, are very small relative to the risks presented by other environmental conditions or situations. In a time of limited resources, common sense dictates that we deal with higher risk activities first, a principle on which EPA, members of the regulated community, and the public can all agree. For this reason, the Administration is supporting HR 2036, legislation which passed the House of Representatives, that would remove the mandate to automatically apply LDR treatment standards to decharacterized wastes managed in centralized wastewater management situations regulated by the CWA or the SDWA. If this legislation passes in its current form, it would affect the regulations discussed in sections III., IV., and VI.B. of the preamble. It would not affect the other sections of the preamble and rule. The sections of preamble and rule that are affected by the legislation have been granted 2-year national capacity variance (see §§ 148.18 (c) and (d) and 268.39 (c) and (d)). The sections of preamble and rule not affected by the legislation have more immediate effective dates. If the legislation does pass into law, the Agency could issue an immediately effective final rule remanding the affected portions.

Nevertheless, the Agency is presently required to set treatment standards for these relatively low risk wastes and disposal practices, although there are other actions and projects with which the Agency could provide greater protection of human health and the environment. At the same time, however, EPA has sought to exercise the full extent of its authority under current law to implement these mandates with significantly lower cost while ensuring protectiveness, such as giving credit for up-stream reductions in hazardous constituents, and crafting limited exemptions for wastewaters containing de minimis amounts of hazardous constituents.

B. Treatment Standards for Hazardous Wastes That Exhibit a Characteristic—The D.C. Circuit's Opinion in Chemical Waste Management v. EPA

In *Chemical Waste Management* v. *EPA*, 976 F.2d 2 (D.C. Cir. 1992) cert. denied 113 S. Ct. 1961 (1993), the court made a number of far-reaching rulings pertaining to treatment standards for hazardous wastes that are hazardous because they exhibit a characteristic. First, the court held that land disposal restriction requirements can continue to apply to characteristic hazardous wastes even after they no longer exhibit a characteristic. 976 F.2d at 12–14. Second, to satisfy the requirement in RCRA section 3004(m) that treatment address both short-term and long-term threats posed by a waste's land disposal, it is not enough that characteristic hazardous wastes be treated to remove the short-term property (viz. ignitability, corrosivity, or reactivity) that makes them hazardous. Long-term threats, in the form of toxic underlying hazardous constituents, also must be addressed. 976 F.2d at 16–17. Third (as EPA reads the opinion), the court held that dilution was ordinarily not a permissible means of treating hazardous constituents. Such constituents generally must be destroyed, immobilized, or removed from the waste to satisfy the requirements of section 3004(m), specifically, the requirement that long-term threats be minimized. 976 F.2d at 23, 25 and n. 8; 60 FR at 11706–11708 (March 2, 1995). Fourth, centralized wastewater management systems whose discharge is ultimately regulated under the Clean Water Act, and which dilute characteristic hazardous wastes before treatment in surface impoundments, may continue to do so provided the wastewater treatment system destroys, immobilizes, or removes the same volume of hazardous constituents as would be removed, immobilized, or destroyed if the wastes were treated separately. 976 F.2d at 22–24. In other words, notwithstanding that these wastes are disposed in impoundments without being fully treated, the practice is permissible provided equivalent treatment occurs before the waste is ultimately discharged. Fifth, this option of demonstrating equivalent treatment across a treatment system is not available for Class I nonhazardous deep well injection systems because such units are permanent disposal rather than treatment units. 976 F.2d at 24–6.

These portions of the opinion are addressed in various sections of today's rule.

The Agency is also addressing the issue of equivalent treatment by Clean Water Act treatment systems managing de-characterized wastes in impoundments by promulgating treatment standards and related requirements that would be used to measure this so-called end-of-pipe equivalence. Finally, EPA is implementing the court's mandate with respect to Class I nonhazardous injection wells by requiring treatment of underlying hazardous constituents in ignitable, and corrosive characteristic wastes being injected into such wells, and prohibiting dilution as a means of achieving those standards.

Responses to the comments on EPA's reading of the court's opinion are found in the Response to Comment Background Document which is part of the administrative record for this rule. In general, however, the Agency adheres to the reading set out in the proposed rule's preamble at 60 FR 11706–11708.

EPA is also amending the treatment standards for reactive wastes (other than reactive sulfide and cyanide reactive wastes) so that treatment addresses both the property of reactivity and the threat posed by disposal of underlying hazardous constituents in these wastes (with an exception for ordnance and other explosives which are the subject of an emergency response, as explained in the next paragraph). The Agency is taking this action despite the fact that the court found reactive wastes did not contain sufficient concentrations of hazardous constituents to require any treatment beyond that of removing the characteristic. The Agency believes that it is as likely that reactive wastes contain underlying hazardous constituents at levels that may create a threat as do ignitable and corrosive wastes, and consequently, proposed to regulate reactive wastes in the Phase III proposal. Commenters submitted no data suggesting that reactive wastes do not contain the same types and concentrations of underlying hazardous constituents. Therefore, EPA is promulgating treatment standards for reactive wastes (other than reactive sulfides and cyanides) in this rule that require treatment of all underlying hazardous constituents reasonably expected to be present in the reactive wastes at the point of generation.

EPA is, however, temporarily deferring application of these amended LDR treatment standards for reactive wastes with respect to unexploded ordnance and other explosive devices which are the subject of an emergency response. An emergency response is an action taken to prevent imminent risk of explosion. (See 40 CFR 264.1(g)(8)

setting out circumstances where such responses are exempt from RCRA permitting requirements.) During the development of the proposed Military Munitions Rule: Hazardous Waste Identification and Management; Explosives Emergencies; Redefinition of On-site proposed rule (60 FR 56468, November 8, 1995), the Department of Defense, the military services, and other Federal agencies raised concerns that LDR requirements requiring treatment of underlying hazardous constituents might impede the most effective emergency responses involving these materials. If a responding team had to determine LDR applicability before deactivating an explosive subject to an emergency response, the response could be significantly delayed or complicated. Furthermore, concern about LDR applicability might discourage the team from responding at all. This discussion serves as EPA's initial response to these comments.

EPA agrees that the primary goal in emergency responses to explosives is the safe and prompt elimination of immediate threats to human life and property, and the Agency would be concerned if LDR or other regulatory requirements complicated these responses. The issue is too important and potentially complicated to resolve in today's rule. Therefore, EPA is temporarily deferring final action while it considers this issue further.

In deferring action for this limited class of reactive wastes, EPA notes that emergency responses present issues different from routine management of reactive wastes, where there is no competing consideration of need for immediate action to prevent an imminent threat. In non-emergency response management situations, as discussed earlier, the Agency believes these wastes can be fully treated to minimize both short and long-term threats posed by land disposal of wastes.[1] EPA also is amending the treatment standards for wastes exhibiting the toxicity characteristic to include standards for underlying hazardous constituents.

Toxic wastes can also contain underlying hazardous constituents in the same potentially harmful concentrations as ICR wastes. 60 FR at 11706. Today's final rule consequently conforms standards for toxic characteristic hazardous wastes to assure treatment of underlying hazardous constituents as well, when such constituents are present at levels exceeding the minimize threat level (as established either by the current technology-based standards or, if risk-based levels are established, exceeding a risk-based level.) Thus, the prohibitions and standards in today's rule will apply to ignitable, corrosive, reactive and toxic characteristic wastes, as just discussed.

II. Miscellaneous Issues for Which EPA Is Not Finalizing an Approach in This Final Rule

A. Treatment Standards for Organobromine Wastes

Organobromine wastes are not yet listed as hazardous. EPA anticipates making a final listing determination in a future rulemaking.

Although EPA proposed treatment standards for organobromine wastes, it clearly would be putting the cart before the horse to promulgate treatment standards in advance of a determination of whether the wastes are hazardous. The Agency intends to establish treatment standards for organobromine wastes should these wastes are listed in the future.

B. Potential Prohibition of Nonamenable Wastes From Land-Based Biological Treatment Systems

The proposed rule contained an extensive discussion of whether certain wastes should be prohibited from placement in biological treatment surface impoundments because they are not amenable to biological treatment. To allow more time to gather comments, the Agency has decided to address this issue in the LDR Phase IV rule, which was proposed on August 22, 1995 (60 FR 43654) and is scheduled to be finalized in June of 1996.

C. Certain Sections of Completing Universal Treatment Standards

The LDR Phase III proposed rule included a section on the completion of universal treatment standards (60 FR at 11727, March 2, 1995). Possible nonwastewater universal treatment standards (UTS) for eleven constituents were discussed in the proposal, and comments and data were solicited. In general, commenters felt more data should be gathered before EPA proposes nonwastewater standards for these constituents, and EPA agrees. EPA had also solicited comment and data on extending certain universal treatment standards to fill gaps in the § 268.40 table of universal treatment standards where ''NA'' appeared for either the wastewater or nonwastewater form of a regulated hazardous constituent. Commenters were opposed to this, stating that it would be arbitrary to add a standard to a waste code where before there was none without supporting data. The Agency again agrees. Therefore, EPA is not taking final action at this time.

D. Prohibition of Hazardous Waste as Fill Material

EPA proposed to prohibit use of hazardous waste as fill material. 60 FR at 11732. Because issues raised in the proposal are related to those in a number of other pending rulemakings, including the Hazardous Waste Identification Rule, and the proposed rule relating to land-based uses of hazardous waste K061 (59 FR 67256 (Dec. 29, 1994)), EPA is not taking final action on the proposal at this time.

E. Point of Generation

The Agency discussed possible changes that could be made to the ''point of generation''—or point at which LDR requirements attach to a hazardous waste (see 60 FR 11717, March 2, 1995). The Agency is still considering the options discussed in the proposal and potentially other options not discussed. The Agency will reopen the point of generation issue for further comment, and is intending to finalize an option in a future rulemaking.

F. Prohibition on Using Iron Filings to Stabilize Spent Foundry Sand

The Agency proposed designating the practice of adding iron dust/filings to spent foundry sand as impermissible dilution (60 FR 11731, March 2, 1995). The Agency is gathering data on the stability of the chemical bond formed between the iron and lead in the spent foundry sand. After the Agency analyzes these data, as well as further studies the public comments on this issue, it may take final action on the proposal.

III. End-of-Pipe Equivalence: Treatment Standards for Clean Water Act (CWA) and CWA-Equivalent Wastewater Treatment Systems

A. Types of Facilities to Which Treatment Standards Apply

As explained above, the D.C. Circuit established a standard of so-called end-of-pipe equivalence, allowing CWA treatment systems with surface impoundments to dilute characteristic wastes before land disposal in those impoundments without violating LDR requirements, provided the treatment system destroys, immobilizes, or removes an equivalent amount of hazardous constituent as if the characteristic waste were treated separately to meet RCRA standards. EPA

[1] EPA also notes that it is not reopening the issue of open burning/open detonation of reactive wastes. In 1986, EPA determined that such activities are not a form of land disposal. See 51 FR at 40580 (Nov. 7, 1986).

is establishing in this rule the treatment standards that must be satisfied in order to demonstrate that equivalent treatment is occurring.

These treatment standards apply to the following types of facilities: (1) facilities treating formerly characteristic wastes in surface impoundments whose ultimate discharge is subject to regulation under either section 402 or 307 of the CWA. The rule thus encompasses both direct dischargers (facilities discharging to navigable waters) and indirect dischargers (those discharging to POTWs); and, (2) permitted and unpermitted zero dischargers engaging in treatment that is equivalent to that of the CWA-regulated facilities (see 40 CFR 268.37(a) defining CWA-equivalent treatment), including facilities treating formerly characteristic wastes in tanks prior to release on the land for such purposes as irrigation or land treatment.

EPA also wishes to make clear the types of wastewater management situations to which these standards do not apply. First, the standards do not apply to facilities that discharge to navigable waters or POTWs and that manage decharacterized wastes in treatment systems without surface impoundments. Consequently, if a facility generates a characteristic waste, dilutes it so that it no longer exhibits a characteristic, and then treats the waste in tanks before ultimate discharge to a navigable water or a POTW, this rule does not apply. There is no land disposal of a prohibited waste occurring and consequently no RCRA requirement that the characteristic waste be pretreated. Applicable CWA limitations and standards would, of course, continue to apply (as would a one-time recordkeeping requirement under RCRA (see § 268.9).

Second, the standards do not apply in situations where RCRA hazardous waste (subtitle C) impoundments are used. The statute already sets out the requirements for subtitle C impoundments receiving wastes which may not yet have met a treatment standard. RCRA section 3005(j)(11). These requirements are not altered by the Third Third opinion. 976 F. 2d at 24 n. 10.

Finally, in response to comment, EPA has determined that the end-of-pipe treatment standards should not apply to stormwater impoundments. Stormwater impoundments are used by treatment facilities to catch stormwater during rain events, because their biological treatment systems cannot adequately handle such sudden, large volumes of water. At some treatment facilities, however, because they have a combined wastewater system, stormwater impoundments also receive process water containing decharacterized wastes.

The Agency agrees with commenters who stated that stormwater impoundments are necessary to maintain the efficacy of biological treatment units. In addition, such impoundments are empty most of the time because they are designed for emergency rain events. In the Third Third opinion, the court focused on wastewater treatment surface impoundments. It seems likely that stormwater impoundments were outside the court's consideration. Furthermore, imposing treatment standards on such impoundments could require treatment of the stormwater/decharacterized waste before it could permissibly go into the impoundment, not a practical alternative during a major storm event. Alternatively, imposing LDR treatment standards might require the facility to replace its combined wastewater system, which would be a major disruption to most of these facilities and hardly seems justified when stormwater impoundments are used only on an emergency basis. These are the very types of disruptions that the integration clause in RCRA 1006(b) is intended to prevent. Consequently, EPA is indicating that today's rule does not apply to stormwater impoundments.

B. End-of-Pipe Treatment Standards

The treatment standards that EPA is promulgating for characteristic wastewaters are found in the table of LDR treatment standards at 40 CFR 268.40 and 268.48. As explained more fully in the following section, these treatment standards generally adopt the limitations or standards that apply to the facility's discharge as the RCRA treatment standards. The reason EPA is taking this approach is that the CWA industry category or case-by-case industrial POTW limitations and standards represent specific determinations of what Best Available Treatment (BAT) technology is capable of achieving for that plant's wastewater, or, in the case of Water Quality Criteria-based limitations, what an appropriate limit is based on BAT treatment plus risk-based considerations. In the event a hazardous constituent present in the wastewater at point of generation of the original characteristic hazardous waste is not already regulated pursuant to a CWA limitation or standard, the RCRA Universal Treatment Standard for that constituent would apply.

These treatment standards may be met at the CWA point of compliance, typically the point the wastewater is discharged to a navigable water or a POTW. For CWA-equivalent facilities, the treatment standards must be met at the point where the wastewater is sprayed onto the land in irrigation (or similar) activities, or injected into a non-Class I injection well. This accords with the equivalence standard established by the court: ''hazardous constituents are [to be] removed from the waste before it enters the environment.'' 976 F. 2d at 24; see also id. at 23 and n. 8. Most commenters likewise agreed with an end-of-pipe measuring point. Indeed, requiring full treatment before ultimate discharge could destroy the very accommodation with the CWA regime that the court thought critical. See 60 FR at 13677 (Aug. 22, 1995).

However, EPA also agrees with commenters that there is no reason to impede individual facilities from choosing an alternative point of compliance (i.e. other than end-of-pipe) provided the facility can demonstrate that the prohibited waste (the decharacterized portion of the combined effluent) has been treated by means other than dilution to remove an equivalent mass of hazardous constituents. This is specifically consistent with the principle announced in the Administration's report on ''Reinventing Environmental Regulation'' to ''provid[e] maximum flexibility in the means of achieving our environmental goals, but requiring accountability for the results''. Consequently, the Agency is allowing a facility to designate any compliance point downstream of treatment that destroys, immobilizes, or removes hazardous constituents as the point for demonstrating that equivalent treatment occurs. This point can, but need not be, the NPDES or pretreatment point of compliance. Examples of alternative points of compliance that would be permissible (assuming the treatment standard is being satisfied) would be prior to initial placement in an impoundment, or after treatment in an impoundment but before final discharge.

The Agency also agrees with commenters that there can be alternative points of compliance for different underlying hazardous constituents. Again, the reason is to allow flexibility of compliance alternatives when a facility can demonstrate that it is destroying, immobilizing, or removing an equivalent mass of hazardous constituents through wastewater treatment as would be achieved by segregating the characteristic wastestream for separate RCRA treatment. Thus, if a facility generated a

characteristic waste containing metal and organic underlying hazardous constituents and the waste was treated sequentially by means not involving impermissible dilution, there could be different compliance points for the metal and organic hazardous constituents.

EPA notes, however, that if alternative points of compliance are utilized, enforcement would normally be pursuant to RCRA, not the Clean Water Act. This is by necessity, since CWA permits (or, for indirect dischargers, control mechanisms) would not normally apply to effluent quality before final discharge. See further discussion on means of implementing today's standards below in this preamble.

C. Why CWA Limitations and Standards Can Also Be RCRA Treatment Standards

As explained above, when a hazardous constituent is already subject to a CWA industry category or Water Quality Criteria-based limitation, or a case-by-case industrial POTW limitation or standard, the Agency believes (and the final rule provides) that the CWA limitations and standards satisfy RCRA section 3004(m) requirements and consequently become the RCRA treatment standard for purposes of demonstrating equivalent treatment. EPA believes that this is an obvious and effective means of integrating CWA and RCRA requirements, in accord with the court's objective. 976 F. 2d at 22; RCRA section 1006(b). This approach was generally supported by commenters as a reasonable means of satisfying the court's mandate and the underlying policy of integration of the two statutes.

Several commenters, however, argued that CWA limitations and standards could not be equivalent to RCRA because such standards can reflect (among other things) ''the cost of achieving such effluent reduction'', and ''the age of equipment and facilities involved''. CWA section 304(b)(2)(B) (factors to be considered in determining Best Available Technology). EPA disagrees. While it is true that technology-based standards developed to address toxic pollutants from various industrial categories are developed after consideration of levels that can be achieved through application of the best available technology economically achievable, the CWA limitations and standards nevertheless represent the best evaluation of what technically advanced wastewater treatment is capable of achieving for a particular industry's (or, in some cases, particular plant's) wastewater. Although there is no requirement that a particular treatment technology must be used to achieve the facility's limits, it is expected that plants utilizing BAT will have treated their effluent so that there are substantial reductions in concentration and mass of hazardous constituents. As the Agency has stated many times, EPA believes that section 3004(m) is satisfied by treatment that substantially destroys, immobilizes, and removes the hazardous constituents that are present in the waste, notwithstanding that minor amounts of hazardous constituents remain after treatment. Put another way, the statute does not require that every conceivable threat posed by land disposal be eliminated by treatment. 55 FR at 6641 and n. 1 (Feb. 26, 1990); 56 FR at 12355 (March 25, 1991); 57 FR 37259 (August 18, 1992); 55 FR at 22596 (June 1, 1990). In fact, the legislative history states explicitly that the treatment standards are not to be technology forcing, but rather are to utilize the available effective treatment technologies. 130 Cong. Rec. S. 1978 (daily ed. July 25, 1984) (statement of Sen. Chaffee); 56 FR at 12355. That is precisely what EPA has done here.

Second, with specific regard to use of CWA limitations, EPA notes that virtually all of the current LDR treatment standards for wastewaters are already drawn from CWA limitations and standards. See 55 FR at 22601 (wastewater standards for U and P wastes and F039, which essentially became the universal treatment standards, were transferred from treatment data from CWA programs), and see also the Final BDAT Background Document for U and P Wastes and Multi-Source Leachate (F039) Volume C (documenting that most of existing RCRA wastewater standards were transferred from CWA limitations and standards). Moreover, the technologies that are often used to achieve CWA limitations and standards are, in most cases, the same technologies upon which the RCRA Universal Treatment Standards are based. As EPA has already stated, ''because most treatment technologies cannot be so precisely calibrated as to achieve, for example, 3.5 ppm rather than 2.7 ppm, the likely result is that the same amount of treatment will occur.'' 59 FR at 47989 (Sept. 19, 1994). Since frequently the same technologies are used to treat wastewaters, EPA expects the degree of treatment to be comparable.

EPA also emphasizes that RCRA section 1006(b) requires EPA (among other things) to integrate provisions of RCRA and the CWA when implementing RCRA, and to avoid duplication to the maximum extent possible with CWA requirements. The Agency feels it is accomplishing this requirement by allowing a constituent-specific, CWA treatment standard to satisfy RCRA 3004(m). The Agency reiterates that a technology-based CWA limitation or standard for a hazardous constituent satisfies RCRA because such a limitation or standard directly reflects the capability of BAT technologies to treat a specific industry's or facility's wastewater, whereas the RCRA UTS for wastewaters were developed by transferring performance data from various industries, and thus EPA need not make that same transfer when industry-specific (or plant-specific) wastewater treatment data is available.

A water-quality based limitation would also satisfy RCRA section 3004(m). A CWA water quality-based limitation must be at least as stringent as the limitations required to implement an existing technology-based standard. (See CWA section 301(b)(1)(c).) Even where there is no existing BAT limitation for a toxic or nonconventional pollutant, a permit writer must determine whether BAT would be more stringent than the applicable water quality-based limitation, and again, must apply the more stringent of the two potential limitations. (40 CFR 125.3(c)(2).)

If a facility has received a Fundamentally Different Factors (FDF) variance, the limitations established by that variance also satisfy RCRA requirements. Limitations established by the FDF variance process are technology-based standards reflecting facility-specific circumstances, and hence can appropriately be viewed as BDAT as well, just as with RCRA treatability variance standards. See 51 FR at 40605 (Nov. 7, 1986).

EPA also believes that there are adequate constraints in the CWA implementing rules to prevent these end-of-pipe standards from being achieved by means of simple dilution. First, many of the effluent limitation guidelines and standards regulate the mass of pollutants discharged, and thus directly regulate not only the concentration of pollutant discharged but the degree of wastewater flow as well. Even where rules are concentration-based, NPDES permit writers can set requirements which preclude excessive water use, and EPA has so instructed permit writers. (See 58 FR 66151, December 17, 1993, encouraging permit writers to estimate reasonable rate of flow per facility and factor that flow limit into the permit.) These permit conditions can take the form of best management practices,

explicit mass limitations, and conditions on internal waste streams. 40 CFR 122.44(k); 122.45 (f), (g) and (h).

Indirect dischargers are also subject to specific CWA dilution rules in both the general pretreatment rules and the Combined Wastestream Formula (as well as through many of the categorical standards). 40 CFR 403.6 (d) and (e). Many of the guidelines and standards also preclude addition of stormwater runoff to process wastewater to preclude achieving treatment requirements by means of dilution. The Agency is accordingly of the view that end-of-pipe equivalence would be achieved by treatment that removes, immobilizes, or destroys hazardous constituents, and therefore we have determined the treatment satisfies the requirements of RCRA section 3004(m).

EPA emphasizes, however, that it is not addressing the issue of whether cross-media transfers of hazardous constituents become so extensive as to invalidate the wastewater treatment function of a land-based unit. This is the subject of the pending Phase IV proposed rule (60 FR at 43654 (August 22, 1995)), and will be addressed as part of that proceeding.

D. When CWA Limitations and Standards Become the RCRA Standards

Today's rule establishes the following principles:

1. Direct Dischargers

A CWA limitation becomes the RCRA treatment standard as well in the following situations: (a) where there is a categorical BAT or NSPS limitation for the underlying hazardous constituent; (b) where there is a facility-specific limitation for the underlying hazardous constituent pursuant to 40 CFR 125.3 (c)(2) and (d)(3); (c) where there is a Water Quality-based limitation established pursuant to 40 CFR 122.44(d); or (d) where the facility has received a Fundamentally Different Factors variance establishing an alternative limitation pursuant to 40 CFR Part 125 subpart D.

2. Indirect Dischargers

A Clean Water Act pretreatment standard becomes the RCRA treatment standard as well in the following circumstances: (a) where there is a categorical PSES or PSNS for a particular hazardous constituent; and, (b) where POTWs have developed local limits, in addition to categorical standards, to prevent pass through and interference and apply them to indirect dischargers.

EPA proposed that if pretreatment standards reflected a finding that a particular hazardous constituent will not pass through to navigable waters because of efficacious treatment by the POTW, that standard would also satisfy RCRA. The reason is that there will be full-scale treatment of the hazardous constituent before its final release into the environment. Such full-scale treatment satisfies the court's equivalency test. 60 FR at 11711. EPA is adopting this provision in today's rule for these reasons.

The Agency also proposed that pretreatment standards based on interference with POTW operations would not be considered to satisfy RCRA. *Id.* EPA is adopting this position in the final rule. The reason is that interference findings reflect the effect the pollutant may have on overall POTW treatment, not necessarily treatment of the particular constituent. Because the relationship of an interference-based standard with treatment of a particular hazardous constituent is tenuous, EPA does not believe that such a standard can be said to be equivalent to RCRA treatment. Several commenters disagreed with this reasoning, but provided no empirical information calling the Agency's conclusion into question. EPA is consequently adopting this provision as proposed.

3. Zero Dischargers Performing CWA-Equivalent Treatment

In the May 24, 1993 emergency rule, EPA established the principle that zero discharge facilities performing CWA-equivalent treatment on decharacterized wastewaters would be subject to the rules for direct dischargers, and thus would retain the ability to use surface impoundments as part of the treatment process for decharacterized wastes provided equivalent treatment occurs. 58 FR at 29863–29864. The reason is that these facilities can be performing wastewater treatment identical to, or more stringent than, that required of direct dischargers, and thus the same policy of integrating RCRA and the CWA should apply to such facilities. *Id.*

EPA is consequently also applying today's rules on equivalency to zero dischargers performing CWA-equivalent treatment, including tank-based systems that ultimately land dispose rather than discharge treated effluent. ''CWA-equivalent treatment'' is defined in 268.37(a) to mean ''biological treatment for organics, alkaline chlorination or ferrous sulfate precipitation/sedimentation for metals, reduction of hexavalent chromium, or other treatment technology that can be demonstrated to perform equally or greater than these technologies''.

E. Implementation

1. Where Permits Contain Standards for Hazardous Constituents

If a direct discharger subject to the rule (i.e. generating a characteristic waste containing underlying hazardous constituents at concentrations exceeding the treatment standard at the point the waste is generated, and is treating those decharacterized wastes in surface impoundments) has an NPDES permit containing a limitation for that hazardous constituent based on BAT, NSPS, BPJ, or a water quality standard, then there are no independent RCRA requirements beyond documenting in the facility's records that this is the facility's mode of compliance.

EPA notes further that if the Agency (or authorized State), as part of the CWA decisionmaking process for setting the limitations, affirmatively decided that such hazardous constituents need not be regulated due to low toxicity, low bioavailability or other environmental factors and that fact is reflected in the rulemaking record, permit or permit record, no additional RCRA standards would apply. If the rulemaking or permit and permit record do not contain such a finding, the permitting authority should reexamine the NPDES permit upon reissuance in order to clarify whether such hazardous constituents need not be regulated. During the time between the date this rule becomes effective and the date the permit is reissued, however, the RCRA Universal Treatment Standards for those constituents must be met.

In addition, if EPA (or an authorized State) affirmatively decided either in the rulemaking or in the permitting process that a particular hazardous constituent is controlled through controls on an indicator pollutant, then again, no additional RCRA standards would apply. For this purpose, however, the Agency would only accept as a valid indicator situations where a toxic pollutant parameter is used as an indicator for another toxic pollutant. The Agency does not believe that use of conventional pollutants (such as BOD or COD) as indicators for toxic constituents guarantees the type of equivalent treatment of hazardous constituents, which EPA feels is necessary to implement the equivalence requirement. 976 F. 2d at 23 n. 8.[2]

[2] In making this statement, EPA is of course not calling into question the use of conventional pollutants as valid indicators to satisfy Clean Water Act requirements. The language in the text is directed solely at implementing the court's mandate for purposes of RCRA.

2. Where Permits Do Not Contain a Limitation for a Hazardous Constituent

If the CWA permit either does not contain a limitation for the pollutant or does not regulate the pollutant through an indicator, or in cases when this rule becomes effective before the reissuance of a facility's permit, the RCRA universal treatment standards would apply as they do for any other RCRA hazardous wastestream. In this situation, the owner or operator of a facility has several choices. The owner/operator could do nothing, in which case the hazardous constituent would be subject to the UTS. These standards would be implemented by rule, and thus would not be embodied in a CWA permit. Enforcement consequently would be solely under RCRA. As noted earlier, the point of compliance could, but need not be, at the end-of-pipe point of discharge.

In the alternative, a facility could seek amendment of its NPDES permit pursuant to § 122.62(a)(3), requesting that the applicable permitting authority modify the permit at reissuance, or sooner, to add limits for the underlying hazardous constituents reflecting BAT for that pollutant at the facility.[3] Assuming proper design and operation of the wastewater treatment technology, a permit writer in such a case could modify the permit to add a limitation for the pollutant based on Best Professional Judgement reflecting actual BAT treatment (40 CFR 125.3(c)). Modification requests would be processed pursuant to the procedures found at § 124.5. The modified permit limitation would be a CWA requirement and enforceable solely under that statute, but would be deemed by the Agency to satisfy RCRA 3004(m), so that meeting UTS per se would not be required.

A final alternative is for the facility to seek a RCRA treatability variance. EPA is amending the grounds for granting such a variance to include situations where a facility is treating decharacterized wastes by treatment identified as BAT or NSPS (New Source Performance Standards), the technology is designed and operated properly, but is not achieving the UTS (see § 268.44(a)).

3. Indirect Dischargers

The same alternatives exist for indirect dischargers. If an underlying hazardous constituent is regulated by a categorical PSES, PSNS, or by a local limit in a control mechanism reflecting PSES or PSNS—level treatment, then that standard satisfies both RCRA and the CWA. In addition, if there is no pretreatment standard (i.e., PSES/PSNS) for an underlying hazardous constituent, because the Agency determined that there was no pass through, then section 3004(m) is satisfied and the RCRA standard for that underlying hazardous constituents does not apply.

If an underlying hazardous constituent is not regulated nationally by a PSES or PSNS, or by a local limit, it becomes subject to the UTS for that constituent. That UTS would be enforced as a RCRA standard. However, in cases where an underlying hazardous constituent is not already subject to categorical PSES, categorical PSNS, or to a local limit in a control mechanism reflecting PSES or PSNS-level treatment, water quality, or pass through, the control mechanism between the indirect discharger and the applicable control authority would have to be modified in order to avoid application of the UTS by rule. EPA is amending § 403.5(c)(1) and § 403.5(c)(2) of the pretreatment rules to specifically authorize control authorities to make such determinations.

The final option is for a facility to obtain a RCRA treatability variance. Thus, the amendment to the treatability variance rules also applies to indirect dischargers properly operating technology identified as the basis for their PSES or their PSNS standard.

4. Zero Dischargers Performing CWA-Equivalent Treatment

The implementation options for zero dischargers performing CWA-equivalent treatment are similar. Some of these facilities may have CWA permits authorizing specified levels of discharge. If these permit limitations apply to underlying hazardous constituents present in the RCRA-prohibited portion of the discharge, the CWA permit limit satisfies RCRA as well. The facility also could seek to amend the CWA permit to add limitations for the hazardous constituent. Enforcement then would be exclusively pursuant to the CWA.

If the zero discharger has no CWA permit, or the permit does not contain limitations for underlying hazardous constituents and is not amended to do so, then the facility would have to meet the RCRA UTS or an alternative standard established by treatability variance either at the point of discharge[4] or at an earlier point of its choosing (assuming, of course, that a valid demonstration of bona fide treatment can be made at an earlier point).

5. Implementation When CWA Standards and Limitations Will Not Be the Exclusive Standard

If the facility treats to UTS and does not modify its CWA permit or control mechanism to include a CWA standard/limitation for an underlying hazardous constituent, EPA is finalizing minimal recordkeeping requirements, under RCRA authority. Generators can use their knowledge to identify the underlying hazardous constituents reasonably expected to be present at the point of generation of the ICRT wastes which are not covered by a CWA limitation or standard and hence must be treated to meet UTS (assuming no permit modification). EPA is requiring that this information be kept on-site in files at the facility. The facility will then monitor compliance with the UTS standard for each of these constituents at the point of ultimate discharge or alternative compliance point, on a quarterly basis, and results of this monitoring must be kept in the facility's on-site files. An exceedence of the RCRA UTS standard must be documented in the facility's on site records.

These same requirements apply to facilities without NPDES permits documenting compliance as zero dischargers with CWA-equivalent treatment who are affected by this rule. The absence of a permit necessitates some alternative means of documenting compliance, and the scheme outlined above seems to be the least burdensome scheme which would still provide a reasonable means of enforcing this rule.

6. RCRA Controls Over Point Source Discharges and Domestic Sewage

Both RCRA and the implementing regulations provide that point source discharges and domestic sewage (including mixtures of domestic sewage with other wastes) are not subject to

[3] EPA is interpreting the language in § 122.62(a)(2) to indicate that the D.C. Circuit's opinion in the Third Third case is new information warranting reopening a permit.

[4] The point of compliance for a zero discharger choosing the point of discharge as a compliance point would be at the point of ultimate disposal. For those zero dischargers who discharge to a dry river bed (common in the western U.S.) not considered a ''water of the U.S.'' under the CWA, the point of compliance would be at the end-of-pipe. For those zero dischargers who spray irrigate, or otherwise place the wastewaters on the land after treatment in the surface impoundment, the point of compliance would be at the point just prior to the land placement. Furthermore, zero dischargers treating wastewaters in a tank system followed by spray irrigation or another form of land placement are also subject to this rule. For those zero dischargers who use evaporation ponds, the point of compliance is before the wastewater enters the surface impoundment, as this is the ultimate disposal point.

RCRA subtitle C jurisdiction. RCRA section 1004(27) and § 261.4(a) (1) and (2). Some commenters questioned whether by allowing CWA limitations and standards to satisfy the RCRA treatment standard requirement, EPA were somehow imposing RCRA controls where it lacks authority to do so.

This is not the case. EPA is creating here a mechanism for evaluating whether RCRA-equivalent treatment has occurred for purposes of determining whether surface impoundments (i.e. RCRA land disposal units) can permissibly be used as part of that treatment process. 976 F. 2d at 22–24. The effect, for RCRA purposes, of failing to satisfy the limitations or standards is that the facility has engaged in illegal land disposal by virtue of not performing equivalent treatment. Id. Thus, the effect of the rule is on activity upstream of the discharge point, and these activities are within RCRA's jurisdictional purview.

7. Applicability to the Pulp and Paper Industry

The concerns about integration of CWA and RCRA standards are particularly acute with respect to the pulp and paper industry. EPA is at a critical stage in developing comprehensive multi-media rules for this industry (to control both hazardous air emissions and wastewater discharges). These rules were proposed at 58 FR 66078 (Dec. 17, 1993) and are slated for promulgation by mid-1996. The rules should fundamentally affect (for the better) the types of wastewaters managed at pulp and paper facilities and the potential releases of hazardous constituents from such wastes. The Agency believes that it would be putting the cart before the horse, and would fail to properly integrating RCRA with the CWA (and potentially CAA in this case) by proceeding with implementation of the court's decision for this industry in advance of completion of this rulemaking. Cf. *Edison Electric Inst.* v. *EPA,* 2 F. 3d 438, 453 (D.C. Cir. 1993) noting when temporary deferrals of action to allow better integration of overlapping statutes is permissible. The Agency will revisit the question of how to implement the court's decision for the pulp and paper industry upon completion of the existing multi-media rulemaking.

IV. Treatment Standards for Class I Nonhazardous Injection Wells and Response to Comments

A. Introduction

Generally, Class I nonhazardous injection well owners/operators injecting decharacterized ICRT wastes do not substantially treat their waste beyond removing the characteristic by aggregating and diluting wastestreams, plus filtering of solids in order to facilitate injection. There are as many as 100 such nonhazardous facilities in addition to the approximately 54 hazardous facilities injecting ICRT wastes. As discussed in the Phase III proposed rule, EPA estimates that the average flow of a ''typical'' Class I nonhazardous well is 107,000 gallons/day. Typically, the volume of hazardous wastes comprises 25% or less of the aggregated injected wastestream.

In the Third rule, EPA proposed that characteristic wastes were not prohibited from injection into these deep wells provided they no longer exhibited a characteristic at the point they are injected.e. land disposed. 60 JR at 11704–11705. The D.C. Circuit rejected this portion of the rule, holding, in EPA's reading of the opinion, that the statutory requirements could not be satisfied absent treatment that addressed both short term and long term threats posed by land disposal of the waste, and hence that hazardous constituents in the waste had to be destroyed, removed or immobilized before injection, not merely diluted. 60 JR at 11706–11708. EPA is implementing that mandate in this rule. (However, EPA reiterates, as it did at proposal, that EPA is taking this action to implement the court's mandate, not because it is an environmental priority, or prudent use of the Agency's or the regulated community's resources. The Administration is in fact pursuing a legislative change which would restore EPA's original policy determination reflected in the 1990 Third rule.)

The effect of today's final rule is to prohibit the land disposal of characteristic waste streams at the point they are generated. If those wastes contain underlying hazardous constituents at levels exceeding the Universal Treatment Standards and (as explained further below) at levels and volumes greater than designated *de minims* amounts, those constituents would have to be destroyed, removed, or immobilized before the waste is injected. This could be accomplished either by segregating the characteristic portion of the injectate for treatment, or by treating the commingled injectate before disposal (i.e. before injection). The rule further provides that if a facility removes an equivalent mass of the hazardous constituent through source reduction, or waste treatment, that the treatment standard is satisfied. The final, alternative means of compliance is for the unit to have received a no-migration determination.

A number of commenters believed that aggregation or dilution of wastes to remove the hazardous characteristic of the waste stream prior to injection was sufficient and that the requirement to treat underlying constituents was legally unnecessary and onerous. EPA's reading of the Third Third opinion and section 3004(m) is that treatment that destroys, immobilizes, or removes hazardous constituents is required, and that this requirement is not satisfied merely by dilution. The statutory findings of the inherent uncertainty of land disposal of hazardous wastes, the propensity to bioaccumulate these same constituents, the statutory goals of waste minimization and proper waste management, plus the legislative history documenting Congressional intent not to permit treatment by dilution supports the Agency in rejecting these comments. 60 FR at 11706–708. Therefore, the Agency has decided not to allow Class I nonhazardous wells to dilute or aggregate their waste streams in order to fulfill, substitute, or avoid treatment levels or methods established in the LDRs. See the dilution prohibition added in § 148.3 of today's final rule.

Furthermore, the Agency, as proposed, is expanding the applicability of 40 CFR Part 148 to now require owners/operators of Class I nonhazardous wells to determine whether LDRs apply to their facilities.

Commenters likewise sharply questioned the Agency's determinations as to when land disposal prohibitions should attach, and state, correctly in the Agency's view, that the opinion did not compel a determination that prohibitions must attach at the initial point of waste generation or when underlying hazardous constituents are present at that point in concentrations exceeding the UTS. EPA is in fact pursuing alternatives on both of these fronts. The Agency proposed alternatives to the strictest point of generation approach, 60 FR at 11715–716, and expects to take final action on this proposal well before the effective date of the Phase III prohibitions for Class I non-hazardous UIC wells. The source reduction compliance option in this rule is a related means of dealing with this issue, since it can be conceptualized as allowing the requisite hazardous constituent reductions to be achieved by means other than downstream treatment notwithstanding presence of hazardous constituents above UTS at what is technically point of waste generation.

With regard to whether presence of hazardous constituents above UTS

would be the trigger level for the LDR prohibition, EPA has recently proposed risk-based hazardous constituent concentration levels which would implement the ''minimize threat'' requirement in section 3004(m), and would cap the technology-based treatment standards whenever the technology-based standards are lower (60 FR 66344, December 21, 1995). The *de minimis* feature of today's rule further addresses situations where EPA believes that prohibitions need not apply due to the low concentrations and volumes of hazardous constituents in the decharacterized portion of the injectate.

B. Compliance Options for Class I Nonhazardous Wells

In the proposed rule, the Agency indicated that facilities could segregate their hazardous wastes, and treat just that volume of the total waste stream to UTS levels in order to conform to the treatment requirement. A number of commenters maintained that the Agency oversimplified this approach and that such segregation was impractical from both a technical and economic standpoint. EPA acknowledges that many facilities may not practically be able to segregate streams. These facilities may utilize of other LDR compliance options as discussed below.

One option would be to apply for an exemption from treatment standards via the no-migration petition variance. EPA is promulgating a clarifying revision to 40 CFR 148.20 which allows facilities to seek a no-migration variance for their Class I nonhazardous wells, and has long indicated that this compliance option is available (see pp. 25–27, Supplemental Information Report prepared for the Notice of Data Availability, January 19, 1993, 58 FR 4972). If these facilities demonstrate to EPA that their formerly characteristic wastes (including any hazardous constituents) will not migrate out of the injection zone for 10,000 years, or no longer pose a threat to human health and the environment because the wastes are attenuated, transformed, or immobilized by natural processes, then they may continue to inject without further treatment.

A significant number of commenters responded to the proposed rule's discussion on the Agency's position on granting no-migration petitions. Comments included that petitions were a too costly option, took too much time to be processed, generic petitions for Class I non-hazardous wells should be granted, and existing no-migration exemptions should not require modification to include Phase III wastes. These comments, among others, will be discussed in detail in the ''Response to Comments'' background document for this rule, but basically many had partial merit.

First, although the Agency has estimated earlier that the average petition costs an operator $343,000, several individual petition reviews have far exceeded that amount. The Agency will examine the possibility of revising petition cost data in future LDR rules. Second, although a petition may take up to 3 years to process, the Agency (as noted above) indicated as early as 1992 (after the Third Third opinion) that it would begin review of Class I nonhazardous injection well no-migration petitions if submitted (58 FR 4972, January 19, 1993). Although time and resource restraints on the Agency are real, the Agency will continue to work with affected Class I operators in order to facilitate the no-migration petition review process. Third, although EPA has established a reasonable knowledge base on the review process for Class I hazardous facilities, it cannot automatically infer that all Class I nonhazardous facilities will successfully make a no-migration demonstration. Well site geology, hydrogeology, abandoned well area of review, and the specific characteristics of the injectate and receiving formation are site specific factors which, as a factual matter, must be evaluated individually in order to demonstrate ''to a reasonable degree of certainty'' (RCRA section 3004(g)(5)) that the no migration standard has been satisfied. See Supplemental Report to Notice of Data Availability, January 19, 1993, at 25–26 9. It must be remembered that not every Class I injection well applying for the variance has been able to make the demonstration, and that one salutary effect of the no migration process has been to identify certain (albeit a limited number of) wells that would not be capable of adequately containing injectate over the long term.

EPA agrees completely with commenters, however, that wells that already have approved no migration exemptions are not affected by the Third Third opinion and thus are not affected by land disposal restrictions affecting decharacterized wastes. (In fact, EPA does not read the proposal to suggest otherwise.) Absent a change in the waste being injected, there is no reason to reopen no migration determinations that have already evaluated the entire injected waste stream. 57 FR at 31963 (July 20, 1992).

EPA is also promulgating additional means for Class I nonhazardous facilities to comply with the LDR requirements. Revisions to 40 CFR 148.1(c)(1) and 148.4 will allow Class I nonhazardous owners and operators to apply for a case-by-case extension of the capacity variance for up to one year (renewable for up to an additional year) in order to acquire or construct alternative treatment capacity. Based on experience, EPA believes that the availability of the case-by-case extension coupled with national capacity variance(s) should allow operators more than adequate time to acquire alternative treatment or complete the no-migration petition process. Two other options include the pollution prevention option and the de minimis volume exclusion.

C. Pollution Prevention Compliance Option

The final rule provides an alternative means of obtaining the reductions in mass loadings of hazardous constituents mandated by the Third Third opinion. Under this alternative, mass reductions can be achieved by removing hazardous constituents from any of the wastestreams that are going to be injected, and these reductions in mass loadings can be accomplished by means of source reduction (i.e. equipment or technology modifications, process or procedure modifications, reformulation or redesign of products, substitution of raw materials, and improvements in housekeeping, maintenance, training, or inventory control), recycling, or conventional treatment. As an example, if a facility can make process changes that reduce the mass of cadmium by the same amount that would be removed if the prohibited wastestream was treated to satisfy UTS, the facility would satisfy LDR requirements. The facility could also remove cadmium from any of the streams (prohibited or non-prohibited) which are going to be injected, or could find a means of recycling some portion of the injectate to reduce injected mass loadings of cadmium. In all cases, the result would be that the mass loading of hazardous constituents into the injection unit would be reduced by the same amount as it would be reduced by treatment of the prohibited, characteristic portion of the injectate. 976 F. 2d at 23 n. 8; see also *Specialty Steel Inst.* v. *EPA,* 27 F. 3d 642, 649 (D.C. Cir. 1994) (treatment standards that result in lower volume of waste to be disposed—precisely what the alternative standard here can achieve—are a permissible means of complying with RCRA section 3004 (m)).

Commenters further requested that this alternative be available on a hazardous constituent by hazardous constituent basis. EPA agrees that this is

reasonable since it still results in the requisite reduction of hazardous constituent mass loading and provides desirable compliance flexibility. Of course, if the pollution prevention alternative is used partially, there must still be compliance by some alternative means for the remaining hazardous constituents subject to the prohibition.

The Agency is not, however, adopting any type of hazardous constituent trading provision as part of this rule. It first is not clear that such a provision would satisfy the equivalency test enunciated by the court. In addition, given the narrow time frame available to the Agency to develop this rule, the Agency lacks the time and resources to properly evaluate the ramifications of the idea in this proceeding.

As a means of implementing this alternative, EPA is adopting the method proposed. The mass/day reduction of a particular underlying hazardous constituents is to be calculated by comparing the injected baseline with the allowance. The injected baseline is determined by multiplying the volume/day of prohibited hazardous waste generated and subsequently injected times the concentration of hazardous constituents before the pollution prevention measure. The allowance is determined by multiplying the volume/day of a hazardous constituent generated/injected times the UTS for that constituent. The difference between the injected baseline and the allowance is the required mass/day reduction.

EPA proposed, and is adopting the requirement that after successful employment of a pollution prevention measure, the facility must demonstrate that the injected mass achieves the required mass/day reduction. Because the amount of an underlying hazardous constituent in the injectate is dependent upon the level of production, a correction factor for production is needed. In the example given in the proposal (60 FR 11714), the calculation for the injected baseline was corrected by a production variability factor based on volume. The Agency had solicited comment on whether there are production parameters other than volume (e.g., mass, square footage, etc.). One commenter gave a specific example where square footage would be a more appropriate parameter. Therefore, the Agency is promulgating today that any appropriate parameter may be used to calculate the production variability factor. Another commenter was concerned that in the example the baseline used after pollution prevention seemed to be based on the production rate, whereas the baseline before pollution prevention was not. The commenter misunderstood the purpose of the production variability factor. In the example the post-pollution prevention injectate was adjusted by the production variability factor; however, the example could have been reorganized such that the initial baseline was adjusted for production variability. It was not necessary to adjust both the pre- and post-pollution prevention baselines for production variabilty; in fact, doing so would cause the variability factor to cancel out.

Several commenters were concerned that there are other factors besides rate of production which could cause variability in the level of an underlying hazardous constituent. One commenter mentioned variations in operation of specific source unit operations such as distillation and/or stripping trains feeding the injection unit. Another commenter stated that since they do not actually produce anything, they have no production rates to use, and suggested basing production on man-hours worked or total water consumed by a facility. The Agency agrees with all these suggestions. The mass/day of an underlying hazardous constituent after pollution prevention is based on the flowrate multiplied by the concentration of the constituent, and must be less than or equal to the calculated mass/day allowance for that underlying hazardous constituent. Beyond this basic formula, the facility can adjust for any factors which would cause a variation in the concentration of the underlying hazardous constituent, provided the variation(s) are part of a normal operating procedure.

Under this approach, a facility would make a one-time change in operating practice. Because the mass loading reductions resulting from the practice are obtained from the time of the change forward, it obviously is not necessary (and neither practical or likely feasible) for the facility to make on-going (potentially daily) changes to qualify under the provision.

A number of commenters, although supporting the Agency's proposal, argued that it should apply to facilities that already have implemented source reduction or other pollution prevention practices before the effective date of the rule, not just those making the change prospectively (as EPA proposed). Their point is that facilities that have already implemented source reduction, and as a result may now have fewer opportunities to do so, should not be on a worse footing than facilities who have been laxer and thus now have a wider range of possible means of reduction. This argument certainly has equitable force. At the same time, however, there has to be some objectively defined baseline period for the rule to be enforceable, and for there to be some nexus between the pollution prevention measure and the reduced mass loadings in current injectate. Balancing these considerations, the Agency is establishing 1990 as the base year for establishing a baseline. This was the year EPA adopted (per Congressional schedule) the prohibitions for characteristic hazardous waste and (coincidentally) the year of the Pollution Prevention Act.

EPA is sensitive to other comments regarding the need for this alternative to be objectively verifiable. The Agency is therefore requiring that facilities must monitor the underlying hazardous constituent concentration and the volume of the prohibited hazardous waste stream (i.e. all characteristic streams subject to LDR treatment standard requirements that will be decharacterized before injection), both on the day before and the day after successful implementation of pollution prevention. Results of this monitoring must be reported to the EPA Region or authorized State on a one-time basis. The Agency had solicited comment on whether more than one day is needed for monitoring. Several commenters were concerned that certain pollution prevention methods would take several weeks, not one day, to show results. It should be noted that the Agency did not intend for the pollution prevention method to show results in one day. Results should be achieved by the effective date of the rule for the facility to be in compliance, and the pollution prevention method should have been employed no earlier than 1990. The facility must also include a description of the pollution prevention method used (including any recycling alternative). In addition, the facility will monitor and keep on-site records of the results on a quarterly basis (this time period is selected to match the quarterly monitoring already required under SDWA regulations at 40 CFR 146.13 (b)). If the facility changes its means of complying with this alternative, it must renotify the EPA Region or authorized State, and again document the basis for its compliance by monitoring.

D. De Minimis Volume Exemption

EPA is finalizing the *de minimis* exemption proposed. 60 FR at 11714–11715. The terms of the exemption are that if decharacterized wastewaters comprise no more than 1% of the total injectate, if the total volume of the characteristic streams do not exceed 10,000 gallons per day, and if underlying hazardous constituents are

present in the characteristic wastes at concentrations less than 10 times UTS at the point of generation, then the wastes are not prohibited from injection in a Class I non-hazardous deepwell (assuming the injectate is not hazardous at the point of injection). The Agency continues to believe that under these circumstances, the relatively small decharacterized hazardous waste streams would not appreciably alter the risks posed by the injection practice.

Generally, the proposed approach was well received. Some commenters stated, however, that the *de minimis* volume exemption, as proposed, would allow excessively large volumes of routinely generated characteristic wastes to go untreated to disposal in deep wells, while others believe that the specific quantifying parameters are overly restrictive. The Agency analyzed potential risks associated with concentrations of 5 contaminants detected in Class I facility waste streams at 10, 20, and 50 times UTS. (This analysis was conducted in conjunction with revising the Regulatory Impact Analysis For Underground Injected Wastes for this rule. See 60 FR 11715.) In brief, risk estimates for 4 geologic settings and 2 well malfunction scenarios were found to be below levels of regulatory concern at 10 and 20 times UTS. However, at 50 times UTS, risk estimates for cancer and hazard index were above regulatory concern for a waste stream containing carbon tetrachloride, assuming an abandoned borehole failure within 500 feet of the injection well. Taking into account the statutorily enumerated ''long-term uncertainties associated with land disposal'' (RCRA section 3004(d)(1)(A)), EPA believes the 10 × UTS level to be well within the zone of reasonable values it could select as *de minimis*. The one percent volumetric requirement is consistent with other longstanding *de minimis* exemptions for wastewater management systems in the subtitle C rules (see § 261.3(a)(2)(iv) (A) and (E)), and would normally cap the total volume of characteristic injectate at approximately 1100 gallons per day, given average Class I UIC non-hazardous injection rates.

At a rate of 1100 gallons per day, 10×UTS for carbon tetrachloride would mean a mass loading of approximately 165 mg of the constituents being injected each day. Mass loadings for the other hazardous constituents would similarly be modest. EPA again believes that these small mass loadings would have *de minimis* effect on the risk potential posed by the injection practice and consequently should be exempted from the prohibition.

V. Treatment Standards for Newly Listed Wastes

A. Carbamates

Hazardous Wastes From Specific Sources (K Waste Codes)

K156—Organic waste (including heavy ends, still bottoms, light ends, spent solvents, filtrates, and decantates) from the production of carbamates and carbamoyl oximes.
K157—Wastewaters (including scrubber waters, condenser waters, washwaters, and separation waters) from the production of carbamates and carbamoyl oximes.
K158—Bag house dust, and filter/separation solids from the production of carbamates and carbamoyl oximes.
K159—Organics from the treatment of thiocarbamate wastes.
K160—Solids (including filter wastes, separation solids, and spent catalysts) from the production of thiocarbamates and solids from the treatment of thiocarbamate wastes.
K161—Purification solids (including filtration, evaporation, and centrifugation solids), baghouse dust, and floor sweepings from the production of dithiocarbamate acids and their salts. (This listing does not include K125 or K126.)

Acute Hazardous Wastes (P Waste Codes)

P203 Aldicarb sulfone
P127 Carbofuran
P189 Carbosulfan
P202 m-Cumenyl methylcarbamate
P191 Dimetilan
P198 Formetanate hydrochloride
P197 Formparanate
P192 Isolan
P196 Manganese dimethyldithiocarbamate
P199 Methiocarb
P190 Metolcarb
P128 Mexacarbate
P194 Oxamyl
P204 Physostigmine
P188 Physostigmine salicylate
P201 Promecarb
P185 Tirpate
P205 Ziram

Toxic Hazardous Wastes

U394 A2213
U280 Barban
U278 Bendiocarb
U364 Bendiocarb phenol
U271 Benomyl
U400 Bis(pentamethylene)thiuram tetrasulfide
U392 Butylate
U279 Carbaryl
U372 Carbendazim
U367 Carbofuran phenol
U393 Copper dimethyldithiocarbamate
U386 Cycloate
U366 Dazomet
U395 Diethylene glycol, dicarbamate
U403 Disulfiram
U390 EPTC
U407 Ethyl Ziram
U396 Ferbam
U375 3–Iodo-2-propynyl n-butylcarbamate
U384 Metam Sodium
U365 Molinate
U391 Pebulate
U383 Potassium dimethyl dithiocarbamate
U378 Potassium n-hydroxymethyl-n-methyldithiocarbamate
U377 Potassium n-methyldithiocarbamate
U373 Propham
U411 Propoxur
U387 Prosulfocarb
U376 Selenium, tetrakis (dimethyldithiocarbamate)
U379 Sodium dibutyldithiocarbamate
U381 Sodium diethyldithiocarbamate
U382 Sodium dimethyldithiocarbamate
U277 Sulfallate
U402 Tetrabutylthiuram disulfide
U401 Tetramethylthiuram monosulfide
U410 Thiodicarb
U409 Thiophanate-methyl
U389 Triallate
U404 Triethylamine
U385 Vernolate

EPA is promulgating the treatment standards that were proposed for wastes from the carbamate industry specified above.

The preamble of the proposed rule described the basis for these treatment standards in greater detail (60 FR 11720). For background information on waste characterization data, data gathering efforts, and applicable technologies, see the Best Demonstrated Available Technology (BDAT) Background Document for Newly Listed or Identified Wastes from the Production of Carbamates.

The concentration-based treatment standards being promulgated today for carbamate wastewaters and nonwastewaters are at UTS levels for certain constituents, and at newly-established levels for other constituents that are today being added to the UTS list. The UTS standards have already been promulgated for 21 of the constituents of concern (16 organic constituents and 5 metals). The Agency is promulgating new UTS for 42 constituents associated with carbamate wastes. Forty of these constituents are chemicals produced by the carbamate industry which may be grouped into the following categories: carbamates and carbamate intermediates, carbamoyl oximes, thiocarbamates, and dithiocarbamates. Please refer to the Background Document for definitions of these chemical groups and the categorization of these 40 chemicals. The other 2 constituents for which new UTS are being promulgated (triethylamine, and o-phenylene diamine) are not carbamate products, but are hazardous constituents present at levels of regulatory concern in carbamate wastes.

One commenter requested clarification on the applicability of the carbamate treatment standards, stating that the summary section of the proposed treatment standards said that treatment standards were being proposed for certain hazardous wastes ''including those from the production of carbamate pesticides'', whereas the section of the rule that directly addressed carbamate wastes referred to carbamates without the pesticide limitation. EPA points out in response that the final listing rule which defined the new waste codes does not limit the definition to pesticides only. The treatment standards being promulgated apply to all wastes which fit the definitions of the waste codes established in the final listing rule.

One commenter stated that EPA exceeded its authority under RCRA section 3004 and violated the Administrative Procedure Act by preparing the proposed treatment standards and sending this rule to OMB well before the final listing had been promulgated. EPA points out that the proposed treatment standards were actually published after publication of the final listing rule. The proposed treatment standards were modified to conform with the changes that appeared in the final listing; thus, treatment standards were only proposed for those carbamate wastes whose listing had been promulgated in final form. Proposed standards for wastes whose listings were not finalized were eliminated from the proposed treatment standards rule. Given the statutory requirement described above (i.e., the requirement to finalize LDR treatment standards six months after the listing is finalized), Congress must have envisioned that the two rulemaking activities would occur in close proximity.

One commenter had several objections to the proposed standards for thiocarbamate wastes, stating that 1) nonwastewater standards should not have been based on detection limits compiled from sampling and analysis performed as part of the listing process

because the Agency made errors in the sampling and analysis; 2) that EPA has no data to support the assertion that the proposed UTS limits can be met by thermal destruction technologies and that the source of the detection limit used to develop the nonwastewater standard was not clearly identified; and, 3) that no document was found in the record to support the proposed wastewater limit of 0.003 mg/l for thiocarbamate constituents (A2213, Butylate, Cycloate, EPTC, Molinate, Pebulate, Prosulfocarb, Triallate, Vernolate), based on granular activated carbon absorption, giving the commenter no basis to evaluate the achievability of this treatment standard.

To respond, the nonwastewater limit for thiocarbamate wastes was actually based on a detection limit of 0.5 mg/kg by GC/NPD, identified in a general characterization report addressing the newly regulated constituents, rather than on the limit of 0.125 mg/kg by SW–846 8270B, identified in the sampling and analysis reports. The commenter has not yet provided any data to indicate that the proposed treatment standards for nonwastewaters cannot be met.

The Agency has decided to promulgate a treatment standard of 0.042 mg/l in wastewaters for the thiocarbamate constituents identified above. This standard is based on an analytical detection limit of 0.015 mg/l for Butylate, identified in an activated carbon isotherm test performed by the Office of Water to support development of effluent guideline limitations. The Agency had proposed a wastewater limit of 0.003 mg/l, based on data taken from the PEST (Pesticide Treatability Database) database containing treatability data for pesticides, prepared and maintained by RREL (Risk Reduction Engineering Laboratory) in Cincinnati, Ohio. However, upon review of the available data, the Agency has decided that the Office of Water data is more accurately representative of available wastewater treatment than the pilot-scale data from the PEST database, and has decided to change the final treatment standard accordingly.

EPA is today clarifying that the LDRs do not apply to waste streams which were specifically exempted from the definition of hazardous waste in the final listing rule for carbamates. These waste streams include sludges from the biological treatment of K156 and K157 and streams which satisfy the concentration-based exemption from the definition of K156 and K157 codified at § 261.3(a)(2)(iv)(G).

The promulgation of treatment standards for carbamate wastes has greatly expanded the number of constituents covered by the Universal Treatment Standards at Section 268.48. The Agency wishes to clarify that only a very limited number of generators or treaters, such as manufacturers or users of carbamate products, are expected to have these new constituents present in their wastes. Therefore, affected parties may rely on process knowledge to determine if it is necessary to analyze for these constituents.

The commenter has not yet provided any data to indicate that the proposed treatment standards cannot be met. The commenter did indicate an intention to submit biological treatment data for thiocarbamate wastes. This commenter was instructed to submit this data quickly (by the end of August) to allow the Agency time to give consideration to this data prior to issuing the final rule.

B. Spent Aluminum Potliners (K088)

K088—Spent potliners from primary aluminum reduction.

EPA proposed to establish treatment standards for K088 expressed as numerical concentration limits (see 60 FR 11722) for the following constituents: acenapthene, anthracene, benz(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(g,h,i)perylene, chrysene, dibenz(a,h)-anthracene, fluoranthene, indeno(1,2,3-cd)pyrene, phenanthrene, pyrene, antimony, arsenic, barium, beryllium, cadmium, chromium, lead, mercury, nickel, selenium, silver, cyanide and fluoride. Today, EPA is promulgating these treatment standards as proposed. The nonwastewater treatment standards for cyanide, and the organic constituents, are based on a total composition concentration analysis. The nonwastewater treatment standards for fluoride, and the metal constituents, are based on analysis using the TCLP. All wastewater treatment standards are based on total composition concentration analysis.

1. Comments Received on the ''Inherently Waste-Like'' Determination

The majority of the comments received on the issue of declaring K088 ''inherently waste-like'' opposed such a determination. As discussed in the proposal, declaring K088 inherently waste-like would require that all K088 treaters/recyclers obtain a RCRA Part B permit regardless of whether the K088 is recycled, reused, used as a feedstock in a process, or conventionally treated. The commenters asserted that this designation would discourage recycling/reuse and development of innovative technologies, and would be overly burdensome for many of the small companies pursuing recycling technologies.

The Agency was persuaded by commenters that a determination of ''inherently waste-like'' is unnecessary at this time. Instead, any determination of whether a particular K088 processing technology is a type of excluded recycling activity would need to be made on a case-by-case basis by EPA Regions or authorized states. EPA was persuaded by commenters that allowing individual flexibility in making such a determination is desirable here.

Criteria that are typically relevant in making any such determinations are set out (among other places) at 50 FR at 638 (Jan. 4, 1985); 53 FR at 522 (Jan. 8, 1988); and 56 FR at 7159 and 7185 (Feb. 21, 1991). EPA also repeats the concerns voiced in the proposed rule that spent aluminum potliners contain high concentrations of cyanides and polyaromatic hydrocarbons which may be conventionally treated by thermal recovery processes, and that these and other hazardous constituents are present in the potliners in concentrations well exceeding those found in the raw materials or products for which the spent potliners would be substituting. 60 FR at 11723 n. 11. Other concerns are that the thermal recovery processes appear to pose the same potential risks of harmful air emissions as processing hazardous wastes in industrial furnaces, that the residues of recovery processes may not be adequately treated, and that storage of spent potliners can (and indeed has) posed significant risk. Id. at 11723–24. EPA also repeats that many of these units may already be subject to the rules for industrial furnaces burning hazardous wastes, since those rules apply to industrial furnaces that burn hazardous wastes for energy recovery, material recovery, or destruction. Id. at 11722 and n. 10; 56 FR at 7142; 50 FR at 49171–49174 (Nov. 29, 1985); 40 CFR 266.100.

A consequence of EPA's decision to allow for individualized determinations is that it is also unnecessary (and indeed, not factually justified) to make a general determination of ''substantial confusion'' pursuant to 270.10(e)(2) which could establish an opportunity for interim status eligibility. That finding would have been premised on the generic inherently wastelike determination (see 60 FR at 11723), which the Agency is not making. EPA is also not pursuing in this proceeding the idea of toxic air emission standards under section 112(d)(1) of the Clean Air Act for these sources. These sources could be subject to these standards if they are major (or, in some cases, area)

sources under section 112, but that determination need not be part of the present rulemaking.

2. Comments Received on Regulated Constituents

EPA requested comment on regulating the phthalates: bis (2-ethylhexyl) phthalate, di-n-butyl phthalate and di-n-octyl phthalate. These constituents have seemingly been detected in the untreated potliner and the treated residue; however, EPA believes that their presence may simply be due to lab contamination. Commenters overwhelmingly requested that these phthalates not be regulated. The Agency agrees and is not including any phthalates in the list of regulated constituents for K088.

A number of commenters requested that benzo(a)pyrene be used as a surrogate for analyzing organics. The commenters were concerned that analytical costs for other PAHs would be excessive. EPA is not convinced that analyzing benzo(a)pyrene would be sufficient for determining proper treatment of all organics. The concentration of one constituent does not always reflect the concentration of similar constituents in a waste. Surrogate analyses assume that all PAHs are present at similar concentrations which may or may not be true. Because of the variability of concentrations found in K088 wastes, benzo(a)pyrene may not be present while other PAHs may be present. Analyzing only for benzo(a)pyrene or any other potential surrogate does not ensure the treatment to UTS concentrations of other PAHs. In addition, the Agency believes that since all of the PAHs are analyzed by a single method the cost increase for additional PAHs should not be significant. Therefore, the Agency does not believe the organic constituents monitored in K088 wastes should be limited to a surrogate indicator. EPA is allowing, however, flexibility in the waste analysis plans developed by the companies with their permit writers to analyze only for those constituents expected to be present in the generated K088.

The Agency proposed to regulate fluoride in K088. While fluoride is not a ''hazardous constituent'', i.e., listed in Appendix VIII of part 261, it is present in very high concentrations in K088 and is capable of causing substantial harm in the form of groundwater degradation, adverse ecological effects and potential adverse human health effects. The Agency's view thus is that, unless fluoride in this waste is treated, the legal standard in section 3004(m) would not be satisfied. That is, treatment would not ''substantially diminish the toxicity of the waste * * * so that short-term and long-term threats to human health and the environment are minimized.'' RCRA section 3004(m)(1). In addition, as discussed in the proposed rule, EPA reads the language in section 3004 (d)(1), (e)(1), and (g)(5) to require that land disposal may still be prohibited after treatment of hazardous constituents if the waste might still pose substantial hazards due to presence of other constituents or properties. 56 FR at 41168 (August 19, 1991); *NRDC* v. *EPA,* 907 F. 2d 1146, 1171–72 (D.C. Cir. 1990) (dissenting opinion). These hazards could be posed due to lack of treatment of other constituents in the waste, in this case, fluoride.

The Agency requested comment on whether fluoride should be added to Appendix VIII, as well. The overwhelming response of the commenters is that fluoride should not be added to Appendix VIII. The Agency agrees that fluoride does not pose the same risks in other wastes because it does not occur in such high concentrations. Furthermore, adding fluoride to Appendix VIII has associated potential analytical costs which would be unwarranted. Therefore, even though the Agency is regulating fluoride in K088, it is not adding it to Appendix VIII at this time.

3. Comments Received on Data

Several comments were received regarding EPA's use of data on K088. One comment in particular suggested that EPA ignored relevant data gathered by the Aluminum Association. The Agency did not ignore these data. They were submitted after the proposal and are currently in the docket for this final rule. The Agency has reviewed these data and found that they do not support any changes to the proposed treatment standards that are being finalized in this rule. This issue is discussed in greater detail in the Response to Comments background document.

4. Comments Received on Technical Basis for BDAT

There were a number of comments submitted on the technical basis for the numerical treatment standards. As described in the preamble to the proposed rule, most of the treatment standards are taken from the universal treatment standards (UTS) (59 FR 47988, September 19, 1994) which were developed for each constituent by evaluating all existing Agency data from various technologies. The exception to the UTS for K088 constituents is the fluoride treatment standard, which was taken from the Reynolds delisting petition. While K088 is a unique waste, available data indicate that these UTS levels can be routinely achieved.

There seemed to be some confusion in that some commenters believed that EPA was proposing a required technology for the treatment of K088. This is not the case. The longstanding position of the Agency is when numerical treatment levels are established under the LDR program, any treatment technology (other than impermissible dilution) can be used to achieve those levels.

Additional K088 comments along with EPA's responses are provided in the Response to Comments Background Document located in the docket for this rule.

VI. Improvements to the Existing Land Disposal Restrictions Program

A. Completion of Universal Treatment Standards

1. Addition of Constituents to Table 268.48

As discussed in the section on carbamate wastes, EPA is today adding 42 new constituents to the table of universal treatment standards (Table 268.48), for which treatment standards are being promulgated today.

2. Wastewater Standard for 1,4-Dioxane

EPA proposed on March 2, 1995 (60 FR 11702), to establish a wastewater treatment standard for 1,4-dioxane. 1,4-Dioxane was the only UTS constituent for which EPA had promulgated a nonwastewater treatment standard but not a wastewater standard. At that time, the Agency proposed a wastewater UTS for 1,4-dioxane of 0.22 mg/l. This proposed standard was based on the maximum daily limit for 1,4-dioxane that had been developed as part of the proposed effluent guidelines for the pharmaceutical industry (60 FR 21592, May 2, 1995). This standard was based on a transfer of distillation performance data from methanol to 1,4-dioxane.

Today, the Agency is promulgating a revised treatment standard for wastewater forms of 1,4-dioxane based on 5 data points. This data was submitted by one of the commenters and represents actual treatment of wastewaters containing 1,4-dioxane. The Agency prefers to use actual treatment data in lieu of a data transfer whenever possible. These data show that wastewaters containing between 2265–7365 mg/l of 1,4-dioxane can be treated by distillation to levels between 3–7 mg/l, representing a 99.9% removal rate for the dioxane. As a result of this data submittal, the Agency is today promulgating a UTS of 12.0 mg/l for 1,4-

dioxane wastewaters based on the performance of distillation. The standard was calculated following the standard methodology employed by EPA in developing all BDAT treatment standards.

Comments received on the wastewater treatment standard for 1,4-dioxane focused on three major points: (1) The unavailability, at the time of proposal, of data from the effluent guidelines proposed rule for the pharmaceutical industry, from which the proposed standard had been derived; (2) the inappropriateness of transferring distillation data from methanol to 1,4-dioxane (based on the effluent guidelines data); and (3) analytical difficulties inherent in analyzing for 1,4 dioxane in wastewater.

In the proposed rule, EPA referenced effluent guidelines data that would be made available to support the proposed wastewater treatment standard for 1,4-dioxane (60 FR 11727, footnote 13). Although the Agency believed that these data would be available for public inspection shortly after signature of the proposed rule, this was not the case. The data were available one day following the close of the comment period on the Phase III proposed rule. As a result, many comments were received that criticized the Agency for not providing appropriate pubic review of data that was used to develop a treatment standard.

In light of the delayed release of the effluent guidelines data, the Agency decided to accept comments on these data and the proposed 1,4-dioxane treatment standard for 30 additional days. In addition, the Agency provided notice of this extension to all commenters of the proposed rule. Several comments were received in response to this memo. Most of the commenters who had raised issue with the proposed standard commented on the EPA memo.

In response to the second concern raised by commenters, the Agency has received actual wastewater treatment data on 1,4-dioxane and as such has developed a UTS based on that data. As stated earlier, the Agency prefers to use actual constituency data from available treatment technology in lieu of transferred data from other constituents whenever feasible.

Finally, several commenters raised concerns regarding the analytical difficulties of reliably detecting and quantifying 1,4-dioxane in wastewater. CMA, in particular, stated that any UTS under 20 mg/l for 1,4-dioxane would be impractical. Other commenters noted extreme variability and difficulty in testing for the presence of 1,4-dioxane in wastewaters. While the analytical results provided by one of the commenters did show some irregularities, a comprehensive analytical protocol was not provided by the any of the comments which would be needed to fully assess their concerns regarding 1,4-dioxane. As such, the Agency believes that there should be no difficulty in analyzing for 1,4-dioxane in wastewater. Analysis can be accomplished by either direct injection into a GCFID (SW 846, Method 8015B) or a more sensitive analysis involving the injection of an azeotropic distillate preparation into a GCFID (SW–846, Method 5031).

3. Revision to the Acetonitrile Standard

EPA proposed to raise the UTS for the nonwastewater form of acetonitrile from 1.8 mg/kg to 38 mg/kg. Commenters generally supported this revision for the reasons given in the proposed rule. Therefore the Agency is promulgating this revised treatment standard in this rule for the reasons stated at 60 FR 11729.

Related to this, EPA also proposed revoking the special wastewater/nonwastewater definition for acrylonitrile wastes (K011/13/14), recognizing that these nonwastewaters could consist of over 90% water, and that wastewater treatment is an appropriate means of treating these wastes. Commenters agreed with this, and the Agency is finalizing this today.

B. Aggressive Biological Treatment as BDAT for Petroleum Refinery Wastes

EPA had solicited comment on whether to specify aggressive biological treatment (ABT) as the treatment standard for decharacterized petroleum refining wastewaters. The Agency is not establishing such a treatment standard in this final rule, but is instead promulgating a reduction in the frequency of monitoring required for those facilities using ABT to treat their wastes. The reasons for this are discussed below.

This issue was raised by the American Petroleum Institute (API), which had submitted data to the Agency on ten of its facilities that used aggressive biological treatment. Along with the data, API requested that EPA specify aggressive biological treatment as the treatment standard for their wastes. Such a standard, which would operate in lieu of UTS, would, in API's view, provide adequate treatment and could reduce their monitoring burden. In a similar vein, CMA commented that EPA should specify an optional treatment method (biological treatment) as an alternative to meeting UTS for underlying hazardous constituents reasonably expected to be present in characteristic wastes.

The Environmental Technology Council (ETC) opposed setting ABT as a new technology-specific treatment standard. They argued that biological treatment only partially destroys underlying hazardous constituents. They also felt that reducing the monitoring burden is inadequate justification for creating a new technology-specific standard.

As discussed in the preamble to the proposed rule (60 FR at 11719), biotreatment systems vary in performance both in general and as to specific constituents; the Agency is therefore reluctant to designate ABT as BDAT based on data from only ten facilities. The main reason given by both API and CMA for having a treatment method as the treatment standard was the elimination of the compliance monitoring burden. Although we agree with ETC that reducing monitoring burden is not an adequate justification for creating a new technology-specific treatment standard, EPA is certainly willing to consider more efficient means of ensuring compliance with LDR requirements.

Therefore, EPA is not designating ABT as BDAT, but is, however, requiring that decharacterized wastes affected by today's rule, which are managed in a wastewater treatment system involving ABT, must be monitored annually to ensure compliance with the treatment standards for underlying hazardous constituents. Other decharacterized wastes affected by today's rule must be monitored quarterly. EPA has been reviewing the paperwork burden posed by the LDR program; this was discussed in the supplemental notice to the LDR Phase IV proposed rule (61 FR 2338, January 25, 1996). As part of this paperwork burden reduction effort, the Agency is considering reducing the monitoring burden for all facilities complying with LDRs. The Agency considers reducing the monitoring burden for facilities treating wastewater with ABT to be a positive step towards this goal, and therefore believes it is justified. Reductions of this type for other types of treatment will be explored in future rulemakings.

C. Dilution Prohibition

Under the existing LDR dilution prohibition (40 CFR 268.3), burning inorganic metal-bearing hazardous wastes can be a form of impermissible dilution. On May 27, 1994, the Assistant Administrator for the Office of Solid Waste and Emergency Response issued

a Statement of Policy which clarified this point (59 FR 27546–27547). Today the Agency is codifying and quantifying these principles.

As discussed in the proposed rule, impermissible dilution may occur when wastes not amenable to treatment by a certain method (i.e., treated very ineffectively by that treatment method) are nevertheless 'treated' by that method (55 FR 22666, June 1, 1990; 52 FR at 25778–25779, July 8, 1987). Today's rule provides a general distinction between ''adequate treatment'' and potential violations of the dilution prohibition.

1. Inorganic Metal-Bearing Wastes

The Agency has evaluated the hazardous wastes and has determined that 43 of the RCRA listed wastes (as set forth in 40 CFR part 261) typically appear to be inorganic hazardous wastes that do not contain organics, or contain only insignificant amounts of organics, and are not regulated for organics. BDAT for these inorganic, metal-bearing listed wastes is metal recovery or stabilization. Thus, impermissible dilution may result when these wastes are combusted. When an inorganic metal-bearing hazardous waste with insignificant concentrations of organics is placed in a combustion unit, legitimate treatment for purposes of LDR ordinarily is not occurring. No treatment of the inorganic component occurs during combustion, and therefore, metals are not destroyed, removed, or immobilized. Since there are no significant concentrations of organic compounds in inorganic metal-bearing hazardous wastes, it cannot be maintained that the waste is being properly or effectively treated via combustion (i.e., thermally treated or otherwise destroyed, removed, or immobilized). For this reason, combustion of inorganic wastes is not a ''metho[d] of treatment * * * which substantially diminish[es] the toxicity of the waste or substantially reduce[s] the likelihood of migration of hazardous constituents from the waste * * *'' (RCRA § 3004(m)) and so is not a permissible method of treatment under that provision.

In terms of the dilution prohibition, if combustion is allowed as a method to achieve a treatment standard for these wastes, metals in these wastes will be dispersed to the ambient air and will be diluted by being mixed in with combustion ash from other waste streams. Adequate treatment (stabilization or metal recovery to meet LDR treatment standards) has not been performed and dilution has occurred. It is also inappropriate to regard eventual stabilizing of such combustion ash as providing adequate treatment for purposes of the LDRs. Simply meeting the numerical BDAT standards for the ash fails to account for metals in the original waste stream that were emitted to the air and for reductions achieved by dilution with other materials in the ash. (In most cases, of course, the metal-bearing wastes will have been mixed with other wastes before combustion, which mixing itself could be viewed as impermissible dilution).

These inorganic, metal-bearing hazardous wastes should be—and are usually—treated by metal recovery or stabilization technologies. These technologies remove hazardous constituents through recovery in products, or through immobilization, and are therefore permissible BDAT treatment methods.

There are eight characteristic metal wastes; however, only wastes that exhibit the TC as measured by both the TCLP and the EP for D004–D011 are presently prohibited (see 55 FR 22660–22662, June 1, 1990). EPA recently proposed prohibition and treatment standards for wastes identified as hazardous solely because they exhibit the TC (60 FR at 43682, August, 22, 1995). Characteristic wastes, of course, cannot be generically characterized as easily as listed wastes because they can be generated from many different types of processes. For example, although some characteristic metal wastes do not contain organics or cyanide or contain only insignificant amounts, others may have organics or cyanide present which justify combustion, such as a used oil exhibiting the TC characteristic for a metal. Thus, it is difficult to say which D004–D011 wastes would be impermissibly diluted when combusted, beyond stating that as a general matter, impermissible dilution would occur if the D004–D011 waste does not have significant organic or cyanide content but is nevertheless combusted.

An ''inorganic metal-bearing waste'' is one for which EPA has established treatment standards for metal hazardous constituents, and which does not otherwise contain significant organic or cyanide content. The table being promulgated in 40 CFR part 268, Appendix XI is the list of waste codes for which EPA regulates only metals that are affected by this rule.

2. Inorganic Metal-Bearing Wastes Not Prohibited Under the LDR Dilution Prohibition

Combustion of the following inorganic metal-bearing wastes is not prohibited under the LDR dilution prohibition: (1) wastes that, at the point of generation, or after any bona fide treatment such as cyanide destruction prior to combustion, contain hazardous organic constituents or cyanide at levels exceeding the constituent-specific treatment standard for UTS; (2) organic, debris-like materials (e.g., wood, paper, plastic, or cloth) contaminated with an inorganic metal-bearing hazardous waste; (3) wastes that, at point of generation, have reasonable heating value such as greater than or equal to 5000 Btu/lb (see 48 FR 11157, March 16, 1983); (4) wastes co-generated with wastes that specify combustion as a required method of treatment; (5) wastes, including soil, subject to Federal and/or State requirements necessitating reduction of organics (including biological agents); and (6) wastes with greater than 1% Total Organic Carbon (TOC).

Several commenters want EPA to add additional criteria. One commenter recommended adding a seventh criterion, i.e., combustion that results in a significant reduction in volume. Several commenters recommended adding a seventh criterion to allow combustion of lab packs. The Agency is not persuaded that a seventh criterion is necessary. It has determined that volume reduction is not a sufficient reason to allow the combustion of inorganic metal-bearing wastes because metals are neither destroyed nor immobilized, and it is possible that a significant amount of metal is being transferred to another media. As for lab packs, in the Phase II final rule (59 FR 47982, September 19, 1994), the Agency specifically addressed lab pack issues when it revised 268 Appendix IV to specify those wastes that are prohibited from inclusion in lab packs destined for combustion. Today's dilution prohibition does not supersede the streamlined treatment standards promulgated in the Phase II final rule. Therefore, metal-bearing inorganic wastes may be included in a lab pack unless it is prohibited under the list of wastes in 268 Appendix IV.

3. Cyanide-Bearing Wastes

A commenter questioned why EPA allows the presence of cyanide to justify combustion when there are adequate alternative treatment methods for that waste constituent. This approach was adopted because cyanide is destroyed—i.e., effectively treated and not diluted—by combustion. Existing LDR rules, in many cases, identify combustion as an appropriate BDAT for destruction of cyanide-bearing wastes. See, e.g., treatment standards for F009, F010, and F011. The LDR Phase III proposal solicited comments on whether the

cyanide criterion should be dropped. Several commenters strongly supported the continued use of combustion as a treatment method for cyanide-bearing wastes, stating that combustion is the most efficient and effective method for treating cyanide wastes. One commenter, ETC, supported dropping the cyanide criterion because of the existence of alternative non-combustion technologies to treat inorganic cyanide-bearing wastes without dispersing metals. The Agency disagrees; combustion, when properly conducted, can effectively destroy all the cyanide in a waste. In the Agency's view, this indicates that cyanide wastes which are treated by combustion are not being diluted impermissibly. This issue of whether metals are being dispersed would be addressed through substantive controls on the combustion unit.

4. Table of Inorganic Metal Bearing Wastes

The table being promulgated in 40 CFR part 268, Appendix XI today indicates the list of waste codes for which EPA regulates only metals and/or cyanides that would be affected by this proposed rule. Except for P122, this list is identical to the list originally published in the aforementioned Policy Statement on this subject. The Agency is removing P122 (Zinc Phosphide greater than 10%) from the list of restricted inorganic metal-bearing wastes, because the Agency has previously promulgated a treatment standard of INCIN for the nonwastewater forms of this waste. See 40 CFR 268.40. The policy memo was in error on this point. EPA wishes to clarify that this dilution prohibition is limited to the 51 waste codes in this table. In addition, if an Appendix IX waste meets any of the six criteria discussed above, it would be permissible to combust the waste despite the fact that it is an Appendix IX waste.

D. Expansion of Treatment Options That Will Meet the LDR Treatment Standard ''CMBST''

EPA is modifying the treatment standard expressed as INCIN, which specifies hazardous waste incineration, to CMBST, which allows combustion in incinerators, boilers and industrial furnaces. EPA also solicited comment on whether the Catalytic Extraction Process, for which Molten Metal Technology received a determination of equivalent treatment under § 268.42(b), should also be allowed for all wastes which have a treatment standard of CMBST, and whether there are other technologies which are equivalent to CMBST. Commenters supported the inclusion of the Catalytic Extraction Process (CEP), and since the Agency has determined that (properly operated) it performs in a manner equivalent to other combustion technologies, is adding it to the CMBST standard. Molten Metal Technology commented that the CEP is not in fact a combustion technology, and the Agency has attempted to reflect this in the definition. One commenter, Exide Corporation, requested that their plasma arc process for the recovery of lead also be added to the definition of CMBST. The Exide plasma arc process is in fact an industrial furnace under § 260.10, and is therefore already considered part of the definition of CMBST.

EPA also notes that the new CMBST standard requires that wastes be thermally treated in units that either are subject to subtitle C standards, or, in cases where non-hazardous but prohibited wastes are being thermally treated, in accordance with applicable technical operating requirements. This situation could arise, for example, if a decharacterized waste were then being thermally treated. Such a waste need not be managed in a hazardous waste combustion unit. The regulatory language makes clear that non-hazardous waste combustion units can be utilized. In fact, the predecessor to the CMBST standard—INCIN—allowed nonhazardous incinerators to be an eligible type of unit because the INCIN standard allowed burning in units subject to applicable emissions standards, which standards did not necessarily have to include subtitle C standards (59 FR 48002, Sept. 19, 1994, and 60 FR 242, June 3, 1995). This language was omitted inadvertently from the CMBST standard, and is being restored in today's rule.

E. Clean Up of 40 CFR Part 268

EPA is finalizing changes to the LDR program to achieve the goal of simplified regulations.

1. Section 268.8

Because treatment standards for all scheduled wastes were promulgated in the Third Third rule in 1990, the § 268.8 ''soft hammer'' requirements are no longer necessary. Therefore, § 268.8 is removed from part 268.

2. Sections 268.10–268.12

The purpose of Subpart B of 268 was to set out a schedule for hazardous wastes by the date when treatment standards were to be established. Deadlines in all three of these sections were met on time, and the wastes are subject to treatment standards. Therefore, these three sections are no longer necessary, and are removed.

3. Section 268.2(f)

With the promulgation of UTS in the LDR Phase II final rule (59 FR 47982, September 19, 1994), distinctions in the definitions of wastewaters are unnecessary. The Agency is therefore removing paragraphs (1)–(3) from § 268.2(f).

4. Corrections to Proposed Rule Language

A number of commenters pointed out properly that EPA had proposed an amendment to § 268.9 of the rules which would have the effect of subjecting all listed wastes which also exhibit a characteristic of hazardous waste to evaluate whether the waste contains underlying hazardous constituents not covered by the treatment standard for the listed waste, and if so, to treat for them. See 60 FR at 11741. EPA agrees with the commenters that this provision is unnecessary and is not adopting it. (In fact, the Agency did not intend any far-reaching change in proposing the revised language.) The provision is unnecessary because EPA already evaluated which hazardous constituents are present in listed wastes at the time of developing the treatment standards (any of the Background Documents supporting the treatment standards indicates the sampling done, and that the sampling encompassed the whole range of hazardous constituents potentially present). There is no need to duplicate this effort. Consequently, the Agency is not amending § 268.9(b).

Other commenters pointed out that the proposed changes to the de minimis exemption in § 268.1(e)(4)(i) (see 60 FR 11740) inadvertently omitted the language which states that de minimis losses are not prohibited. That language has been put back into the final rule language.

VII. Capacity Determinations

A. Introduction

This section summarizes the results of the capacity analysis for the wastes covered by this rule. For background information on data sources, methodology, and a summary of each analysis, see the Background Document for Capacity Analysis for Land Disposal Restrictions, Phase III—Decharacterized Wastewaters, Carbamate Wastes, and Spent Potliners, found in the docket for today's rule. For EPA's responses to capacity-related comments, see the Response to Capacity-Related Comments Received on the Phase III

Land Disposal Restrictions Rulemaking, also found in the docket for today's rule.

In general, EPA's capacity analysis methodologies focus on the amount of waste to be restricted from land disposal that is currently managed in land-based units and that will require alternative treatment as a result of the LDRs. The quantity of wastes that are not managed in land-based units (e.g., wastewaters managed only in RCRA exempt tanks, with direct discharge to a POTW) is not included in the quantities requiring alternative treatment as a result of the LDRs. Also, wastes that do not require alternative treatment (e.g., those that are currently treated using an appropriate treatment technology) are not included in these quantity estimates.

EPA's decisions on whether to grant a national capacity variance are based on the availability of alternative treatment or recovery technologies. Consequently, the methodology focuses on deriving estimates of the quantities of waste that will require either commercial treatment or the construction of new on-site treatment systems as a result of the LDRs—quantities of waste that will be treated adequately either on site in existing systems or off site by facilities owned by the same company as the generator (i.e., captive facilities) are omitted from the required capacity estimates.

B. Capacity Analysis Results Summary

For the decharacterized ICR and TC wastes managed in CWA, CWA-equivalent, and Class I injection well systems, EPA estimates that between 85 and 500 million tons per year (estimated at end-of-pipe) will be affected as a result of today's rule. EPA believes that many affected facilities need time to build treatment capacity for these wastes, as wastewater volumes generally make off-site treatment impractical. Thus, EPA has determined that sufficient alternative treatment capacity is not available, and today is granting a two-year national capacity variance for decharacterized wastewaters.

Commenters to the rule generally supported EPA's decision to grant a national capacity variance for decharacterized wastes managed in CWA, CWA-equivalent, and Class I injection well systems. Numerous other comments were received on issues such as those associated with the definition of point of generation for ICR and TC wastewaters and the applicability of today's rule to wastewater management units other than surface impoundments, such as stormwater impoundments, sumps, sewers, and trenches. The Response to Capacity-Related Comments Received on the Phase III Land Disposal Restrictions Rulemaking background document provides a detailed discussion of the capacity-related comments on decharacterized wastewaters and EPA's response to them.

To assess the quantity of D003 wastes that could be affected by the rule other than those wastes managed in CWA and CWA-equivalent systems, EPA extracted information from the 1993 Biennial Reporting System (BRS) on the generation and management of D003 wastes. According to the BRS, approximately 2.2 million tons of D003 wastewaters are currently deepwell injected, 650 tons of D003 nonwastewaters are managed through land application, and 17,600 tons of D003 nonwastewaters are managed in ''other'' disposal units (not specified in the BRS). These wastes may require additional treatment in order to meet the LDRs. In addition, some D003 waste that may be affected by the rule may not be reported in the BRS, because these wastes may not be considered hazardous by the generator once they have been decharacterized. Although EPA believes that in general there is adequate treatment capacity for these wastes, such capacity may not be immediately available. Therefore, EPA is granting a 90-day capacity variance for D003 wastes that are impacted by the rule and are not managed in CWA and CWA-equivalent systems in order to allow facilities time to determine whether their wastes are affected by this rule, and identify and locate alternative treatment capacity if necessary.

EPA estimates that approximately 105,000—130,000 tons of newly listed wastes included in today's rule will require alternative treatment. In particular, approximately 4,500 tons of carbamate wastes (K156–K161, P127, P128, P185, P188–P192, P194, P196–P199, P201–P205, U271, U277–U280, U364–U367, U372, U373, U375–U379, U381–U387, U389–U396, U400–U404, U407, U409–U411) will require alternative treatment. In addition, 100,000—125,000 tons (not including contaminated media) of spent aluminum potliners (K088) will require alternative treatment capacity.

EPA received a number of comments on its capacity analysis for K088 wastes. Most commenters disagreed with EPA's proposal not to grant a capacity variance for K088 wastes. Specifically, these commenters believe that EPA overestimated the quantity of available capacity and underestimated the quantity of required capacity. In performing the capacity analysis for the final rule, EPA considered all of the issues raised by the commenters and reexamined its estimates of both available and required capacity. EPA found that adequate treatment capacity does exist for K088 wastes, although the amount of treatment capacity appears to be just adequate to accommodate demand. However, some of the facilities capable of treating these wastes may require pretreatment such as grinding or crushing prior to accepting the waste. In order to allow facilities generating K088 adequate time to work out logistics such as transportation, pretreatment capacity, and contracting for treatment capacity, EPA has decided to grant a nine-month national capacity variance for these wastes—the time at which EPA estimates existing treatment capacity will be available as a practical matter. A detailed discussion of the final capacity analysis is provided in the Background Document for Capacity Analysis for Land Disposal Restrictions, Phase III—Decharacterized Wastewaters, Carbamate Wastes, and Spent Potliners and EPA's responses to the individual comments on the K088 capacity analysis are provided in the Response to Capacity-Related Comments Received on the Phase III Land Disposal Restrictions Rulemaking, both of which are in the docket for today's rule.

EPA has determined that there is adequate alternative treatment capacity available for the 4,500 tons of carbamate wastes generated each year and is therefore not granting a national capacity variance for these wastes.

The quantities of radioactive wastes mixed with wastes included in today's rule are generated primarily by the U.S. Department of Energy (DOE). EPA estimates that 820 tons of high-level waste and 360 tons of mixed low-level waste that may be affected by this proposal will be generated annually by DOE. In addition, there are currently 7,000 tons of high-level waste, 10 tons of mixed transuranic waste, and 2,700 tons of mixed low-level waste in storage that may be affected by this rule. DOE currently faces treatment capacity shortfalls for high-level wastes and mixed transuranic wastes. Although DOE does have some available treatment capacity for mixed low-level wastes, most of this capacity is limited to treatment of wastewaters with less than one percent total suspended solids and is not readily adaptable for other waste forms. DOE has indicated that it will generally give treatment priority to mixed wastes that are already restricted under previous LDR rules. Therefore, EPA is granting a two-year national capacity variance to radioactive wastes mixed with the hazardous wastes affected by today's rule. Commenters to the proposed rule supported EPA's

decision to grant a national capacity variance for these wastes.

Table 1 lists each RCRA hazardous waste code for which EPA is today promulgating LDR standards. For each code, this table indicates whether EPA is granting a national capacity variance for land-disposed wastes. Also, EPA is granting a three-month national capacity variance for all wastes in this rule to handle logistical problems associated with complying with the new standards.

TABLE 1.—VARIANCES FOR NEWLY LISTED AND IDENTIFIED WASTES

Waste description[1]	Surface-disposed wastes	Deepwell-injected wastes
Ignitable and corrosive wastes managed in CWA or CWA-equivalent systems, or SDWA (D001 and D002)	2 Years	2 Years.
Reactive wastes managed in CWA or CWA-equivalent systems, or SDWA (D003)	2 Years	2 Years.
Reactive wastes not managed in CWA or CWA-equivalent systems, or SDWA (D003)	3 Months	3 Months.
Newly identified pesticide wastes managed in CWA or CWA-equivalent systems, or SDWA (D012–D017)	2 Years	2 Years.
Newly identified TC organic wastewaters managed in CWA or CWA-equivalent systems, or SDWA (D018–D043)	2 Years	2 Years.
Spent aluminum potliners (K088)	9 Months	3 Months.
Carbamate production wastes (K156–K161, P127, P128, P185, P188–P192, P194, P196–P199, P201–P205, U271, U277–U280, U364–U367, U372, U373, U375–U379, U381–U387, U389–U396, U400–U404, U407, U409–U411) mixed radioactive wastes[2].	3 Months	3 Months.

[1] Includes soil and debris contaminated with each waste.

[2] The variance determinations listed apply only to radioactive wastes mixed with decharacterized D001–D003 or newly identified D012–D017 wastes managed in CWA and CWA-equivalent systems; to radioactive wastes mixed with newly identified TC organic wastewaters; and to radioactive wastes mixed with spent aluminum potliners, or carbamate production wastes.

VIII. State Authority

A. Applicability of Rules in Authorized States

Under section 3006 of RCRA, EPA may authorize qualified States to administer and enforce the RCRA program within the State. Following authorization, EPA retains enforcement authority under sections 3008, 3013, and 7003 of RCRA, although authorized States have primary enforcement responsibility. The standards and requirements for authorization are found in 40 CFR Part 271.

Prior to HSWA, a State with final authorization administered its hazardous waste program in lieu of EPA administering the Federal program in that State. The Federal requirements no longer applied in the authorized State, and EPA could not issue permits for any facilities that the State was authorized to permit. When new, more stringent Federal requirements were promulgated or enacted, the State was obliged to enact equivalent authority within specified time frames. New Federal requirements did not take effect in an authorized State until the State adopted the requirements as State law.

In contrast, under RCRA section 3006(g) (42 U.S.C. 6926(g)), new requirements and prohibitions imposed by HSWA take effect in authorized States at the same time that they take effect in unauthorized States. EPA is directed to carry out these requirements and prohibitions in authorized States, including the issuance of permits, until the State is granted authorization to do so.

Today's rule is being promulgated pursuant to sections 3004(d) through (k), and 3004(m), of RCRA (42 U.S.C. 6924(d) through (k), and 6924(m)). Therefore, the Agency is adding today's rule to Table 1 in 40 CFR 271.1(j), which identifies the Federal program requirements that are promulgated pursuant to HSWA. States may apply for final authorization for the HSWA provisions in Table 1, as discussed in the following section of this preamble. Table 2 in 40 CFR 271.1(j) is also modified to indicate that this rule is a self-implementing provision of HSWA.

B. Abbreviated Authorization Procedures for Specified Portions of Today's Rule

On August 22, 1995, EPA proposed in the Phase IV LDR notice an abbreviated authorization procedure that would also be used for certain parts of the Phase III LDR rule that are minor in nature (EPA also proposed to use this procedure for the Universal Treatment Standards (UTS) in the Phase II rule). This procedure is designed to expedite the authorization process by reducing the scope of a State's submittal, for authorization to a State certification and copies of applicable regulations and statutes. EPA would then conduct a short review of the State's request, primarily consisting of a completeness check (see 60 FR 43686 for a full description of the proposed procedures). The parts of the Phase III rule to which the streamlined authorization procedures would be applicable are: (1) treatment standards for newly listed wastes, (2) improvements to the existing land disposal restrictions program, and (3) revisions and corrections to the treatment standards in §§ 268.40 and 268.48. (Further discussion of this issue also is found in the supplemental proposal to the LDR Phase IV rule (61 FR 2358, 2365, January 25, 1996)).

Although EPA is firmly committed to streamlining the RCRA State authorization procedures, the Agency has decided not to finalize the proposed Category 1 authorization procedures for parts of the Phase III rule today's notice. EPA believes that public comments from both the August 22 proposal and comments submitted for the recent HWIR-contaminated media proposal should be considered before finalizing new procedures for authorization. This full consideration will enable EPA to make the best decision regarding how the authorization process should work. EPA intends to finalize both the Category 1 and Category 2 procedures at the same time.

C. Effect on State Authorization

Because today's Phase III LDR rule is being promulgated under HSWA authority, those sections of today's rule that expand the coverage of the LDR program (e.g., to newly identified wastes) would be implemented by EPA on the effective date of today's rule in authorized States until their programs are modified to adopt these rules and the modification is approved by EPA.

However, some of today's regulatory amendments are neither more or less stringent than the existing Federal requirements. EPA clarified in a December 19, 1994, memorandum (which is in the docket for today's rule) that EPA would not implement the Universal Treatment Standards (promulgated under HSWA authority in the Phase II LDR rule) separately for those States for which the State has received LDR authorization. EPA views any changes from the existing limits to

be neither more or less stringent since the technology basis of the standards has not changed. Accordingly, EPA will not implement the amendments to the UTS in today's LDR Phase III rule for those states with LDR authorization.

Because today's rule is promulgated pursuant to HSWA, a State submitting a program modification may apply to receive interim or final authorization under RCRA section 3006(g)(2) or 3006(b), respectively, on the basis of requirements that are substantially equivalent or equivalent to EPA's. The procedures and schedule for State program modifications for final authorization are described in 40 CFR 271.21. It should be noted that all HSWA interim authorizations will expire January 1, 2003. (See § 271.24 and 57 FR 60132, December 18, 1992.)

Section 271.21(e)(2) requires that States with final authorization must modify their programs to reflect Federal program changes and to subsequently submit the modification to EPA for approval. The deadline by which the State would have to modify its program to adopt these regulations is specified in § 271.21(e). This deadline can be extended in certain cases (see § 271.21(e)(3)). Once EPA approves the modification, the State requirements become Subtitle C RCRA requirements.

States with authorized RCRA programs may already have requirements similar to those in today's rule. These State regulations have not been assessed against the Federal regulations being proposed today to determine whether they meet the tests for authorization. Thus, a State is not authorized to implement these requirements in lieu of EPA until the State program modifications are approved. Of course, states with existing standards could continue to administer and enforce their standards as a matter of State law. In implementing the Federal program, EPA will work with States under agreements to minimize duplication of efforts. In most cases, EPA expects that it will be able to defer to the States in their efforts to implement their programs rather than take separate actions under Federal authority.

States that submit official applications for final authorization less than 12 months after the effective date of these regulations are not required to include standards equivalent to these regulations in their application. However, the State must modify its program by the deadline set forth in § 271.21(e). States that submit official applications for final authorization 12 months after the effective date of these regulations must include standards equivalent to these regulations in their application. The requirements a State must meet when submitting its final authorization application are set forth in 40 CFR 271.3.

IX. Regulatory Requirements

A. Regulatory Impact Analysis Pursuant to Executive Order 12866

Executive Order No. 12866 requires agencies to determine whether a regulatory action is ''significant.'' The Order defines a ''significant'' regulatory action as one that ''is likely to result in a rule that may: (1) have an annual effect on the economy of $100 million or more or adversely affect, in a material way, the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities; (2) create serious inconsistency or otherwise interfere with an action taken or planned by another agency; (3) materially alter the budgetary impact of entitlements, grants, user fees, or loan programs or the rights and obligations of recipients; or (4) raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in the Executive Order.''

The Agency estimated the costs of today's rule to determine if it is a significant regulation as defined by the Executive Order. The analysis considers compliance cost and economic impacts for both characteristic wastes and newly listed wastes affected by this rule. For characteristic wastes, the potential cost impacts of this rule depend on whether facilities' current wastewater treatment systems will meet the UTS levels or if additional treatment will be required. If current treatments are adequate, facilities will only incur administrative costs to have their permits revised as well as on-going monitoring costs. In general, the Agency expects that facilities will seek permit modifications, treatability variances, or certification of adequate POTW treatment because these compliance options can be implemented at much lower cost than the option requiring treatment to UTS levels. EPA estimates the total annualized costs of the rule for these wastes would range from approximately $197,000 to $598,000, of which $154,000 to $425,000 would be incurred at the 28 to 73 potentially affected facilities in the organic chemical industry, and approximately $43,000 to $173,000 would be incurred at the 8 to 30 potentially affected facilities in the petroleum refining industry. However, at the high end, if current wastewater treatment systems need to be augmented with additional treatment steps, the incremental compliance costs for today's rule could be as high as $1 million per affected facility. The Agency does not have adequate data to estimate how many, if any, facilities may require modification to their treatment facilities. The Agency did conduct a sensitivity analysis, considering the costs of the rule under two scenarios: (1) Assuming that 80 percent of the facilities comply with the rule by obtaining permit modifications and 20 percent comply by treating their wastes, and, (2) assuming that 60 percent comply by obtaining permit modifications and 40 percent comply by treating their wastes. Based on the first scenario, the estimated annualized costs of the rule would range from $6.6 million to $18.2 million. Based on the second scenario, the estimated annualized costs would range from $12.9 million to $35.7 million. For newly listed wastes, the costs are substantially higher and will be incurred each year. These costs range from approximately $11.9 million to $47.3 million and are attributable to thermal treatment of aluminum potliner wastes (K088). Therefore, today's rule may be considered an economically significant rule. Because today's rule is significant, the Agency analyzed the costs, economic impacts, and benefits.

This section of the preamble for today's rule provides a discussion of the methodology used for estimating the costs, economic impacts and the benefits attributable to today's rule, followed by a presentation of the cost, economic impact and benefit results. More detailed discussions of the methodology and results may be found in the background document, ''Regulatory Impact Analysis of the Land Disposal Restrictions Final Rule for the LDR Phase III Newly Listed and Identified Wastes,'' which has been placed in the docket for today's rule.

1. Methodology Section

In today's rule, the Agency is establishing treatment standards for the following wastes: end-of-pipe standards for ignitable, corrosive, and reactive (ICR) wastewaters managed in CWA, CWA-equivalent systems, and UIC wells; Toxicity Characteristic pesticide (D012–17) and organic (D018–43) wastewaters managed in CWA, CWA-equivalent systems, and UIC wells; and newly listed wastes from two industries—spent aluminum potliners and carbamates.

a. Methodology for Estimating the Affected Universe. In determining the costs, economic impacts, and benefits associated with today's rule, the Agency

estimated the volumes of waste affected by today's rule. The procedure for estimating the volumes of ICR waste and TC organic and pesticide waste, and newly listed wastes affected by today's rule is summarized below.

First, the Agency examined all industries which might be likely to produce wastes covered under today's standards. Through reviewing comments to the Supplemental Notice of Data Availability published by the Agency in 1993, reviewing runs from the Biennial Reporting System (BRS) of volumes generated from particular industry sectors, as well as discussions with industry, and discussions with the Office of Water at EPA HQ, the Agency narrowed it down to 16 industries which would potentially have significant volumes of wastewater affected by today's rule.

Using a host of databases and/or sources, the Agency collected data on the quantities, constituents, and concentrations of the volumes affected from each of the 16 industries. In addition, the Agency gathered any data on current management practices, plant design, etc. The following sources were used: Toxic Release Inventory (TRI), Section 308 data from the Office of Water, Industrial Studies Database (ISDB), 1991 Biennial Reporting System (BRS), primary summary and development documents data from effluent guidelines, TCRIA documents, data gathered in the capacity analysis performed for today's rule, as well as comments from potentially affected industries.

The Agency obtained volume information for the newly listed wastes—spent aluminum potliners (K088) and carbamate wastes (K156–161)—from the listing documents prepared for these wastes during the listing procedure.

b. Cost Methodology. The cost analysis estimates the national level incremental costs which will be incurred as a result of today's rule. The cost estimates for both the baseline and post-regulatory scenarios are calculated employing: (i) the facility wastestream volume, (ii) the management practice (baseline or post-regulatory) assigned to that wastestream, and (iii) the unit cost associated with that practice. Summing the costs for all facilities produces the total costs for the given waste and scenario. Subtracting the baseline cost from the post-regulatory cost produces the national incremental cost associated with today's rule for the given waste.

The cost methodology section includes three sub-sections: (i) ICR and TC Pesticide and Organic Wastes Managed in CWA and CWA-Equivalent Systems, (ii) Newly Listed Wastes, (iii) Testing and Recordkeeping Costs.

i. ICR and TC Pesticide and Organic Wastes Managed in CWA and CWA-Equivalent Systems. The Agency employed the following approach to estimate the incremental costs for the ICR and TC wastes. First, using information available on the affected industries, the Agency created average-sized model facilities for each industry. Second, for a given model facility in an affected industry, the Agency used available unit cost data to develop costs for the baseline management practices (usually treatment in surface impoundments followed by discharge into receiving waters through a NPDES permit). Third, the Agency used data on the constituents and waste quantities for each industry, where applicable, to determine the necessary treatment required to reduce to UTS levels the constituents present. Fourth, the Agency used unit costs to develop costs for the post-regulatory management practices for the treatment requirements determined in the third step. Fifth, subtracting the baseline from the post-regulatory costs for an average facility in an industry sector and using the data available on the number of facilities affected within each industry, the Agency was able calculate the incremental cost for a given industry. Sixth, summing costs across affected industries, the Agency determined the incremental cost for the rule for the end-of-pipe treatment standards.

ii. Newly Listed Wastes. The costs for treatment of spent aluminum potliners (K088) and carbamate wastes (K156–161) will be determined using data from the listings on baseline management practices, judgment on the technology(s) required to meet the UTS standards for these wastes, and available unit cost data.

iii. Testing and Recordkeeping Costs. Testing and recordkeeping costs, including costs that facilities will incur for ensuring that hazardous constituents in characteristic waste are meeting new treatment standards and costs associated with permit modifications will be based upon an average, one-time testing cost, on-going monitoring costs, and an Information Collection Request, respectively.

c. Economic Impact Methodology. The economic effects of today's rule are defined as the difference between the industrial activity under post-regulatory conditions and the industrial activity in the absence of regulation (i.e., baseline conditions).

The Agency used (1) historic average capital expenditures for each industry, (2) historic average operating expenditures for each industry, (3) historic revenues, and (4) historic average pollution abatement and control expenditures (PACE) to determine the economic impacts. However, the Agency was unable to examine the impacts on a facility-specific basis due to lack of data. Therefore, the impacts are assessed on an industry-specific basis.

d. Benefits Methodology. The approach for estimating benefits associated with today's rule involves three components: (i) estimation of pollutant loadings reductions, (ii) estimation of reductions in exceedances of health-based levels, and, (iii) qualitative description of the potential benefits. The benefits assessment is based upon the waste quantity and concentration data collected for the cost analysis. This incremental assessment focuses upon reductions in toxic concentrations at the point of discharge and does not consider any potential benefits resulting from reductions in air emissions or impacts on impoundment leaks and sludges which may occur as part of treating wastes to comply with the LDRs. It is expected that additional treatment to comply with the LDRs may result in risk reductions from air emissions, leaks, and sludges.

EPA has conducted an assessment of the benefits related to the effects of the rule on newly listed spent aluminum potliners. These benefits depend on the incremental risk reductions that may result from treatment of the wastes. In conducting the risk assessment for spent aluminum potliners, EPA improved upon the fate and transport modeling approach used in the RIA. Specifically, in the RIA, EPA applied generic dilution/attenuation factors (DAFs) (which did not reflect constituent-specific fate and transport processes, site-specific hydrogeological conditions, or waste characterization data) to relate the concentration of contaminants in the leachate to their concentration in a down-gradient well. Instead, EPA used its Composite Model for Leachate Migration and Transformation Products (EPACMTP) to perform constituent-specific fate and transport modeling. A summary of the analysis can be found in the Addendum to the RIA placed in the docket for this rule. EPA data indicate that approximately 120,000 metric tons of spent aluminum potliners are generated annually. EPA has not conducted an assessment of the benefits related to the effects of the rule on newly listed carbamate wastes. Because the Agency expects facilities to comply with LDRs through permit modifications, and because the quantity of waste is very small, benefits for

newly listed carbamate wastes are expected to be minimal.

i. Estimation of Pollutant Loadings Reductions. An incremental approach was used to estimate reductions in pollutant loadings. For the baseline scenario, contaminant concentrations were based upon data or estimates of current effluent discharge concentration levels. For the post-regulatory scenario, concentration levels were assumed to equal UTS levels.

ii. Estimation of Reductions in Exceedances of Health-Based Levels. The methods used for evaluating the benefits associated with cancer and noncancer risk reductions resulting from the rule entail comparing constituent concentration levels to health-based standards to evaluate whether implementation of the rule reduces concentration levels below levels that pose risk to human health.

To estimate benefits from cancer risk reductions resulting from the rule, a simple screening analysis was performed. This analysis compared contaminant concentrations for the baseline and post-regulatory scenario to health-based levels for carcinogens. Further analysis may be undertaken to quantify benefits associated with facility/ wastestream combinations identified in the contaminant concentration comparisons.

Benefits associated with reductions in non-cancer exceedances are estimated based upon comparisons of contaminant concentration levels in effluent discharges of the affected wastestreams to the reference health levels. These benefits are expressed in terms of the number of exceedances of health-based levels under the baseline scenario compared to the number of exceedances under the rule.

iii. Qualitative Description of the Potential Benefits. A qualitative assessment of potential benefits likely to result from the rule is used where data are limited. The Agency acknowledges limited data availability in developing waste volumes affected, constituents, concentrations, cost estimates, economic impacts, and benefits estimates for the LDR Phase III rulemaking. The Agency continues to request comment from industry regarding constituents, concentrations, waste volumes, and current management practices.

2. Results

a. Volume Results. The Agency has estimated the volumes of formerly characteristic wastes potentially affected by today's rule to total in the range of 33.5 to 500 million metric tons. The Agency requests comment on waste volumes affected by the LDR Phase III rule. For newly listed wastes, the analyses supporting the listing determination showed about 4,500 metric tons of carbamate wastes and 118,000 metric tons of spent aluminum potliners are potentially affected by this rule.

b. Cost Results. For characteristic wastes, the potential cost impacts of this rule depend on whether facilities' current wastewater treatment systems will meet the UTS levels or if additional treatment will be required. If current treatments are adequate, facilities will only incur administrative costs to have their permits revised. EPA estimates the total annualized costs of the rule for these wastes would range from approximately $197,000 to $598,000, of which $154,000 to $425,000 would be incurred at the 28 to 73 potentially affected facilities in the organic chemical industry, and approximately $43,000 to $173,000 would be incurred at the 8 to 30 potentially affected facilities in the petroleum refining industry. However, at the high end, if current wastewater treatment systems need to be augmented with additional treatment steps, the incremental compliance costs could be as high as $1 million per affected facility. The Agency does not have adequate data to estimate how many, if any, facilities may require modification to their treatment facilities. The Agency continues to request comment and data on how often additional treatment may be required.

For newly listed wastes, the costs are substantially higher and will be incurred each year. These costs range from approximately $11.9 million to $47.3 million and are attributable to thermal treatment of aluminum potliner wastes (K088). The Agency requests comment on where industry falls within this range.

c. Economic Impact Results. The Agency has estimated the economic impacts of today's rule to represent less than one percent of historic pollution control and operating costs for the organic chemical and petroleum refining industries. However, for those facilities that may need to treat to UTS to comply with today's rule, costs could be more significant. The estimated compliance costs for treating newly listed spent aluminum potliners represents 40 percent of pollution control operating costs for aluminum reducers; however, treatment costs represent only one percent of total historic operating costs.

d. Benefit Estimate Results. The Agency expects facilities to comply with the LDRs through permit modifications. As a result, the Agency has estimated the benefits associated with today's rule to be small. Assuming facilities comply with the rule by treating their affected wastestreams, loadings reductions estimates range between 1,527 to 21,322 metric tons per year at 129 to 291 facilities (direct and indirect dischargers) involving 175 to 647 constituent/wastestream combinations. Ninety-eight percent of the reductions occur at organic chemicals facilities, with the remainder occurring at petroleum refiners. Estimated loadings reductions for direct dischargers range between 36 and 267 tons per year, representing between 0.03 and 0.2 percent of total Toxic Release Inventory (TRI) chemical loadings to surface waters. For indirect dischargers, estimated loadings reductions range between 1,491 and 21,055 metric tons per year, representing between 0.8 and 11.0 percent of total TRI chemical loadings transferred to POTWs. Based upon the results of the screening and more detailed risk assessments, the estimated baseline risks associated with nine to twenty wastestreams (out of the 155 to 404 constituent/wastestream combinations potentially affected by the rule) exceed 10^{-6} under baseline conditions and three to six wastestreams with noncancer risk levels exceeding reference doses. These 12 to 26 wastestreams contain one of five constituents: aniline (9 to 19 wastestreams), acrylamide (0 to 1 wastestream), pyridine (2 waststreams), barium compounds (1 wastestream), and acetonitrile (0 to 2 wastestreams). For these 12 to 26 wastestreams, EPA conducted a more detailed risk assessment, using site-specific data. Results of the more detailed risk assessment indicate that the benefits from the rule are small. EPA identified four wastestreams potentially posing cancer risk exceeding the threshold risk levels. Three wastestreams pose baseline cancer risk ranging from 1×10^{-5} to 1×10^{-4} (due to exposure to aniline) which potentially would be reduced to between 8×10^{-8} and 3×10^{-6} under the LDR Phase III rule. A fourth wastestream containing acrylamide poses baseline cancer risk at a level of 2×10^{-3}. The rule is estimated to reduce this risk to between 2×10^{-4} and 4×10^{-36}. All four of these wastestreams are discharged to POTWs; if POTW treatment removes these constituents from the wastewater prior to discharge to surface water and/or if no drinking water intake is located downstream from the POTW's outfall, baseline risks will be lower. The Agency expects facilities to comply with the LDRs through permit modifications;

however, additional treatment may result in potentially significant risk reduction.

EPA performed constituent-specific fate and transport modeling using its EPACMTP to further assess cancer and noncancer risks of spent aluminum potliners. Using these additional data, EPA assessment of baseline risks indicates that individual lifetime cancer risks increase to about 10^{-6} under central tendency assumptions and 10^{-3} under high-end assumptions. In addition, the new estimates suggest that under high-end assumptions, baseline concentrations in drinking water may be high enough to present noncancer risks; previously, noncancer risks were estimated to be negligible. Consequently, the benefits of regulating spent aluminum potliners are higher than previously estimated. Under central tendency assumptions, individual lifetime cancer risks resulting from current waste management practices are slightly higher than post-regulatory risks (10^{-6} versus less than 10^{-6}); some incremental benefits may therefore be realized as a result of the LDRs. Under high-end assumptions, however, the regulation could reduce cancer risks by one or two order of magnitude, while noncancer risks could be eliminated. Although population risks would also be reduced correspondingly, EPA is unable to specify the magnitude of the exposed population.

B. Regulatory Impact Analysis for Underground Injected Wastes

The Agency has completed a separate regulatory impact analysis for underground injected wastes affected by the LDR Phase III final rule. This analysis describes the regulatory impacts only to the Class I injection well universe. The new Phase III LDRs cover decharacterized ICR and TC organic wastes, and other newly-identified hazardous wastes that are distinctly industrial wastes injected by owners and operators of only Class I hazardous and non-hazardous injection wells.

According to the available data outlined in the RIA, our best estimate indicates that of the 223 Class I injection facilities in the nation, up to 154 facilities will be affected by the new Phase III LDRs. Of these facilities, 100 inject nonhazardous waste and 54 inject hazardous waste. Combined, these facilities inject approximately 18 billion gallons of waste annually into Class I wells. These Class I injection wells will now be required to either treat wastes onsite, segregate and ship affected wastes offsite for treatment and disposal, or file no migration petitions as outlined in the UIC regulations in 40 CFR Part 148 (See 53 FR 28118, July 26, 1988, preamble for a mote thorough discussion of the no migration petition review process). Additional options for compliance with the final Phase III LDRs, including a *de minimis* exemption and a pollution prevention option discussed in detail elsewhere in this rule and in the final UIC RIA.

Of the newly affected Class I facilities, 38 already have no migration exemptions approved by EPA, but they may be required to submit a petition modification to EPA due to the Phase III rule unless their original petition already addressed affected Phase III wastes, including underlying hazardous constituents in decharacterized wastes. In the cases where the petition already covers all hazardous wastes and underlying hazardous constituents in the injected waste stream (i.e., the injectate that was evaluated during the no migration petition process has not changed), no further Agency review of these petitions is necessary. For the facilities which do not have approved no migration exemptions, the rule will add compliance costs to those incurred as a result of previous rulemakings. The Agency analyzed costs and benefits for the final Phase III rule using the same approach and methodology developed in the Regulatory Impact Analysis of the Underground Injection Control Program: Proposed Hazardous Waste Disposal Injection Restriction (53 FR 28118) and subsequent LDR rulemaking. An analysis was performed to assess the economic effect of associated compliance costs for the additional volumes of injected wastes attributable to this rule.

In general, Class I injection facilities affected by the LDR Phase III rule have several options. As previously outlined, some facilities will modify existing no migration petitions already approved by the Agency, others may submit entirely new petitions, and still others may accept the prohibitions and either continue to inject treated wastes or cease injection operations altogether. And some facilities with approved petitions already addressing Phase III wastes will have no or little additional compliance costs. EPA assessed compliance costs for Class I facilities submitting no migration petitions, employing alternative treatment, and/or implementing pollution prevention measures. Although facilities using pollution prevention/waste minimization to comply with the Phase III LDRs will likely lower overall regulatory compliance costs, these situations are site-specific and, therefore, EPA cannot estimate these costs savings at this time.

For Class I facilities opting to use alternative treatment, the Agency derived costs for both treating wastes on-site, and/or shipping wastes and treating them off-site at a commercial facility. However, EPA believes that the segregation and transportation of large volumes of liquid wastes off-site is not very practical or cost-effective. This makes the off-site treatment scenario, at best, a highly conservative analysis and in actuality, a least likely and therefore discountable scenario. EPA expects that all injection facilities will opt for the most cost-effective approach in complying with the Phase III final rule and they will either submit a no migration petition or treat their wastes on-site. EPA also assumes that non-commercial facilities will segregate wastes for treatment on-site, whereas commercial facilities will find it more cost effective to not segregate LDR Phase III wastes. For the final rule, EPA estimates that the total annual compliance cost for petitions and alternative on-site treatment to industry affected by the new LDR Phase III prohibitions will range between $32.91 million to $34.08 million per year. The average annual compliance costs per affected facility employing on-site alternative treatment were $217,500. The range of costs for alternative treatment is the result of applying a sensitivity analysis. Only the incremental treatment costs for the new waste listings are calculated in this RIA. All of these costs will be incurred by Class I injection well owners and operators. The average annual compliance costs per affected facility employing on-site alternative treatment were $217,500. The total annual compliance costs for the 154 potentially affected facilities would therefore be $33.4 million. These figures were derived by applying the probability of certain outcomes occurring, via the decision tree methodology described in the RIA, to the costs associated with those outcomes for each affected facility.

Additionally, as part of the RIA analysis, the costs associated with three differing scenarios also were derived. These scenarios are represented by (1) a minimum case, where all facilities incur only petition costs, (2) a mid-line case, where all facilities incur treatment costs (commercial facilities treat on-site with no waste segregation while non-commercial facilities chose the least cost treatment option), and a maximum case, where all facilities incur both petition and treatment costs. Costs associated with these scenarios range

from $3.67 million per year for all facilities incurring only petition costs to $132.62 million per year for all facilities incurring both petition and treatment costs. Based on past EPA experience, there is little probability that all facilities will arrive at each of these possible outcomes. However, this indicated range provides an extreme lower and upper bound estimate for national compliance costs purposes.

The benefits to human health and the environment in the RIA are generally defined as reduced human health risk resulting from fewer instances of ground water contamination. In general, potential health risks from Class I injection wells are extremely low.

EPA conducted a quantitative assessment of the potential human health risks associated with two well malfunction scenarios. EPA developed a methodology described in the RIA to measure health risks of five Phase III contaminants: benzene, carbon tetrachloride, chloroform, phenol, and toluene. The results of these analyses show that most of the cancer risks calculated are below the 1×10^{-4} to 1×10^{-6} risk range generally used by EPA to regulate exposure to carcinogens. Virtually all of the non-cancer risks are below a hazard index (HI) of 1, which represents a ratio used to compare the relative health risks posed by contaminants. Therefore, these cancer and non-cancer risks calculated are below any levels of regulatory concern. Only two cancer risk estimates in the high end scenarios, those calculated for benzene and carbon tetrachloride, slightly exceeded the risk range to regulate exposure to carcinogens. Only one hazard index calculated for carbon tetrachloride exceeded EPA's level of concern of a ratio greater than 1. However, these results were derived from a scenario where an abandoned borehole (i.e. the ''failure pathway'') was in very close proximity to the injection well, substantial pumping of a drinking water well was occurring, and the local geology was typical of the highly transmissive East Gulf Coast Region. The assumptions used in deriving these results were based on conservative, upper-bound estimates, therefore the cancer and non-cancer risks represent worst-case estimates. Considering the limitations imposed by the failure scenarios, and the documented low probability of Class I failures, the overall risks from failure of Class I injection wells would be below regulatory concern.

There also is a potential qualitative benefit to the no-migration process for Class I nonhazardous wells. It is possible that the process would uncover certain wells that cannot satisfy the no-migration standard and indeed may not be suitable for Class I injection in any case. This proved to be true for Class I hazardous wells. However, notwithstanding this potential benefit, as noted in the early part of this preamble, the Agency does not regard this regulatory effort as deserving of the priority afforded it, due to the litigation-driven schedule and the D.C. Circuit's mandate, and would not be undertaking the effort at this time were it not for that mandate and schedule.

The economic analysis of LDR Phase III compliance costs suggests that publicly traded companies probably will not be significantly affected. The limited data available for privately-held companies suggests, however, that they may face significant costs due to the proportionally larger expenses they may face due to the LDR Phase III rule.

C. Regulatory Flexibility Analysis

Pursuant to the Regulatory Flexibility Act of 1980, 5 U.S.C. 601 et seq., when an agency publishes a notice of rulemaking, for a rule that will have a significant effect on a substantial number of small entities, the agency must prepare and make available for public comment a regulatory flexibility analysis that considers the effect of the rule on small entities (i.e.: small businesses, small organizations, and small governmental jurisdictions). Under the Agency's Revised Guidelines for Implementing The Regulatory Flexibility Act, dated May 4, 1992, the Agency committed to considering regulatory alternatives in rulemakings when there were any economic impacts estimated on any small entities. (See RCRA sections 3004 (d), (e), and (g)(5), which apply uniformly to all hazardous wastes.) Previous guidance required regulatory alternatives to be examined only when significant economic effects were estimated on a substantial number of small entities.

In assessing the regulatory approach for dealing with small entities in today's rule, for both surface disposal of wastes, the Agency considered two factors. First, data on potentially affected small entities are unavailable. Second, due to the statutory requirements of the RCRA LDR program, no legal avenues exist for the Agency to provide relief from the LDR's for small entities. The only relief available for small entities is the existing small quantity generator provisions and conditionally exempt small quantity generator exemptions found in 40 CFR 262.11–12, and 261.5, respectively. These exemptions basically prescribe 100 kilograms (kg) per calendar month generation of hazardous waste as the limit below which one is exempted from complying with the RCRA standards.

Given these two factors, the Agency was unable to frame a series of small entity options from which to select the lowest cost approach; rather, the Agency was legally bound to regulate the land disposal of the hazardous wastes covered in today's rule without regard to the size of the entity being regulated.

The Agency has, however, included an exemption covering injection facilities where the decharacterized portion of the injectate is minimal in absolute terms, as a percentage of the total injectate, and in hazardous constituent mass loadings. This *de minimis* exemption provides a measure of relief to both small and larger entities satisfying its terms.

D. Paperwork Reduction Act

The information collection requirements in this rule have been submitted for approval to the Office of Management and Budget (OMB) under the Paperwork Reduction Act, 44 U.S.C. 3501 *et seq*. Four Information Collection Request (ICR) documents have been prepared by EPA, as follows. OSWER ICR No. 1442.12 would amend the existing ICR approved under OMB Control No. 2050–0085. The additional information requirements for the Underground Injection Control (UIC) Program were submitted to OMB under ICR No. 0370.14; this will amend the existing UIC approval under OMB Control No. 2040–0042. OSWER ICR No. 1442.12 and UIC ICR No. 0370.14 have not been approved by OMB and the information collection requirements in those ICRs are not enforceable until OMB approves them. EPA will publish a document in the Federal Register when OMB approves the information collection requirements. Until EPA publishes a document displaying the valid OMB control number, persons are not required to respond to collections of information in these two ICRs. Two amendments to National Pollutant Discharge Elimination System (NPDES) ICRs were approved at proposal. These are ICR 0229.10 for the Discharge Monitoring Report, approved under OMB Control No. 2040–0004, and ICR 0226.11 for NPDES Applications, approved under OMB Control No. 2040–0086.

Copies of these ICRs may be obtained from Sandy Farmer, OPPE Regulatory Information Division; U.S. Environmental Protection Agency (2136); 401 M St., S.W.; Washington, D.C. 20460 or by calling (202) 260–2740. Include the ICR numbers in any request. The information requirements for the

OSWER ICR and the UIC ICR are not effective until OMB approves them.

The additional burden associated with the OSWER ICR 1442.12 is as follows. The overall annual burden for the recordkeeping and reporting requirements is 4,202 hours. It is expected that approximately 125 respondents will be affected, therefore, the annual recordkeeping and reporting burden averages 33 hours per respondent. This time is necessary to collect data, submit notifications and certifications to waste treaters and disposers, and to maintain records of this information. The annual cost burden for this rule is approximately $177,045. Of this amount, it is estimated that facilities will incur annual operation and maintainence capital costs of approximately $8,375.

The additional burden associated with the UIC Program, explained in ICR 0370.14, is as follows. The estimated annual reporting burden averages 3845 hours per respondent (i.e., inclusive of incremental reporting burdens associated with all affected Class I facilities and Primacy States). The average incremental annual reporting and recordkeeping burdens are about 4,442 hours per each affected Class I nonhazardous facility and about 2,700 hours per each affected Class I hazardous facility. For efforts associated with implementing the rule amendments, the annual incremental State burden equals about 22 hours for each Class I respondent.

Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; develop, acquire, install, and utilize technology and systems for the purposes of collecting, validating, and verifying information, processing and maintaining information, and disclosing and providing information; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to be able to respond to a collection of information; search data sources; complete and review the collection of information; and transmit or otherwise disclose the information.

An Agency may not conduct or sponsor, and a person is not required to respond to a collection of information unless it displays a currently valid OMB control number.

Send comments on the Agency's need for this information, the accuracy of the provided burden estimates, and any suggested methods for minimizing respondent burden, including through the use of automated collection of techniques to the Director, OPPE Regulatory Information Division; U.S. Environmental Protection Agency (2136); 401 M St., S.W.; Washington, DC 20460; and to the Office of Information and Regulatory Affairs, Office of Management and Budget, 725 17th St., N.W., Washington, D.C. 20503, marked ''Attention: Desk Officer for EPA.'' Include the ICR numbers in any correspondence.

X. Unfunded Mandates Reform Act

Under Section 202 of the Unfunded Mandates Reform Act of 1995, signed into law on March 22, 1995, EPA must prepare a statement to accompany any rule where the estimated costs to State, local, or tribal governments in the aggregate, or to the private sector, will be $100 million or more in any one year. Under Section 205, EPA must select the most cost-effective and least burdensome alternative that achieves the objective of the rule and is consistent with statutory requirements. Section 203 requires EPA to establish a plan for informing and advising any small governments that may be significantly impacted by the rule.

EPA has completed an analysis of the costs and benefits from the LDR Phase III rule and has determined that this rule does not include a Federal mandate that may result in estimated costs of $100 million or more to either State, local or tribal governments in the aggregate. As stated above, the private sector may incur costs exceeding $100 million per year depending upon the option chosen in the final rulemaking. EPA has fulfilled the requirement for analysis under the Unfunded Mandates Reform Act, and results of this analysis have been included in the background document ''Regulatory Impact Analysis of the Final Phase III Land Disposal Restrictions Rule,'' which was placed in the docket for today's rule.

List of Subjects

40 CFR Part 148

Environmental protection, Administrative practice and procedure, Hazardous waste, Reporting and recordkeeping requirements, Water supply.

40 CFR Part 268

Hazardous waste, Reporting and recordkeeping requirements.

40 CFR Part 271

Administrative practice and procedure, Hazardous materials transportation, Hazardous waste, Penalties, Reporting and recordkeeping requirements.

40 CFR Part 403

Reporting and recordkeeping requirements, Waste treatment and disposal, Water pollution control.

Dated: February 16, 1996.

Carol M. Browner,

Administrator.

For the reasons set out in the preamble, title 40, chapter I of the Code of Federal Regulations is amended as follows:

PART 148—HAZARDOUS WASTE INJECTION RESTRICTIONS

1. The authority citation for part 148 continues to read as follows:

Authority: Secs. 3004, Resource Conservation and Recovery Act, 42 U.S.C. 6901 *et seq.*

2. Section 148.1 is amended by revising paragraphs (a), (b) and (d) to read as follows:

§ 148.1 Purpose, scope and applicability.

(a) This part identifies wastes that are restricted from disposal into Class I wells and defines those circumstances under which a waste, otherwise prohibited from injection, may be injected.

(b) The requirements of this part apply to owners or operators of Class I hazardous waste injection wells used to inject hazardous waste; and, owners or operators of Class I injection wells used to inject wastes which once exhibited a prohibited characteristic of hazardous waste identified in 40 CFR part 261, subpart C, at the point of generation, and no longer exhibit the characteristic at the point of injection.

* * * * *

(d) Wastes that are only hazardous because they display a characteristic of ignitability, corrosivity, reactivity, or toxicity that are otherwise prohibited, are not prohibited:

(1) If the wastes are disposed into a nonhazardous waste injection well defined under 40 CFR 144.6(a); and

(2) Do not exhibit any prohibited characteristic of hazardous waste identified in 40 CFR part 261, subpart C, and either:

(i) Do not contain any hazardous constituents identified in 40 CFR 268.48 at levels greater than the 40 CFR 268.48 Universal Treatment Standard levels at the point of generation;

(ii) Are de minimis in volume and hazardous constituent concentration levels, as defined in 40 CFR 268.1(e)(4)(ii). (Recordkeeping requirements for this alternative are found at 40 CFR 268.9(d)(4).); or

(iii)(A) The facility removes an equivalent mass of hazardous

constituents as would be removed by treating the characteristic hazardous wastestream pursuant to the treatment standards in 40 CFR 268.48. This mass reduction can come from:

(*1*) Treating nonhazardous portions of the injectate;

(*2*) Recycling before ultimate injection; or

(*3*) Engaging in pollution prevention practices (such as equipment or technology modifications, substitution of raw materials, and improvements in housekeeping, maintenance, training, or inventory control).

(B) The compliance alternative in paragraph (d)(2)(iii)(A) of this section is demonstrated by comparing the injected baseline (determined by multiplying the volume/day of characteristically hazardous waste generated and injected) times the concentration of hazardous constituents before the treatment/recycling/pollution prevention measure, with the mass allowance obtained by multiplying the volume/day of a hazardous constituent generated and injected times the universal treatment standard for that constituent. The baseline cannot include practices initiated before the year 1990. (Recordkeeping requirements for this alternative are found at 40 CFR 268.9(d)(3).)

3. Section 148.3 is revised to read as follows:

§ 148.3 Dilution prohibited as a substitute for treatment.

(a) The provisions of 40 CFR 268.3 shall apply to owners or operators of Class I wells used to inject a waste which is hazardous at the point of generation whether or not the waste is hazardous at the point of injection.

(b) Owners or operators of Class I nonhazardous waste injection wells which inject waste formerly exhibiting a hazardous characteristic which has been removed by dilution, may address underlying hazardous constituents by treating the hazardous waste, obtaining an exemption pursuant to a petition filed under § 148.20, or complying with the provisions set forth in 40 CFR 268.9.

4. Section 148.4 is revised to read as follows:

§ 148.4 Procedures for case-by-case extensions to an effective date.

The owner or operator of a Class I hazardous or nonhazardous waste injection well may submit an application to the Administrator for an extension of the effective date of any applicable prohibition established under subpart B of this part according to the procedures of 40 CFR 268.5.

5. Section 148.18 is added to subpart B to read as follows:

§ 148.18 Waste specific prohibitions—Newly Identified Wastes.

(a) On July 8, 1996, the wastes specified in 40 CFR 261.32 as EPA Hazardous waste numbers K156–K161, P127, P128, P185, P188–P192, P194, P196–P199, P201–P205, U271, U277–U280, U364–U367, U372, U373, U375–U379, U381–387, U389–U396, U400–U404, U407, and U409–U411 are prohibited from underground injection.

(b) On January 8, 1997, the wastes specified in 40 CFR 261.32 as EPA Hazardous waste number K088 is prohibited from underground injection.

(c) On April 8, 1998, the wastes specified in 40 CFR part 261 as EPA Hazardous waste numbers D018–043, and Mixed TC/Radioactive wastes, are prohibited from underground injection.

(d) On April 8, 1998, the wastes specified in 40 CFR part 261 as EPA Hazardous waste numbers D001–D003 are prohibited from underground injection.

6. Section 148.20 is amended by revising paragraph (a) introductory text to read as follows:

§ 148.20 Petitions to allow injection of a waste prohibited under subpart B.

(a) Any person seeking an exemption from a prohibition under subpart B of this part for the injection of a restricted hazardous waste, including a hazardous waste exhibiting a characteristic and containing underlying hazardous constituents at the point of generation, but no longer exhibiting a characteristic when injected into a Class I injection well or wells, shall submit a petition to the Director demonstrating that, to a reasonable degree of certainty, there will be no migration of hazardous constituents from the injection zone for as long as the waste remains hazardous. This demonstration requires a showing that:

* * * * *

PART 268—LAND DISPOSAL RESTRICTIONS

7. The authority citation for part 268 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6921, and 6924.

Subpart A—General

8. Section 268.1 is amended in paragraph (e)(3) by removing the period at the end of the paragraph and adding ''; or'' in its place, by revising paragraph (e)(4) and by removing paragraph (e)(5) to read as follows:

§ 268.1 Purpose, scope and applicability.

* * * * *

(e) * * *

(4) *De minimis* losses of characteristic wastes to wastewaters are not considered to be prohibited wastes and are defined as:

(i) Losses from normal material handling operations (e.g. spills from the unloading or transfer of materials from bins or other containers, leaks from pipes, valves or other devices used to transfer materials); minor leaks of process equipment, storage tanks or containers; leaks from well-maintained pump packings and seals; sample purgings; and relief device discharges; discharges from safety showers and rinsing and cleaning of personal safety equipment; rinsate from empty containers or from containers that are rendered empty by that rinsing; and laboratory wastes not exceeding one per cent of the total flow of wastewater into the facility's headworks on an annual basis, or with a combined annualized average concentration not exceeding one part per million in the headworks of the facility's wastewater treatment or pretreatment facility; or

(ii) Decharacterized wastes which are injected into Class I nonhazardous wells which wastes combined volume is less than one per cent of the total flow at the wellhead on an annualized basis, is no greater than 10,000 gallons per day, and in which any underlying hazardous constituents in the characteristic wastes are present at the point of generation at levels less than ten times the treatment standards found at § 268.48.

* * * * *

9. Section 268.2 is amended by revising paragraphs (f) and (i), and by adding paragraphs (j), (k), and (l) to read as follows:

§ 268.2 Definitions applicable in this part.

* * * * *

(f) *Wastewaters* are wastes that contain less than 1% by weight total organic carbon (TOC) and less than 1% by weight total suspended solids (TSS).

* * * * *

(i) *Underlying hazardous constituent* means any constituent listed in § 268.48, Table UTS—Universal Treatment Standards, except fluoride, vanadium, and zinc, which can reasonably be expected to be present at the point of generation of the hazardous waste, at a concentration above the constituent-specific UTS treatment standards.

(j) *Inorganic metal-bearing waste* is one for which EPA has established treatment standards for metal hazardous constituents, and which does not otherwise contain significant organic or cyanide content as described in § 268.3(b)(1), and is specifically listed in appendix XI of this part.

(k) *End-of-pipe* refers to the point where effluent is discharged to the environment.

(l) *Stormwater impoundments* are surface impoundments which receive wet weather flow, and only receive process waste during wet weather events.

10. Section 268.3 is revised to read as follows:

§ 268.3 Dilution prohibited as a substitute for treatment.

(a) No generator, transporter, handler, or owner or operator of a treatment, storage, or disposal facility shall in any way dilute a restricted waste or the residual from treatment of a restricted waste as a substitute for adequate treatment to achieve compliance with subpart D of this part, to circumvent the effective date of a prohibition in subpart C of this part, to otherwise avoid a prohibition in subpart C of this part, or to circumvent a land disposal prohibition imposed by RCRA section 3004.

(b) Dilution of wastes that are hazardous only because they exhibit a hazardous characteristic in a treatment system which treats wastes subsequently discharged to a water of the United States pursuant to a permit issued under section 402 of the Clean Water Act (CWA), or which treats wastes for the purposes of pretreatment requirements under section 307 of the CWA, or zero discharge systems with wastewater treatment equivalent to these systems, is not impermissible dilution, so long as the § 268.48 universal treatment standards are met at the point of discharge, or at a prior point of compliance specified under a CWA permit, for all underlying hazardous constituents reasonably expected to be present at the point of generation of the hazardous waste.

(c) Combustion of the hazardous waste codes listed in Appendix XI of this part is prohibited, unless the waste, at the point of generation, or after any bona fide treatment such as cyanide destruction prior to combustion, can be demonstrated to comply with one or more of the following criteria (unless otherwise specifically prohibited from combustion):

(1) the waste contains hazardous organic constituents or cyanide at levels exceeding the constituent-specific treatment standard found in § 268.48;

(2) The waste consists of organic, debris-like materials (e.g., wood, paper, plastic, or cloth) contaminated with an inorganic metal-bearing hazardous waste;

(3) The waste, at point of generation, has reasonable heating value such as greater than or equal to 5000 BTU per pound;

(4) The waste is co-generated with wastes for which combustion is a required method of treatment;

(5) The waste is subject to Federal and/or State requirements necessitating reduction of organics (including biological agents); or

(6) The waste contains greater than 1% Total Organic Carbon (TOC).

11. Section 268.7 is amended by revising the last sentence of paragraph (a) introductory text, paragraphs (a)(1)(ii), (a)(2)(i)(B), (a)(3)(ii), (b)(4)(ii), (b)(5)(iv), by removing ''268.45'';'' at the end of paragraph (a)(1)(iv) and adding ''268.45'; and'' in its place, by removing ''; and,'' at the end of paragraph (a)(1)(v) and adding a period in its place, by removing paragraph (a)(1)(vi), and by adding paragraph (b)(5)(v) to read as follows:

§ 268.7 Waste analysis and recordkeeping.

(a) * * * If the generator determines that his waste exhibits the characteristic of ignitability (D001) (and is not in the High TOC Ignitable Liquids Subcategory or is not treated by CMBST or RORGS of § 268.42, Table 1), and/or the characteristic of corrosivity (D002), and/or reactivity (D003), and/or the characteristic of organic toxicity (D012–D043), and is prohibited under § 268.37, § 268.38, and § 268.39, the generator must determine the underlying hazardous constituents (as defined in § 268.2, in the D001, D002, D003, or D012–D043 wastes.

(1) * * *

(ii) The waste constituents that the treater will monitor, if monitoring will not include all regulated constituents, for wastes F001–F005, F039, D001, D002, D003, and D012–D043. Generators must also include whether the waste is a nonwastewater or wastewater (as defined in § 268.2 (d) and (f), and indicate the subcategory of the waste (such as ''D003 reactive cyanide''), if applicable;

* * * * *

(2) * * *

(i) * * *

(B) The waste constituents that the treater will monitor, if monitoring will not include all regulated constituents, for wastes F001–F005, F039, D001, D002, D003, and D012–D043. Generators must also include whether the waste is a nonwastewater or wastewater (as defined in § 268.2(d) and (f)) and indicate the subcategory of the waste (such as ''D003 reactive cyanide''), if applicable;

* * * * *

(3) * * *

(ii) The waste constituents that the treater will monitor, if monitoring will not include all regulated constituents, for wastes F001–F005, F039, D001, D002, D003, and D012–D043. Generators must also include whether the waste is a nonwastewater or wastewater (as defined in § 268.2(d) and (f)), and indicate the subcategory of the waste (such as ''D003 reactive cyanide''), if applicable;

* * * * *

(b) * * *

(4) * * *

(ii) The waste constituents to be monitored, if monitoring will not include all regulated constituents, for wastes F001–F005, F039, D001, D002, D003, and D012–D043. Generators must also include whether the waste is a nonwastewater or wastewater (as defined in § 268.2(d) and (f), and indicate the subcategory of the waste (such as D003 reactive cyanide), if applicable;

* * * * *

(5) * * *

(iv) For characteristic wastes D001, D002, D003, and D012–D043 that are: subject to the treatment standards in § 268.40 (other than those expressed as a required method of treatment); that are reasonably expected to contain underlying hazardous constituents as defined in § 268.2(i); are treated on-site to remove the hazardous characteristic; and are then sent off-site for treatment of underlying hazardous constituents, the certification must state the following:

I certify under penalty of law that the waste has been treated in accordance with the requirements of 40 CFR 268.40 to remove the hazardous characteristic. This decharacterized waste contains underlying hazardous constituents that require further treatment to meet universal treatment standards. I am aware that there are significant penalties for submitting a false certification, including the possibility of fine and imprisonment.

(v) For characteristic wastes D001, D002, D003 and D012–D043 that contain underlying hazardous constituents as defined in § 268.2(i) that are treated on-site to remove the hazardous characteristic and to treat underlying hazardous constituents to levels in § 268.48 Universal Treatment Standards, the certification must state the following:

I certify under penalty of law that the waste has been treated in accordance with the requirements of 40 CFR 268.40 to remove the hazardous characteristic, and that underlying hazardous constituents, as defined in § 268.2, have been treated on-site to meet the § 268.48 Universal Treatment Standards. I am aware that there are

significant penalties for submitting a false certification, including the possibility of fine and imprisonment.

* * * * *

§ 268.8 [Removed and reserved]

12. Section 268.8 is removed and reserved.

13. Section 268.9 is amended by revising paragraphs (a), (d) introductory text, (d)(1)(i), and (d)(1)(ii), and by adding paragraphs (d)(3), (e), (f), and (g) to read as follows:

§ 268.9 Special rules regarding wastes that exhibit a characteristic.

(a) The initial generator of a solid waste must determine each EPA Hazardous Waste Number (waste code) applicable to the waste in order to determine the applicable treatment standards under subpart D of this part. For purposes of this part 268, the waste will carry the waste code for any applicable listing under 40 CFR part 261, subpart D. In addition, the waste will carry one or more of the waste codes under 40 CFR part 261, subpart C, where the waste exhibits a characteristic, except in the case when the treatment standard for the waste code listed in 40 CFR part 261, subpart D operates in lieu of the standard for the waste code under 40 CFR part 261, subpart C, as specified in paragraph (b) of this section. If the generator determines that his waste displays a hazardous characteristic (and the waste is not a D004—D011 waste, a High TOC D001, or is not treated by CMBST, or RORGS of § 268.42, Table 1), the generator must determine what underlying hazardous constituents (as defined in § 268.2), are reasonably expected to be present above the universal treatment standards found in § 268.48.

* * * * *

(d) Wastes that exhibit a characteristic are also subject to § 268.7 requirements, except that once the waste is no longer hazardous, a one-time notification and certification must be placed in the generators or treaters files and sent to the EPA region or authorized state, except for those facilities discussed in paragraph (f) of this section. The notification and certification that is placed in the generators or treaters files must be updated if the process or operation generating the waste changes and/or if the Subtitle D facility receiving the waste changes. However, the generator or treater need only notify the EPA region or an authorized state on an annual basis if such changes occur. Such notification and certification should be sent to the EPA region or authorized state by the end of the calendar year, but no later than December 31.

(1) * * *

(i) For characteristic wastes other than those managed on site in a wastewater treatment system subject to the Clean Water Act (CWA), zero-dischargers engaged in CWA-equivalent treatment, or Class I nonhazardous injection wells, the name and address of the Subtitle D facility receiving the waste shipment; and

(ii) For all characteristic wastes, a description of the waste as initially generated, including the applicable EPA Hazardous Waste Number(s), treatability group(s), and underlying hazardous constituents.

* * * * *

(3) For characteristic wastes whose ultimate disposal will be into a Class I nonhazardous injection well, and compliance with the treatment standards found in § 268.48 for underlying hazardous constituents is achieved through pollution prevention that meets the criteria set out at 40 CFR 148.1(d), the following information must also be included:

(i) A description of the pollution prevention mechanism and when it was implemented if already complete;

(ii) The mass of each underlying hazardous constituent before pollution prevention;

(iii) The mass of each underlying hazardous constituent that must be removed, adjusted to reflect variations in mass due to normal operating conditions; and

(iv) The mass reduction of each underlying hazardous constituent that is achieved.

(e) For decharacterized wastes managed on-site in a wastewater treatment system subject to the Clean Water Act (CWA) or zero-dischargers engaged in CWA-equivalent treatment, compliance with the treatment standards found at § 268.48 must be monitored quarterly, unless the treatment is aggressive biological treatment, in which case compliance must be monitored annually. Monitoring results must be kept in on-site files for 5 years.

(f) For decharacterized wastes managed on-site in a wastewater treatment system subject to the Clean Water Act (CWA) for which all underlying hazardous constituents (as defined in § 268.2), are addressed by a CWA permit, this compliance must be documented and this documentation must be kept in on-site files.

(g) For characteristic wastes whose ultimate disposal will be into a Class I nonhazardous injection well which qualifies for the *de minimis* exclusion described in § 268.1, information supporting that qualification must be kept in on-site files.

§§ 268.10–268.12 [Removed and Reserved]

14. Sections 268.10 through 268.12 are removed and reserved.

15. Section 268.39 is added to subpart C to read as follows:

§ 268.39 Waste specific prohibitions—End-of-pipe CWA, CWA-equivalent, and Class I nonhazardous injection well treatment standards; spent aluminum potliners; and carbamate wastes.

(a) On July 8, 1996, the wastes specified in 40 CFR 261.32 as EPA Hazardous Waste numbers K156–K161; and in 40 CFR 261.33 as EPA Hazardous Waste numbers P127, P128, P185, P188–P192, P194, P196–P199, P201–P205, U271, U277–U280, U364–U367, U372, U373, U375–U379, U381–U387, U389–U396, U400–U404, U407, and U409–U411 are prohibited from land disposal. In addition, soil and debris contaminated with these wastes are prohibited from land disposal.

(b) On July 8, 1996 the wastes identified in 40 CFR 261.23 as D003 that are managed in systems other than those whose discharge is regulated under the Clean Water Act (CWA), or that inject in Class I deep wells regulated under the Safe Drinking Water Act (SDWA), or that are zero dischargers that engage in CWA-equivalent treatment before ultimate land disposal, are prohibited from land disposal. This prohibition does not apply to unexploded ordnance and other explosive devices which have been the subject of an emergency response (such D003 wastes are prohibited unless they meet the treatment standard of DEACT before land disposal (see § 268.40)).

(c) On July 8, 1996, the wastes specified in 40 CFR 261.32 as EPA Hazardous Waste number K088 are prohibited from land disposal. In addition, soil and debris contaminated with these wastes are prohibited from land disposal.

(d) On April 8, 1998, decharacterized wastes managed in surface impoundments whose discharge is regulated under the Clean Water Act (CWA), or decharacterized wastes managed by zero dischargers in surface impoundments or tanks that engage in CWA-equivalent treatment before ultimate land disposal are prohibited from land disposal. The following are exceptions to this requirement:

(1) Surface impoundments which are permitted under subtitle C of RCRA;

(2) Storm water impoundments as defined in § 268.2;

(3) Surface impoundments which are part of facilities in the pulp, paper, and paperboard industrial category.

(e) On April 8, 1998, Radioactive wastes mixed with K088, K156–K161, P127, P128, P185, P188–P192, P194, P196–P199, P201–P205, U271, U277–U280, U364–U367, U372, U373, U375–U379, U381–U387, U389–U396, U400–U404, and U407, U409–U411 are also prohibited from land disposal. In addition, soil and debris contaminated with these radioactive mixed wastes are prohibited from land disposal.

(f) Between July 8, 1996 and April 8, 1998, the wastes included in paragraphs (a), (b), (c), and (e) of this section may be disposed in a landfill or surface impoundment, only if such unit is in compliance with the requirements specified in § 268.5(h)(2).

(g) The requirements of paragraphs (a), (b), (c), (d), and (e) of this section do not apply if:

(1) The wastes meet the applicable treatment standards specified in Subpart D of this part;

(2) Persons have been granted an exemption from a prohibition pursuant to a petition under § 268.6, with respect to those wastes and units covered by the petition;

(3) The wastes meet the applicable alternate treatment standards established pursuant to a petition granted under § 268.44;

(4) Persons have been granted an extension to the effective date of a prohibition pursuant to § 268.5, with respect to these wastes covered by the extension.

(h) To determine whether a hazardous waste identified in this section exceeds the applicable treatment standards specified in § 268.40, the initial generator must test a sample of the waste extract or the entire waste, depending on whether the treatment standards are expressed as concentrations in the waste extract or the waste, or the generator may use knowledge of the waste. If the waste contains constituents in excess of the applicable Subpart D levels, the waste is prohibited from land disposal, and all requirements of this part 268 are applicable, except as otherwise specified.

16. Section 268.40 is amended by revising paragraph (e) and the table at the end of § 268.40 to read as follows:

§ 268.40 Applicability of treatment standards.

* * * * *

(e) For characteristic wastes (D001–D043) that are subject to treatment standards in the following table ''Treatment Standards for Hazardous Wastes,'' all underlying hazardous constituents (as defined in § 268.2(i)) must meet Universal Treatment Standards, found in § 268.48, ''Table UTS,'' prior to land disposal.

(1) When these wastes are managed in wastewater treatment systems regulated by the Clean Water Act (CWA), compliance with the treatment standards must be achieved no later than ''end-of-pipe'' as defined in § 268.2(k); or

(2) When these wastes are managed in CWA-equivalent treatment systems and tank-based systems that discharge onto the land, compliance with the treatment standards must be achieved no later than the point the wastewater is released to the land (e.g., spray irrigation, discharge to dry river beds, placed into evaporation ponds); or

(3) When these wastes are managed in Class I nonhazardous injection wells, compliance with the treatment standards must be achieved no later than the well head; or

(4) For all other, compliance with the treatment standard must be met prior to land disposal as defined in § 268.2(c).

* * * * *

Treatment Standards for Hazardous Wastes

* * * * *

TREATMENT STANDARDS FOR HAZARDOUS WASTES

(Note: NA means not applicable.)

Waste code	Waste description and treatment/regulatory subcategory[1]	Regulated hazardous constituent		Wastewaters	Nonwastewaters
		Common name	CAS[2] No.	Concentration in mg/l[3]; or technology code[4]	Concentration in mg/kg[5] unless noted as "mg/l TCLP"; or technology code
D001	Ignitable Characteristic Wastes, except for the §261.21(a)(1) High TOC Subcategory.	NA	NA	DEACT and meet §268.48 standards; or RORGS; or CMBST[8]	DEACT and meet §268.48 standards; or RORGS; or CMBST[8]
	High TOC Ignitable Characteristic Liquids Subcategory based on 40 CFR 261.21(a)(1)—Greater than or equal to 10% total organic carbon. (Note: This subcategory consists of nonwastewaters only).	NA	NA	NA	RORGS; or CMBST
D002	Corrosive Characteristic Wastes.	NA	NA	DEACT and meet §268.48 standards[8]	DEACT and meet §268.48 standards[8]
D002, D004, D005, D006, D007, D008, D009, D010, D011.	Radioactive high level wastes generated during the reprocessing of fuel rods. (Note: This subcategory consists of nonwastewaters only).	Corrosivity (pH)	NA	NA	HLVIT
		Arsenic	7440–38–2	NA	HLVIT
		Barium	7440–39–3	NA	HLVIT
		Cadmium	7440–43–9	NA	HLVIT
		Chromium (Total)	7440–47–3	NA	HLVIT
		Lead	7439–92–1	NA	HLVIT
		Mercury	7439–97–6	NA	HLVIT
		Selenium	7782–49–2	NA	HLVIT
		Silver	7440–22–4	NA	HLVIT
D003	Reactive Sulfides Subcategory based on 261.23(a)(5).	NA	NA	DEACT and meet §268.48 standards[8]	DEACT and meet §268.48 standards[8]
	Explosives Subcategory based on 261.23(a) (6), (7) and (8).	NA	NA	DEACT and meet §268.48 standards[8]	DEACT and meet §268.48 standards[8]
	Unexploded ordnance and other explosive devices which have been the subject of an emergency response.	NA	NA	DEACT	DEACT
	Other Reactives Subcategory based on 261.23(a)(1).	NA	NA	DEACT and meet §268.48 standards[8]	DEACT and meet §268.48 standards[8]
	Water Reactive Subcategory based on 261.23(a)(2), (3), and (4). (Note: This subcategory consists of nonwastewaters only).	NA	NA	NA	DEACT and meet §268.48 standards[8]
	Reactive Cyanides Subcategory based on 261.23(a)(5).	Cyanides (Total)[7]	57–12–5	Reserved	590
		Cyanides (Amendable)[7]	57–12–5	0.86	30
D004	Wastes that exhibit, or are expected to exhibit, the characteristic of toxicity for arsenic based on the extraction procedure (EP) in SW846 Methods 1310.	Arsenic	7440–38–2	5.0	5.0 mg/l EP

TREATMENT STANDARDS FOR HAZARDOUS WASTES—Continued

(Note: NA means not applicable.)

Waste code	Waste description and treatment/regulatory subcategory[1]	Regulated hazardous constituent		Wastewaters	Nonwastewaters
		Common name	CAS[2] No.	Concentration in mg/l[3]; or technology code[4]	Concentration in mg/kg[5] unless noted as "mg/l TCLP"; or technology code
		Arsenic; alternate[6] standard for nonwastewaters only.	7440–38–2	NA	5.0 mg/l TCLP
D005	Wastes that exhibit, or are expected to exhibit, the characteristic of toxicity for barium based on the extraction procedure (EP) in SW846 Method 1310.	Barium	7440–39–3	100	100 mg/l TCLP
D006	Wastes that exhibit, or are expected to exhibit, the characteristic of toxicity for cadmium based on the extraction procedure (EP) in SW846 Method 1310.	Cadmium	7440–43–9	1.0	1.0 mg/l TCLP
	Cadmium Containing Batteries Subcategory. (Note: This subcategory consists of nonwastewaters only).	Cadmium	7440–43–9	NA	RTHRM
D007	Wastes that exhibit, or are expected to exhibit, the characteristic of toxicity for chromium based on the extraction procedure (EP) in SW846 Method 1310.	Chromium (Total)	7440–47–3	5.0	5.0 mg/l TCLP
D008	Wastes that exhibit, or are expected to exhibit, the characteristic of toxicity for lead based on the extraction procedure (EP) in SW846 Method 1310.	Lead	7439–92–1	5.0	5.0 mg/l EP
		Lead; alternate[6] standard for nonwastewaters only.	7439–92–1	NA	5.0 mg/l TCLP
	Lead Acid Batteries Subcategory (Note: This standard only applies to lead acid batteries that are identified as RCRA hazardous wastes and that are not excluded elsewhere from regulation under the land disposal restrictions of 40 CFR 268 or exempted under other EPA regulations (see 40 CFR 266.80). This subcategory consists of nonwastewaters only.).	Lead	7439–92–1	NA	RLEAD
	Radioactive Lead Solids Subcategory (Note: these lead solids include, but are not limited to, all forms of lead shielding and other elemental forms of lead. These lead solids do not include treatment residuals such as hydroxide sludges, other wastewater treatment residuals, or incinerator ashes that can undergo conventional pozzolanic stabilization, nor do they include organo-lead materials that can be incinerated and stabilized as ash. This subcategory consists of nonwastewaters only).	Lead	7439–92–1	NA	MACRO

D009	Nonwastewaters that exhibit, or are expected to exhibit, the characteristic of toxicity for mercury based on the extraction procedure (EP) in SW846 Method 1310; and contain greater than or equal to 260 mg/kg total mercury that also contain organics and are not incinerator residues. (High Mercury-Organic Subcategory.).	Mercury	7439–97–6	NA	IMERC; OR RMERC
	Nonwastewaters that exhibit, or are expected to exhibit, the characteristic of toxicity for mercury based on the extraction procedure (EP) in SW846 Method 1310; and contain greater than or equal to 260 mg/kg total mercury that are inorganic, including incinerator residues and residues from RMERC. (High Mercury-Inorganic Subcategory.).	Mercury	7439–97–6	NA	RMERC
	Nonwastewaters that exhibit, or are expected to exhibit, the characteristic of toxicity for mercury based on the extraction procedure (EP) in SW846 Method 1310; and contain less than 260 mg/kg total mercury. (Low Mercury Subcategory.).	Mercury	7439–97–6	NA	0.20 mg/l TCLP
	All D009 wastewaters	Mercury	7439–97–6	0.20	NA
	Elemental mercury contaminated with radioactive materials. (Note: This subcategory consists of nonwastewaters only.).	Mercury	7439–97–6	NA	AMLGM
	Hydraulic oil contaminated with Mercury Radioactive Materials Subcategory. (Note: This subcategory consists of nonwastewaters only.).	Mercury	7439–97–6	NA	IMERC
D010	Wastes that exhibit, or are expected to exhibit, the characteristic of toxicity for selenium based on the extraction procedure (EP) in SW846 Method 1310.	Selenium	7782–49–2	1.0	5.7 mg/l TCLP
D011	Wastes that exhibit, or are expected to exhibit, the characteristic of toxicity for silver based on the extraction procedure (EP) in SW846 Method 1310.	Silver	7440–22–4	5.0	5.0 mg/l TCLP
D012	Wastes that are TC for Endrin based on the TCLP in SW846 Method 1311.	Endrin	72–20–8	BIODG; or CMBST[8]	0.13 and meet § 268.48 standards[8]
		Endrin aldehyde	7421–93–4	BIODG; or CMBST[8]	0.13 and meet § 268.48 standards[8]
D013	Wastes that are TC for Lindane based on the TCLP in SW846 Method 1311.).	alpha-BHC	319–84–6	CARBN; or CMBST[8]	0.066 and meet § 268.48 standards[8]
		beta–BHC	319–85–7	CARBN; or CMBST[8]	0.066 and meet § 268.48 standards[8]
		delta-BHC	319–86–8	CARBN; or CMBST[8]	0.066 and meet § 268.48 standards[8]
		gamma-BHC (Lindane)	58–89–9	CARBN; or CMBST[8]	0.066 and meet § 268.48 standards[8]
D014	Wastes that are TC for Methoxychlor based on the TCLP in SW846 Method 1311.	Methoxychlor	72–43–5	WETOX or CMBST[8]	0.18 and meet § 268.48 standards[8]

TREATMENT STANDARDS FOR HAZARDOUS WASTES—Continued

(Note: NA means not applicable.)

Waste code	Waste description and treatment/regulatory subcategory[1]	Regulated hazardous constituent		Wastewaters	Nonwastewaters
		Common name	CAS[2] No.	Concentration in mg/l[3]; or technology code[4]	Concentration in mg/kg[5] unless noted as "mg/l TCLP"; or technology code
D015	Wastes that are TC for Toxaphene based on the TCLP in SW846 Method 1311.	Toxaphene	8001–35–2	BIODG or CMBST[8]	2.6 and meet § 268.48 standards[8]
D016	Wastes that are TC for 2,4-D (2,4-Dichlorophenoxyacetic acid) based on the TCLP in SW846 Method 1311.	2,4-D (2,4-Dichlorophenoxyacetic acid).	94–75–7	CHOXD, BIODG, or CMBST[8]	10 and meet § 268.48 standards[8]
D017	Wastes that are TC for 2,4,5-TP (Silvex) based on the TCLP in SW846 Method 1311.	2,4,5-TP (Silvex)	93–72–1	CHOXD or CMBST[8]	7.9 and meet § 268.48 standards[8]
D018	Wastes that are TC for Benzene based on the TCLP in SW846 Method 1311.	Benzene	71–43–2	0.14 and meet § 268.48 standards[8]	10 and meet § 268.48 standards[8]
D019	Wastes that are TC for Carbon tetrachloride based on the TCLP in SW846 Method 1311.	Carbon tetrachloride	56–23–5	0.057 and meet § 268.48 standards[8]	6.0 and meet § 268.48 standards[8]
D020	Wastes that are TC for Chlordane based on the TCLP in SW846 Method 1311.	Chlordane (alpha and gamma isomers).	57–74–9	0.0033 and meet § 268.48 standards[8]	0.26 and meet § 268.48 standards[8]
D021	Wastes that are TC for Chlorobenzene based on the TCLP in SW846 Method 1311.	Chlorobenzene	108–90–7	0.057 and meet § 268.48 standards[8]	6.0 and meet § 268.48 standards[8]
D022	Wastes that are TC for Chloroform based on the TCLP in SW846 Method 1311.	Chloroform	67–66–3	0.046 and meet § 268.48 standards[8]	6.0 and meet § 268.48 standards[8]
D023	Wastes that are TC for o-Cresol based on the TCLP in SW846 Method 1311.	o-Cresol	95–48–7	0.11 and meet § 268.48 standards[8]	5.6 and meet § 268.48 standards[8]
D024	Wastes that are TC for m-Cresol based on the TCLP in SW846 Method 1311.	m-Cresol (difficult to distinguish from p-cresol).	108–39–4	0.77 and meet § 268.48 standards[8]	5.6 and meet § 268.48 standards[8]
D025	Wastes that are TC for p-Cresol based on the TCLP in SW846 Method 1311.	p-Cresol (difficult to distinguish from m-cresol).	106–44–5	0.77 and meet § 268.48 standards[8]	5.6 and meet § 268.48 standards[8]
D026	Wastes that are TC for Cresols (Total) based on the TCLP in SW846 Method 1311.	Cresol-mixed isomers (Cresylic acid)(sum of o-, m-, and p-cresol concentrations).	1319–77–3	0.88 and meet § 268.48 standards[8]	11.2 and meet § 268.48 standards[8]
D027	Wastes that are TC for p-Dichlorobenzene based on the TCLP in SW846 Method 1311.	p-Dichlorobenzene (1,4-Dichlorobenzene).	106–46–7	0.090 and meet § 268.48 standards[8]	6.0 and meet § 268.48 standards[8]
D028	Wastes that are TC for 1,2-Dichloroethane based on the TCLP in SW846 Method 1311.	1,2-Dichloroethane	107–06–2	0.21 and meet § 268.48 standards[8]	6.0 and meet § 268.48 standards[8]
D029	Wastes that are TC for 1,1-Dichloroethylene based on the TCLP in SW846 Method 1311.	1,1-Dichloroethylene	75–35–4	0.025 and meet § 268.48 standards[8]	6.0 and meet § 268.48 standards[8]

D030	Wastes that are TC for 2,4-Dinitrotoluene based on the TCLP in SW846 Method 1311.	2,4-Dinitrotoluene	121–14–2	0.32 and meet § 268.48 standards [8]	140 and meet § 268.48 standards [8]
D031	Wastes that are TC for Heptachlor based on the TCLP in SW846 Method 1311.	Heptachlor	76–44–8	0.0012 and meet § 268.48 standards [8]	0.066 and meet § 268.48 standards [8]
		Heptachlor epoxide	1024–57–3	0.016 and meet § 268.48 standards [8]	0.066 and meet § 268.48 standards [8]
D032	Wastes that are TC for Hexachlorobenzene based on the TCLP in SW846 Method 1311.	Hexachlorobenzene	118–74–1	0.055 and meet § 268.48 standards [8]	10 and meet § 268.48 standards [8]
D033	Wastes that are TC for Hexachlorobutadiene based on the TCLP in SW846 Method 1311.	Hexachlorobutadiene	87–68–3	0.055 and meet § 268.48 standards [8]	5.6 and meet § 268.48 standards [8]
D034	Wastes that are TC for Hexachloroethane based on the TCLP in SW846 Method 1311.	Hexachloroethane	67–72–1	0.055 and meet § 268.48 standards [8]	30 and meet § 268.48 standards [8]
D035	Wastes that are TC for Methyl ethyl ketone based on the TCLP in SW846 Method 1311.	Methyl ethyl ketone	78–93–3	0.28 and meet § 268.48 standards [8]	36 and meet § 268.48 standards [8]
D036	Wastes that are TC for Nitrobenzene based on the TCLP in SW846 Method 1311.	Nitrobenzene	98–95–3	0.068 and meet § 268.48 standards [8]	14 and meet § 268.48 standards [8]
D037	Wastes that are TC for Pentachlorophenol based on the TCLP in SW846 Method 1311.	Pentachlorophenol	87–86–5	0.089 and meet § 268.48 standards [8]	7.4 and meet § 268.48 standards [8]
D038	Wastes that are TC for Pyridine based on the TCLP in SW846 Method 1311.	Pyridine	110–86–1	0.014 and meet § 268.48 standards [8]	16 and meet § 268.48 standards [8]
D039	Wastes that are TC for Tetrachloroethylene based on the TCLP in SW846 Method 1311.	Tetrachloroethylene	127–18–4	0.056 and meet § 268.48 standards [8]	6.0 and meet § 268.48 standards [8]
D040	Wastes that are TC for Trichloroethylene based on the TCLP in SW846 Method 1311.	Trichloroethylene	79–01–6	0.054 and meet § 268.48 standards [8]	6.0 and meet § 268.48 standards [8]
D041	Wastes that are TC for 2,4,5-Trichlorophenol based on the TCLP in SW846 Method 1311.	2,4,5-Trichlorophenol	95–95–4	0.18 and meet § 268.48 standards [8]	7.4 and meet § 268.48 standards [8]
D042	Wastes that are TC for 2,4,6-Trichlorophenol based on the TCLP in SW846 Method 1311.	2,4,6-Trichlorophenol	88–06–2	0.035 and meet § 268.48 standards [8]	7.4 and meet § 268.48 standards [8]
D043	Wastes that are TC for Vinyl chloride based on the TCLP in SW846 Method 1311.	Vinyl chloride	75–01–4	0.27 and meet § 268.48 standards [8]	6.0 and meet § 268.48 standards [8]

F037	Petroleum refinery primary oil/water/solids separation sludge—Any sludge generated from the gravitational separation of oil/water/solids during the storage or treatment of process wastewaters and oily cooling wastewaters from petroleum refineries. Such sludges include, but are not limited to, those generated in: oil/water/solids separators; tanks and impoundments; ditches and other conveyances; sumps; and stormwater units receiving dry weather flow. Sludge generated in stormwater units that do not receive dry weather flow, sludges generated from non-contact once-through cooling waters segregated for treatment from other process or oil cooling waters, sludges generated in aggressive biological treatment units as defined in §261.31(b)(2) (including sludges generated in one or more additional units after wastewaters have been treated in aggressive biological treatment units) and K051 wastes are not included in this listing. Notes to Table:

[1] The waste descriptions provided in this table do not replace waste descriptions in 40 CFR part 261. Descriptions of Treatment/Regulatory Subcategories are provided, as needed, to distinguish betweenapplicability of different standards.

[2] CAS means Chemical Abstract Services. When the waste code and/or regulated constituents are described as a combination of a chemical with it's salts and/or esters, the CAS number is given for the parent compound only.

[3] Concentration standards for wastewaters are expressed in mg/l and are based on analysis of composite samples.

[4] All treatment standards expressed as a Technology Code or combination of Technology Codes are explained in detail in 40 CFR 268.42 Table 1—Technology Codes and Descriptions of Technology-Based Standards.

[5] Except for Metals (EP or TCLP) and Cyanides (Total and Amenable) the nonwastewater treatment standards expressed as a concentration were established, in part, based upon incineration in units operated in accordance with the technical requirements of 40 CFR Part 264, Subpart O, or Part 265, Subpart O, or based upon combustion in fuel substitution units operating in accordance with applicable technical requirements. A facility may comply with these treatment standards according to provisions in 40 CFR 268.40(d). All concentration standards for nonwastewaters are based on analysis of grab samples.

[6] Where an alternate treatment standard or set of alternate standards has been indicated, a facility may comply with this alternate standard, but only for the Treatment/Regulatory Subcategory or physical form (i.e., wastewater and/or nonwastewater) specified for that alternate standard.

[7] Both Cyanides (Total) and Cyanides (Amenable) for nonwastewaters are to be analyzed using Method 9010 or 9012, found in ''Test Methods for Evaluating Solid Waste, Physical/Chemical Methods'', EPA Publication SW–846, as incorporated by reference in 40 CFR 260.11, with a sample size of 10 grams and a distillation time of one hour and 15 minutes.

[8] As an alternative to these standards, the underlying hazardous constituents in the waste must meet a CWA limitation, which can include a toxic pollutant indicator for the constituent; Pretreatment Standards for Existing Sources; Pretreatment Standards for New Sources; local limitations based upon a pass-through determination; or a Fundamentally Different Factors variance under 40 CFR 125.30–125.32.

17. In § 268.42 Table 1. is amended by revising the entry ''CMBST'' to read as follows:

§ 268.42 Treatment standards expressed as specified technologies.

TABLE 1.—TECHNOLOGY CODES AND DESCRIPTION OF TECHNOLOGY-BASED STANDARDS

Technology code	Description of technology-based standards
* * * * * * *	
CMBST:	High temperature organic destruction technologies, such as combustion in incinerators, boilers, or industrial furnaces operated in accordance with the applicable requirements of 40 CFR part 264, subpart O, or 40 CFR part 265, subpart O, or 40 CFR part 266, subpart H, and in other units operated in accordance with applicable technical operating requirements; and certain non-combustive technologies, such as the Catalytic Extraction Process.
* * * * * * *	

* * * * *

18. Section 268.44 is amended by revising paragraph (a) to read as follows:

§ 268.44 Variance from a treatment standard.

(a) Where the treatment standard is expressed as a concentration in a waste or waste extract and a waste cannot be treated to the specified level, or where the treatment technology is not appropriate to the waste, the generator or treatment facility may petition the Administrator for a variance from the treatment standard. The petitioner must demonstrate that because the physical or chemical properties of the waste differs significantly from wastes analyzed in developing the treatment standard, the waste cannot be treated to specified levels or by the specified methods. The petitioner may also demonstrate that it is treating underlying hazardous constituents in characteristically hazardous wastewaters by sending the waste to a properly designed and operated BAT/PSES system, which may not be achieving the treatment standards found in § 268.48.

* * * * *

19. In § 268.48 the table in paragraph (a) is revised to read as follows:

§ 268.48 Universal treatment standards.

(a) * * *

UNIVERSAL TREATMENT STANDARDS

[Note: NA means not applicable.]

Regulated constituent/common name	CAS [1] number	Wastewater standard	Nonwastewater standard
		Concentration in mg/l [2]	Concentration in mg/kg [3] unless noted as ''mg/l TCLP''
I. Organic constituents:			
A2213	30558–43–1	0.003	1.4
Acenaphthene	83–32–9	0.059	3.4
Acenaphthylene	208–96–8	0.059	3.4
Acetone	67–64–1	0.28	160
Acetonitrile	75–05–8	5.6	38
Acetophenone	96–86–2	0.010	9.7
2-Acetylaminofluorene	53–96–3	0.059	140
Acrolein	107–02–8	0.29	NA
Acrylamide	79–06–1	19	23
Acrylonitrile	107–13–1	0.24	84

Vanadium [4]	7440–62–2	4.3	0.23 mg/l TCLP
Zinc [5]	7440–66–6	2.61	5.3 mg/l TCLP

Notes to table:

[1] CAS means Chemical Abstract Services. When the waste code and/or regulated constituents are described as a combination of a chemical with it's salts and/or esters, the CAS number is given for the parent compound only.

[2] Concentration standards for wastewaters are expressed in mg/l and are based on analysis of composite samples.

[3] Except for Metals (EP or TCLP) and Cyanides (Total and Amenable) the nonwastewater treatment standards expressed as a concentration were established, in part, based upon incineration in units operated in accordance with the technical requirements of 40 CFR part 264, subpart O, or 40 CFR part 265, subpart O, or based upon combustion in fuel substitution units operating in accordance with applicable technical requirements. A facility may comply with these treatment standards according to provisions in 40 CFR 268.40(d). All concentration standards for nonwastewaters are based on analysis of grab samples.

[4] Both Cyanides (Total) and Cyanides (Amenable) for nonwastewaters are to be analyzed using Method 9010 or 9012, found in "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods", EPA Publication SW–846, as incorporated by reference in 40 CFR 260.11, with a sample size of 10 grams and a distillation time of one hour and 15 minutes.

[5] These constituents are not "underlying hazardous constituents" in characteristic wastes, according to the definition at § 268.2(i).

20. Appendix XI is added to part 268 to read as follows:

APPENDIX XI TO PART 268—METAL BEARING WASTES PROHIBITED FROM DILUTION IN A COMBUSTION UNIT ACCORDING TO 40 CFR 268.3(C) [1]

Waste code	Waste description
D004	Toxicity Characteristic for Arsenic.
D005	Toxicity Characteristic for Barium.
D006	Toxicity Characteristic for Cadmium.
D007	Toxicity Characteristic for Chromium.
D008	Toxicity Characteristic for Lead.
D009	Toxicity Characteristic for Mercury.
D010	Toxicity Characteristic for Selenium.
D011	Toxicity Characteristic for Silver.

APPENDIX XI TO PART 268—METAL BEARING WASTES PROHIBITED FROM DILUTION IN A COMBUSTION UNIT ACCORDING TO 40 CFR 268.3(C) [1]—Continued

Waste code	Waste description
F006	Wastewater treatment sludges from electroplating operations except from the following processes: (1) sulfuric acid anodizing of aluminum; (2) tin plating carbon steel; (3) zinc plating (segregated basis) on carbon steel; (4) aluminum or zinc-plating on carbon steel; (5) cleaning/stripping associated with tin, zinc and aluminum plating on carbon steel; and (6) chemical etching and milling of aluminum.
F007	Spent cyanide plating bath solutions from electroplating operations.
F008	Plating bath residues from the bottom of plating baths from electroplating operations where cyanides are used in the process.
F009	Spent stripping and cleaning bath solutions from electroplating operations where cyanides are used in the process.
F010	Quenching bath residues from oil baths from metal treating operations where cyanides are used in the process.
F011	Spent cyanide solutions from salt bath pot cleaning from metal heat treating operations.
F012	Quenching waste water treatment sludges from metal heat treating operations where cyanides are used in the process.
F019	Wastewater treatment sludges from the chemical conversion coating of aluminum except from zirconium phosphating in aluminum car washing when such phosphating is an exclusive conversion coating process.
K002	Wastewater treatment sludge from the production of chrome yellow and orange pigments.
K003	Wastewater treatment sludge from the production of molybdate orange pigments.
K004	Wastewater treatment sludge from the production of zinc yellow pigments.
K005	Wastewater treatment sludge from the production of chrome green pigments.
K006	Wastewater treatment sludge from the production of chrome oxide green pigments (anhydrous and hydrated).
K007	Wastewater treatment sludge from the production of iron blue pigments.
K008	Oven residue from the production of chrome oxide green pigments.
K061	Emission control dust/sludge from the primary production of steel in electric furnaces.
K069	Emission control dust/sludge from secondary lead smelting.
K071	Brine purification muds from the mercury cell processes in chlorine production, where separately prepurified brine is not used.
K100	Waste leaching solution from acid leaching of emission control dust/sludge from secondary lead smelting.
K106	Sludges from the mercury cell processes for making chlorine.
P010	Arsenic acid H_3AsO_4
P011	Arsenic oxide As_2O_5
P012	Arsenic trioxide
P013	Barium cyanide
P015	Beryllium
P029	Copper cyanide Cu(CN)
P074	Nickel cyanide $Ni(CN)_2$
P087	Osmium tetroxide
P099	Potassium silver cyanide
P104	Silver cyanide
P113	Thallic oxide
P114	Thallium (I) selenite
P115	Thallium (I) sulfate
P119	Ammonium vanadate
P120	Vanadium oxide V_2O_5
P121	Zinc cyanide.
U032	Calcium chromate.
U145	Lead phosphate.
U151	Mercury.
U204	Selenious acid.
U205	Selenium disulfide.
U216	Thallium (I) chloride.
U217	Thallium (I) nitrate.

[1] A combustion unit is defined as any thermal technology subject to 40 CFR part 264, subpart O; Part 265, subpart O; and/or 266, subpart H.

PART 271—REQUIREMENTS FOR AUTHORIZATION OF STATE HAZARDOUS WASTE PROGRAMS

21. The authority citation for part 271 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a) and 6926.

Subpart A—Requirements for Final Authorization

22. Section 271.1(j) is amended by adding the following entries to Table 1 in chronological order by date of publication in the Federal Register, and by adding the following entries to Table 2 in chronological order by effective date in the Federal Register to read as follows:

§ 271.1 Purpose and scope.

PART 403—GENERAL PRETREATMENT REGULATIONS FOR EXISTING AND NEW SOURCES OF POLLUTION

23. The authority citation for part 403 continues to read as follows:

Authority: Sec. 54(c)(2) of the Clean Water Act of 1977, (Pub. L. 95–217) sections 204(b)(1)(C), 208(b)(2)(C)(iii), 301(b)(1)(A)(ii), 301(b)(2)(A)(ii), 301(b)(2)(C), 301(h)(5), 301(i)(2), 304(e), 304(g), 307, 308, 309, 402(b), 405 and 501(a) of the Federal Water Pollution Control Act (Pub. L. 92–500) as amended by the Clean Water Act of 1977 and the Water Quality Act of 1987 (Pub. L. 100–4).

24. In § 403.5, paragraphs (c) heading, (c)(1) and (d) are revised to read as follows:

§ 403.5 National pretreatment standards: Prohibited discharges.

* * * * *

(c) *Development of specific limits by POTW.* (1) Each POTW developing a POTW Pretreatment Program pursuant to § 403.8 shall develop and enforce specific limits to implement the prohibitions listed in paragraphs (a)(1) and (b) of this section. Each POTW with an approved pretreatment program shall continue to develop these limits as necessary and effectively enforce such limits. In addition, the POTW may establish such limits as necessary to address the land disposal restrictions at 40 CFR 268.40.

* * * * *

(d) *Local limits.* Where specific prohibitions or limits on pollutants or pollutant parameters are developed by a POTW in accordance with paragraph (c) of this section, including those standards established to address land disposal restrictions at 40 CFR 268.40, such limits shall be deemed Pretreatment Standards for the purposes of section 307(d) of the Act.

Land Disposal Restrictions Phase III—Decharacterized Wastewaters, Carbamate Wastes, and Spent Potliners

AGENCY: Environmental Protection Agency (EPA).

ACTION: Partial withdrawal and amendment of final rule.

SUMMARY: Elsewhere in this Federal Register, EPA is promulgating a final rule which, among other things, revises treatment standards for hazardous wastewaters that exhibit the characteristic of ignitability, corrosivity, reactivity, or toxicity. The revised treatment standards were promulgated to implement the mandate of the opinion of the Circuit Court of Appeals for the District of Columbia Circuit in *Chemical Waste Management (CWM)* v. *EPA*, 976 F. 2d 2 (D.C. Cir. 1992) cert. denied 507 U.S. 1057 (1993). On March 26, 1996, President Clinton signed into law the Land Disposal Program Flexibility Act of 1996 which, among other things, provides that the wastes in question are no longer prohibited from land disposal so long as they are not hazardous wastes at the point they are land disposed. By operation of the statute, this provision is made effective immediately and therefore essentially overrules this portion of the CWM opinion. EPA accordingly is incorporating the statutory provision into the regulations by amending and/or withdrawing the portions of the regulations that are superseded by the new legislation. The amendment/withdrawal of these standards does not affect any other part of the final rule; and the effective dates of the other actions in the final rule likewise will not change. Furthermore, EPA is amending parts of the LDR Phase II final rule, published on September 19, 1994 (59 FR 47982) which are also overruled by the legislation.

EFFECTIVE DATE: April 5, 1996.

FOR FURTHER INFORMATION CONTACT: For general information contact the RCRA Hotline at 800–424–9346 (toll-free) or 703–412–9810 locally. For specific information on the LDR Phase III rule

Land Disposal Restrictions Phase III—Decharacterized Wastewaters, Carbamate Wastes, and Spent Potliners

AGENCY: Environmental Protection Agency (EPA).

ACTION: Partial withdrawal and amendment of final rule.

SUMMARY: Elsewhere in this Federal Register, EPA is promulgating a final rule which, among other things, revises treatment standards for hazardous wastewaters that exhibit the characteristic of ignitability, corrosivity, reactivity, or toxicity. The revised treatment standards were promulgated to implement the mandate of the opinion of the Circuit Court of Appeals for the District of Columbia Circuit in *Chemical Waste Management (CWM)* v. *EPA*, 976 F. 2d 2 (D.C. Cir. 1992) cert. denied 507 U.S. 1057 (1993). On March 26, 1996, President Clinton signed into law the Land Disposal Program Flexibility Act of 1996 which, among other things, provides that the wastes in question are no longer prohibited from land disposal so long as they are not hazardous wastes at the point they are land disposed. By operation of the statute, this provision is made effective immediately and therefore essentially overrules this portion of the CWM opinion. EPA accordingly is incorporating the statutory provision into the regulations by amending and/or withdrawing the portions of the regulations that are superseded by the new legislation. The amendment/withdrawal of these standards does not affect any other part of the final rule; and the effective dates of the other actions in the final rule likewise will not change. Furthermore, EPA is amending parts of the LDR Phase II final rule, published on September 19, 1994 (59 FR 47982) which are also overruled by the legislation.

EFFECTIVE DATE: April 5, 1996.

and this document, contact Peggy Vyas in the Office of Solid Waste, phone 703–308–8594.

SUPPLEMENTARY INFORMATION:

I. Today's Action

Elsewhere in this Federal Register, a final rule is published which revises treatment standards for decharacterized wastewaters that are managed in surface impoundments regulated under the Clean Water Act (CWA) or in CWA-equivalent systems, and in Class I nonhazardous waste injection wells regulated under the Safe Drinking Water Act (SDWA). Among other actions, the final rule would have (1) revised 40 CFR 148.1(b) and (d), 148.3, 148.4, 148.20(a), 268.3, 268.40(e), 268.44(a), and 403.5(d); and (2) amended 268.1(e), 268.9(d), and 403.5(c); as well as (3) added 148.18, 268.2 (k) and (l), 268.9 (e), (f), and (g), and 268.39. EPA also promulgated certain regulations as part of the LDR Phase II rule prohibiting injection of certain decharacterized wastes (see 40 CFR 148.17(c) and 268.1(c)(3) at 59 FR 48041 and 48043 (September 19, 1994)).

EPA promulgated these provisions to implement the holding and reasoning of the D.C. Circuit's opinion in *CWM* v. *EPA*, 976 F. 2d 2 (D.C. Cir. 1992), cert. denied 507 U.S. 1057 (1993). EPA interpreted this opinion to require hazardous constituents in characteristic wastes to be treated so that the constituents were removed, destroyed or immobilized before the wastes were permanently land disposed, in order to minimize threats posed by land disposal of the wastes. This requirement extended to wastewaters managed in the types of centralized wastewater management systems mentioned above. In doing so, EPA noted in the LDR Phase III final rule, published elsewhere in this Federal Register, that it would not have set treatment standards for hazardous constituents in these characteristic wastewaters at this time but for the court's opinion, and noted the pendency of legislation which could overrule the court's opinion and so require amendments to the final rule.

Congress has now passed that legislation, the Land Disposal Program Flexibility Act of 1996, and President Clinton signed it into law on March 26, 1996 (Public Law 104–119, 100 Stat. 830). A main purpose of the legislation is to put back in place the approach for centrally-managed, decharacterized wastewater which EPA adopted in the LDR ''Third Third'' rule promulgated on June 1, 1990 (55 FR 22520). The new legislation states, in essence, that hazardous wastes which are hazardous only because they are identified as exhibiting a characteristic are not prohibited from land disposal if they are managed in either a treatment system whose ultimate discharge is regulated under the CWA (including both direct and indirect dischargers), a CWA-equivalent treatment system, or a Class I nonhazardous injection well regulated under the SDWA, provided that the wastes no longer are hazardous (i.e. no longer exhibit a characteristic) at the point land disposal occurs (RCRA § 3004(g) (7) and (8)). The characteristic can be removed by any means, including dilution or other deactivation through aggregation of different wastestreams preceding land disposal (see H. Rep. No. 454, 104th Cong. 2d Sess. at 9). For wastes managed in CWA or CWA-equivalent systems, there is a further caveat that characteristic wastes for which EPA has promulgated a method of treatment as the treatment standard (for example, high TOC ignitable wastes for which the treatment standard is recovery of organics (RORGS) or combustion (CMBST)) remain prohibited unless treated pursuant to that method (RCRA § 3004(g)(7)). Reactive cyanide wastes (i.e. wastes that may release toxic emissions when exposed to pH conditions between 2 and 12 as defined in 40 CFR 261.23(a)(5)) likewise remain prohibited from disposal units in CWA and CWA-equivalent treatment systems unless first treated to satisfy the treatment standard (*id.*).

The purpose of this notice is to withdraw the portions of the existing rules which are inconsistent with the new statute and therefore no longer in effect, or, in a few limited instances, to amend language which cannot be feasibly withdrawn. Thus, treatment standards for wastes identified as exhibiting a characteristic and managed in centralized wastewater management systems identified above will require only that the wastes be deactivated (i.e. rendered non-hazardous) before they are land disposed. The exception will continue to be for wastes for which the treatment standard is a method of treatment—namely high TOC ignitables—and for reactive cyanide wastes, which must be treated to satisfy the existing treatment standard before land disposal in a surface impoundment at CWA and CWA-equivalent treatment systems.

This action puts back in place the rules which existed before EPA promulgated the LDR Phase III provisions. Thus, for example, withdrawing the version of 148.1(d) promulgated in the LDR Phase III rule has the effect of restoring the previous version of that provision. EPA believes that withdrawing the portions of the rules that have been superseded is the quickest and simplest way of amending the rules that conform to the new legislation. Certain portions of the LDR Phase III rule have to be amended (namely §§ 268.3, 268.39 and 268.40) because withdrawing them would undo other revisions which are not affected by the legislation. [1]

EPA realizes that there may be certain questions relating to other provisions of the rules which may benefit from clarifying revisions in light of the statutory amendment. (Communications from various affected parties suggesting such changes are part of the record for this notice.) EPA is limiting this notice to changes that have to be made to eliminate superceded regulatory provisions. EPA intends to pursue the possibility of whether clarifying amendments are needed in other proceedings.

EPA does wish, however, that to clarify that as a result of withdrawing these provisions, generators with decharacterized wastewaters that are being managed in CWA or CWA-equivalent systems or injected into Class I nonhazardous injection wells do not have to identify underlying hazardous constituents. EPA also wishes to make clear to States that withdrawing these provisions removes the obligation for States to adopt them as part of an authorized program.

II. Interpretive Issues

A. Definition of CWA-Equivalent Treatment

The legislation does not define what a CWA-equivalent treatment system is, leaving the issue to the Administrator (RCRA § 3004(g)(7)(A)). EPA's existing rules at 40 CFR 268.38(a) provide a definition: ''CWA equivalent treatment means biological treatment for organics, alkaline chlorination or ferrous sulfate precipitation for cyanide, precipitation/sedimentation for metals, reduction of hexavalent chromium, or other treatment technology that can be demonstrated to perform equally or better than these technologies.'' EPA intends to use this definition in implementing the new statute.

B. Wastes Listed Because They Exhibit a Characteristic

A number of wastes, such as F003 ignitable solvents, are listed as hazardous solely because they exhibit a characteristic of hazardous waste. The legislation does not by its terms apply

[1] In addition, EPA is withdrawing § 148.18(d) because this prohibition already exists in § 148.16 (c) and (f).

to such wastes (it applies only to wastes that are identified by characteristic, and so does not apply to listed wastes). EPA's current rules addressing the status of this type of waste under the LDR program are tangled. The Agency initially found that the dilution prohibition should apply to such wastes. See 56 FR 3864 and 3871 (Jan. 31, 1991). However, in a later notice, EPA amended the rules so that wastewaters that are listed solely because they exhibit a characteristic would not be subject to the dilution prohibition. 57 FR 37194 and 37263 (August 18, 1992). EPA did so to be consistent with the Third Third rule's approach to characteristic wastewaters. Id. at 37210–37211. This action occurred before the D.C. Circuit issued its decision remanding portions of the Third Third rule dealing with wastewaters. The Agency never corrected the regulation (found at 40 CFR 261.3(a)(2)(iii)) to conform to the opinion.

EPA's initial view is that the existing regulatory provision not applying the dilution prohibition to wastewaters listed because they exhibit a characteristic is probably inconsistent with the court's opinion, but that the principles of the new legislation (although not its language) could apply to these wastes. EPA thus has a policy choice as to whether to amend the existing rule. Today's notice is not intended to make policy choices, but rather to withdraw those rules no longer in effect. EPA plans to revisit this issue in a later proceeding. In the interim, the existing rule which provides that the dilution prohibition does not apply to wastewaters listed solely because they exhibit a characteristic remains in effect.

III. Status of Other LDR Treatment Standards

EPA is not withdrawing other treatment standards promulgated in either the LDR Phase III rule or other rules implementing portions of the court's opinion that are unaffected by the new legislation. Consequently, the provisions of the May 24, 1993, Interim Final Rule (58 FR 29860), which applied to disposal not involving the types of centralized wastewater management systems covered by the legislation, remain unaffected. Thus, underlying hazardous constituents in decharacterized wastes that are disposed of in systems other than these centralized wastewater management systems must continue to be treated before land disposal. Similarly, EPA amended the treatment standards for reactive wastes in the LDR Phase III final rule, published elsewhere in this Federal Register, to require that underlying hazardous constituents be treated when the wastes are land disposed (with an exception for certain types of emergency detonation situations). These requirements are likewise not addressed by the legislation (unless centralized wastewater management of the wastes is involved), and EPA is consequently not withdrawing these treatment standards.

IV. Rationale for Immediate Effective Date

EPA is taking this action without prior notice and opportunity to comment. Because the provisions of the legislation are effective immediately, the legislation overrules the D.C. Circuit's opinion, and thus necessarily overrules the rules implementing those parts of the opinion. Consequently, those rules need to be withdrawn to reflect the new statute. The situation is similar to what the Agency faced in 1985 when it codified portions of the 1984 amendments to RCRA without prior notice and opportunity to comment. 50 FR 28704 (July 15, 1985). The Agency's action was upheld in *United Technologies* v. *EPA,* 821 F. 2d 714, 720 (D.C. Cir. 1987). See also *Metzenbaum* v. *Federal Energy Regulatory Commission (FERC),* 675 F. 2d 1282, 1291 (D.C. Cir. 1982) (funding orders implementing statutory waiver were non-discretionary acts regulated by such waiver and that notice and comment procedures were unnecessary and possibly contrary to public interest ''given the expense that would have been involved in the futile gesture''); *Hadson Gas Systems* v. *FERC,* _____ F. 2d ____ (D.C. Cir. Feb. 9, 1996) (because controlling statute left FERC no authority to retain a regulation, notice and comment is not needed to withdraw it). EPA views today's effort as comparable to that involved in codifying the 1984 amendments since the legislation is focused clearly on one particular set of regulations and requires little interpretation by the Agency, and consequently that the decision to issue an immediately final withdrawal is justified. Consequently, EPA believes that good cause exists to issue this rule in immediately final form.

List of Subjects

40 CFR Part 148

Environmental protection, Administrative practice and procedure, Hazardous waste, Reporting and recordkeeping requirements, Water supply.

40 CFR Part 268

Hazardous waste, Reporting and recordkeeping requirements.

40 CFR Part 403

Reporting and recordkeeping requirements, Waste treatment and disposal, Water pollution controls.

Dated: March 29, 1996.

Carol M. Browner,

Administrator.

For the reasons set forth in the preamble, title 40, chapter I of the Code of Federal Regulations is amended as follows:

1. The amendments revising 40 CFR 148.1(b) and (d), 148.3, 148.4, 148.20(a) introductory text, 268.3, 268.40(e), 268.44(a), and 403.5(d); as well as the amendments amending 40 CFR 268.1(e), 268.9(d), and 403.5(c); as well as the amendments adding 40 CFR 148.18, 268.2(k) and (l), 268.9(e), (f), and (g), and 268.39 as published elsewhere in this issue of the Federal Register are withdrawn.

PART 148—HAZARDOUS WASTE INJECTION RESTRICTIONS

2. The authority citation for part 148 continues to read as follows:

Authority: Sec. 3004, Resource Conservation and Recovery Act, 42 U.S.C. 6901 *et seq.*

§ 148.17—[Amended]

3. Section 148.17 is amended by removing and reserving paragraph (c).

4. Section 148.18 is added to subpart B to read as follows:

§ 148.18 Waste specific prohibitions—newly identified wastes.

(a) On July 8, 1996, the wastes specified in 40 CFR 261.32 as EPA Hazardous waste numbers K156–K161, P127, P128, P185, P188–P192, P194, P196–P199, P201–P205, U271, U277–U280, U364–U367, U372, U373, U375–U379, U381–387, U389–U396, U400–U404, U407, and U409–U411 are prohibited from underground injection.

(b) On January 8, 1997, the wastes specified in 40 CFR 261.32 as EPA Hazardous waste number K088 is prohibited from underground injection.

(c) On April 8, 1998, the wastes specified in 40 CFR part 261 as EPA Hazardous waste numbers D018–043, and Mixed TC/Radioactive wastes, are prohibited from underground injection.

PART 268—LAND DISPOSAL RESTRICTIONS

5. The authority citation for part 268 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6921, and 6924.

Subpart A—General

6. Section 268.1 is amended by removing and reserving paragraph (c)(3).

7. Section 268.3 is revised to read as follows:

§ 268.3 Dilution prohibited as a substitute for treatment.

(a) Except as provided in paragraph (b) of this section, no generator, transporter, handler, or owner or operator of a treatment, storage, or disposal facility shall in any way dilute a restricted waste or the residual from treatment of a restricted waste as a substitute for adequate treatment to achieve compliance with subpart D of this part, to circumvent the effective date of a prohibition in subpart C of this part, to otherwise avoid a prohibition in subpart C of this part, or to circumvent a land disposal prohibition imposed by RCRA section 3004.

(b) Dilution of wastes that are hazardous only because they exhibit a characteristic in a treatment system which treats wastes subsequently discharged to a water of the United States pursuant to a permit issued under section 402 of the Clean Water Act (CWA), or which treats wastes in a CWA-equivalent treatment system, or which treats wastes for the purposes of pretreatment requirements under section 307 of the CWA is not impermissible dilution for purposes of this section unless a method has been specified in § 268.40 as the treatment standard, or unless the waste is a D003 reactive cyanide wastewater or nonwastewater.

(c) Combustion of the hazardous waste codes listed in Appendix XI of this part is prohibited, unless the waste, at the point of generation, or after any bona fide treatment such as cyanide destruction prior to combustion, can be demonstrated to comply with one or more of the following criteria (unless otherwise specifically prohibited from combustion):

(1) The waste contains hazardous organic constituents or cyanide at levels exceeding the constituent-specific treatment standard found in § 268.48;

(2) The waste consists of organic, debris-like materials (e.g., wood, paper, plastic, or cloth) contaminated with an inorganic metal-bearing hazardous waste;

(3) The waste, at point of generation, has reasonable heating value such as greater than or equal to 5000 BTU per pound;

(4) The waste is co-generated with wastes for which combustion is a required method of treatment;

(5) The waste is subject to Federal and/or State requirements necessitating reduction of organics (including biological agents); or

(6) The waste contains greater than 1% Total Organic Carbon (TOC).

8. Section 268.39 is added to read as follows:

§ 268.39 Waste specific prohibitions—spent aluminum potliners; reactive; and carbamate wastes.

(a) On July 8, 1996, the wastes specified in 40 CFR 261.32 as EPA Hazardous Waste numbers K156–K161; and in 40 CFR 261.33 as EPA Hazardous Waste numbers P127, P128, P185, P188–P192, P194, P196–P199, P201–P205, U271, U277–U280, U364–U367, U372, U373, U375–U379, U381–U387, U389–U396, U400–U404, U407, and U409–U411 are prohibited from land disposal. In addition, soil and debris contaminated with these wastes are prohibited from land disposal.

(b) On July 8, 1996, the wastes identified in 40 CFR 261.23 as D003 that are managed in systems other than those whose discharge is regulated under the Clean Water Act (CWA), or that inject in Class I deep wells regulated under the Safe Drinking Water Act (SDWA), or that are zero dischargers that engage in CWA-equivalent treatment before ultimate land disposal, are prohibited from land disposal. This prohibition does not apply to unexploded ordnance and other explosive devices which have been the subject of an emergency response. (Such D003 wastes are prohibited unless they meet the treatment standard of DEACT before land disposal (see § 268.40)).

(c) On January 8, 1997, the wastes specified in 40 CFR 261.32 as EPA Hazardous Waste number K088 are prohibited from land disposal. In addition, soil and debris contaminated with these wastes are prohibited from land disposal.

(d) On April 8, 1998, Radioactive wastes mixed with K088, K156–K161, P127, P128, P185, P188–P192, P194, P196–P199, P201–P205, U271, U277–U280, U364–U367, U372, U373, U375–U379, U381–U387, U389–U396, U400–U404, and U407, U409–U411 are also prohibited from land disposal. In addition, soil and debris contaminated with these radioactive mixed wastes are prohibited from land disposal.

(e) Between July 8, 1996, and April 8, 1998, the wastes included in paragraphs (a), (b), (c), and (d) of this section may be disposed in a landfill or surface impoundment, only if such unit is in compliance with the requirements specified in § 268.5(h)(2).

(f) The requirements of paragraphs (a), (b), (c), and (d) of this section do not apply if:

(1) The wastes meet the applicable treatment standards specified in Subpart D of this part;

(2) Persons have been granted an exemption from a prohibition pursuant to a petition under § 268.6, with respect to those wastes and units covered by the petition;

(3) The wastes meet the applicable alternate treatment standards established pursuant to a petition granted under § 268.44;

(4) Persons have been granted an extension to the effective date of a prohibition pursuant to § 268.5, with respect to these wastes covered by the extension.

(g) To determine whether a hazardous waste identified in this section exceeds the applicable treatment standards specified in § 268.40, the initial generator must test a sample of the waste extract or the entire waste, depending on whether the treatment standards are expressed as concentrations in the waste extract or the waste, or the generator may use knowledge of the waste. If the waste contains constituents in excess of the applicable Subpart D levels, the waste is prohibited from land disposal, and all requirements of this part 268 are applicable, except as otherwise specified.

9. Section 268.40 is amended by revising paragraph (e) to read as follows:

§ 268.40 Applicability of treatment standards.

* * * * *

(e) For characteristic wastes (D001–D003, and D018–D043) that are subject to treatment standards in the following table ''Treatment Standards for Hazardous Wastes,'' all underlying hazardous constituents (as defined in § 268.2(i)) must meet Universal Treatment Standards, found in § 268.48, ''Table UTS,'' prior to land disposal as defined in § 268.2(c).

* * * * *

10. In § 268.40, Table § 268.40, as revised elsewhere in this issue of the Federal Register, is further amended by removing note 8 at the end of the table and by revising the entries for D001, D002, D003 and D018–D043 to read as follows:

* * * * *

TREATMENT STANDARDS FOR HAZARDOUS WASTES

(Note: NA means not applicable.)

Waste code	Waste description and treatment/regulatory subcategory [1]	Regulated Hazardous Constituent		Wastewaters	Nonwastewaters
		Common name	CAS [2] No.	Concentration in mg/l [3]; or technology code [4]	Concentration in mg/kg [5] unless noted as "mg/l TCLP"; or technology code
D001 ..	Ignitable Characteristic Wastes, except for the § 261.21(a)(1) High TOC Subcategory, that are managed in non-CWA/non-CWA-equivalent/non-Class I SDWA systems.	NA	NA	DEACT and meet § 268.48 standards; or RORGS; or CMBST	DEACT and meet § 268.48 standards; or RORGS; or CMBST
	Ignitable Characteristic Wastes, except for the § 261.21(a)(1) High TOC Subcategory, that are managed in CWA/CWA-equivalent/Class I SDWA systems.	NA	NA	DEACT	DEACT
	High TOC Ignitable Characteristic Liquids Subcategory based on 40 CFR 261.21(a)(1)—Greater than or equal to 10% total organic carbon. (Note: This subcategory consists of nonwastewaters only).	NA	NA	NA	RORGS; or CMBST
D002 ..	Corrosive Characteristic Wastes that are managed in non-CWA/non-CWA equivalent/non-Class I SDWA systems.	NA	NA	DEACT and meet § 268.48 standards	DEACT and meet § 268.48 standards
	Corrosive Characteristic Wastes that are managed in CWA, CWA-equivalent, or Class I SDWA systems.	NA	NA	DEACT	DEACT
	* * *	*	*	*	*
D003 ..	Reactive Sulfides Subcategory based on 261.23(a)(5).	NA	NA	DEACT	DEACT
	Unexploded ordnance and other explosive devices which have been the subject of an emergency response.	NA	NA	DEACT	DEACT
	Explosives Subcategory based on 261.23(a)(6), (7), and (8).	NA	NA	DEACT and meet § 268.48 standards	DEACT and meet § 268.48 standards
	Other Reactives Subcategory based on 261.23(a)(1).	NA	NA	DEACT	DEACT
	Water Reactive Subcategory based on 261.23(a) (2), (3), and (4). (Note: This subcategory consists of nonwastewaters only.).	NA	NA	NA	DEACT and meet § 268.48 standards
	Reactive Cyanides Subcategory based on 261.23(a)(5).	Cyanides (Total) [7]	57–12–5	Reserved	590
		Cyanides (Amenable) [7]	57–12–5	0.86	30
	* * *	*	*	*	*
D018 ..	Wastes that are TC for Benzene based on the TCLP in SW846 Method 1311 and that are managed in non-CWA/non-CWA equivalent/non-Class I SDWA systems only.	Benzene	71–43–2	0.14 and meet § 268.48 standards	10 and meet § 268.48 standards
	Wastes that are TC for Benzene based on the TCLP in SW846 Method 1311 and that are managed in CWA, CWA equivalent, or Class I SDWA systems.	Benzene	71–43–2	0.14	10
D019 ..	Wastes that are TC for Carbon tetrachloride based on the TCLP in SW846 Method 1311 and that are managed in non-CWA/non-CWA equivalent/non-Class I SDWA systems only.	Carbon tetrachloride	56–23–5	0.057 and meet § 268.48 standards	6.0 and meet § 268.48 standards
	Wastes that are TC for Carbon tetrachloride based on the TCLP in SW846 Method 1311 and that are managed in CWA, CWA equivalent, or Class I SDWA systems.	Carbon tetrachloride	56–23–5	0.057	6.0
D020 ..	Wastes that are TC for Chlordane based on the TCLP in SW846 Method 1311 and that are managed in non-CWA/non-CWA equivalent/non-Class I SDWA systems only.	Chlordane (alpha and gamma isomers).	57–74–9	0.0033 and meet § 268.48 standards	0.26 and meet § 268.48 standards
	Wastes that are TC for Chlordane based on the TCLP in SW846 Method 1311 and that are managed in CWA, CWA equivalent, or Class I SDWA systems.	Chlordane (alpha and gamma isomers).	57–74–9	0.0033	0.26

Notes to table:

[1] The waste descriptions provided in this table do not replace waste descriptions in 40 CFR part 261. Descriptions of Treatment/Regulatory Subcategories are provided, as needed, to distinguish between applicability of different standards.

[2] CAS means Chemical Abstract Services. When the waste code and/or regulated constituents are described as a combination of a chemical with it's salts and/or esters, the CAS number if given for the parent compound only.

[3] Concentration standards for wastewaters are expressed in mg/l and are based on analysis of composite samples.

[4] All treatment standards expressed as a Technology Code or combination of Technology Codes are explained in detail in 40 CFR 268.42 Table 1—Technology Codes and Descriptions of Technology-Based Standards.

[5] Except for Metals (EP or TCLP) and Cyanides (Total and Amenable) the nonwastewater treatment standards expressed as a concentration were established, in part, based upon incineration in units operated in accordance with the technical requirements of 40 CFR Part 264, Subpart O, or based upon combustion in fuel substitution units operating in accordance with applicable technical requirements. A facility may comply with these treatment standards according to provisions in 40 CFR 268.40(d). All concentration standards for nonwastewaters are based on analysis of grab samples.

* * * * * *

[7] Both Cyanides (Total) and Cyanides (Amenable) for nonwastewaters are to be analyzed using Method 9010 or 9012, found in "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods", EPA Publication SW–846, as incorporated by reference in 40 CFR 260.11, with a sample size of 10 grams and distillation time of one hour and 15 minutes.

Shelled Almonds and Almonds in the Shell; Grade Standards

Correction

In Proposed Rule document 96–9829 beginning on page 17580 in the issue of Monday, April 22, 1996 make the following correction:

On page 17580, in the first column, under **DATES**, in the third line ''July 21, 1996'' should read ''June 21, 1996''.

BILLING CODE 1505–01–D

and 604. Alternatively, EPA may certify that the rule will not have a significant impact on a substantial number of small entities. Small entities include small businesses, small not-for-profit enterprises, and government entities with jurisdiction over populations of less than 50,000.

SIP approvals under section 110 and Subchapter I, Part D of the Clean Air Act do not create any new requirements, but simply approve requirements that the State is already imposing. Therefore, because the federal SIP-approval does not impose any new requirements, I certify that it does not have a significant impact on any small entities affected. Moveover, due to the nature of the federal-state relationship under the Clean Air Act, preparation of a regulatory flexibility analysis would constitute federal inquiry into the economic reasonableness of state action. The Clean Air Act forbids EPA to base its actions concerning SIPs on such grounds. *Union Electric Co.* v *US EPA,* 427 US 246, 256–66 (S.Ct. 1976); 42 U.S.C. 7410(a)(2).

Under sections 202, 203, and 205 of the Unfunded Mandates Reform Act of 1995 (''Unfunded Mandates Act''), signed into law on March 22, 1995, EPA must undertake various actions in association with proposed or final rules that include a federal mandate that may result in estimated annual costs of $100 million or more to the private sector, or to state, local, or tribal governments in the aggregate.

Through submission of this SIP or plan revision, the state and any affected local or tribal governments have elected to adopt the program provided for under sections 110 and 187 of the Clean Air Act. These rules may bind state, local and tribal governments to perform certain actions and also require the private sector to perform certain duties. To the extent that the rules being approved by this action would impose any mandate upon the state, local or tribal governments either as the owner or operator of a source or as a regulator, or would impose any mandate upon the private sector, EPA's action will impose no new requirements; such sources are already subject to these regulations under State law. Accordingly, no additional costs to state, local, or tribal governments, or to the private sector, result from this action. EPA has also determined that this final action does not include a mandate that may result in estimated annual costs of $100 million or more to state, local, or tribal governments in the aggregate or to the private sector.

Under 5 U.S.C. section 605(b), I certify that redesignations do not have a significant economic impact on a substantial number of small entities. (See 46 FR 8709.)

This action has been classified as a Table 3 action for signature by the Regional Administrator under the procedures published in the Federal Register on January 19, 1989 (54 FR 2214–2225), as revised by a July 10, 1995 memorandum from Mary Nichols, Assistant Administrator for Air and Radiation. The Office of Management and Budget (OMB) has exempted this regulatory action from E.O. 12866 review.

Under section 307(b)(1) of the Clean Air Act, petitions for judicial review of this rule must be filed in the United States Court of Appeals for the appropriate circuit within 60 days from date of publication. Filing a petition for reconsideration by the Administrator of this final rule does not affect the finality of this rule for the purposes of judicial review nor does it extend the time within which a petition for judicial review may be filed and shall not postpone the effectiveness of such rule or action. This rule may not be challenged later in proceedings to enforce its requirements. (See 307(b)(2).)

Land Disposal Restrictions Phase III—Decharacterized Wastewaters, Carbamate Wastes, and Spent Potliners

AGENCY: Environmental Protection Agency (EPA).

ACTION: Technical correction.

SUMMARY: On April 8, 1996, EPA published regulations covering both congressionally-mandated and court-ordered prohibitions on land disposal of certain hazardous wastes. On the same day, EPA published a partial withdrawal and correction of those regulations to the extent the Land Disposal Program Flexibility Act (LDPFA) (signed by the President on March 26, 1996) revoked most of the court-ordered prohibitions. This notice corrects technical errors in the final regulations and the partial withdrawal notice.

EFFECTIVE DATE: This rule is effective on June 28, 1996.

ADDRESSES: Supporting materials are available for viewing in the RCRA Information Center (RIC), located at Crystal Gateway One, 1235 Jefferson Davis Highway, First Floor, Arlington, VA. The Docket Identification Number is F–96–PH3F–FFFFF. The RCRA Docket is open from 9 a.m. to 4 p.m. Monday through Friday, except for Federal holidays. The public must make an appointment to review docket materials by calling (703) 603–9230. The public may copy a maximum of 100 pages from any regulatory document at no cost. Additional copies cost $0.15 per page.

FOR FURTHER INFORMATION CONTACT: For general information contact the RCRA Hotline at (800) 424–9346 (toll free) or (703) 920–9810 in the Washington, DC metropolitan area. For information on this notice contact Michael Petruska (5302W), Office of Solid Waste, 401 M Street, S.W., Washington, DC 20460, (703) 308–8434.

SUPPLEMENTARY INFORMATION:

I. Reasons and Basis for Today's Amendment

The Agency has received comments from the regulated community and State agencies requesting clarification on certain aspects of the April 8, 1996 Land Disposal Restrictions (LDR) Phase III final rule (61 FR 15566) and the April 8, 1996 withdrawal notice (61 FR 15660). Today's amendment responds to these comments and makes technical corrections where appropriate.

II. Amendments to the LDR Phase III Final Rule

There were several errors in the treatment standard table in § 268.40, and in the table of Universal Treatment Standards (UTS) in § 268.48. The errors pertained to portions of the final rule which were not affected by the LDPFA. It should be noted that certain errors in both of these tables are not being corrected here as they are being corrected by the Office of Federal Register.

A. Section 268.40 Table

There were several errors in the table ''Treatment Standards for Hazardous

Waste'' in section 268.40. First, the waste codes for the proposed organobromine wastes—K140 and U404—inadvertently appeared in the table. As was explained in the preamble to the final rule (61 FR 15566, 15569, April 8, 1996), however, the Agency is not promulgating treatment standards for these wastes at this time since the listing of these wastes as hazardous has not been finalized. Today's notice removes these entries from the table.

Second, the treatment standards set out in the table for the carbamate wastes were incorrect. These entries reflected the waste codes and constituents in the proposed listing instead of the waste codes and constituents in the finalized listing (60 FR 7824, February 9, 1995). These entries also are being corrected in today's notice.

Third, the entries for F006, F007, F010, F037, F039, K006, and K062 included treatment standards for constituents for which previously there was no standard (''NA'' had appeared instead). The proposed rule had included treatment standards to replace all of the ''NA'' entries in the table. However, as was explained in the preamble to the final rule (61 FR at 15569), the Agency agreed with commenters who felt it was arbitrary to add a standard for the sake of completeness where previously there was none, and, therefore, the Agency did not finalize the proposed changes. However, EPA inadvertently continued to include the standard for these waste codes in the final rule. Today's notice restores the ''NA'' entries.

B. Section 268.48 Table

The wastewater treatment standards for A2213, Butylate, Cycloate, EPTC, Molinate, Pebulate, Prosulfocarb, Triallate, and Vernolate appeared in the table of UTS as 0.003, although the preamble gave the correct standard as 0.042 (61 FR 15584). Today's notice corrects the UTS table.

III. Amendments to the LDR Phase III Withdrawal Notice

There are four sections in the withdrawal notice that need correction/clarification—§§ 148.1, 268.1, 268.3, and 268.40.

A. Section 148.1

The Agency today is amending the language in § 148.1(d) to more accurately reflect the recently enacted LDPFA. The revised language clarifies that decharacterized wastes injected in any Class I injection well—either hazardous or nonhazardous—are not prohibited wastes, and, therefore, are not subject to the Land Disposal Restrictions (LDR) treatment standards. This result was alluded to in the April 8, 1996 withdrawal notice (61 FR 15661), but the Agency believes it is appropriate to further make it clear that both hazardous and nonhazardous Class I wells are excepted, as provided in the text of the legislation.

B. Section 268.1

The Agency also is amending the language in § 268.1(c) to mirror the amended language in § 148.1(d) described above. We also are clarifying that decharacterized wastewaters managed in Clean Water Act (CWA) or equivalent systems with land disposal units are not prohibited wastes, and, thus, are not subject to LDR treatment standards. As provided in the legislation, the decharacterized wastes managed in CWA or CWA-equivalent systems which remain prohibited are those that have a specified ''method of treatment'' for a treatment standard, or are reactive cyanide wastes. This clarification was also alluded to in the April 8, 1996 withdrawal notice (61 FR 15661).

C. Section 268.3

The Agency is today amending the dilution prohibition language in § 268.3(b) to clarify that the treatment method of deactivation (DEACT) is not considered a specified method of treatment for the purposes of that section. This change merely codifies existing Agency interpretation (see preamble discussion at 55 FR 22666, June 1, 1990; and 57 FR 8087–8088, March 6, 1992).

D. Section 268.40

As discussed in A. and B. of this section, decharacterized wastes managed in CWA or CWA-equivalent systems (with land disposal units receiving the decharacterized waste) are no longer prohibited wastes, with the exception of characteristic wastes that have a specified method as a treatment standard and reactive cyanide. All decharacterized wastes injected into Class I wells also are no longer prohibited wastes.

In the rush of preparing a notice to reflect the new legislation as quickly as possible, EPA inadvertently failed to remove the numerical standards for these categories of wastes and replace them with the characteristic level (61 FR at 15664–15668). Therefore, the treatment standards in the April 8 withdrawal notice for these wastes were in error. For instance, the wastewater treatment standard for benzene in D018 wastes that are managed in CWA, CWA equivalent, or Class I injection wells was given as 0.14 mg/l. In fact, a D018 wastewater managed in one of these systems need only meet the regulatory level of 0.5 mg/l to be rendered nonhazardous (i.e. decharacterized) and, hence, no longer prohibited. Today's notice corrects this mistake by removing that category from the table of Treatment Standards for Hazardous Wastes, and indicating via a footnote that these wastes, once decharacterized, are no longer subject to LDR treatment standards.

The Agency wishes to clarify further that these non-LDR wastes also are not subject to the LDR notification and certification requirements of § 268.7 and § 268.9.

IV. Clarification to the Phase III Withdrawal Notice

Under RCRA regulations in effect before the LDPFA, wastes that are listed solely because they exhibit a hazardous characteristic are not prohibited from land disposal if they are managed in CWA, CWA-equivalent, or Class I injection well systems and are no longer hazardous at the point of land disposal. Id.; see also the codification of this principle at 40 CFR 261.3(a)(2)(iii) and 57 FR at 37210–211 (August 18, 1992). (The exception is for listed wastes that are subject to a method of treatment; these wastes cannot be disposed of in CWA or equivalent systems. See 55 FR at 22656, 22657 (general principle in Third Third final rule that characteristic wastes subject to a method of treatment remain subject to dilution prohibition even when managed in CWA treatment systems) and 57 FR 37210 (same principle should apply to wastes listed solely because they exhibit a characteristic).

In the April 8, 1996 withdrawal notice, EPA stated that it would not, at least for the time being, reopen those land disposal restriction rules applicable to wastes listed solely because they exhibit a hazardous waste characteristic (e.g. U002 commercial chemical product acetone). See 61 FR at 15661–62. This is because the new legislation does not directly apply to such wastes. Id.

EPA is taking this opportunity to clarify that the existing rules on wastes listed solely because they exhibit a characteristic apply to all wastes, regardless of whether they are wastewaters or non-wastewaters, so long as they are managed in the prescribed types of wastewater management systems. Notwithstanding unclear language in the August, 1992 preamble cited above, what the Agency intended to do was to put wastes listed solely because they exhibit a characteristic on

the same footing vis-a-vis the dilution prohibition as the characteristic wastes covered by the Third Third rule. 57 FR at 37210. Under that Third Third rule, most characteristic wastes (whether or not they were in the wastewater or nonwastewater treatability group) could be permissibly be managed in CWA systems and Class I UIC injection wells so long as they were rendered non-hazardous by any means before being placed in a land disposal unit (i.e. surface impoundment or Class I injection well). 55 FR at 22656–658 (June 1, 1990). EPA is formally clarifying this point by means of today's preamble discussion.

V. Rationale for Immediate Effective Date

Today's notice does not create any new regulatory requirements; rather, it restates and clarifies requirements already in effect (by virtue of the new legislation) by correcting a number of errors in the April 8, 1996 final rule and withdrawal notice. For these reasons, EPA finds that good cause exists under section 3010(b)(3) of RCRA, 42 U.S.C. 9903(b)(3), to provide for an immediate effective date. See generally 61 FR at 15662. For the same reasons, EPA finds that there is good cause under 5 U.S.C. 553(b)(3) to promulgate today's corrections in final form and that there is good cause under 5 U.S.C. 553(b)(3) to waive the requirement that regulations be published at least 30 days before they become effective.

VI. Analysis Under Executive Order 12866, the Unfunded Mandates Reform Act of 1995, the Regulatory Flexibility Act, and the Paperwork Reduction Act

This technical correction does not create any new regulatory requirements. It merely corrects technical errors and clarifies requirements already in effect (by virtue of the new legislation) and therefore is not a ''significant'' regulatory action within the meaning of Executive Order 12866, and does not impose any Federal mandate on State, local, or tribal governments or the private sector within the meaning of the Unfunded Mandates Reform Act of 1995. For the same reasons, pursuant to the Regulatory Flexibility Act, I certify that this action would not have a significant impact on a substantial number of small entities. Finally, because this is a technical correction, it does not affect requirements under the Paperwork Reduction Act.

VII. Submission to Congress and the General Accounting Office

Under section 801(a)(1)(A) of the Administrative Procedure Act (APA) as amended by the Small Business Regulatory Enforcement Fairness Act of 1996, EPA submitted a report containing this rule and other required information to the U.S. Senate, the U.S. House of Representatives and the Comptroller General of the General Accounting Office prior to publication of the rule in today's Federal Register. This rule is not a ''major rule'' as defined by section 804(2) of the APA as amended.

List of Subjects

40 CFR Part 148

Environmental protection, Administrative practice and procedure, Hazardous waste, Reporting and recordkeeping requirements, Water supply.

40 CFR Part 268

Hazardous waste, Reporting and recordkeeping requirements.

Dated: June 21, 1996.

Elliott Laws,

Assistant Administrator, Office of Solid Waste and Emergency Response.

For the reasons set forth in the preamble, title 40, chapter I of the Code of Federal Regulations is amended as follows:

PART 148—HAZARDOUS WASTE INJECTION RESTRICTIONS

1. The authority citation for part 148 continues to read as follows:

Authority: Secs. 3004, Resource Conservation and Recovery Act, 42 U.S.C. 6901, et seq.

2. Section 148.1 is amended by revising paragraph (d) to read as follows:

§ 148.1 Purpose, scope and applicability.

* * * * *

(d) Wastes that are hazardous only because they exhibit a hazardous characteristic, and which are otherwise prohibited under this part, or part 268 of this chapter, are not prohibited if the wastes:

(1) Are disposed into a nonhazardous or hazardous injection well as defined under 40 CFR § 146.6(a); and

(2) Do not exhibit any prohibited characteristic of hazardous waste identified in 40 CFR part 261, subpart C at the point of injection.

PART 268—LAND DISPOSAL RESTRICTIONS

3. The authority citation for part 268 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6921, and 6924.

Subpart A—General

4. In section 268.1, paragraph (c) is amended by adding paragraphs (3) and (4) to read as follows:

§ 268.1 Purpose, scope and applicability.

* * * * *

(c) * * *

(3) Wastes that are hazardous only because they exhibit a hazardous characteristic, and which are otherwise prohibited under this part, or part 148 of this chapter, are not prohibited if the wastes:

(i) Are disposed into a nonhazardous or hazardous injection well as defined under 40 CFR 146.6(a); and

(ii) Do not exhibit any prohibited characteristic of hazardous waste identified in 40 CFR part 261, subpart C at the point of injection.

(4) Wastes that are hazardous only because they exhibit a hazardous characteristic, and which are otherwise prohibited under this part, are not prohibited if the wastes meet any of the following criteria, unless the wastes are subject to a specified method of treatment other than DEACT in § 268.40, or are D003 reactive cyanide:

(i) The wastes are managed in a treatment system which subsequently discharges to waters of the U.S. pursuant to a permit issued under section 402 of the Clean Water Act; or

(ii) The wastes are treated for purposes of the pretreatment requirements of section 307 of the Clean Water Act; or

(iii) The wastes are managed in a zero discharge system engaged in Clean Water Act-equivalent treatment as defined in § 268.37(a); and

(iv) The wastes no longer exhibit a prohibited characteristic at the point of land disposal (i.e., placement in a surface impoundment).

* * * * *

5. Section 268.2 is amended by revising paragraph (j) to read as follows:

§ 268.2 Definitions applicable in this part.

* * * * *

(j) *Inorganic metal-bearing waste* is one for which EPA has established treatment standards for metal hazardous constituents, and which does not otherwise contain significant organic or cyanide content as described in § 268.3(c)(1), and is specifically listed in appendix XI of this part.

* * * * *

6. Section 268.3 is amended by revising paragraph (b) to read as follows:

§ 268.3 Dilution prohibited as a substitute for treatment.

* * * * *

(b) Dilution of wastes that are hazardous only because they exhibit a characteristic in treatment systems which include land- based units which treat wastes subsequently discharged to a water of the United States pursuant to a permit issued under section 402 of the Clean Water Act (CWA), or which treat wastes in a CWA-equivalent treatment system, or which treat wastes for the purposes of pretreatment requirements under section 307 of the CWA is not impermissible dilution for purposes of this section unless a method other than DEACT has been specified in § 268.40 as the treatment standard, or unless the waste is a D003 reactive cyanide wastewater or nonwastewater.

* * * * *

7. Section 268.39 is amended by revising paragraph (e) to read as follows:

§ 268.39 Waste specific prohibitions—spent aluminum potliners; reactive; and carbamate wastes.

* * * * *

(e) Between July 8, 1996, and April 8, 1998, the wastes included in paragraphs (a), (c), and (d) of this section may be disposed in a landfill or surface impoundment, only if such unit is in compliance with the requirements specified in § 268.5(h)(2).

* * * * *

8. Section 268.40 is amended by revising the first sentence of paragraph (a), and paragraph (e) to read as follows:

§ 268.40 Applicability of treatment standards.

(a) A prohibited waste identified in the table ''Treatment Standards for Hazardous Wastes'' may be land disposed only if it meets the requirements found in the table. * * *

* * * * *

(e) For characteristic wastes (D001–D003, and D012–D043) that are subject to treatment standards in the following table ''Treatment Standards for Hazardous Wastes,'' all underlying hazardous constituents (as defined in § 268.2(i)) must meet Universal Treatment Standards, found in § 268.48, ''Table UTS,'' prior to land disposal as defined in § 268.2(c) of this part.

* * * * *

§ 268.40 [Amended]

9. In § 268.40, the table at the end of the section is amended by removing the entries for K140, P187, P193, P195, P200, U360–U363, U368–U371, U374, U380, U388, U397–U399, U405, U406, and U408; and by revising the entries for D001–D003, D012–D043, F006, F007, F010, F037, F039, K006, K008, K062, K108, K156–K161, P093, P196, P202, U277, U365, U366, U375–U379, U381–U387, U389–U396, U400–U404, and U407; and by adding the entries for U278, U409, U410, and U411; and by adding footnotes 8 and 9 to read as follows:

* * * * *

TREATMENT STANDARDS FOR HAZARDOUS WASTES

[Note: NA means not applicable]

Waste code	Waste description and treatment/regulatory subcategory [1]	Regulated hazardous constituent		Wastewaters (Concentration in mg/l [3], or technology code [4])	Nonwastewaters (Concentration in mg/kg [5] unless noted as ''mg/l TCLP''; or technology code)
		Common name	CAS [2] No.		
D001	Ignitable Characteristic Wastes, except for the § 261.21(a)(1) High TOC Subcategory.	NA	NA	DEACT and meet § 268.48 standards;[8] or RORGS;[9] or CMBST [9].	DEACT and meet § 268.48 standards;[8] or RORGS;[9] or CMBST.[9]
	High TOC Ignitable Characteristic Liquids Subcategory based on 40 CFR 261.21(a)(1)—Greater than or equal to 10% total organic carbon. (Note: This subcategory consists of nonwastewaters only).	NA	NA	NA	RORGS;[9] or CMBST.[9]
D002	Corrosive Characteristic Wastes	NA	NA	DEACT and meet § 268.48 standards [8].	DEACT and meet § 268.48 standards [8]
	* * *	*	*	*	*
D003	Reactive Sulfides Subcategory based on 261.23(a)(5).	NA	NA	DEACT and meet § 268.48 standards [8].	DEACT and meet § 268.48 standards.[8]
	Explosives Subcategory based on 261.23(a)(6), (7), and (8).	NA	NA	DEACT and meet § 268.48 standards [8].	DEACT and meet § 268.48 standards.[8]
	Unexploded ordnance and other explosive devices which have been the subject of an emergency response.	NA	NA	DEACT	DEACT
	Other Reactives Subcategory based on 261.23(a)(1).	NA	NA	DEACT and meet § 268.48 standards [8].	DEACT and meet § 268.48 standards.[8]
	Water Reactive Subcategory based on 261.23(a)(2),(3), and (4). (Note: This subcategory consists of nonwastewaters only).	NA	NA	NA	DEACT and meet § 268.48 standards.[8]
	Reactive Cyanides Subcategory based on 261.23(a)(5).	Cyanides (Total) [7]	57–12–5	Reserved	590.[9]
		Cyanides (Amenable)[7].	57–12–5	0.86[9]	30.[9]

TREATMENT STANDARDS FOR HAZARDOUS WASTES—Continued

[Note: NA means not applicable]

Waste code	Waste description and treatment/regulatory subcategory [1]	Regulated hazardous constituent		Wastewaters (Concentration in mg/l [3], or technology code [4])	Nonwastewaters (Concentration in mg/kg [5] unless noted as "mg/l TCLP"; or technology code)
		Common name	CAS [2] No.		
*	* *	*	*	*	*
D012	Wastes that are TC for Endrin based on the TCLP in SW846 Method 1311.	Endrin	72–20–8	BIODG;[9] or CMBST [9].	0.13 and meet § 268.48 standards.[8]
		Endrin aldehyde	7421–93–4	BIODG;[9] or CMBST [9].	0.13 and meet § 268.48 standards [8]
D013	Wastes that are TC for Lindane based on the TCLP in SW846 Method 1311.	alpha-BHC	319–84–6	CARBN;[9] or CMBST [9].	0.066 and meet § 268.48 standards [8]
		beta-BHC	319–85–7	CARBN;[9] or CMBST [9].	0.066 and meet § 268.48 standards [8]
		delta-BHC	319–86–8	CARBN;[9] or CMBST [9].	0.066 and meet § 268.48 standards [8]
		gamma-BHC (Lindane).	58–89–9	CARBN;[9] or CMBST [9].	0.066 and meet § 268.48 standards [8]
D014	Wastes that are TC for Methoxychlor based on the TCLP in SW846 Method 1311.	Methoxychlor	72–43–5	WETOX [9] or CMBST [9].	0.18 and meet § 268.48 standards [8]
D015	Wastes that are TC for Toxaphene based on the TCLP in SW846 Method 1311.	Toxaphene	8001–35–2	BIODG [9] or CMBST [9].	2.6 and meet § 268.48 standards [8]
D0l6	Wastes that are TC for 2,4-D(2,4-Dichlorophenoxyacetic acid) based on the TCLP in SW846 Method 1311.	2,4-D(2,4-Dichlorophenoxyacetic acid).	94–75–7	CHOXD;[9] BIODG;[9] or CMBST [9].	10 and meet § 268.48 standards [8]
D017	Wastes that are TC for 2,4,5-TP (Silvex) based on the TCLP in SW846 Method 1311.	2,4,5-TP(Silvex)	93–72–1	CHOXD [9] or CMBST [9].	7.9 and meet § 268.48 standards [8]
D018	Wastes that are TC for Benzene based on the TCLP in SW846 Method 1311.	Benzene	71–43–2	0.14 and meet § 268.48 standards [8].	10 and meet § 268.48 standards [8]
D019	Wastes that are TC for Carbon tetrachloride based on the TCLP in SW846 Method 1311.	Carbon tetrachloride	56–23–5	0.057 and meet § 268.48 standards [8].	6.0 and meet § 268.48 standards [8]
D020	Wastes that are TC for Chlordane based on the TCLP in SW846 Method 1311.	Chlordane (alpha and gamma isomers).	57–74–9	0.0033 and meet § 268.48 standards [8].	0.26 and meet § 268.48 standards [8]
D021	Wastes that are TC for Chlorobenzene based on the TCLP in SW846 Method 1311.	Chlorobenzene	108–90–7	0.057 and meet § 268.48 standards[8].	6.0 and meet § 268.48 standards.[8]
D022	Wastes that are TC for Chloroform based on the TCLP in SW846 Method 1311.	Chloroform	67–66–3	0.046 and meet § 268.48 standards[8].	6.0 and meet § 268.48 standards.[8]
D023	Wastes that are TC for o-Cresol based on the TCLP in SW846 Method 1311.	o-Cresol	95–48–7	0.11 and meet § 268.48 standards[8].	5.6 and meet § 268.48 standards.[8]
D024	Wastes that are TC for m-Cresol based on the TCLP in SW846 Method 1311.	M-Cresol (difficult to distinguish from p-cresol).	108–39–4	0.77 and meet § 268.48 standards[8].	5.6 and meet § 268.48 standards.[8]
D025	Wastes that are TC for p-Cresol based on the TCLP in SW846 Method 1311.	p-Cresol (difficult to distinguish from m-cresol).	106–44–5	0.77 and meet § 268.48 standards[8].	5.6 and meet § 268.48 standards.[8]
D026	Wastes that are TC for Cresols (Total) based on the TCLP in SW846 Method 1311.	Cresol-mixed isomers (Cresylic acid) (sum of o-, m-, and p-cresol concentrations).	1319–77–3	0.88 and meet § 268.48 standards[8].	11.2 and meet § 268.48 standards.[8]
D027	Wastes that are TC for p-Dichloro- benzene based on the TCLP in SW846 Method 1311.	p-Dichlorobenzene (1,4-Dichlorobenzene).	106–46–7	0.090 and meet § 268.48 standards[8].	6.0 and meet § 268.48 standards.[8]
D028	Wastes that are TC for 1,2-Dichloroethane based on the TCLP in SW846 Method 1311.	1,2-Dichloroethane	107–06–2	0.21 and meet § 268.48 standard[8].	6.0 and meet § 268.48 standards.[8]

TREATMENT STANDARDS FOR HAZARDOUS WASTES—Continued

[Note: NA means not applicable]

Waste code	Waste description and treatment/regulatory subcategory [1]	Regulated hazardous constituent		Wastewaters (Concentration in mg/l [3], or technology code [4])	Nonwastewaters (Concentration in mg/kg [5] unless noted as "mg/l TCLP"; or technology code)
		Common name	CAS [2] No.		
D029	Wastes that are TC for 1,1-Dichloroethylene based on the TCLP in SW846 Method 1311.	1,1-Dichlorethylene	75–35–4	0.025 and meet § 268.48 standards[8].	6.0 and meet § 268.48 standards.[8]
D030	Wastes that are TC for 2,4-Dinitrotoluene based on the TCLP in SW846 Method 1311.	2,4-Dinitrotoluene	121–14–2	0.32 and meet § 268.48 standards[8].	140 and meet § 268.48 standards.[8]
D031	Wastes that are TC for Heptachlor based on the TCLP in SW846 Method 1311.	Heptachlor	76–44–8	0.0012 and meet § 268.48 standards[8].	0.066 and meet § 268.48 standards.[8]
		Heptachlor epoxide	1024–57–3	0.016 and meet § 268.48 standards[8].	0.066 and meet § 268.48 standards.[8]
D032	Wastes that are TC for Hexachloro- benzene based on the TCLP in SW846 Method 1311.	Hexachlorobenzene	118–74–1	0.055 and meet § 268.48 standards[8].	10 and meet § 268.48 standards.[8]
D033	Wastes that are TC for Hexachlorobutadiene based on the TCLP in SW846 Method 1311.	Hexachlorobutadiene.	87–68–3	0.055 and meet § 268.48 standards[8].	5.6 and meet § 268.48 standards.[8]
D034	Wastes that are TC for Hexachloroethane based on the TCLP in SW846 Method 1311.	Hexachloroethane ...	67–72–1	0.055 and meet § 268.48 standards[8].	30 and meet § 268.48 standards.[8]
D035	Wastes that are TC for Methyl ethyl ketone based on the TCLP in SW846 Method 1311.	Methyl ethyl ketone	78–93–3	0.28 and meet § 268.48 standard[8].	36 and meet § 268.48 standards.[8]
D036	Wastes that are TC for Nitrobenzene based on the TCLP in SW846 Method 1311.	Nitrobenzene	98–95–3	0.068 and meet § 268.48 standards[8].	14 and meet § 268.48 standards.[8]
D037	Wastes that are TC for Pentachlorophenol based on the TCLP in SW846 Method 1311.	Pentachlorophenol	87–86–5	0.089 and meet § 268.48 standards[8].	7.4 and meet § 268.48 standards.[8]
D038	Wastes that are TC for Pyridine based on the TCLP in SW846 Method 1311.	Pyridine	110–86–1	0.014 and meet § 268.48 standards[8].	16 and meet § 268.48 standards.[8]
D039	Wastes that are TC for Tetrachloroethylene based on the TCLP in SW846 Method 1311.	Tetracholorethylene	127–18–4	0.056 and meet § 268.48 standards..	6.0 and meet § 268.48 standards.[8]
D040	Wastes that are TC for Trichloroethylene based on the TCLP in SW846 Method 1311.	Trichloroethylene	79–01–6	0.054 and meet § 268.48 standards[8].	6.0 and meet § 268.48 standards.[8]
D041	Wastes that are TC for 2,4,5-Trichlorophenol based on the TCLP in SW846 Method 1311.	2,4,5-Trichlorophenol.	95–95–4	0.18 and meet § 268.48 standards[8].	7.4 and meet § 268.48 standards.[8]
D042	Wastes that are TC for 2,4,6-Trichlorophenol based on the TCLP in SW846 Method 1311.	2,4,6-Tricholorphenol.	88–06–2	0.035 and meet § 268.48 standards[8].	7.4 and meet § 268.48 standards.[8]
D043	Wastes that are TC for Vinyl chloride based on the TCLP in SW846 Method 1311.	Vinyl chloride	75–01–4	0.27 and meet § 268.48 standards[8].	6.0 and meet § 268.48 standards.[8]

[1] The waste descriptions provided in this table do not replace waste descriptions in 40 CFR 261. Descriptions of Treatment/Regulatory Subcategories are provided, as needed, to distinguish between applicability of different standards.

[2] CAS means Chemical Abstract Services. When the waste code and/or regulated constituents are described as a combination of a chemical with it's salts and/or esters, the CAS number is given for the parent compound only.

[3] Concentration standards for wastewaters are expressed in mg/l and are based on analysis of composite samples.

[4] All treatment standards expressed as a Technology Code or combination of Technology Codes are explained in detail in 40 CFR 268.42 Table 1—Technology Codes and Descriptions of Technology-Based Standards.

[5] Except for Metals (EP or TCLP) and Cyanides (Total and Amenable) the nonwastewater treatment standards expressed as a concentration were established, in part, based upon incineration in units operated in accordance with the technical requirements of 40 CFR Part 264 Subpart O or Part 265 Subpart O, or based upon combustion in fuel substitution units operating in accordance with applicable technical requirements. A facility may comply with these treatment standards according to provisions in 40 CFR 268.40(d). All concentration standards for nonwastewaters are based on analysis of grab samples.

* * * * * * *

[7] Both Cyanides (Total) and Cyanides (Amenable) for nonwastewaters are to be analyzed using Method 9010 or 9012, found in ''Test Methods for Evaluating Solid Waste, Physical/Chemical Methods'', EPA Publication SW–846, as incorporated by reference in 40 CFR 260.11, with a sample size of 10 grams and a distillation time of one hour and 15 minutes.

[8] These wastes, when rendered nonhazardous and then subsequently managed in CWA, CWA-equivalent, or Class I SDWA systems are not subject to treatment standards. (See § 148.1(d) and § 268.1(c) (3) and (4)).

[9] These wastes, when rendered nonhazardous and then subsequently injected in a Class I SDWA well are not subject to treatment standards. (See § 148.1(d)).

10. In subpart D, § 268.48 the table in paragraph (a) is revised to read as follows:

§ 268.48 Universal treatment standards.

(a) * * *

40 CFR Part 279

[FRL–5529–1]

Hazardous Waste Management System; Identification and Listing of Hazardous Waste; Recycled Used Oil Management Standards

AGENCY: Environmental Protection Agency.

ACTION: Final rule, notice of judicial vacatur of administrative stay.

SUMMARY: On January 19, 1996, the United States Court of Appeals for the District of Columbia Circuit vacated the Environmental Protection Agency's (EPA) October 30, 1995, administrative stay of part of the regulatory provision, known as the ''used oil mixture rule', set forth in 40 CFR 279.10(b)(2). The provisions of the used oil mixture rule at issue relate to mixtures of used oil destined for recycling and characteristic hazardous waste (including waste listed as hazardous because it exhibits a hazardous waste characteristic). This action clarifies the regulatory status of mixtures of used oil and the hazardous wastes destined for recycling described above in light of the Court's vacatur of the administrative stay and eliminates the explanatory note to 40 CFR 279.10(b)(2) that was included in the notice of the administrative stay. In addition it notifies the public as to the provisions of a recent EPA proposal that may affect such mixtures.

EFFECTIVE DATE: June 28, 1996.

ADDRESSES: EPA does not seek comment on this notice, however any data the public wishes EPA to consider concerning mixtures of used oil and characteristic hazardous waste should be submitted to the public docket. Submissions should include the original and two copies, should reference docket No. F–96–U2SW–FFFFF, and should be addressed to: RCRA Docket Information Center, Office of Solid Waste (5305W), U.S. Environmental Protection Agency Headquarters, 401 M Street, SW., Washington, DC 20460. Hand deliveries should be made to the RCRA Information Center (RIC), located at Crystal Gateway I, First Floor, 1235 Jefferson Davis Highway, Arlington, VA. The RIC is open from 9:00 to 4:00, Monday through Friday, except federal holidays. To review docket materials at the RIC, it is recommended that the public make an appointment by calling 703 603–9230. The public may copy a maximum of 100 pages from any regulatory docket at no charge. Additional copies cost $.15 per page.

FOR FURTHER INFORMATION CONTACT: For general information contact the RCRA Hotline at 800 424–9346 or TDD 800 553–7672 (hearing impaired). In the Washington D.C. metropolitan area at 703 412–9810 or TDD 703 412–3323. For more detailed information on specific aspects of this action, contact Tracy Bone, Office of Solid Waste (5304w), U.S. EPA, D.C., 20460 at 703 308–8826.

SUPPLEMENTARY INFORMATION:

Background Information

Legal Challenge to the Used Oil Mixture Rule. On September 10, 1992, EPA promulgated regulations pursuant to section 3014(a) of the Resource Conservation and Recovery Act (RCRA), 42 U.S.C. 6935(a), governing the management of used oil destined for recycling. 57 FR 41566 (September 9, 1992). These regulations are codified at 40 CFR Part 279. As part of these regulations, EPA promulgated a used oil mixture rule, 40 CFR 279.10(b), that specifies when mixtures of used oil destined for recycling and hazardous waste are regulated as used oil and when they are regulated as hazardous waste. Among other things, the used oil mixture rule specifies that mixtures of used oil destined for recycling and characteristic hazardous waste are regulated as a hazardous waste under Subtitle C of RCRA only if the resultant mixture exhibits a hazardous waste characteristic. 40 CFR 279.10(b)(2)(I). If the mixture does not exhibit a hazardous waste characteristic, it is regulated under the used oil management standards, and the hazardous waste regulations (including those relating to land-disposal restrictions (LDRs)) are inapplicable to the mixture. Further, wastes which are hazardous solely because they exhibit the characteristic of ignitability may be mixed with used oil and the mixture regulated as used oil so long as the mixture does not exhibit the characteristic of ignitability (despite exhibiting any of the other characteristics). 40 CFR 279.10(b)(2)(ii)-(iii). The hazardous waste regulations and LDR requirements continue to apply to the hazardous waste prior to mixing with used oil.

Petitions for review challenging EPA's used oil mixture rule subsequently were filed in the United States Court of Appeals for the District of Columbia Circuit. Petitioners argued, in relevant part, that the provision of the management standards which governed mixtures of recycled used oil and characteristic hazardous waste was inconsistent with the Court's decision in *Chemical Waste Management, Inc.* v. *EPA,* 976 F.2d 2 (D.C. Cir. 1992), *cert. denied,* 113 S. Ct. 1961 (1993) (''Chem Waste''). *Chem Waste,* which was issued two weeks after the management standards were promulgated, held that EPA could not allow certain wastes exhibiting the hazardous characteristics of ignitability, reactivity, or corrosivity to be diluted to eliminate the characteristic and then be land-disposed unless the hazardous constituents in the waste were adequately treated to minimize threats to human health and the environment.

On September 12, 1994, petitioner, Safety-Kleen, and EPA filed a joint motion requesting the Court to vacate the mixture provision and remand the issue to EPA. Intervenors in the *Safety-Kleen* litigation opposed this motion. On September 15, 1994, the Court remanded the record in this matter to EPA, stating: ''If the EPA determines that its rule is invalid, [citation omitted], it can proceed accordingly.'' Order (Sept. 15, 1994) (citing *American Tele. & Telegraph Co.* v. *FCC,* 978 F.2d 727, 733 (D.C. Cir. 1992)). The Court did not vacate the mixture rule.

Administrative Stay of the Used Oil Mixture Rule. In 1995, EPA issued an order staying the used oil mixture rule. The Agency determined that a stay was necessary to the effective implementation of the recycled used oil management program, pending the Agency's completion of a rulemaking on the issue of whether the used oil mixture rule should be modified or repealed in light of the Court's decision in *Chem Waste.* See 60 FR 55202 (Oct. 30, 1995).

On January 19, 1996, the Court, in ruling on a motion filed by the intervenors, vacated the Administrative stay. The Court explained that EPA could not suspend a promulgated rule without notice and comment. The Court further noted that, if EPA determines that the used oil mixture rule is invalid, it may be able to rely on the good cause exception, 5 U.S.C. 553(b), to vacate the rule without notice and comment rulemaking.

Effect of the Court's Vacatur of the Administrative Stay. The vacatur of the administrative stay reinstates the used oil mixture rule found at 40 CFR 279.10(b)(2) as part of the federal used oil management standards. Accordingly, as a matter of federal RCRA law, the regulated community may mix certain characteristic hazardous wastes and used oil to be recycled (*e.g.*, mixtures of solvents compatible with the use of

Emergency Revision of the Land Disposal Restrictions (LDR) Phase III Treatment Standards for Listed Hazardous Wastes From Carbamate Production

AGENCY: Environmental Protection Agency (EPA, the Agency).

ACTION: Immediate final rule.

SUMMARY: On April 8, 1996, EPA published treatment standards (the ''Phase III'' final rule) for a number of hazardous wastes associated with the production of carbamate pesticides (''carbamate wastes'') (61 FR 15566, April 8, 1996). The treatment standards were expressed as levels of chemical constituents that had to be measured in treatment residues before land disposal. They became effective July 8, 1996.

The Agency recently has become aware, however, of a serious analytic monitoring problem associated with the carbamate constituent treatment standards. Laboratory standards (chemicals used to calibrate laboratory instruments) do not exist for every carbamate constituent. Since commercial laboratories currently are unable to analyze all of the carbamate waste constituents, treatment facilities cannot certify that the LDR treatment standards have been achieved. Today's final rule revises the carbamate waste treatment standards for one year from the date of publication by allowing carbamate wastes to be treated either by any technology which achieves the constituent concentration levels promulgated in the Phase III rule, or by treatment technologies specified in this final rule as alternative treatment standards. This rule also suspends the requirement to treat carbamate waste constituents when they are expected to be present in ignitable, corrosive, reactive or toxic hazardous wastes as ''underlying hazardous constituents.''

The Agency believes that these temporary alternative treatment standards will assure that carbamate wastes are adequately treated prior to land disposal, while providing time for analytic chemical standards to be developed. At the end of the year EPA expects that laboratories will be able to perform the analyses necessary to measure compliance with treatment levels. At that time, therefore, the LDR treatment standards for carbamate wastes will revert to those originally promulgated in the Phase III rule.

EFFECTIVE DATE: August 26, 1996.

ADDRESSES: Supporting materials are available for viewing in the RCRA Information Center (RIC), located at Crystal Gateway One, 1235 Jefferson Davis Highway, First Floor, Arlington, VA. The Docket Identification Number is F–96–P32F–FFFFF. The RIC is open from 9 a.m. to 4 p.m., Monday through Friday, except for Federal holidays. The public must make an appointment to review docket materials by calling (703) 603–9230. The public may copy a maximum of 100 pages from any regulatory document at no cost. Additional copies cost $0.15 per page.

FOR FURTHER INFORMATION CONTACT: For general information contact the RCRA Hotline at 800–424–9346 (toll-free) or 703–412–9810 locally. For technical information on the carbamate treatment standards, contact Shaun McGarvey in the Office of Solid Waste, phone 703–308–8603. For specific information about this rule, contact Rhonda Craig, phone 703–308–8771.

SUPPLEMENTARY INFORMATION:

I. Background

The Phase III final rule established treatment standards for 64 listed hazardous wastes associated with carbamate pesticide production (61 FR 15583; see also the attached appendix for the list of carbamate wastes). The treatment standards were at Universal Treatment Standard (UTS) levels for 21 of the constituents of concern (16 organic constituents and 5 metals), and at newly-established levels for 42 other constituents that were added to the UTS list.

The wastewater standards for the 42 new constituents were based on data developed by the Office of Water for the development of effluent guideline limitations, or on data transferred from other UTS constituents. These data reflected performance of biodegradation, combustion, carbon adsorption, or chemical oxidation.

There were no sampling data from treatment of carbamate nonwastewaters at the time treatment standards were being developed; thus, the nonwastewater treatment standard levels were calculated using analytical detection limits, based on EPA's experience that combustion technologies destroy organic constituents to nondetectable levels. To account for variability, the treatment standards were based on the detection limit for the waste constituent times a variability factor. (See BDAT Background Document for Carbamates at 4–4 through 4–9.)

During the comment period for the Phase III proposed rule, EPA became aware that commenters thought a number of the 42 constituents with newly-established UTS levels did not have EPA-recommended analytical methods for measuring compliance. Furthermore, some commenters noted that laboratory standards were not available for some of the constituents. Thus, laboratories would not be able to calibrate their instruments to measure compliance with treatment standards for those constituents. EPA responded that analytical methods had been recommended for all carbamate waste constituents, and that analytical standards were expected to become available prior to the Phase III effective date, as laboratories geared up for the new regulation.

After EPA published the Phase III rule on April 8, 1996, but shortly before the treatment standards took effect on July 8, several companies in the waste management industry again contacted EPA reporting that analytic laboratory standards were in fact not available for some of the carbamate waste constituents. The Agency contacted several laboratories (see Memorandum to the Docket from Shaun McGarvey, EPA, August 1, 1996). EPA now agrees that the waste management industry was unintentionally left in a quandary: they were required to certify compliance with the carbamate waste treatment standards but commercial laboratories indicated that they were only able to perform the necessary analyses for some of the newly regulated constituents. Thus, it would be impossible to document that the treatment standards were or were not achieved for those constituents which cannot be analyzed.

The problem was complicated by the LDR rules that pertain to regulation of underlying hazardous constituents (UHCs) in characteristic (or formerly characteristic) hazardous wastes. Because 42 new carbamate constituents have been added to the UTS list (61 FR 15584), they thus become UHCs. Under the regulations published on May 24, 1993 (the ''Emergency Rule,'' 58 FR 29860; codified at 40 CFR 268.2(i), 268.7(a) and 268.9), and on September 19, 1994 (Phase II Rule, 59 FR 47982; same citations as above), whenever a generator sends a characteristic (or formerly-characteristic) waste to a treatment facility, they must identify for treatment not only the hazardous characteristic, but also all UHCs reasonably expected to be present in the waste at the point of generation. Because of the lack of laboratory

standards for all carbamate constituents, generators could not in all cases identify the UHCs reasonably expected to be present in their wastes, and treatment facilities and EPA could not monitor compliance with the standards for the carbamate UHCs.

II. The Revised Carbamate Treatment Standards

This final rule establishes temporary treatment standards for carbamate wastes for a one-year period. EPA believes that one year is sufficient time for laboratory standards to be developed and for laboratories to take appropriate steps to do the necessary analyses for these wastes. The temporary alternative treatment standards will be in effect for one year from the date of publication of this final rule.

The Phase III rule required treatment of carbamate wastes to UTS levels. The temporary alternative standards being promulgated today provide waste handlers with a choice of meeting the Phase III treatment levels, or of using a specified treatment technology. Combustion is the specified technology for nonwastewaters; combustion, biodegradation, chemical oxidation, and carbon adsorption are the specified technologies for wastewaters. These technologies are defined at 40 CFR 268.42, Table 1 (see technology codes: BIODG, CARBN, CHOXD, and CMBST). If the wastes are treated by a specified technology, there is no requirement to measure compliance with treatment levels (thus the analytical problems are avoided). Because the performance of these Best Demonstrated Available Technologies (BDATs) was the basis of the originally promulgated treatment levels, EPA believes that temporarily allowing the use of these BDATs—without a requirement to monitor the treatment residues—fully satisfies the core requirement of the LDR program: hazardous wastes must be effectively treated before they are land disposed.

EPA considered completely replacing the carbamate treatment standard levels with specified treatment methods, rather than providing the alternative approach being promulgated in this rule. EPA decided it was better to retain the treatment levels (along with the alternative treatment methods) and let the regulated community decide which treatment standards to meet. EPA believes that it is important to retain the treatment levels because laboratories may be ready to analyze all carbamate waste constituents before the end of the year. Furthermore, it is possible that a carbamate waste would not contain any of the problem constituents that cannot be analyzed at this time. Thus compliance with the treatment levels for such a waste could easily be measured.

The Agency's preference, ultimately, is to establish only constituent treatment standard levels for these wastes. The Agency believes that compliance with treatment levels provides maximum flexibility in selecting treatment technologies, while ensuring that the technologies are optimally operated to achieve full waste treatment. Therefore, the alternative specified treatment technologies only temporarily satisfy the LDR treatment standards. The treatment standards will revert exclusively to treatment levels at the end of one year.

The Agency is also temporarily suspending inclusion of carbamate waste constituents on the UTS list at 40 CFR 268.48. Not including these constituents on the UTS list elimiantes the need to identify and treat them, and monitor compliance with their UTS levels, when they are present as UHCs in characteristic hazardous wastes.

The Agency believes that suspending the carbamate constituents from the UTS list will not have adverse environmental consequences because it will be in effect for only one year. Furthermore, EPA found in the Phase III rulemaking that these constituents are unlikely to occur in wastes generated outside the carbamate production industry (61 FR 15584, April 8, 1996), so today's rule may not cause an adverse environmental impact because carbamate constituents simply are not present in most characteristic hazardous wastes.

III. Good Cause for Foregoing Notice and Comment Requirements

This final rule is being issued without notice and opportunity for public comment. Under the Administrative Procedure Act (APA), 5 U.S.C. 553(b)(B), an agency may forgo notice and comment in promulgating a rule when, according to the APA, the agency for good cause finds (and incorporates the finding and a brief statement of the reasons for that finding into the rules issues) that notice and public comments procedures are impracticable, unnecessary, or contrary to the public interest. For the reasons set forth below, EPA believes it has good cause to find that notice and comment would be unnecessary and contrary to the public interest, and therefore is not required by the APA.

First, the Agency has discovered an unanticipated unavailability of analytic laboratory standards for a number of the carbamate waste constituents covered by the Phase III rule. As a practical matter, therefore, members of the regulated community cannot fully document compliance with the requirements of the treatment standard through no fault of their own. For the same reason, EPA cannot ascertain compliance for these constituents.

In addition, this unavailability of analytic standards is likely to create a serious disruption in the production of at least some carbamate pesticides. Although the treatment of the restricted carbamate wastes through biodegradation, carbon adsorption, chemical oxidation (for wastewaters), and combustion is both possible and highly effective, certification that the treatment actually meets the treatment standard levels may not be possible in many instances. Without the certification, disposal of the residuals left after treatment cannot legally occur. The Agency believes this situation will quickly impede production of certain pesticides, since legal disposal of some carbamate wastes will no longer be available. *See Steel Manufacturers Ass'n* v. *EPA,* 27 F.3d 642, 646–47 (D.C. Cir. 1994) (absence of a treatment standard providing a legal means of disposing of wastes from a process is equivalent to shutting down that process). With regard to the suspension of certain carbamates as underlying hazardous constituents in characteristic (and formerly-characteristic) prohibited wastes, the Agency believes that the same practical difficulties described for listed carbamate wastes would be created.

Finally, today's rule merely removes, on a temporary basis, an administrative hurdle that would impede sound management of certain hazardous wastes. By altering the treatment standard to allow certification of compliance, the Agency can ensure that treatment through use of the BDAT basis of the treatment standard levels actually occurs without delay.

Consequently, EPA today is preserving the core of the promulgated Phase III rule by ensuring that the restricted carbamate wastes are treated by a BDAT before they are land disposed. At the same time, EPA is eliminating the situation which could halt production of carbamate pesticides. For these reasons, EPA believes there is good cause to issue the rule immediately without prior notice and opportunity for comment.

IV. Rationale for Immediate Effective Date

The Agency believes that the regulated community is in the untenable position of having to comply with treatment standards for which there is not an analytical way to measure

compliance. Therefore, it is imperative that relief be immediately provided from those treatment standards. In addition, today's rule does not create additional regulatory requirements; rather, it provides greater flexibility for compliance with treatment standards. For these reasons, EPA finds that good cause exists under section 3010(b)(3) of RCRA, 42 U.S.C. 6903(b)(3), to provide for an immediate effective date. See generally 61 FR at 15662. For the same reasons, EPA finds that there is good cause under 5 U.S.C. 553(b)(3) to waive the requirement that regulations be published at least 30 days before they become effective.

V. Analysis Under Executive Order 12866, the Unfunded Mandates Reform Act of 1995, the Regulatory Flexibility Act, and the Paperwork Reduction Act

This final rule does not create new regulatory requirements; rather, it provides a temporary alternative means to comply with the treatment standards already promulgated. Therefore, this final rule is not a ''significant'' regulatory action within the meaning of Executive Order 12866.

Title II of the Unfunded Mandates Reform Act of 1995 (UMRA), Public Law 104–4, establishes requirements for Federal agencies to assess the effects of their regulatory actions on State, local, and tribal governments and the private sector. Under section 202 of the UMRA, EPA generally must prepare a written statement, including a cost-benefit analysis, for proposed and final rules with ''Federal mandates'' that may result in expenditures to State, local, and tribal governments, in the aggregate, or to the private sector, of $100 million or more in any one year. Before promulgating an EPA rule for which a written statement is needed, section 205 of the UMRA generally requires EPA to identify and consider a reasonable number of regulatory alternatives and adopt the least costly, most cost-effective or least burdensome alternative that achieves the objectives of the rule. The provisions of section 205 do not apply when they are inconsistent with applicable law. Moreover, section 205 allows EPA to adopt an alternative other than the least costly, most cost-effective or least burdensome alternative if the Administrator publishes with the final rule an explanation why that alternative was not adopted. Before EPA establishes any regulatory requirements that may significantly or uniquely affect small governments, including tribal governments, it must have developed under section 203 of the UMRA a small government agency plan. The plan must provide for notifying potentially affected small governments, enabling officials of affected small governments to have meaningful and timely input in the development of EPA regulatory proposals with significant Federal intergovernmental mandates, and informing, educating, and advising small governments on compliance with the regulatory requirements.

Today's rule contains no Federal mandates (under the regulatory provisions of Title II of the UMRA) for State, local, or tribal governments or the private sector, and does not impose any Federal mandate on State, local, or tribal governments or the private sector within the meaning of the Unfunded Mandates Reform Act of 1995. This final rule does not create new regulatory requirements; rather, it provides a temporary alternative means to comply with the treatment standards already promulgated. EPA has determined that this rule does not contain a Federal mandate that may result in expenditures of $100 million or more for State, local, and tribal governments, in the aggregate, or the private sector in any one year. Thus, today's rule is not subject to the requirements of sections 202 and 205 of the UMRA. For the same reasons, EPA has determined that this rule contains no regulatory requirements that might significantly or uniquely affect small governments.

EPA has determined that this rule will not have a significant economic impact on a substantial number of small entities. EPA recognizes that small entities may own and/or operate carbamate pesticide manufacturing operations or TSDFs that will become subject to the requirements of the land disposal restrictions program. However, since such small entities are already subject to the requirements in 40 CFR part 268, this rule does not impose any additional burdens on these small entities, because this rule does not create new regulatory requirements. Rather, it provides a temporary alternative means to comply with the treatment standards already promulgated.

Therefore, EPA provides the following certification under the Regulatory Flexibility Act, as amended by the Small Business Regulatory Enforcement Fairness Act. Pursuant to the provision at 5 U.S.C. 605(b), I hereby certify that this final rule will not have a significant economic impact on a substantial number of small entities. It does not impose any new burdens on small entities. This rule, therefore, does not require a regulatory flexibility analysis.

Today's rule does not contain any new information collection requirements subject to OMB review under the Paperwork Reduction Act of 1980, 44 U.S.C. 3501 *et seq.* Because there are no new information collection requirements in today's rule, an Information Collection Request has not been prepared.

VI. Submission to Congress and the General Accounting Office

Under 5 U.S.C. 801(a)(1)(A) as added by the Small Business Regulatory Enforcement Fairness Act of 1996, EPA submitted a report containing this rule and other required information to the U.S. Senate, the U.S. House of Representatives and the Comptroller General of the General Accounting Office prior to publication of the rule in today's Federal Register. This rule is not a ''major rule'' as defined by 5 U.S.C. 804(2).

VII. State Authority

A. Applicability of Rule in Authorized States

Under section 3006 of RCRA, EPA may authorize qualified States to administer and enforce the RCRA program within the State. Following authorization, EPA retains enforcement authority under sections 3008, 3013, and 7003 of RCRA, although authorized States have primary enforcement responsibility. The standards and requirements for authorization are found in 40 CFR Part 271.

Prior to HSWA, a State with final authorization administered its hazardous waste program in lieu of EPA administering the Federal program in that State. The Federal requirements no longer applied in the authorized State, and EPA could not issue permits for any facilities that the State was authorized to permit. When new, more stringent Federal requirements were promulgated or enacted, the State was obliged to enact equivalent authority within specified time frames. New Federal requirements did not take effect in an authorized State until the State adopted the requirements as State law.

In contrast, under RCRA section 3006(g) (42 U.S.C. 6926(g)), new requirements and prohibitions imposed by HSWA take effect in authorized States at the same time that they take effect in unauthorized States. EPA is directed to carry out these requirements and prohibitions in authorized States, including the issuance of permits, until the State is granted authorization to do so.

Today's rule is being promulgated pursuant to section 3004(m), of RCRA (42 U.S.C. 6924(m)). Therefore, the Agency is adding today's rule to Table 1 in 40 CFR 271.1(j), which identifies

the Federal program requirements that are promulgated pursuant to HSWA. States may apply for final authorization for the HSWA provisions in Table 1, as discussed in the following section of this preamble.

B. Effect on State Authorization

As noted above, EPA will implement today's rule in authorized States until they modify their programs to adopt these rules and the modification is approved by EPA. Because today's rule is promulgated pursuant to HSWA, a State submitting a program modification may apply to receive interim or final authorization under RCRA section 3006(g)(2) or 3006(b), respectively, on the basis of requirements that are substantially equivalent or equivalent to EPA's. The procedures and schedule for State program modifications for final authorization are described in 40 CFR 271.21. All HSWA interim authorizations will expire January 1, 2003. (See § 271.24 and 57 FR 60132, December 18, 1992.)

In general, EPA recommends that States pay close attention to the sunset date for today's rule. If States are adopting the Phase III rule before the sunset date of today's rule, and applying for authorization, EPA strongly encourages these States to adopt today's rule when they adopt the April 8, 1996, Phase III rule. States should note that after the sunset date, the provisions of this rule will be considered less stringent. Thus, States would be barred under section 3009 of RCRA, from adopting this rule after the date one year from the date of publication of today's rule, and would not be able to receive authorization for it. States that are planning to adopt and become authorized for today's rule and the Phase III rule should factor the sunset date into their rulemaking activities.

Appendix to Preamble —List of Regulated Carbamate Wastes

K156—Organic waste (including heavy ends, still bottoms, light ends, spent solvents, filtrates, and decantates) from the production of carbamates and carbamoyl oximes.
K157—Wastewaters (including scrubber waters, condenser waters, washwaters, and separation waters) from the production of carbamates and carbamoyl oximes.
K158—Bag house dust, and filter/separation solids from the production of carbamates and carbamoyl oximes.
K159—Organics from the treatment of thiocarbamate wastes.
K160—Solids (including filter wastes, separation solids, and spent catalysts) from the production of thiocarbamates and solids from the treatment of thiocarbamate wastes.
K161—Purification solids (including filtration, evaporation, and centrifugation solids), baghouse dust, and floor sweepings from the production of dithiocarbamate acids and their salts. (This listing does not include K125 or K126.)
P203 Aldicarb sulfone
P127 Carbofuran
P189 Carbosulfan
P202 m-Cumenyl methylcarbamate
P191 Dimetilan
P198 Formetanate hydrochloride
P197 Formparanate
P192 Isolan
P196 Manganese dimethyldithiocarbamate
P199 Methiocarb
P190 Metolcarb
P128 Mexacarbate
P194 Oxamyl
P204 Physostigmine
P188 Physostigmine salicylate
P201 Promecarb
P185 Tirpate
P205 Ziram
U394 A2213
U280 Barban
U278 Bendiocarb
U364 Bendiocarb phenol
U271 Benomyl
U400 Bis(pentamethylene)thiuram tetrasulfide
U392 Butylate
U279 Carbaryl
U372 Carbendazim
U367 Carbofuran phenol
U393 Copper dimethyldithiocarbamate
U386 Cycloate
U366 Dazomet
U395 Diethylene glycol, dicarbamate
U403 Disulfiram
U390 EPTC
U407 Ethyl Ziram
U396 Ferbam
U375 3–Iodo-2-propynyl n-butylcarbamate
U384 Metam Sodium
U365 Molinate
U391 Pebulate
U383 Potassium dimethyl dithiocarbamate
U378 Potassium n-hydroxymethyl-n-methyldithiocarbamate
U377 Potassium n-methyldithiocarbamate
U373 Propham
U411 Propoxur
U387 Prosulfocarb
U376 Selenium, tetrakis (dimethyldithiocarbamate)
U379 Sodium dibutyldithiocarbamate
U381 Sodium diethyldithiocarbamate
U382 Sodium dimethyldithiocarbamate
U277 Sulfallate
U402 Tetrabutylthiuram disulfide
U401 Tetramethylthiuram monosulfide
U410 Thiodicarb
U409 Thiophanate-methyl
U389 Triallate
U404 Triethylamine
U385 Vernolate

List of Subjects

40 CFR Part 268

Hazardous waste, Reporting and recordkeeping requirements.

40 CFR Part 271

Administrative practice and procedure, Hazardous materials transportation, Hazardous waste, Penalties, Reporting and recordkeeping requirements.

Dated: August 20, 1996.

Carol M. Browner,

Administrator.

For the reasons set forth in the preamble, title 40, chapter I of the Code of Federal Regulations is amended as follows:

PART 268—LAND DISPOSAL RESTRICTIONS

1. The authority citation for part 268 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6921, and 6924.

Subpart D—Treatment Standards

2. Section 268.40 is amended by adding paragraph (g) and by revising in the table ''Treatment Standards for Hazardous Wastes'' the entries for K156–K161, P127, P128, P185, P188–P192, P194, P196–P199, P201–P205, U271, U277–U280, U364–U367, U372, U373, U375–U379, U381–U387, U389–U396, U400–U404, U407, and U409–U411; to read as follows:

§ 268.40 Applicability of treatment standards.

* * * * *

(g) Between August 26, 1996 and August 26, 1997 the treatment standards for the wastes specified in 40 CFR 261.32 as EPA Hazardous Waste numbers K156–K161; and in 40 CFR 261.33 as EPA Hazardous Waste numbers P127, P128, P185, P188–P192, P194, P196–P199, P201–P205, U271, U277–U280, U364–U367, U372, U373, U375–U379, U381–U387, U389–U396, U400–U404, U407, and U409–U411; and soil contaminated with these wastes; may be satisfied by either meeting the constituent concentrations presented in the table ''Treatment Standards for Hazardous Wastes'' in this section, or by treating the waste by the following technologies: combustion, as defined by the technolgy code CMBST at § 268.42 Table 1, for nonwastewaters; and, biodegradation as definded by the technolgy code BIODG, carbon adsorption as defined by the technology code CARBN, chemical oxidation as defined by the technology code CHOXD, or combustion as defined as technolgy code CMBST at § 268.42 Table 1, for wastewaters.

TREATMENT STANDARDS FOR HAZARDOUS WASTES

[Note: NA means not applicable]

Waste code	Waste description and treatment/regulatory subcategory [1]	Regulated hazardous constituent		Wastewaters	Nonwastewaters
		Common name	CAS [2] No.	Concentration in mg/l [3]; or technology code [4]	Concentration in mg/kg [5] unless noted as "mg/l TCLP" or technology code
*	* *	* * *		*	
K156	Organic waste (including heavy ends, still bottoms, light ends, spent solvents, filtrates, and decantates) from the production of carbamates and carbamoyl oximes [10].	Acetonitrile	75–05–8	5.6	1.8
		Acetophenone	96–86–2	0.010	9.7

Notes to the Table:

[1] The waste descriptions provided in this table do not replace waste descriptions in 40 CFR part 261. Descriptions of Treatment/Regulatory Subcategories are provided, as needed, to distinguish between applicability of different standards.

[2] CAS means Chemical Abstract Services. When the waste code and/or regulated constituents are described as a combination of a chemical with its salts and/or esters, the CAS number is given for the parent compound only.

[3] Concentration standards for wastewaters are expressed in mg/l and are based on analysis of composite samples.

[4] All treatment standards expressed as a Technology Code or combination of Technology Codes are explained in detail in 40 CFR 268.42 Table 1—Technology Codes and Descriptions of Technology-Based Standards.

[5] Except for Metals (EP or TCLP) and Cyanides (Total and Amenable) the nonwastewater treatment standards expressed as a concentration were established, in part, based upon incineration in units operated in accordance with the technical requirements of 40 CFR Part 264, Subpart O, or Part 265, Subpart O, or based upon combustion in fuel substitution units operating in accordance with applicable technical requirements. A facility may comply with these treatment standards according to provisions in 40 CFR 268.40(d). All concentration standards for nonwastewaters are based on analysis of grab samples.

* * * * * * *

[10] Between August 26, 1996 and August 27, 1997, the treatment standard for this waste may be satisfied by either meeting the constituent concentrations if this table or by treating the waste by the specified technologies: combustion, as defined by the technology code CMBST at § 268.42 Table 1, for nonwastewaters; and, biodegradation as defined by the technology code BIODG, carbon adsorption as defined by the technology code CARBN, chemical oxidation as defined by the technology code CHOXD, or combustion as defined as technology code CMBST at § 268.42 Table 1, for wastewaters.

4. In § 268.48, the table in paragraph (a) is amended by adding footnote number ''[6]'' in column one, under the heading *Regulated Constituents/ Common Name,* under I. Organic constituents, after the following chemical names: ''2213''; ''Aldicarb sulfone''; ''Barban''; ''Bendiocarb''; ''Bendiocarb phenol''; ''Benomyl''; ''Butylate''; ''Carbaryl''; ''Carbenzadim''; ''Carbofuran''; ''Carbofuran phenol''; ''Carbosulfan''; ''m-Cumenyl methylcarbamate''; ''Cycloate''; ''Diethylene glycol, dicarbamate''; ''Dimetilan''; ''Dithiocarbamates (total)''; ''EPTC''; ''Formetanate hydrochloride''; ''Formparanate''; ''3-Iodo-2-propynyl n-butylcarbamate''; ''Isolan''; ''Methiocarb''; ''Methomyl''; ''Metolcarb''; ''Mexacarbate''; ''Molinate''; ''Oxamyl''; ''Pebulate''; ''o-Phenylenediamine''; ''Physostigmine''; ''Physostigmine salicylate''; ''Promecarb''; ''Propham''; ''Propoxur''; ''Prosulfocarb''; ''Thiodicarb''; ''Thiophanate-methyl''; ''Tirpate''; ''Triallate''; ''Triethylamine''; and, ''Vernolate''; and adding footnote [6] at the end of the table to read as follows:

§ 268.48 Universal treatment standards.

(a) * * *

[6] Between August 26, 1996 and August 26, 1997, these constituents are not underlying hazardous constituents as defined at § 268.2(i).

PART 271—REQUIREMENTS FOR AUTHORIZATION OF STATE HAZARDOUS WASTE PROGRAMS

5. The authority citation for part 271 continues to read as follows:

Authority: 42 U.S.C. 9602; 33 U.S.C. 1321 and 1361.

Subpart A—Requirements for Final Authorization

6. Section 271.1(j) is amended by adding the following entry to Table 1 in chronological order by date of publication in the Federal Register to read as follows:

§ 271.1 Purpose and scope.

Environmental Protection Agency

40 CFR Part 268

Land Disposal Restrictions: Correction of Tables; Treatment Standards for Hazardous Waste and Universal Treatment Standards; Final Rule

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 268

[EPA #530–296–002; FRL–5681–4]

RIN 2050–AD38

Land Disposal Restrictions: Correction of Tables; Treatment Standards for Hazardous Wastes and Universal Treatment Standards

AGENCY: Environmental Protection Agency (EPA).

ACTION: Technical amendment of final rule.

SUMMARY: On April 8, 1996, EPA published Land Disposal Restrictions Phase III; Final Rule and Partial Withdrawal and Amendment of Final Rule, including the complete tables ''Treatment Standards for Hazardous Wastes'' at § 268.40, and ''Universal Treatment Standards'' at § 268.48. The Agency is today publishing updated and corrected versions of these two tables, incorporating all revisions to the treatment standards promulgated since the Phase III Final Rule. The updated tables also incorporate additional technical corrections which the Agency is making today, including the removal of treatment standards for the 25 waste codes whose listings were vacated by the November 1, 1996 court decision, *Dithiocarbamate Task Force* v. *Environmental Protection Agency* (DTC Court Case), *F.3d (D.C.Cir. November 1, 1996).* These corrected tables will eliminate confusion as to what levels of treatment must be achieved by the regulated community as they comply with the LDR requirements.

EFFECTIVE DATE: This rule is effective on February 19, 1997.

ADDRESSES: Supporting materials are available for viewing in the RCRA information Center (RIC), located at Crystal Gateway One, 1235 Jefferson Davis Highway, First Floor, Arlington, VA. The Docket Identification Number is F–96–PH3F–FFFFF. The RCRA Docket is open from 9 a.m. to 4 p.m. Monday through Friday, except for Federal holidays. The public must make an appointment to review docket materials by calling (703) 603–9230. The public may copy a maximum of 100 pages from any regulatory document at no cost. Additional copies cost $0.15 per page.

FOR FURTHER INFORMATION CONTACT: For general information contact the RCRA Hotline at (800) 424–9346 (toll free) or (703) 920–9810 in the Washington, DC metropolitan area. For information on this document contact Shaun McGarvey (5302W), Office of Solid Waste, 401 M Street, S.W., Washington, DC 20460, (703) 308–8603.

SUPPLEMENTARY INFORMATION:

I. Reasons and Basis for Today's Amendment

The Agency has received comments from the regulated community and State agencies pointing out mistakes in the ''Treatment Standards for Hazardous Wastes'' table at 40 CFR 268.40 and the ''Universal Treatment Standards'' table at 40 CFR 268.48, published in the April 8, 1996 Land Disposal Restrictions (LDR) Phase III Final Rule (61 FR 15566) that were not addressed by Phase III: Technical correction of final rule (June 28, 1996, 61 FR 33680). Today's amendment addresses these comments, makes further technical corrections where necessary, and incorporates all revisions and corrections made since the Phase III Final Rule into complete and updated versions of these tables.

Today's amendment corrects all the errors that are considered appropriate for correction without notice and comment. The Agency is aware of certain other issues or problems that may be addressed at a later time, with notice and comment as appropriate. An example is that the rules currently specify that compliance with LDR standards is be measured using ''grab samples'' (see 40 CFR 268.40, the table ''Treatment Standards for Hazardous Wastes'', footnote 5). We note that some data used to develop standards for some of the constituents required for K061 were derived from composite samples from high temperature metal recovery (HTMR) facilities, and it would not be appropriate to require HTMR facilities to comply with the standards for those constituents using grab samples. We plan to correct this problem in the near future.

II. Incorporating Revisions Since the LDR Phase III Final Rule

The updated versions of the tables, ''Treatment Standards for Hazardous Wastes'' and ''Universal Treatment Standards'' incorporate the following revisions and corrections which have been promulgated since the Phase III Final Rule, the last time the complete tables were published in the Federal Register.

A. Partial Withdrawal of Phase III: April 8, 1996

The revisions of the standards for characteristic waste codes D001–D003 and D018–D043 that were promulgated in the Partial Withdrawal were superceded by the Phase III Technical Correction. Therefore, the treatment standards for these waste codes as they appeared in the Partial Withdrawal do not appear in today's updated tables.

B. Phase III Technical Correction: June 28, 1996

This rule implemented the following changes to the ''Treatment Standards for Hazardous Wastes'' table at § 268.40:

- Removal of entries for codes which were considered for listing at one time but were never finalized: K140, P187, P193, P195, P200, U360–U363, U368–U371, U374, U380, U388, U397–U399, U405, U406, U408.
- Correct revision of standards for the following waste codes: D001, D002, D012–D043, F006, F007, F010, K008, K108, and P093.

Please note that revisions to the ''Treatment Standards for Hazardous Wastes'' table for the following waste codes were either partially incorrect or were superceded by the Carbamate Emergency Rule or the vacature of the hazardous waste listing due to the DTC Court Decision: D003, F037, F039, K006, K062, K108, K156–K161, P196, P202, P205, U277–U278, U365–U366, U375–U379, U381–U387, U389–U396, U400–U404, U407, U409–U411.

Also note that although footnotes 8 and 9 were added to the treatment standard table by the June 28 Technical correction, the position of footnote 9 in the table and the text of footnote 8 are being modified by today's rule, as described further below.

This rule also implemented the following changes to the ''Universal Treatment Standards'' table at § 268.48:

- Revision of standards for the following constituents: A2213, Butylate, EPTC, Molinate, Pebulate, Prosulfocarb, Triallate, and Vernolate. Note that the UTS standard for Cycloate was also revised, but this constituent was later removed from the UTS list due to the DTC Court Decision.

C. Emergency Revision of Carbamate Standards: August 26, 1996

This rule implemented the following changes to the ''Treatment Standards for Hazardous Wastes'' table at § 268.40:

- Revision of all carbamate waste codes except K156.

Please note that the treatment standard for K156 and the second date specified by footnote 10 in the Emergency Revision included errors which are corrected in today's rule.

The Emergency Revision also promulgated the following change to the ''Universal Treatment Standards'' table at § 268.48:

- Addition of footnote 6 to the Universal Treatment Standard table for

all carbamate constituents added to the UTS table by the Phase III rule.

III. New Technical Corrections to Treatment Standards for Hazardous Wastes and Universal Treatment Standards

The Agency is today promulgating the following technical corrections to the ''Treatment Standards for Hazardous Wastes'' table at § 268.40:

• On November 1, 1996, the DTC Court Decision vacated the listing of the following 25 waste codes: K160, U277, U365–U366, U375–U379, U381–U386, U390–U393, U396, U400–U403, U407. Therefore, since these wastes are no longer listed as hazardous, they are not subject to LDR prohibitions (assuming they do not exhibit a characteristic; if they do exhibit a characteristic, they would be covered under the prohibition for that characteristic). For this reason, EPA is removing the treatment standards for these waste codes from the treatment standard table.

• The text of footnote 9, ''These wastes, when rendered nonhazardous and then subsequently injected in a Class I SDWA well are not subject to treatment standards,'' applies to all subcategories of wastes codes D001–D003 (except for radioactive high level D002), and D012–D043. Therefore, the position of all citations of footnote 9 in the table are being moved from the columns containing the treatment standards for wastewaters and nonwastewaters to the ''Waste Code'' column of the table. The text of footnote 8 is also being simplified to apply only to wastes managed in CWA or CWA-equivalent systems. Footnote 9 applies to all wastes for which footnote 8 applies; thus, it is no longer necessary for footnote 8 to apply to wastes managed in Class I SDWA wells.

• The standards for D003 now correctly reflect the preamble language from the Phase III final rule (61 FR at 15568–15569), which states that the requirement to meet § 268.48 standards does not apply to the reactive sulfides, unexploded ordnance, and reactive cyanides subcategories.

• For F037, the Phase III Technical Correction mistakenly reported the standard for Acenaphthene in nonwastewaters as 3.4 mg/l. This standard is now being corrected to read ''NA''.

• For F039, the Phase III Technical Correction mistakenly reported the standard for Acenaphthylene in nonwastewasters as ''NA''. This standard is now being corrected to read ''3.4 mg/l''.

• For K006, the Phase III Technical Correction mistakenly reported the standard for Lead in nonwastewaters from the ''hydrated'' subcategory as ''3.7 mg/l TCLP''. This standard is now being corrected to read ''NA''.

• For K062, the Phase III Technical Correction mistakenly reported the standard for Nickel in nonwastewaters as ''5.0 mg/l TCLP''. This standard is now being corrected to read ''NA''.

• For K088, the Phase III Final Rule mistakenly omitted footnote 7 from the entries for ''Cyanide (Total)'' and ''Cyanide (Amenable)'' in the common name column. Footnote 7 is now being added to these entries.

• For U003, the alternate standard for Acetronitrile in nonwastewaters is now being corrected to read ''38 mg/l''.

• For U190, the additional language ''(measured as Phthalic acid or Terephthalic acid)'' is being added to the common name for Phthalic acid with CAS number 85–44–9.

• For F027 and F028, all numerical treatment standards for these codes in the Phase III Final Rule were incorrect. The standards for all constituents are now being corrected to the concentrations that appeared in the Phase II Final Rule.

• For U027, the treatment standard for bis(2-Chloroisopropyl)ether in wastewaters is being corrected to read ''0.055 mg/l''.

• For K156, the treatment standard for Acetonitrile (CAS 78–05–8) in nonwastewaters has been corrected to read ''38 mg/l''.

• Footnote 10 to the treatment standard table is today being corrected to read as follows: ''Between August 26, 1996, and August 26, 1997, the treatment standard for this waste may be satisfied by either meeting the constituent concentrations in this table or by treating the waste by the specified technologies: combustion, as defined by the technology code CMBST at § 268.42 Table 1 of this Part, for nonwastewaters; and, biodegradation as defined by the technology code BIODG, carbon adsorption as defined by the technology code CARBN, chemical oxidation as defined by the technology code CHOXD, or combustion as defined as technology code CMBST at § 268.42 Table 1 of this Part, for wastewaters.'' This change corrects a minor discrepancy as to the dates during which the alternative treatment standards for carbamate wastes remain in effect.

The Agency is today promulgating the following technical corrections to the ''Universal Treatment Standards'' table at § 268.48:

• Cycloate and 3-Iodo-2-propynyl n-butylcarbamate were only regulated constituents for waste codes U386 and U375, respectively. Since the listing of these two waste codes were vacated by the DTC court decision, the Agency is today removing these constituents from the Universal Treatment Standards table.

IV. Rationale for Immediate Effective Date

Today's amendment does not create any new regulatory requirements; rather, it restates and clarifies requirements already in effect by correcting a number of errors in the April 8, 1996 final rule and withdrawal notice, the June 28, 1996 technical correction, and the August 26, 1996 emergency revision of the carbamate standards. For these reasons, EPA finds that good cause exists under section 3010(b)(3) of RCRA, 42 U.S.C. 9903(b)(3), to provide for an immediate effective date. See generally 61 FR at 15662. For the same reasons, EPA finds that there is good cause under 5 U.S.C. 553(b)(3) to promulgate today's corrections in final form and that there is good cause under 5 U.S.C. 553(b)(3) to waive the requirement that regulations be published at least 30 days before they become effective.

V. Analysis Under Executive Order 12866, the Unfunded Mandates Reform Act of 1995, the Regulatory Flexibility Act, and the Paperwork Reduction Act

Under Executive Order 12866, this action is not a ''significant regulatory action'' and is therefore not subject to review by the Office of Management and Budget. In addition, this action does not impose annual costs of $100 million or more, will not significantly or uniquely affect small governments, and is not a significant federal intergovernmental mandate. The Agency thus has no obligations under sections 202, 203, 204 and 205 of the Unfunded Mandates Reform. Moreover, since this action is not subject to notice-and-comment requirements under the Administrative Procedure Act or any other statute, it is not subject to section 603 or 604 of the Regulatory Flexibility Act.

VI. Submission to Congress and the General Accounting Office

Because there is good cause to forego notice-and-comment procedures, the rule also may take effect upon promulgation without prior submission of the rule to the Congress. 5 U.S.C. section 808. EPA will thereafter submit the rule to Congress, as required by 5 U.S.C. 801(a).

List of Subjects in 40 CFR Part 268

Environmental protection, Hazardous waste, Reporting and recordkeeping requirements.

Dated: January 13, 1997.

Elliott Laws,

Assistant Administrator, Office of Solid Waste and Emergency Response.

For the reasons set forth in the preamble, title 40, chapter I of the Code of Federal Regulations is amended as follows:

PART 268—LAND DISPOSAL RESTRICTIONS

1. The authority citation for part 268 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6921, and 6924.

Subpart D—Treatment Standards

2. Section 268.40 is amended by revising the table ''Treatment Standards for Hazardous Wastes'' to read as follows:

§ 268.40 Applicability of treatment standards.

* * * * *

F037	Petroleum refinery primary oil/water/solids separation sludge-Any sludge generated from the gravitational separation of oil/water/solids during the storage or treatment of process wastewaters and oily cooling wastewaters from petroleum refineries. Such sludges include, but are not limited to, those generated in: oil/water/solids separators; tanks and impoundments; ditches and other conveyances; sumps; and stormwater units receiving dry weather flow. Sludge generated in stormwater units that do not receive dry weather flow, sludges generated from non-contact once-through cooling waters segregated for treatment from other process or oily cooling waters, sludges generated in aggressive biological treatment units as defined in §261.31(b)(2) (including sludges generated in one or more additional units after wastewaters have been treated in aggressive biological treatment units) and K051 wastes are not included in this listing. FOOTNOTES TO TREATMENT STANDARDS TABLE 268.40:

1 The waste descriptions provided in this table do not replace waste descriptions in 40 CFR part 261. Descriptions of Treatment/Regulatory Subcategories are provided, as needed, to distinguish between applicability of different standards.

2 CAS means Chemical Abstract Services. When the waste code and/or regulated constituents are described as a combination of a chemical with its salts and/or esters, the CAS number is given for the parent compound only.

3 Concentration standards for wastewaters are expressed in mg/l and are based on analysis of composite samples.

4 All treatment standards expressed as a Technology Code or combination of Technology Codes are explained in detail in §268.42 Table 1 - Technology Codes and Descriptions of Technology-Based Standards.

5 Except for Metals (EP or TCLP) and Cyanides (Total and Amenable) the nonwastewater treatment standards expressed as a concentration were established, in part, based upon incineration in units operated in accordance with the technical requirements of 40 CFR part 264, subpart O, or part 265, subpart O, or based upon combustion in fuel substitution units operating in accordance with applicable technical requirements. A facility may comply with these treatment standards according to provisions in §268.40(d). All concentration standards for nonwastewaters are based on analysis of grab samples.

6 Where an alternate treatment standard or set of alternate standards has been indicated, a facility may comply with this alternate standard, but only for the Treatment/Regulatory Subcategory or physical form (i.e., wastewater and/or nonwastewater) specified for that alternate standard.

7 Both Cyanides (Total) and Cyanides (Amenable) for nonwastewaters are to be analyzed using Method 9010 or 9012, found in "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods", EPA Publication SW-846, as incorporated by reference in 40 CFR 260.11, with a sample size of 10 grams and a distillation time of one hour and 15 minutes.

8 These wastes, when rendered nonhazardous and then subsequently managed in CWA, or CWA-equivalent systems are not subject to treatment standards. (See §268.1(c)(3)and (4)).

9 These wastes, when rendered nonhazardous and then subsequently injected in a Class I SDWA well are not subject to treatment standards. (See 40 CFR 148.1(d)).

10 Between August 26, 1996, and August 26, 1997, the treatment standard for this waste may satisfied by either meeting the constituent concentrations in this table or by treating the waste by the specified technologies: combustion, as defined by the technolgy code CMBST at §268.42 Table 1 of this part, for nonwastewaters; and, biodegradation as definded by the technolgy code BIODG, carbon adsorption as defined by the technology code CARBN, chemical oxidation as defined by the technology code CHOXD, or combustion as defined as technolgy code CMBST at §268.42 Table 1 of this part, for wastewaters.

BILLING CODE 6560–50–C

3. In § 268.48, the table ''Universal Treatment Standards'' in paragraph (a) is revised to read as follows:

§ 268.48 Universal treatment standards.

(a) * * *

UNIVERSAL TREATMENT STANDARDS

UNIVERSAL TREATMENT STANDARDS—Continued

[Note: NA means not applicable.]

Regulated constituent common name	CAS [1] number	Wastewater standard	Nonwastewater standard
		Concentration in mg/l [2]	Concentration in mg/kg [3] unless noted as "mg/l TCLP"
Sulfide	18496–25–8	14	NA
Thallium	7440–28–0	1.4	0.078 mg/l TCLP
Vanadium [5]	7440–62–2	4.3	0.23 mg/l TCLP
Zinc [5]	7440–66–6	2.61	5.3 mg/l TCLP

Footnotes to Universal Treatment Standards Table:

[1] CAS means Chemical Abstract Services. When the waste code and/or regulated constituents are described as a combination of a chemical with it's salts and/or esters, the CAS number is given for the parent compound only.44.

[2] Concentration standards for wastewaters are expressed in mg/l and are based on analysis of composite samples.

[3] Except for Metals (EP or TCLP) and Cyanides (Total and Amenable) the nonwastewater treatment standards expressed as a concentration were established, in part, based upon incineration in units operated in accordance with the technical requirements of 40 CFR part 264, subpart O, or 40 CFR part 265, subpart O, or based upon combustion in fuel substitution units operating in accordance with applicable technical requirements. A facility may comply with these treatment standards according to provisions in § 268.40(d). All concentration standards for nonwastewaters are based on analysis of grab samples.

[4] Both Cyanides (Total) and Cyanides (Amenable) for nonwastewaters are to be analyzed using Method 9010 or 9012, found in "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods", EPA Publication SW–846, as incorporated by reference in 40 CFR 260.11, with a sample size of 10 grams and a distillation time of one hour and 15 minutes.

[5] These constituents are not "underlying hazardous constituents" in characteristic wastes, according to the definition at § 268.2(i).

[6] Between August 26, 1996, and August 26, 1997, these constituents are not "underlying hazardous constituents" as defined at § 268.2(i).

Part II

Environmental Protection Agency

40 CFR Part 261, et al.

Organic Air Emission Standards for Tanks, Surface Impoundments, and Containers; Final Rule

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Parts 261, 262, 264, 265, 270, and 271

[IL–64–2–5807; FRL–5634–4]

RIN 2060–AG44

Hazardous Waste Treatment, Storage, and Disposal Facilities and Hazardous Waste Generators; Organic Air Emission Standards for Tanks, Surface Impoundments, and Containers

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: Under the authority of the Resource Conservation and Recovery Act (RCRA), as amended, the EPA has published standards (59 FR 62896, December 6, 1994) to reduce organic air emissions from certain hazardous waste management activities to levels that are protective of human health and the environment. (The standards are known colloquially as the ''subpart CC'' standards due to their inclusion in subpart CC of parts 264 and 265 of the RCRA subtitle C regulations). These air standards apply to certain tanks, containers, and surface impoundments (including tanks and containers at generators' facilities) used to manage hazardous waste capable of releasing organic waste constituents at levels which can harm human health and the environment.

The EPA previously has stayed the effective date of those rules administratively in order to receive and evaluate comments and ultimately to revise the rules in an appropriate manner. Today's action amends and clarifies the regulatory text of the final standards, clarifies certain language in the preamble to the final rule, and in doing so provides additional options for compliance that give owners and operators increased flexibility in meeting the requirements of the rules while still providing sufficient controls to be protective of human health and the environment. In addition, today's action suspends the applicability and implementation of subpart CC of Parts 264 and 265 from October 6, 1996, to December 6, 1996.

DATES: These amendments are effective October 6, 1996. The applicability and implementation of Subpart CC of Parts 264 and 265 is suspended from October 6, 1996, to December 6, 1996.

ADDRESSES: This document is available on the EPA's Clean-up Information Bulletin Board (CLU–IN). To access CLU–IN with a modem of up to 28,800 baud, dial (301) 589–8366. First time users will be asked to input some initial registration information. Next, select ''D'' (download) from the main menu. Input the file name ''RCRAAMEN.ZIP'' to download this notice. Follow the on-line instructions to complete the download. More information about the download procedure is located in Bulletin 104; to read this type ''B 104'' from the main menu. For additional help with these instructions, telephone the CLU–IN help line at (301) 589–8368.

Docket. The supporting information used for this rulemaking is available for public inspection and copying in the RCRA docket. The RCRA docket numbers pertaining to this rulemaking are F–91–CESP–FFFFF, F–92–CESA–FFFFF, F–94–CESF–FFFFF, F–94–CE2A–FFFFF, F–95–CE3A–FFFFF and F–96–CE4A–FFFFF. The RCRA docket is located at Crystal Gateway, 1235 Jefferson Davis Highway, First Floor, Arlington, Virginia. Hand delivery of items and review of docket materials are made at the Virginia address. The public must have an appointment to review docket materials. Appointments can be scheduled by calling the Docket Office at (703) 603–9230. The mailing address for the RCRA docket office is RCRA Information Center (5305W), U.S. Environmental Protection Agency, 401 M Street SW, Washington, DC 20460.

For general information about the RCRA Air Rules, or specific rule requirements of RCRA rules, please contact the RCRA Hotline, toll-free at (800) 424–9346. For questions about testing or analytical methods mentioned in this notice, please contact the Emission Measurement Center (MD–19), U.S. Environmental Protection Agency, Research Triangle Park, North Carolina 27711, telephone (919) 541–5374. For information concerning the analyses performed in developing this rule, contact Ms. Michele Aston, Emission Standards Division (MD–13), U.S. Environmental Protection Agency, Research Triangle Park, North Carolina 27711.

Note: The EPA notes that this published preamble differs in two respects from that signed by the Administrator on October 4, 1996. First, the EPA has altered the wording of the **DATES** section of the rule to indicate that these amendments are suspended between the period October 4, 1996, and December 6, 1996. The alteration is in the use of the new term, ''suspend.'' The result of this alteration is equivalent to that in the version of the rule signed October 4, 1996; namely, that the final regulations, as amended by the action signed October 4, 1996, take effect on December 6, 1996. The reason for the altered language is essentially due to conventions in printing format. The EPA has also added an explanation in the preamble to clarify that, in revising this terminology, the EPA is not altering its intent that the effective date of the regulations will be December 6, 1996.

Second, with respect to the issue of whether RCRA subpart AA and BB standards apply to recycling units (i.e., units performing the actual process of recycling) at 90-day generator facilities, the October 4, 1996, preamble did not clearly reflect the text of the regulation or the Agency's intention. The Agency's intent is that recycling units which are exempt from RCRA under 40 CFR 261.6(c)(1) are not subject to subpart AA and

BB standards under 40 CFR part 264 or 265, unless some other unit at the facility has to obtain a RCRA permit. In addition, it is the Agency's intent that units recycling waste that have permit-exempt status by virtue of the provisions of 40 CFR 262.34 (the 90-day unit provision), but are not exempt under the requirement of 40 CFR 261.6(c)(1), are subject to the 40 CFR part 265, subpart AA and BB standards. The preamble discussion contained in the version of this notice signed October 4, 1996, did not clearly distinguish between these two populations, and thus could have easily been interpreted to be contrary to this intent. The EPA has edited the preamble text to clearly reflect its intent.

The EPA believes that making this clarifying change can be done without re-proposing the edited preamble language. In promulgating the October 4, 1996, signed amendments, the EPA did not voice any intention to deviate from previous regulatory actions under this rulemaking that, when applying to generator facilities, subpart AA and BB requirements cover only 90-day tanks and containers (see December 6, 1994, promulgated rule 59 FR at page 62909; final rule Background Information Document, EPA–453/R–94–076b, at page 7–11; July 22, 1991, proposed rule at 56 FR at page 33530; proposed rule Background Information Document, EPA–450/3–89–023c, at page L–3). For this purpose, the EPA does not consider a recycling unit which is exempt from permitting under 40 CFR 261.6(c)(1) to be a 90-day tank or container. Any suggestion in the October 1996 preamble that these recycling units would all be covered would have expanded the scope of the underlying rule, contrary to EPA's stated intent.

The primary reason EPA is correcting the preamble language now (as opposed to a later Federal Register notice, perhaps with a public comment period) is to minimize any confusion on this issue. The best way to do so is to have the Federal Register publication be accurate, not to issue a later notice correcting and clarifying preamble language. The EPA is therefore making changes to be incorporated into this Federal Register notice, in an effort to correct any potentially confusing preamble discussions before publication. This revised notice will replace the version of the notice signed by the Administrator on October 4, 1996, which was previously available on the EPA's CLU–IN electronic bulletin board.

SUPPLEMENTARY INFORMATION:

Regulated Entities

The entities potentially affected by this action include:

Category	Examples of regulated entities
Industry	Businesses that treat, store, or dispose of hazardous waste and are subject to RCRA subtitle C permitting requirements, or that accumulate hazardous waste on-site in RCRA permit-exempt tanks or containers pursuant to 40 CFR 262.34(a).
Federal Government.	Federal agencies that treat, store, or dispose of hazardous waste and are subject to RCRA subtitle C permitting requirements, or that accumulate hazardous waste on-site in RCRA permit-exempt tanks or containers pursuant to 40 CFR 262.34(a).

This table is not intended to be exhaustive, but rather provides a guide for readers regarding entities likely to be interested in the amendments to the regulation affected by this action. To determine whether your facility is regulated by this action, you should carefully examine the applicability criteria in § 264.1080 and § 265.1080 of the RCRA subpart CC air rules. If you have questions regarding the applicability of this action to a particular entity, consult the person listed in the preceding **FOR FURTHER INFORMATION CONTACT** section.

Background

Section 3004(n) of RCRA requires EPA to develop standards to control air emissions from hazardous waste treatment, storage, and disposal facilities as may be necessary to protect human health and the environment. This requirement echoes the general requirement in section 3004(a) and section 3002(a)(3) to develop standards to control hazardous waste management activities as may be necessary to protect human health and the environment. The Agency has issued a series of regulations to implement the section 3004(n) mandate; these regulations control air emissions from certain process vents and equipment leaks (part 264 and part 265 subparts AA and BB), and emissions from certain tanks, containers, and surface impoundments (the subpart CC standards, which are the primary subject of today's action).

The EPA is today amending the final subpart AA, BB, and CC standards. Since the publication of the final subpart CC rule (59 FR 69826, December 4, 1994), the EPA has published three Federal Register documents to delay the effective date of that rule. The first (60 FR 26828, May 19, 1995) revised the effective date of the standards to be December 6, 1995. The second (60 FR 56952, November 13, 1995) revised the effective date of the standards to be June 6, 1996. The third (61 FR 28508, June 5, 1996) further postponed the effective date for the rule requirements until October 6, 1996. The EPA has also issued an indefinite stay of the standards specific to units managing wastes produced by certain organic peroxide manufacturing processes (60 FR 50426, September 29, 1995).

On August 14, 1995, the EPA published a Federal Register document entitled, ''Proposed rule; data availability'' (60 FR 41870) and opened RCRA Docket F–95–CE3A–FFFFF to accept comments on revisions that the EPA was considering for the final subpart CC standards. The EPA accepted public comments on the appropriateness of these revisions through October 13, 1995. Throughout 1995 and into the present year, the EPA also engaged in repeated discussions with representatives of the groups filing petitions for review challenging the subpart CC standards.

Sixty-four comment letters were received by the EPA in response to the August 14, 1995 notice of ''Proposed rule; data availability;'' the commenters included companies affected by the rules, trade associations, consulting companies, and one State environmental agency. Most comment letters contained multiple comments. Comments generally supported the proposed amendments although many offered specific criticisms and suggested changes. The EPA considered all comments on the proposed rule amendments in developing the final amendments published today.

In the August 14, 1995 notice of ''Proposed rule; data availability,'' the EPA requested comment on specific revisions to the final subpart CC tank, surface impoundment, and container standards that the EPA was considering. The notice identified those provisions of the final rule that the revisions would potentially affect which included the waste determination procedures, the standards (or technical requirements) for tanks and containers, and the applicability of the final standards to units that operate with air emission controls in accordance with certain Clean Air Act standards. In addition, it was noted that the revisions would reduce the monitoring, inspection, recordkeeping, and reporting requirements for affected tanks, surface impoundments, and containers.

To further inform the affected public of the major clarifications, compliance options, and technical amendments

being considered, the EPA conducted a series of seminars during August and September of 1995. A total of six seminars were held nationally. (Refer to EPA RCRA Docket No. F–95–CE3A–FFFFF, Item No. F–95–CE3A–S0017.) During these seminars, additional comments were received on the RCRA air rules for tanks, surface impoundments, and containers. These comments were also considered by the EPA in developing these amendments.

On February 9, 1996, the EPA published a Federal Register notice (61 FR 4903), ''Final rule; technical amendment,'' which made clarifying amendments in the regulatory text of the final standards, corrected typographical and grammatical errors, and clarified certain language in the preamble to the final rule to better convey the EPA's original intent.

Today's action amends provisions of the final subparts AA, BB, CC rules to better convey the EPA's original intent, to provide additional flexibility to owners and operators who must comply with the rules, and to change the effective date of the requirements contained in the subpart CC rules. The amendments to subparts AA, BB, and CC that are being promulgated today are discussed below in various sections of this preamble. Comments received on the proposed amendments and the EPA's responses to those comments are also discussed together with the changes being made by today's action. Some commenters submitted comments on aspects of the original rule that were unaffected by, and not reopened by the proposed amendments. These comments are outside the scope of the rulemaking for the proposed amendments and, therefore, these comments, although perhaps mentioned, are not addressed in this rulemaking.

In today's amendments, certain sections of the subpart CC rules are reprinted in total; this accounts, in large part, for the lengthy amendatory language contained in today's amendments. Reprinting of entire sections of the rule is being done for two reasons. First, some sections of the rule have been entirely redrafted to improve organizational structure and drafting clarity and to avoid ambiguity while only making minor revisions to the basic control requirements of the rule. Second, in other sections of the rule, the technical requirements have been changed significantly or options added to increase flexibility for the source owner or operator. Therefore, to ensure the rule is implemented as intended and for the convenience of the public, the EPA decided to reprint these entire sections. In doing so it was not intended to completely reopen these entire sections of the rule for judicial review or legal challenge. As provided by section 7006(a), judicial review is not newly available for aspects of the subparts AA, BB, and CC rules that were already finalized more than 90 days ago, and which are not substantively addressed by today's amendments.

The information presented in this preamble is organized as follows:

I. Subpart I—Use and Management of Containers and Subpart J—Tank Systems

Under the existing RCRA regulations, hazardous waste generators who accumulate waste on-site for up to 90 days in tanks and containers (''90-day tanks and containers'' or ''90-day units'') may permissibly do so without obtaining a storage permit provided the generator complies with certain conditions specified in 40 CFR 262.34(a). The conditions include compliance with the requirements of 40 CFR part 265, subpart I when the waste is accumulated in a container and 40 CFR part 265, subpart J when the waste is accumulated in a tank.

The subpart CC regulations proposed by the EPA on July 22, 1991 (56 FR 33491) contained provisions to amend the conditions with which a hazardous waste generator must comply to exempt 90-day tanks and containers from RCRA subtitle C permitting requirements, namely to comply with standards set out in subparts AA, BB, CC applicable to tanks and containers. The EPA took comments on this proposed action and responded to those comments in (among other places) the preamble to the 1994 final subpart CC regulations. The 1994 final rules regarding 90-day tanks and containers were the same as those proposed.

As noted in Section VI.D of the preamble to the 1994 final subpart CC RCRA air rules (59 FR 62910, December 6, 1994), the organic air emissions from 90-day tanks and containers are sufficient to have an adverse and significant effect upon human health and the environment and therefore ''led the EPA to require that these units comply with the appropriate air emission control requirements of the subpart AA, BB, and CC standards to maintain an exemption from permitting.''

Commenters requested that EPA clarify precisely when 90-day units are subject to the subpart AA, BB, and CC standards, and, in a related question, requested clarification as to when these rules would apply to units that are engaged in recycling. With respect to when the subpart AA, BB, and CC rules apply to 90-day units that are not recycling units (for example, tanks or containers that store hazardous waste before recycling), the EPA intends that the subpart AA, BB, or CC standards apply so long as the substantive applicability provisions of one or more of these subparts is satisfied. This means, for example, that if the 90-day units are receiving hazardous waste with organic concentrations of at least 10 per cent by weight, the subpart BB standards would apply to the associated equipment components; on the other hand, if the units only receive hazardous waste below this applicability threshold, the subpart BB requirements would not apply (see § 265.1050(b)). Similarly, the subpart CC air emission control requirements would apply to a 90-day tank or container if the owner or operator does not demonstrate that the hazardous waste stored in the unit contains average volatile organic concentrations below 500 ppmw. It should be noted that the fact that one of these subparts applies does not automatically mean that the others apply as well. Thus, for example, if a generator manages hazardous waste with organic concentration of 500 ppmw in a tank

equipped with an open-ended valve, the unit would be subject to the subpart CC standards (See § 265.1080(a)). This does not mean that the open-ended valve is also automatically subject to the subpart BB standards; rather, the respective applicability section of those provisions would have to be satisfied before they would apply.

The EPA notes further, however, that the applicability of the subpart AA and BB standards, prior to publication of the final subpart CC rule in December 1994, was conditioned on there being another unit at the facility otherwise requiring a RCRA permit—the notion being that the subpart AA and BB rules by themselves would not require a facility to obtain a RCRA permit (see Section V of the preamble in 55 FR 25449, June 21, 1990, and §§ 265.1030(b)(2) and 265.1050(b)(2)).[1] This consideration does not apply to 90-day units, since these units are not subject to RCRA permitting requirements in any case. In addition, the risks posed by these units is the same whether or not another unit at the plant has received a RCRA permit; the EPA evaluated and discussed these risks when promulgating the December 1994 final rule and found that substantive controls were necessary to protect human health and the environment. See 59 FR at 62910 and also Appendix L, 90–Day Tanks and Container Impacts, in ''Hazardous Waste TSDF—Background Information for Proposed RCRA Air Emission Standards'' (EPA–450/3–89–023c), June 1991. Consequently, subparts AA and BB apply to 90-day tanks and containers whether or not another unit at the facility has to obtain a RCRA permit (assuming the other applicability criteria in the rule are satisfied, as explained above). For this purpose, the EPA does not consider a recycling unit which is exempt from permitting under 40 CFR 261.6(c) to be a 90-day tank or container. The EPA is adding clarifying language as a part of today's rule amendments to make clear that applicability of subparts AA and BB to 90-day units is not conditioned on another unit at the generator's facility obtaining a RCRA permit.

With respect to the commenters' questions regarding applicability of the subpart AA, BB, CC rules to recycling units (i.e., units actually performing the recycling function, such as a solvent distillation column), EPA notes the following principles. The revised applicability sections to subparts AA and BB state that units that have permit exempt status by virtue of 40 CFR 262.34, including recycling units, will now be subject to subparts AA and BB. In practice, the EPA does not believe that this will include many, if any, recycling units. This is because such units typically are exempt from RCRA permitting by virtue of 40 CFR 261.61(c)(1). Thus, the net effect of these amendments, with respect to recycling units, is to preserve the status quo of regulating those units which are located at a facility which must obtain a RCRA permit for some other unit.

In addition, subpart CC does not apply to recycling units. Section 261.6(d), Requirements for recyclable materials, for example, does not indicate that recycling units must comply with the subpart CC provisions. The reason these provisions do not apply is that the standards are not normally appropriate for recycling units handling volatile hazardous wastes; rather, the subpart AA standards are the appropriate standards. The emission mechanisms for traditional hazardous waste storage tanks (e.g. circular above-ground units with open tops or covered open tops) differ significantly from the emission mechanism of the distillation-type unit used for recycling and certain treatment operations (e.g. air strippers and thin-film evaporators) regulated under subpart AA. Recycling units typically emit air pollutants through some type of process vent, and consequently are controlled under the subpart AA process vent standards. The suppression-type controls (e.g. covers) prescribed for traditional storage and treatment tanks in subpart CC simply are not suitable for most distillation-type units.

Finally, EPA is slightly amending the applicability sections of subparts AA and BB to make clear that these standards can apply to non-recycling units that are located at either TSDF sites or generator accumulation sites, assuming that the units otherwise satisfy the subpart AA or BB applicability requirements. Thus, for example, a steam stripper engaged in conventional hazardous waste treatment at a permitted TSDF could be subject to the subpart AA standards. The risks posed by the types of units enumerated in subparts AA and BB are the same, whether or not they are recycling or non-recycling units, so any distinction between them is unfounded. In fact, today's language merely clarifies the coverage of the existing subpart AA and BB rules, since those rules already cover all units (i.e. recycling and non-recycling) that are subject to the permitting requirements of part 270, and thus covers non-recycling units.

The following examples illustrate these principles.

1. Generator A stores volatile spent solvents (F001) in 90 day tanks before recycling them in an on-site distillation column. The facility has one other unit requiring a RCRA permit. The volatile organic concentration of the waste exceeds the subpart AA, BB and CC applicability thresholds.

In this case, the 90-day storage tanks and associated equipment components are subject to the subpart BB and subpart CC standards, since the substantive applicability standards of both subparts are satisfied. Subpart AA does not apply to the spent solvent storage tanks (assuming the tanks are not distillation, fractionation, thin-film evaporation or other type of unit set out in § 265.1030(b), the subpart AA applicability section). The distillation column (and its associated equipment) is subject to the subpart AA and BB standards, but not the subpart CC standards since subpart CC does not apply to recycling units.

2. Same facts as Example 1 except that the waste contains less than 10 percent total organics and greater than 500 ppmw volatile organics.

In this case, the spent solvent storage tank is subject to the subpart CC standards but the associated equipment components are not subject to the subpart BB standards (since subpart BB does not apply to hazardous wastes with less than 10 percent total organic content). The distillation column is subject to the subpart AA standards for the reasons explained in Example 1. This example illustrates that applicability of one of the subparts (AA, BB, or CC) does not automatically mean that the standards from the other subparts also apply. The substantive applicability provisions of each subpart still must be satisfied.

II. Subpart AA—Air Emission Standards for Process Vents: Standards for Closed-Vent Systems and Control Devices

On the subject of closed-vent systems and control devices, commenters requested a provision for control device downtime to allow for preventive, routine, or non-routine maintenance; an exemption for control devices subject to 95 percent efficiency requirements in other rules from performance test and design analysis requirements; an exemption from monitoring requirements for closed-vent system components that operate under negative pressure; a revision such that only spent carbon removed from a carbon adsorption system that is a hazardous waste must be managed in accordance with subpart CC requirements; and a reduction in the closed-vent system and

[1] The subpart CC rules are not so conditioned.

control device inspection and monitoring requirements.

The EPA has decided to amend certain of the control device and closed-vent system standards of subpart AA in 40 CFR parts 264 and 265 so that these requirements are consistent and up-to-date with the general decisions the EPA has made regarding inspection, monitoring, maintenance, repair, malfunctions, recordkeeping, and reporting requirements for organic air emission control devices and associated closed-vent systems installed and operated to meet requirements of other regulations under the Clean Air Act or RCRA (e.g., National Emission Standards for Hazardous Air Pollutants: Off-Site Waste and Recovery Operations, 61 FR 34140, July 1, 1996). These revisions are both consistent with the integration provisions of RCRA Section 1006(b), which require that RCRA standards be consistent and not duplicative of Clean Air Act standards, and also are a part of the EPA's overall approach of allowing unit-specific Clean Air Act standards to be used in lieu of control requirements under RCRA subpart CC. (See § 265.1080(b)(7) in today's amended rule.) The changes to the control device and closed-vent system standards in no way affect the overall performance or emission reductions achieved by the control devices and closed-vent systems. Therefore, the revised standards are considered by the EPA to be equally protective to those already adopted, and thus adequate to protect human health and the environment. The revisions to the standards for closed-vent systems and control devices in subpart AA of 40 CFR parts 265 and 264 include the changes described below.

The monitoring requirement for a condenser in § 264.1033(f)(2)(vi)(B) and § 265.1033(f)(2)(vi)(B) is being revised such that only the temperature of the exhaust vent stream from the condenser exit must be continuously monitored; the requirement to monitor the coolant fluid temperature exiting the condenser is being dropped. This revision reduces the owner's or operator's monitoring and recordkeeping burden while maintaining the EPA's ability to ensure that the emission control equipment is properly operated and maintained to achieve the required emission reduction.

The closed-vent system requirements in § 264.1033 and § 265.1033 are being revised such that a closed-vent system that is designed to operate at a pressure below atmospheric pressure is not required to be monitored by Method 21 procedures either initially or annually. For these negative pressure systems, an initial visual inspection and annual follow-on inspection is required; in addition, a pressure gauge or other pressure measurement device is required to verify that negative pressure is maintained in the closed-vent system when the control device is operating. As noted in section 10 of the preamble to the earlier subpart CC rule clarifications (61 FR 4910, February 9, 1996), ''the EPA had intended to not require annual monitoring of closed-vent system components which operate under pressure such that all emissions are routed to a control device even if a leak or hole exists in the component. A component that continuously operates under negative pressure would satisfy this intent * * *'' In today's action, the EPA is removing the requirement for the initial leak detection monitoring for negative pressure systems; this change reduces owner or operator burden resulting from any redundant or non-productive monitoring.

Unsafe-to-monitor and delay of repair provisions for closed-vent systems are being added. Corresponding recordkeeping requirements also are being added. This common sense change is made to avoid creating any unsafe conditions as a result of the monitoring requirements of subpart AA, § 264.1033 and § 265.1033. This revision adds the same type of unsafe-to-monitor and delay of repair provisions that are contained for pumps and valves in the subpart BB—Air Emission Standards for Equipment Leaks as well as in other equipment leak standards promulgated under the Clean Air Act.

On April 23, 1996, the EPA published a notice of data availability (61 FR 17863) addressing the narrow issue of whether ''Other Thermal Treatment Facilities'' subject to regulation under subpart P of part 265 (40 CFR 265.370 through 265.383) are eligible to receive for regeneration spent activated carbon which is a hazardous waste. In the December 6, 1994 final subpart CC standards (59 FR 62896), the EPA established a requirement that spent activated carbon removed from a control device had to be managed at particular types of facilities, namely regulated boilers or industrial furnaces, or ''thermal treatment units that (are) permitted under subpart X of 40 CFR part 264 or subpart P of (part 265).'' See 40 CFR 265.1033(l)(1) as promulgated at 59 FR 62935 (December 6, 1994). A parallel requirement was contained in 40 CFR 264.1033(m), but no reference to subpart P was included (59 FR 62927). In the February 9, 1996 technical correction notice, the EPA amended these provisions to clarify that they apply only to activated carbon which is a hazardous waste, and that interim status boilers and industrial furnaces which had certified compliance and interim status incinerators could treat such activated carbon. (See 61 FR 4910, 4911, and 4913.) In doing so, the EPA removed the reference to subpart P facilities in § 265.1033(l)(1), thus removing such facilities from eligibility to receive hazardous waste spent activated carbon.

As a part of today's amendments, EPA is restoring the eligibility of subpart P facilities to treat hazardous waste spent activated carbon. So long as the hazardous waste spent activated carbon is managed safely by such facilities, there is no automatic reason to preclude such facilities' eligibility to manage the spent carbon. However, because the subpart P standards do not contain substantive air emission control provisions that assure that any hazardous organic constituents desorbed from the carbon are adequately controlled rather than emitted to the atmosphere during regeneration or other treatment, the EPA is requiring that units receiving such hazardous wastes meet the control requirements of the subpart CC rules or are units which are subject to emission control requirements under 40 CFR part 61 or part 63. With respect to this last point, this means that the actual unit must meet a part 61 or 63 control standard for hazardous air pollutants. If the standard is no control or if compliance with the standard is determined on a plant-wide (viz. averaging among units) basis, then it could not be used in place of the subpart CC standards.

It should be noted that the EPA is imposing this requirement regardless of the organic content of the carbon being regenerated, so long as the activated carbon is a hazardous waste. This is because the purpose of the carbon is to capture organic emissions, and it is the Agency's judgment that in light of this purpose, the carbon will be saturated with organics which would need to be captured or destroyed and not released indiscriminately during the regeneration process (see 56 FR 7200, February 21, 1991).

Finally, in order to assure maximum flexibility for protective compliance, the EPA is adding that permitted facilities (i.e., Part 264 facilities) complying with either the subpart CC standards, or a part 61 or 63 Clean Air Act standard, are also eligible to receive spent carbon (which is a hazardous waste) for regeneration. Such facilities certainly would be operating protectively and so should be eligible to receive spent carbon. The EPA notes, however, that this provision may be redundant in light

of the provision in the existing rule stating that units which have received a subpart X permit are eligible to receive such activated carbon (§ 265.1033(m)(1)(i)), but commenters indicated a preference for this clarification of eligibility. In order that there be no confusion, the EPA is adding it to the final rule.

III. Subpart BB—Air Emission Standards for Equipment Leaks

Commenters requested that the EPA incorporate into the subpart BB standards recent changes that have been made to other national standards that require equipment leak detection and repair programs. In response, revisions to the emission standards for equipment leaks consist of incorporating changes to the requirements so that the subpart BB requirements in parts 264 and 265 are consistent and up-to-date with the general decisions the EPA has made regarding leak detection and repair program requirements for organic air emission control in other regulations under the Clean Air Act (e.g., National Emission Standards for Hazardous Air Pollutants (NESHAP): Off-Site Waste and Recovery Operations, 61 FR 34140, July 1, 1996, or the National Emission Standards for Organic Hazardous Air Pollutants for Equipment Leaks, 40 CFR part 63, subpart H, 59 FR 19402, April 22, 1994, i.e., the HON). These revisions are consistent with the integration provisions of RCRA Section 1006(b) which require that RCRA standards be consistent and not duplicative of Clean Air Act Standards and are a part of the EPA's overall approach of allowing Clean Air Act standards to be used in lieu of control requirements under RCRA TSDF air rules. The changes to the subpart BB equipment leak standards in no way affect the overall performance or emission reductions achieved. Therefore, the revised standards are considered by the EPA to be equally protective as those being replaced. The revisions to the standards for equipment leaks in subpart BB of 40 CFR parts 265 and 264 include the changes described below.

The applicability provisions of subpart BB (§ 264.1050 and § 265.1050) are revised to exclude equipment that contains or contacts affected hazardous waste for a period of less than 300 hours per calendar year from the equipment leak control requirements. This change parallels the applicability provisions in the Hazardous Organic National Emission Standard for Hazardous Air Pollutants (''HON''). (Supporting information for this decision is contained in the CAA docket A–90–20, item II-B–5.)

The sampling connection system requirements of subpart BB are being revised consistent with the HON such that gases displaced during filling of the sample container are not required to be collected or captured. In the context of the HON, EPA explained that it was not necessary to require control of those vapors. Also, the requirement for no detectable emissions to the atmosphere during return of the purged hazardous waste stream to the hazardous waste management process line, or during collection and recycling of the purged hazardous waste, is being eliminated. Upon further review, the EPA has determined that the emissions from these extremely small amounts of hazardous waste can be adequately controlled if the owner or operator stores the sample waste in a covered container, and ensures it is treated or disposed in a manner consistent with the requirements for the waste stream from which it was extracted.

Under today's amendments, any connector that is inaccessible or is ceramic or ceramic-lined is exempt from the monitoring and recordkeeping requirements of subpart BB as is the case in recent EPA rules such as the HON. (See Section VI.C of the HON preamble for further discussion regarding the rationale for these changes to EPA's equipment leak standards, 59 FR 19445, April 22, 1994)

IV. Subpart CC—Air Emission Standards for Tanks, Surface Impoundments, and Containers

A. Suspension of Subpart CC Rule Requirements

Today's rule is being signed on October 4, 1996, and the substantive requirements of the rule take effect on December 6, 1996. The EPA is clarifying here that, for all practical purposes, December 6, 1996, is the effective date of the rule. The EPA is further clarifying that the December 6, 1994, rule, which was stayed until October 6, 1996, is not taking effect during the two months between October 6, 1996, and December 6, 1996, the reason being that it is superseded by these October 4, 1996, amendments.

To accomplish this result, the EPA is indicating (in the **DATES** block of this Federal Register document), that the applicability and implementation of Subpart CC of Parts 264 and 265 is suspended until December 6, 1996. The result, as just stated, is that: (1) The December 1994 rules are replaced by the amended rules as of October 4, 1996; and (2) members of the regulated community are not subject to any of the requirements in the October 4, 1996, amended rule between October 4, 1996, and December 6, 1996.

The EPA specified in the 1994 final rule a schedule that established the compliance dates by which different requirements of the final rule must be met. These requirements and compliance dates (all of which are December 6, 1996, or later) are explained further in the final rule (59 FR 62896, December 6, 1994) under **SUPPLEMENTARY INFORMATION.** Today's amendments do not change the dates by which compliance with all the requirements must be achieved. Thus, all compliance dates for the final rule, as amended today, remain as published in the 1994 final rule (59 FR 62896).

Given that the EPA is amending the rule in ways that would increase compliance flexibility and reduce certain regulatory requirements (and in no cases would increase the stringency of the standards or eliminate a previously existing compliance option), the EPA considers it appropriate to suspend the requirements that became effective October 6, 1996, for two months to December 6, 1996. By December 6, 1996, affected sources will have had ample time to make any necessary alterations to their compliance plans in response to today's amendments. Affected sources have been on notice of the final regulations since they were published in December 1994. The EPA expects that by early 1995, most facilities had begun preparing their implementation strategies and planning for any necessary equipment modifications, in anticipation of the originally scheduled implementation date of June 6, 1995. Thus, the EPA considers a two-month suspension to provide sufficient time for affected facilities to become familiar with the revised requirements contained in the amended standards, and to make any necessary revisions to their implementation strategies.

B. Retention of Final Compliance Date

The December 6, 1994 published rule set a final compliance date of December 8, 1997, by which time all required air emission control equipment must be operating (59 FR 62897). The EPA does not believe that suspending the rule requirements necessitates any postponement of the December 8, 1997 compliance date. The final compliance date was chosen to allow time for facility modifications that may be involved in the compliance approach of certain facilities. The EPA believes that, for many air emission control applications, the required control devices can be installed and in operation within several months.

However, the EPA agrees that under some circumstances, the owner's or operator's approach to complying with the air emission control requirements under the subpart CC standards may involve a major design and construction project which requires a longer time to complete. In recognition of these cases, the EPA decided that it is reasonable to allow up to December 8, 1997, for affected facilities to install and begin operation of air emission controls required by the subpart CC standards (See Hazardous Waste TSDF Background Information Document for Promulgated Organic Air Emission Standards, EPA–453/R–94–076b, page 9–7).

The final rule requirements that may necessitate a major modification, as described above, for tanks are paragraphs (b) through (d) of 40 CFR 264.1084 and 265.1085. These paragraphs specify air emission control equipment that must be operated on tanks receiving affected hazardous waste. Similarly, the requirements that may necessitate such a major modification for surface impoundments are paragraphs (b) through (e) of 40 CFR 264.1085 and 265.1086. These paragraphs specify air emission control equipment that must be operated on surface impoundments receiving affected hazardous waste. To comply with these requirements for tanks and surface impoundments, facilities may choose to construct new hazardous waste management units to replace existing units, or may choose to modify existing hazardous waste management units. Examples of facility equipment modifications that could require an extended period of compliance would be replacing a large open surface impoundment with a series of covered tanks, or fitting an existing open tank with a fixed roof vented to a control device. The EPA recognizes that such major modifications or new construction can require several months or more, and therefore allows until December 8, 1997, for facilities to comply with the air emission control requirements of the final subpart CC standards.

In addition, certain States may require that a facility obtain a permit modification prior to performing a major modification such as those described above. The EPA recognizes that such a permit modification can be a lengthy process, and therefore felt it was appropriate to afford an extended compliance period to allow such modifications to be obtained (59 FR 62919). The EPA does not expect that such a lengthy period of implementation would be required in circumstances other than those described above, although § 264.1082(c) allows that such a period is available if necessary.

The final rule provisions that justified a compliance date of December 8, 1997, are not among those that are affected by the revisions being made under today's action. Specifically, the EPA is not considering either a broader applicability or more stringent control requirements for covers and air emission controls on tanks and surface impoundments. All affected facilities thus have been on notice of the final rule air emission control requirements for these units since the final CC rule publication on December 6, 1994. Therefore, the EPA does not consider it appropriate to postpone the compliance date of December 8, 1997, by which all required air emission control equipment must be operating.

It should be noted that the Regional Administrator may elect to extend the implementation date for control equipment at a facility, on a case by case basis, to a date later than December 8, 1997, when special circumstances that are beyond the facility owner's or operator's control delay installation or operation of control equipment and the owner or operator has made all reasonable and prudent attempts to comply with the requirements of the subpart CC rules (see § 265.1082).

C. Applicability

Numerous comments were received concerning overlap between the RCRA subpart CC rules and Clean Air Act NESHAP, particularly the HON. Most commenters argued that subpart CC requirements should not apply to units, either 90-day generators or TSDF, meeting Clean Air Act control requirements, including units meeting standards through emissions averaging.

The EPA fully recognizes that in developing air standards to meet congressional directives established by provisions in the Clean Air Act and Resource Conservation and Recovery Act, the potential exists for regulatory overlap. However, it is the EPA's intention to minimize, if not eliminate, regulatory overlap to the extent that the Agency is allowed under the different legislative acts. Section 1006(b) of RCRA indeed requires that the air standards be consistent with and not duplicative of Clean Air Act standards. Similarly, the Clean Air Act voices a strong preference for consistency of CAA section 112 standards and RCRA standards where practicable (see section 112(n)(7)).

The EPA is aware that at some sites managing hazardous wastes, the owner or operator of the hazardous waste treatment, storage, and disposal facility could be subject to the RCRA air rules under subparts AA, BB, and CC and also subject to a Clean Air Act NESHAP standard such as the Off-Site Waste rule or the HON. At a particular TSDF, some waste management units may be required to use air emission controls under one or the other, but not both, a Clean Air Act NESHAP and the RCRA air rules. However, some other waste management units could be subject to using air emission controls to comply with both sets of rules. It is unnecessary for owners and operators of those waste management units subject to air standards under both sets of rules to perform duplicative testing and monitoring, keep duplicative sets of records, or perform other duplicative actions.

In Section VI.A, *Development of Air Standards Under RCRA,* of the preamble to the final rule (59 FR 62906, December 6, 1994), the EPA discussed the potential for duplication between the RCRA air rules and various rules being developed under the Clean Air Act maximum achievable control technology (MACT) program but noted that the air standards developed under RCRA section 3004(n) did not duplicate or contradict existing NESHAP or new source performance standards (NSPS). As the MACT program has matured and additional standards have been developed, the EPA is now aware that the possibility for overlap is greater than was originally thought.

The EPA has decided that the best way to eliminate any regulatory overlap is to amend the RCRA rules to exempt units that are using air emission controls in accordance with the requirements of applicable Clean Air Act NESHAP or NSPS regulations. Therefore, the subpart CC applicability is amended to exempt any hazardous waste management unit that the owner or operator certifies is equipped with and operating air emission controls in accordance with an applicable Clean Air Act regulation codified under 40 CFR part 60, part 61, or part 63, with the sole exception of tanks being controlled through the use of an enclosure rather than a cover. (The EPA's rationale for placing additional conditions on that control approach is explained in detail in sections E and G of this preamble.) Providing this exemption eliminates the possibility of duplicative or conflicting requirements for those TSDF tanks, surface impoundments, or containers using organic emission controls in compliance with a NESHAP but also subject to requirements under the RCRA standards. It is important to note that this exemption only applies to those

units using organic air emission controls. This seems to EPA to be the best way to assure that air emissions from hazardous waste management units are controlled to the extent necessary to protect human health and the environment. A unit that does not use the required air emission controls but is in compliance with a NESHAP through an ''emission averaging'' or ''bubbling'' provision does not qualify for the exemption since EPA lacks assurance that emissions from the unit are controlled to the extent necessary to protect human health and the environment.[2]

Similarly, if the Clean Air Act standard for the particular unit is no control (for example, because the MACT floor for the source category is no control and the Agency decided not to apply controls more stringent than the floor), the exemption from the RCRA standards would not apply since the unit would not actually be controlled under provisions of the MACT standard. Again, as stated above, the EPA believes the best way to assure protectiveness in this national rule is to require controls on each particular unit.

Section 3004(n) of RCRA, of course, requires that EPA control emissions from (among other things) tanks, surface impoundments, and containers as may be necessary to protect human health and the environment. Some of the Clean Air Act standards, in contrast, are technology-based controls implementing the provisions of section 112(d) of the Clean Air Act. The EPA, however, has found that under some circumstances a technology-based standard may satisfy the RCRA protectiveness requirement by adequately controlling air emissions and thus adequately controlling risk or controlling risk sufficiently that the Clean Air Act section 112(f) residual risk process need not be interdicted. See 60 FR at 32593 (June 23, 1995), the preamble for final MACT standards for the secondary lead source category, and 61 FR at 17369–370 (April 19, 1996), the preamble for proposed MACT standards for hazardous waste combustion units.

The EPA is finding here that where there are MACT air emission control requirements for a specific unit otherwise covered by subpart CC, the MACT requires the same technical air emission controls as would be required under subpart CC. Thus, it follows that compliance with the MACT requirements would thus afford equal protectiveness as would be achieved under subpart CC, and therefore can be considered to satisfy the RCRA protectiveness requirements. This is a conscious effort on the Agency's part to provide consistency of requirements where at all possible in its rulemakings.[3]

The technical requirements for the RCRA air rules in subpart CC as amended are essentially the same as those published by the EPA under the MACT program (e.g., those in subparts OO, PP, and QQ of part 63). A unit controlled under one or the other set of requirements would achieve the same emission reduction and performance level; and the various requirements thus provide the same level of protection.

D. Definitions

Definitions are being added for closure device, continuous seal, enclosure, hard-piping, in light material service, malfunction, metallic shoe seal, no detectable organic emissions, safety device, and single-seal system and other definitions are being revised consistent with their use in the amended regulation. These amended or added definitions do not directly affect the substance of the subpart CC standards, but rather, serve to clarify the 1994 final provisions, or today's amended provisions, of the final regulations.

E. Standards: General

1. Action Level

Several major changes are being made to the general standards for the final subpart CC rule. First, the average VO concentration action level for hazardous waste required to be managed in the units using air emission controls under the rule is being changed to 500 ppmw (as determined at the point of waste origination). Units managing hazardous wastes determined by the owner or operator to have average VO concentrations that remain less than 500 ppmw are not required to use air emission controls under the rule.

The EPA considered a range of possible values to establish the VO concentration limit for the Subpart CC RCRA air rules. The EPA proposed a VO concentration value of 500 ppmw to be used as the action level for the rule (56 FR 33491, July 22, 1991) and promulgated an action level of 100 ppmw in the 1994 final subpart CC rule (59 FR 62897). However, in promulgating this value, the EPA acknowledged that some hazardous waste management units subject to the subpart CC RCRA air rules could be subject to other Clean Air Act NESHAP and NSPS with differing action levels (59 FR 62903, 62906, and 62907).

The EPA received comments in response to the August 14, 1995 Federal Register notice, stating that the 100 ppmw VO concentration action level promulgated by the EPA for the subpart CC RCRA air rules is inappropriate (e.g., the action level cannot be justified on the basis of risk and the action level is too close to the detection limit of method 25D; this results in numerous waste determination errors such as false positives) and is inconsistent with other applicable Clean Air Act NSPS and NESHAP (i.e, the Off-Site Waste rule,

[2] EPA believes it is both reasonable and legally permissible to interpret section 3004(n) to apply to specific waste management units. Section 3004(n) addresses specific unit types (''open tanks, surface impoundments, and landfills''), and the overarching requirement to control air emissions at hazardous waste management ''facilities'' can reasonably be construed as applying to individual units. See *Mobil Oil Corp. v. EPA,* 871 F. 2d 149, 152–54 (D.C. Cir. 1989). On the other hand, ''facilities'' might also be construed to apply to an entire plant, *id.* at 153. Consequently, EPA is not indicating by the discussion in the text that an averaging approach is legally foreclosed. Certain types of site-specific demonstrations, for example, might indicate the appropriateness of an averaging approach to demonstrating that air emissions from hazardous waste management are sufficiently controlled. In such a situation, EPA could interpret the term ''facility'' as applying to an entire plant. What EPA is finding in this rule is that for this national rule (i.e., in the absence of potential case-specific demonstrations), the best way of assuring that emissions from hazardous waste tanks, containers, and impoundments are sufficiently controlled is to require control of each particular unit.

[3] For example, EPA, in promulgating the final requirements for the Off-Site Waste and Recovery Operations NESHAP (61 FR 34147, July 1, 1996), added a series of new subparts to 40 CFR part 63. These subparts included Subpart OO—National Emission Standards for Tanks - Level 1, Subpart PP—National Emission Standards for Containers, Subpart QQ—National Emission Standards for Surface Impoundments, Subpart RR—National Emission Standards for Individual Drain Systems, and Subpart VV—National Emission Standards for Oil-Water Separators and Organic-Water Separators. These standards are essentially identical to the requirements for tanks, containers, and impoundments found in the RCRA subpart CC rule under discussion in this notice.

The EPA set out at length in the Off-Site Waste rule preamble (59 FR 62908) the Agency's goal as to integration of these various air standards, ''the EPA decided to promulgate the air emission control requirements for selected types of units in individual subparts for ease of reference, administrative convenience, and as a step towards assuring consistency of the air emission control requirements applied to similar types of units under different rules. The EPA believes adopting the format of codifying the air emission control requirements for specific unit types in individual subparts will provide significant advantages to both regulated industries and to the Agency.''

''A major advantage for using the unit-specific subpart format for NESHAP and other air rules is for those situations when more than one rule applies to a particular source (e.g., a tank) and each of these rules requires use of air emission controls on that source (e.g., a fixed roof). By establishing unit-specific subparts, all of the rules will reference a common set of design, operating, testing, inspection, monitoring, repair, recordkeeping, and reporting requirements for air emission controls. This eliminates the potential for duplicative or conflicting air emission control requirements being placed on the unit by the different rules, and assures consistency of the air emission control requirements applied to the same types of units.''

the HON, and the proposed new source performance standard (NSPS) for volatile organic compound emissions from the synthetic organic chemical manufacturing industry wastewater (59 FR 46780, September 12, 1994), all apply to wastes and/or wastewaters and all have higher action levels). The commenters recommended that the EPA select a higher action level of 500 ppmw for the rule, consistent with the above noted Clean Air Act rules.

The EPA considered the comments received regarding the action level, other revisions being considered for the final subpart CC RCRA air rules, and changes that the EPA anticipates making for other waste and wastewater related rules. The EPA concluded that a reexamination of the action level determination was appropriate. Based on consideration of the information available to the Agency regarding emissions from hazardous waste management TSDF operations, the EPA has concluded that an average VO concentration value of 500 ppmw is reasonable and accomplishes an adequate general level of protection, as compared with the 100 ppmw action level of the 1994 published rule. As was discussed in Section V.C. of the preamble published on December 6, 1994 (59 FR 62905), all five of the control options considered for the final rule are estimated to achieve similar levels of substantial reductions in nationwide organic emissions from TSDF and in annual cancer incidence. Under the new action level of 500 ppmw, the MIR for most of the 2,300 TSDF nationwide are estimated to be below the target MIR range of between 1×10^{-4} and 1×10^{-6}.

Thus, while the action levels at 100 ppmw and 500 ppmw are not equally protective of human health and the environment to the extent ascertainable by the modeling methodology used, these action levels do achieve the same general range of protection and were in the zone of reasonable values being considered by EPA for selection as the action level for the final rule. After further consideration, the EPA has concluded that the degree of incremental risk reduction at the 500 ppmw action level is so small as to not warrant the inconsistency and attendant disruption with other air rules applicable to hazardous waste TSDF. This incremental risk reduction is made less relevant by the fact that the EPA has already stated in the preamble to the final rule (59 FR 62905) that (even at the 100 ppmw action level), ''the EPA is further evaluating the waste management practices and the specific chemical compounds composing the organic emissions from those individual TSDF for which the MIR values are estimated to be greater than the historical RCRA target MIR levels. Following this evaluation, the EPA will determine what other actions, such as the use of section 3005(c)(3) omnibus permitting authority or additional rulemaking, are necessary to attain the health-based goals of RCRA section 3004(n).''

2. Treatment Alternatives

The treatment alternatives in the General Standards (§ 264.1083 and § 265.1083) are being revised where appropriate to reflect the new action level of 500 ppmw. The treatment alternatives contained in the General Standards of the subpart CC RCRA air rules provide owners or operators with a selection of alternative provisions for determining when a treated hazardous waste is no longer required to be managed in units meeting the air emission control requirements of the rule. The alternatives contained in the final CC rules published December 6, 1994 are being revised as a result of the change in the action level. The volatile organic concentration criteria contained in some of the alternatives are being revised upward to reflect the higher action level of 500 ppmw. Additional alternatives also are being added to the rule to provide greater flexibility to the owner or operator in the treatment of hazardous waste. The changes being made to the General Standards by today's action are described below.

For the treatment option that requires an organic reduction efficiency for the process of at least 95 percent and an average VO concentration of the waste at the point of waste treatment of less than 50 ppmw (§ 264.1082(c)(2)(ii)), the criteria for the average VO concentration of the treated waste is raised to 100 ppmw in direct response to the change in the action level. The value of 50 ppmw was chosen for the 1994 final rule to provide some added level of demonstration that co-mingled wastes streams had achieved a level of organic reduction through treatment, rather than through dilution (see 59 FR 62915, December 6, 1994). The selection of 50 ppmw in the 1994 final rule guaranteed that hazardous waste streams with VO concentrations of 2,000 ppmw or less at their point of waste origination were being reduced by 95% organics through treatment, as opposed to dilution. For today's final rule, EPA considers it appropriate to modify that 50 ppmw value to be 100 ppmw. In part, EPA is making this modification in response to comments that the value of 50 ppmw was too close to the level of detection for the test method 25D, and was therefore a very difficult and costly demonstration for the facility. After further consideration, the EPA feels that an exit concentration value of 100 ppmw is much less difficult and costly for a facility to make. Further, when combined with the revised action level of 500 ppmw for the overall rule, an exit value of 100 ppmw will ensure that the majority of hazardous waste streams are achieving the 95% reduction through treatment, as opposed to dilution that may occur through commingling.

For the treatment option that allows mixed hazardous waste to be treated by an organic destruction or removal process that reduces the VO concentration of the hazardous waste to meet a site-specific treatment process exit concentration limit (§ 264.1082(c)(2)(v)); the requirement that only hazardous waste enter the process is being removed. The exit concentration limit is being revised to be the lowest average VO concentration at the point of waste origination for each individual waste stream entering the process or 500 ppmw, whichever value is lower (this latter change is consistent with the revised action level for the standards also contained in today's action). Upon evaluation of this option, the EPA agreed with commenters that making these revisions will allow operators to use this option with a greater number of waste management systems, while still ensuring that reductions in VO concentrations are achieved through organic treatment or removal, as opposed to dilution.

A treatment option (§ 264.1082(c)(2)(vi)) is being added that requires an organic reduction efficiency for the process equal to or greater than 95 percent, and the average VO concentration of each individual waste stream entering the process is certified by the owner or operator to be less than 10,000 ppmw at the point of waste origination. This option is being added in response to commenters' concerns that many waste treatment operations have a multitude of waste streams being co-mingled early in the treatment process, and it would be infeasible for an operator to evaluate each waste stream. Further, the commenters stated that for these same treatment systems, the concentration of the hazardous waste streams at their point of waste origination is relatively low (e.g. 600 ppmw), and the exit concentration that would be required to demonstrate a 95% removal efficiency (in this example 30 ppmw) is below the level of detection of many organic test methods. Therefore, the EPA considered it reasonable to allow the owner or

operator to document the 95% organic removal efficiency of the control device, and certify that no waste streams greater than 10,000 ppmw at their point of origination were entering the centralized treatment process. The EPA chose the upper value of 10,000 ppmw because any waste stream with less than 10,000 volatile organic concentration, when treated with a 95% efficient organic control device, would be reduced to below 500 ppmw (and thus would not require further control under the subpart CC regulations. The EPA considers the combination of these two criteria (95% efficient organic control device, and waste streams below 10,000 ppmw VO concentration at their point of waste origination) to be adequate to ensure that any waste stream entering the treatment process is adequately treated for the purpose of the subpart CC standards.

3. Exemptions

An exemption from subpart CC control requirements is added to the General Standards to further clarify that a tank or surface impoundment used for biological treatment of hazardous waste in accordance with provisions in the subpart CC General Standards (§ 265.1082(c)(2)(vi) or § 264.1082(c)(2)(vi)) is exempt from the control device requirements under the rule. This was the Agency's intent in the 1994 promulgated rule, but several commenters advised the EPA that this intent was not evident. Therefore, the EPA is making this addition to the General Standards to more clearly describe this intent.

The following two exemptions are being added to the subpart CC General Standards in order to avoid the potential overlap of the subpart CC rules with RCRA standards established as part of the Land Disposal Restrictions (LDR) and to avoid overlap with the recently promulgated Benzene Waste Operations NESHAP.

In response to commenters' requests that compliance with applicable LDR treatment standards be reinstated as a subpart CC treatment alternative, an exemption from the subpart CC control requirements is being added for a tank, surface impoundment, or container if the material placed in the unit is a hazardous waste that meets the numerical concentration limits for organics applicable to the hazardous waste, as specified in 40 CFR part 268 (Land Disposal Restrictions) under Table—''Treatment Standards for Hazardous Waste'' in 40 CFR 268.40, or has been treated by the treatment technology established by EPA for the waste in 40 CFR 268.42(a), or treated by an equivalent method of treatment approved by EPA pursuant to 40 CFR 268.42(b).

The EPA in fact originally proposed such a provision (see 56 FR 33491, July 22, 1991), and commenters stressed again that wastes meeting LDR requirements for organics would have reduced organic concentrations sufficiently so that there need not be air emission controls on the units receiving the wastes. Upon reflection, EPA now agrees with these comments. The LDR treatment standards are based on the performance of Best Demonstrated Available Technology and are deemed sufficient to minimize threats to human health and the environment posed by land disposal of the waste. See 51 FR 40572, November 7, 1986 and RCRA section 3004(m)(1). In fact, the standards for most organics reflect the performance of combustion technology, which destroys organics to non-detectable levels, so that the treatment standard is actually the analytic detection limit for the organic times a factor which reflects technological variability. Consequently, it is EPA's finding here that units receiving wastes that satisfy these standards for organics need not be controlled further, since the organics in the wastes are already reduced to levels where threats posed by release of the organics have been minimized.

The EPA notes that, to be exempt from the subpart CC standards, the waste must meet the LDR treatment standards for that waste whether or not the waste actually is prohibited (or restricted) from land disposal, i.e., whether or not the waste is going to be ultimately land disposed. Thus, for example, if an organic ignitable waste is going to be managed in tanks and ultimately disposed of in a manner not involving land disposal, in order for the tanks to be exempt from subpart CC (assuming the subpart CC rules otherwise apply), the waste would have to meet the treatment standards for D001 wastes. It should be clear from this example that the treatment standards are being used here as a means of demonstrating that further control of air emissions from the waste is not necessary to protect human health and the environment. This determination does not hinge on whether the waste is being land disposed (i.e., on whether the waste would otherwise have to be treated to meet the standard as a precondition to land disposal).

The EPA is amending the 1994 final rule to address certain of the commenters' concerns regarding applicability of the subpart CC rules to incinerator bulk feed tanks (that is, tanks used for bulk feed of hazardous waste to an incinerator). A standard industry practice is to control the air emissions from these tanks by enclosing the tank and feed operation, and venting emissions for the enclosure through a closed-vent system to an organic emission control device. The EPA has received comments stating that some industry members have alternate designs which allow them to effectively operate bulk incinerator feed systems using a tight-fitting cover on the tank and enclosing the feed line, with all emissions vented to a control device.

The EPA is addressing two issues with respect to those former bulk feed operations. The first is the efficiency of the organic control device, and whether existing facilities must replace those devices previously installed to comply with the Benzene Waste Operations NESHAP. The second issue is whether an enclosure can provide adequate capture and control of organic emissions from an open tank, when compared with a tight-fitting cover on that tank.

The subpart CC rules require 95% reduction of total organics in vapor streams, by weight. The Benzene Waste Operations NESHAP (40 CFR part 61, subpart FF) requires 98% reduction of benzene in vapor streams. This distinction is appropriate, given the Benzene Waste Operations NESHAP's purpose to control benzene specifically, and the subpart CC rule's purpose to control total organics (including benzene). However, incinerator bulk feed operators have installed non-combustion control devices (such as activated carbon systems and condensers) which achieve 98% reduction of benzene, but do not effectively achieve 95% reduction of total organics. (This is because benzene is more amenable to certain reduction technologies than other organic compounds.)

The EPA has decided that it is not justified to require owners and operators to replace these relatively new control devices, which were installed pursuant to EPA regulation, and is therefore adding an exemption for control devices installed on such systems.[4] The EPA is making this decision chiefly due to the high replacement cost, action in reliance on EPA's Benzene Waste Operations

[4] Although there is probably some degree of decrease in protectiveness between these control devices and the proscribed 95% total organic control device requirements, EPA considers that difference to be not significant enough to warrant the substantial dislocations noted above. With respect to newly constructed control devices, there would be obviously, no such dislocations, and EPA therefore, does not believe there is any reason to forego the full protection provided by the 95% total organic control device efficiency requirements.

NESHAP, and the desire for consistency among the various standards controlling organic constituents.

With respect to enclosures used in lieu of a discreet tank cover, the issue is the same as that which EPA is addressing for all tank systems (see Section G of this Preamble.)

F. Waste Determination Procedures

Under the subpart CC RCRA air rules, air emission controls are not required for a hazardous waste management unit when the unit manages hazardous waste having an average VO concentration less than the action level (i.e., 500 ppmw at the point of waste origination). As part of the procedure for determining the VO concentration of the hazardous waste, the EPA allowed that an owner or operator could use either: (1) Direct measurement using Method 25D for preparation and analysis of samples of the waste collected in accordance with the procedures specified in the rule; or (2) the owner's or operator's knowledge of the VO concentration in the waste based on information, as specified in the rule.

In response to comments received concerning Method 25D relating to aggressiveness, expense, and repeatability of the method, the EPA decided to add other appropriate test methods that an owner or operator can choose to use for direct measurement of the VO concentration of a hazardous waste (see discussion below). In addition, the EPA is making certain other changes to facilitate the use of organic concentration data obtained using other test methods not specifically listed in the rule. The EPA believes that the changes being incorporated into the waste determination requirements in conjunction with changes to the applicability and action level for the subpart CC RCRA air rules for tanks, surface impoundments, and containers provide a range of options for determining the VO concentration of a hazardous waste such that every owner and operator of a facility subject to the final rule has available practical and inexpensive waste determination alternatives.

The EPA developed Method 25D to provide a relative measure of the potential for specific volatile organic compounds to be emitted from waste materials. When using Method 25D, the waste is analyzed to determine the total concentration, by weight, of all organics purged from the waste sample. However, some commenters stated that measuring all organics resulted in an overly aggressive method. Commenters suggested that there is some universe of organic compounds which usually do not volatilize, but which some test methods would measure. In a practical sense, the EPA does not consider it equitable to require air emission controls for wastes that do not contain organic compounds which are likely to volatilize. In response to these comments, the EPA is amending the waste determination procedures to allow the owner or operator to discount any contribution to the total volatile organic concentration that is a result of including a compound with a Henry's law constant of less than 0.1 mole-fraction-in-the-gas-phase/mole-fraction-in-the-liquid-phase (0.1 Y/X) [which can also be expressed as 1.8×10^{-6} atmospheres/gram-mole/m^3] at 25 degrees Celsius. The Henry's law constant of a compound is one indication that is commonly used to predict the potential of a compound to volatilize.

If the waste contains compounds with Henry's law constants below the cutoff level, the VO concentration for the waste can be adjusted to exclude the VO concentration of these compounds from the total VO concentration for the waste stream. The contribution to the measured total VO concentration for the waste that is made by a specific compound can be determined by multiplying the actual concentration of the compound in the waste times the appropriate compound-specific adjustment ''f_m factor'' to obtain the Method 25D VO concentration. The VO concentration for the compound, with a Henry's law constant of less than 0.1 Y/X, can then be subtracted from the total VO concentration measured for the waste. In order to identify those compounds with a Henry's law constant below the cutoff level, the EPA has published a table listing the known compounds as part of today's amendments. The Henry's law constant value used as the cutoff in determining the VO concentration of a waste has been used in other EPA regulations (e.g., the Off-Site Waste and Recovery Operations NESHAP and the HON) and was selected based on modeling studies to identify and classify compounds with a significant potential for air emissions when present in a waste/wastewater system. With this amendment to the waste determination procedures, the EPA considers Method 25D to be an appropriate method for determining the VO concentration of hazardous wastes subject to the subpart CC RCRA air rules. Therefore, Method 25D continues to be an approved test method for determining the VO concentration of a waste, although other methods are allowed as direct measurement under today's amendment. This is discussed in greater detail below.

Other test methods have been developed by the EPA for use in rulemakings under the Clean Water Act that measure the concentration of organic pollutants in municipal and industrial wastewaters (see appendix A to 40 CFR part 136). Commenters suggested that certain of these test methods are applicable to EPA air rulemakings affecting hazardous waste and wastewater management units. After extensive review, the EPA decided that as alternatives to using Method 25D for direct measurement of VO concentration in a hazardous waste for the subpart CC RCRA air rules it is appropriate to add Methods 624, 625, 1624, and 1625 (all contained in 40 CFR part 136, appendix A) and Methods 8260(B) and 8270(C) (both in ''Test Methods for Evaluating Solid Waste, Physical/Chemical Methods'' in EPA Publication SW–846) when these methods are used under certain specified conditions. It is important to note that for each of these methods there is a published list of chemical compounds which the EPA considers the method appropriate to measure. The owner or operator may only use these methods to measure compounds that are contained on the list associated with that method, unless specified validation procedures are also performed. Further, for the purpose of a waste determination, the owner or operator must evaluate the mass of all VO compounds in a waste that have a Henry's Law value above the 0.1 Y/X cutoff. Therefore, the owner or operator is responsible for determining that the analytical method being used for a waste determination is sufficient to evaluate all of the applicable organic compounds that are contained in the waste. If an owner or operator chooses to use a method other than Method 25D to analyze a waste that contains unknown compounds or many different compounds, it may be necessary to perform screening analyses to verify that the alternate analytical method chosen is, in fact, appropriate to evaluate all the necessary compounds.

Because these methods measure the total concentration of various constituents, owners and operators may choose to ''correct'' these measured values to equate to the values that would be measured using Method 25D. This is accomplished by multiplying the total concentration measured values times the appropriate compound-specific adjustment ''f_m factor'' to obtain the Method 25D VO concentration. The EPA has published lists of the compound-specific adjustment factors

in other rulemakings; see Table 1 in the Off-Site Waste and Recovery Operations NESHAP (40 CFR part 63, subpart DD) and Table 34 in the HON (40 CFR part 63, subpart G). Compound specific adjustment factors (f_m factors) for additional compounds can be obtained by contacting the Waste and Chemical Processes Group, Office of Air Quality Planning and Standards, Research Triangle Park, NC 27711.

Sufficient recovery study results are available for Methods 1624 and 1625 to correct for possible bias, and therefore, these methods are considered adequate by the EPA to characterize the concentration of a hazardous waste sample. In addition, Methods 624 and 625 are appropriate provided the initial calibration of the analytical system is performed with the target compounds to be measured. Methods 8260(B) and 8270(C) are also considered appropriate provided that formal quality assurance procedures are established, followed, and records are maintained to cover those elements of the methods considered relevant to measuring the actual concentration of organic compounds. The quality assurance program must address procedures to minimize the loss of compounds due to volatilization, biodegradation, reaction, or sorption during the sample collection, storage, and preparation steps as well as addressing the overall accuracy and precision of the specific method used.

Sample collection procedures and sample recovery conditions are established by Method 25D (40 CFR part 60, Appendix A). For the hazardous wastes typically managed in the operations subject to the RCRA air rules, the EPA has concluded that using Method 25D sample collection procedures and sample recovery conditions for other analysis methods is reasonable for the purpose of this rulemaking. However, none of the other methods discussed above specifies a sample collection and handling procedure that the EPA considers adequate to minimize the volatilization of organics from the sample prior to analysis. Therefore, to ensure that an adequately representative sample of a hazardous waste is analyzed by the method, an owner or operator that chooses to use either Method 624, 625, 1624, 1625, 8260(B) or 8270(C) for the subpart CC RCRA air rules is required to develop and follow a written sampling plan. Similarly, such a plan is required for alternative methods validated by EPA Method 301 in appendix A of 40 CFR part 63, or the ''Alternative Validation Procedure for EPA Waste and Wastewater Methods'' in appendix D of 40 CFR part 63. This plan must describe a step-by-step procedure for collecting representative samples of the hazardous waste such that material integrity is maintained and minimal loss of organics from the sample occurs throughout the collection and analysis process. An example of an acceptable sampling plan is one that incorporates sample collection and sample handling procedures similar to those specified in Method 25D. The sampling plan is to be maintained on-site in the facility records.

It should be noted that as long as one of the allowable test methods is being used for direct measurement of the VO concentration of a hazardous waste, the EPA would only enforce against the facility on that basis (i.e., using the same test method), unless the method used is not appropriate for the hazardous waste managed in the unit. For example, if the method is not suitable for use on semi-volatile organic compounds and the waste is known to contain organic compounds that are classified as semi-volatile, then the method is not appropriate.

In the published rule, the EPA allows use of knowledge-of-the-waste as the basis for a waste determination (§ 265.1084(a)(2)). Among the waste determination techniques that would have been considered knowledge, was analysis by methods other than 25D, if the alternate method had been validated using Test Method 301, from appendix A of part 63. Certain commenters indicated that it was not clear in the 1994 final rule that data from non-validated methods could be used to make a waste determination, with those results being again, considered knowledge-of-the-waste (as opposed to direct measurement). Today EPA is clarifying that, and, also in response to comments, the EPA has decided to allow organic concentration test data that are validated in accordance specifically with Sections 5.1 and 5.3 and the corresponding calculations in Section 6.1 or 6.3 of Method 301 to be used as direct measurement data. This makes validation of the alternative test method a self-check of the method being validated. Also, if appropriate, owners and operators may choose to ''correct'' values measured by the alternative test method to equate to the values that would be measured using Method 25D by multiplying the measured values times the appropriate compound-specific adjustment ''f_M factor.''

In addition, as discussed in Section II.G of the preamble to the final Off-Site Waste and Recovery Operations NESHAP (61 FR 34140, July 1, 1996), the EPA promulgated a less rigorous validation procedure, ''Alternative Validation Procedure for EPA Waste and Wastewater Methods,'' in Appendix D to 40 CFR part 63 as an alternative to Method 301 for the validation of a test method established by the EPA Office of Water (OW) or the EPA Office of Solid Waste (OSW) when this EPA test method is used for air emission standards. The EPA decided it is appropriate to allow organic concentration test data that are validated in accordance with this method to be used as direct measurement data because it is considered to produce equally reliable validation results. Other test methods not previously mentioned that are used to measure organic concentrations in the waste shall be validated according to section 5.1 or 5.3, and the corresponding calculations in section 6.1 or 6.3, or Method 301 of Appendix A of 40 CFR part 63.

The main point that must be reemphasized regarding direct measurement of VO concentration is that, although the EPA is amending the rule to allow various test methods other than Method 25D to be used in a waste determination, the owner or operator must use a test method(s) that is appropriate for the compounds contained in the waste. The method(s) used for the waste determination must be suitable for and must reflect or account for all compounds in the waste with a Henry's Law constant equal to or greater than 0.1 Y/X at 25 degrees Celsius.

In a further clarification, today's action is revising the waste determination procedures such that for both point of waste origination and point of waste treatment, no distinction is made for batch or continuous processes or for whether the owner or operator is the generator or receives the waste from off-site. The owner or operator chooses an averaging period appropriate for the hazardous waste stream of not more than 1 year. As has been noted previously, a site sampling plan is required that describes the procedure for collecting representative samples of the hazardous waste stream such that a minimum loss of organics occurs throughout the sample collection and handling process and by which sample integrity is maintained.

As was originally promulgated in the 1994 final rule, in the event that the Regional Administrator and the owner or operator disagree on a determination of the average VO concentration of a hazardous waste stream at the point of waste origination using knowledge, then direct measurement shall be used to establish compliance. As noted above,

because of the expansion of analysis methods in today's amendments, direct measurement to establish compliance is not limited to Method 25D, but can be performed using any of the methods specified in the rule or any test method validated as specified in the rule, as appropriate for the waste managed in the unit. Because of the expansion of analysis methods, the rule has been revised such that, if the Regional Administrator determines that the method used by the owner or operator for a waste determination using direct measurement was not appropriate for the waste managed in the unit, then the Regional Administrator may choose an appropriate method to verify the waste determination.

G. Standards: Tanks

The subpart CC tank standards have been revised to address comments on the proposed technical amendments, to be consistent with tank standards established for related Clean Air Act NESHAP, and to reduce the inspection, monitoring, recordkeeping, and reporting requirements. In general, the amendments published today establish two levels of air emission control (referred to as Level 1 and Level 2 controls) for tanks managing hazardous waste having a maximum organic vapor pressure less than 76.6 kilopascals (kPa). The control level applicable to a tank required to use controls is determined by the tank design capacity and the maximum organic vapor pressure of the material in the tank. Ranges of capacity and vapor pressure limits or criteria have been established for tanks. However, tanks used for waste stabilization processes are required to use specific air emission controls.

For a tank to meet Level 1 controls, the revised final rule specifies that the hazardous waste be managed in a tank using a fixed-roof. For the Level 2 controls, the revised final rule requires that hazardous waste be managed in one of the following: (1) A fixed-roof tank equipped with an internal floating roof; (2) a tank equipped with an external floating roof; (3) a tank vented through a closed-vent system to a control device; (4) a pressure tank; or (5) a tank located inside an enclosure that is vented through a closed-vent system to an enclosed combustion control device.

A tank is allowed to use the Level 1 controls if it meets the conditions that were in the 1994 final subpart CC rule to qualify for control by only a fixed roof, with several revisions to the conditions. In response to comments, the condition that the waste is neither mixed, stirred, agitated, nor circulated within the tank is being dropped; the condition on heating the waste is being revised to require that the hazardous waste in the tank not be heated to a temperature that is greater than the temperature at which the maximum organic vapor pressure of the waste was determined; and the condition that the hazardous waste not be treated by a process that produces an exothermic reaction is being dropped. The EPA agrees with commenters that these conditions are redundant given the criteria based on determination of a maximum organic vapor pressure. The conditions that are being dropped from the rule thus are adequately accounted for in the maximum organic vapor pressure criteria.

The owner or operator of a tank that qualifies for the Level 1 controls may choose to use Level 2 controls. A tank that does not qualify for the Level 1 controls is subject to the Level 2 controls.

Tank Level 1 control requirements consist of a fixed roof meeting the design, operation, inspection, and recordkeeping requirements specified in the rule. Because of commenters' concerns with the safety of workers during tank cleaning, the operating requirements are being clarified to explicitly include the removal of accumulated sludge or other residues from the bottom of the tank as a time when the opening of closure devices or removal of the fixed roof is allowed. In response to commenters' concerns that the subpart 1994 CC rules (inadvertently) required that a conservation vent must discharge through a closed-vent system to a control device, the revised rule states that a pressure relief device, such as a conservation vent which vents to the atmosphere, is allowed for the purpose of maintaining the tank internal pressure in accordance with the tank design specifications. Normal operating conditions that might require a pressure relief device to open include internal pressure buildup as a result of loading operations or diurnal ambient temperature fluctuations.

To reduce the inspection, monitoring, and recordkeeping burden of the rule, a number of rule revisions are being made in response to comments. The semiannual inspection requirement for the fixed roof and closure devices is being changed to an annual inspection requirement. The EPA considers this change to greatly reduce the requirements placed on the tank operators, while not affecting the protectiveness of the rules. The regulations still require tanks to be operated with covers that do not have visible openings or gaps; therefore, any openings or gaps will still need to be immediately repaired. The instrument monitoring requirements are being dropped, EPA's rationale being that the fixed roofs are allowed to operate with a conservation vent, and thus, leaks detectable only by an instrument are relatively insignificant. The time during which repair of a defect must be completed is being extended from 15 to 45 calendar days. The delay of repair provisions are being clarified to indicate that repair of a defect on a fixed roof or closure device may be delayed beyond 45 calendar days if repair would require the tank to be emptied or removed from service and no alternative capacity is available at the facility to accept the hazardous waste normally managed in the tank. The recordkeeping requirements are being clarified to explicitly define the information required for the annual inspection.

The revised Tank Level 2 air emission control requirements include options that were available in the 1994 final subpart CC rule, i.e., a tank equipped with a fixed roof and internal floating roof, a tank equipped with an external floating roof, a fixed roof vented through a closed-vent system to a control device, and a pressure tank. In addition, an option is being provided allowing the use of an enclosure vented through a closed-vent system to an enclosed combustion device or a control device designed and operated to reduce the total organic content of the inlet vapor stream by at least 95 percent by weight.

For a tank equipped with a fixed roof and internal floating roof, an operating requirement is being revised, such that, when the floating roof is resting on the leg supports, the process of filling, emptying, or refilling must be accomplished as soon as practical rather than as rapidly as possible. The rationale for this is explained in the preamble of the February 9, 1996 technical amendments (see 61 FR 4910).

Internal floating roof and external floating roof design, operating, inspection, and monitoring requirements are revised to reflect current technology and to be consistent with requirements of Clean Air Act standards for the same equipment (e.g. the off-site waste and recovery operations NESHAP, promulgated July 1, 1996). Again, this is part of the EPA's effort to promote consistency between requirements for similar types of units. Overall performance and emission reductions are effectively unchanged.

For a tank with a fixed roof that is vented through a closed-vent system to a control device, the operating, monitoring, and inspection requirements are being revised

consistent with the Tank Level 1 control requirements described previously. In summary, the times when opening of closure devices or removal of the fixed roof are allowed are being clarified, the rule is being clarified to allow the opening of a safety device, the semiannual inspection required for the fixed-roof and closure devices is changed to an annual inspection requirement, monitoring requirements are dropped, the time during which repair of a defect must be completed is extended from 15 to 45 calendar days, the delay of repair provisions are being clarified to indicate that repair of a defect on a fixed roof or closure device may be delayed beyond 45 calendar days, and the recordkeeping requirements are being clarified to explicitly define the information required for the annual inspection.

In response to the numerous comments regarding establishment of criteria to identify or define a pressure tank, the pressure tank requirements are being clarified to state that the tank shall be designed to operate with no detectable organic emissions during filling to the tank design capacity and the subsequent compression of the vapor headspace in the tank.

For the control option being added as a part of these amendments that allows the use of an enclosure vented through a closed-vent system to an enclosed combustion device or alternative control device, the enclosure must be designed and operated in accordance with the criteria for a permanent total enclosure as specified in 40 CFR 52.741, Appendix B, Procedure T-Criteria for and Verification of a Permanent or Temporary Total Enclosure. The EPA is adding this control option in response to comments from, among others, members of the hazardous waste stabilization industry and the incineration industry, who maintain that certain waste handling or treatment operations (e.g. incinerator bulk feed systems and stabilization) can not feasibly be conducted in covered tanks.

The EPA has made a number of revisions to the regulations that address this concern. As noted earlier, the increased VO concentration action level (from 100 ppmw to 500 ppmw) plus the inapplicability of the rule to hazardous wastes that meet the LDR standard for organic hazardous constituents should sharply reduce the number of situations where a metal-bearing waste undergoing stabilization would also be subject to the subpart CC standards.

In addition, the EPA reexamined the data in the record for those wastes that may undergo stabilization and still be subject to the Subpart CC requirements; this includes data supplied by waste management companies after promulgation of the 1994 final CC rule, in response to EPA's solicitation (see 59 FR 62912, December 6, 1994). However, the data currently available to the EPA do not support the commenters' assertions that no controls at all are needed for these wastes undergoing stabilization. All currently available data indicate that a significant fraction, by mass, of organics in waste are volatilized during stabilization processes.[5]

The EPA recognizes that certain stabilization and waste handling operations can only be feasibly conducted in open tanks (and containers). For such operations, where a cover is impractical, the most practical alternative is a permanent total enclosure that achieves high capture efficiency of the organic compounds emitted from the open tank (or container) and routes them through a closed-vent system to an organic control device. The EPA defines a permanent total enclosure as a ''permanently installed enclosure that completely surrounds a source of emissions such that all (VOC) emissions are captured and contained for discharge through a control device.'' The EPA has developed a set of criteria (in 40 CFR 52.741, appendix B) to ensure high capture efficiencies through proper design and operation of an enclosure and to eliminate the need for expensive and disruptive capture efficiency performance tests. The EPA method states that if a facility meets the criteria for a permanent total enclosure and all emissions are directed to a control device, the capture efficiency may be assumed to be 100 percent and measurement requirements are waived. The EPA has concluded that these enclosure criteria are appropriate for application to waste stabilization operations, bulk feed tank operations, and other waste handling situations where an owner or operator may deem a covered tank impractical; the design and operational criteria allow for necessary worker access to perform necessary operations, while assuring a high capture efficiency. Therefore, in this limited situation, use of an enclosure and control device that meets the criteria specified in the rule, for both the enclosure and the control device, is considered to provide the same level of emission reduction performance as does the other control options provided in the rule for tanks and thus achieves the same level of protection.

One commenter argued that the permanent enclosure criteria are inappropriate because they were originally developed for use in another industry (the paint and coating industry). However, the EPA considers these criteria appropriate for ensuring adequate design and operation of any enclosure used to capture organic emissions. The criteria are not prescriptive, that is, they do not specified detailed design and operation conditions. Rather, the criteria are just that: Parameters that must be evaluated, and minimum or maximum values that must be met for each parameter. These criteria are the only description known to the Agency that ensure an enclosure is effective in: (1) Preventing significant volumes of organics from escaping to the atmosphere, (2) capturing the organics from within the enclosure, and (3) routing the organics from within the enclosure to a control device.

The permanent total enclosure criteria specifies: (1) Maximum total area for natural draft openings, or NDO (which are holes in the enclosure that allow passage of organics through to the atmosphere), (2) minimum distance from emission points to NDO, (3) minimum face velocity to ensure sufficient negative pressure, (4) closure of any accesses that were not open for the purpose of performing the criteria calculations, and (5) routing of all emissions to a control device. All of these are parameters that would require consideration in the evaluation of any enclosure's effectiveness. Further, the minimum and maximum values specified in the permanent total enclosure criteria were chosen by EPA specifically for the purposes of ensuring adequate capture of organic emissions from industrial operations, such as paint and coating operations. The paint and coating industry operations are similar enough to other industrial operations, including waste treatment, that it is appropriate to use the permanent total

[5] Recent data supplied to EPA (including information contained in docket F–94–CE3A–FFFFF, and information submitted by subpart CC rule commenters to the EPA's Office of Solid Waste and Emergency Response) do not lead the Agency to conclude otherwise. Rather, the data submitted indicate that numerical quantification methods, or test methods, used to measure the mass of organics emitted during stabilization do not yield consistent or precise results when waste streams below 500 ppmw VO concentration are evaluated. These data, among other factors, prompted the Agency to raise the action level to 500 ppmw. However, the data submitted did not support any revision to the Agency's policy of requiring stabilization of organics to be performed in units with air emission controls. The Agency maintains that stabilization, and other operations that raise the temperature of the waste or agitate the waste, increase the rate of volatilization or organics in the waste. Therefore, it follows that a regulation that considers it appropriate to control the organic emissions from storage of hazardous waste would consider it at least as important to control the organic emissions during treatment of hazardous waste.

enclosure criteria for specifying enclosure integrity elsewhere.

One commenter remarked that the costs to retrofit two particular existing enclosures to the permanent total enclosure criteria would be prohibitive. The EPA does not agree with that remark. After reviewing that data, the EPA estimates that it would be less costly for that facility to upgrade those enclosures than it would be for any facility to retrofit an existing tank with an air-tight cover, which is the requirement for other tanks subject to the subpart CC standards.[6]

Safety devices, as defined in the rule, may be installed on the enclosure, as needed. The closed-vent system and enclosed combustion device or alternative control device must be designed and operated in accordance with standards in subpart CC. The enclosure is required to be inspected initially and annually thereafter. When defects are detected, the owner or operator must make first attempts at repair no later than 5 calendar days after detection and complete repair within 45 days.

Finally, in response to commenters' concerns with the feasibility of transferring solids and sludges between containers and tanks in a ''closed system'' as required by the final rules, the closed system transfer requirements for hazardous wastes transferred to or from a tank and another waste management unit subject to subpart CC control requirements are being revised such that transfer of hazardous waste between a tank and container is not required to be done in a closed system.

H. Standards: Surface Impoundments

Revisions are being made to the subpart CC surface impoundment standards so that, where relevant and appropriate, the inspection, monitoring, recordkeeping, and reporting requirements for surface impoundments are consistent with the requirements established for tanks in subpart CC and for surface impoundments under the Clean Air Act NESHAP. A discussion of these revisions is presented below.

More design and installation information is being included for rigid covers. A provision is being added that clarifies the intent of the 1994 final subpart CC rule, that venting to a control device is not required and that opening of closure devices or removal of the cover is allowed to remove accumulated sludge or other residues from the bottom of the surface impoundment. A provision is being added that explicitly allows opening of a safety device installed on the cover, closed-vent system, or control device at any time conditions require it to do so to avoid an unsafe condition. Also under the technical amendments published today, visual inspection of the rigid cover and closure devices is required initially and annually thereafter, rather than semiannually; leak detection monitoring is only required initially; and there are no requirements for periodic monitoring (as discussed above, the EPA does not consider it warranted to survey for non-visible leaks, while allowing conservation vents to route emissions to the atmosphere). The repair period for a defect also is being extended from 15 to 45 days to be consistent with other CAA regulations (e.g. the HON).

The floating membrane cover design and installation requirements are being clarified, e.g., language is being added to clarify that the ''floating membrane cover shall be designed to float during normal operations on the surface of the liquid contained in the surface impoundment.'' A provision is being added that allows the floating membrane cover to be equipped with emergency cover drains for removal of storm water. Opening of a safety device installed on the cover is allowed at any time conditions require it to do so to avoid an unsafe condition. Visual inspection of the floating membrane cover and closure devices is required initially and annually, rather than semiannually. The leak detection monitoring requirements for floating membrane covers are being dropped. The repair period for a defect is being extended from 15 to 45 days.

The closed system transfer requirements for hazardous wastes transferred to or from a surface impoundment and another waste management unit subject to subpart CC control requirements are being revised such that transfer of hazardous waste between a surface impoundment and container is not required to be done in a closed system. This change is being made to provide consistency within the subpart CC rules; containers are not subject to transfer requirements among other containers; therefore, the EPA does not consider it necessary to require closed transfer between containers and surface impoundments.

I. Standards: Containers

The subpart CC container standards are being significantly revised under today's amendments to address comments on the proposed changes to the container requirements, to make this rule compatible with the existing U.S. Department of Transportation (DOT) regulations for transporting hazardous materials, and to reduce any unnecessary inspection, monitoring, recordkeeping, and reporting requirements.

1. Control Requirements

Commenters stated that promulgated air emission control requirements for containers are impractical to implement or require equipment that is commercially unavailable. Also, commenters stated that the requirements should be consistent with the container air emission control requirements under the Clean Air Act rules.

Since promulgation in December 1994, the EPA has obtained more information on the practices and equipment currently used to manage hazardous waste in containers. Based on consideration of this information, the EPA decided to revise the air emission control requirements for containers to better reflect the container organic emission potential, the various container types, and the common container management practices used for hazardous waste operations. The EPA believes that these revised requirements are technically feasible and practical to implement on all types of containers that the Agency expects to be subject to the rule. These revisions are described in detail later in this section of today's notice.

The EPA is addressing consistency between the air emission control requirements for containers (as well as

[6] The EPA further notes that one of the two enclosures described in this commenter's submission would require only the sealing of a natural draft opening which is too close to an emission point. The other enclosure would require an increase in the face velocity, which could possibly be achieved by closing some of the natural draft openings in the enclosure. The cost to close a natural draft opening is not at all prohibitive; in many instances it can be accomplished with a patch and some air-tight caulk or foam. However, it is conceivable that the facility may need to increase the capacity of the control device for this second enclosure, in order to be able to effectively handle the resulting increased air flow. However, the EPA considers it highly relevant to note that the commenter states that his permitting authority has confirmed the tank inside this enclosure is not subject to the subpart CC standards; therefore, the enclosure would not be required to meet the permanent total enclosure criteria referenced by the subpart CC standards. It should be noted that costs associated with achieving a level of protectiveness required under RCRA 3004(n) are not a consideration in the selection of standards.

The EPA considers it also noteworthy to mention that a hazardous waste treatment industry group polled its members that operate incinerator bulk feed tanks, and was informed that all the member companies polled either: (1) Currently perform the bulk feed operations using covered tanks, (2) currently perform the bulk feed operations inside enclosures which already meet all of the permanent total enclosure criteria, or (3) would consider it reasonable to (and are willing to) upgrade or modify their existing enclosures to meet the permanent total enclosure criteria.

the other affected waste management units) in the RCRA rules and those contained in Clean Air Act NESHAP or NSPS by amending the RCRA rules to include an exemption for those affected units using organic emission controls in accordance with the requirements of any applicable NESHAP or NSPS. Because the Clean Air Act controls for containers are essentially the same as those required under the RCRA air rules, they are considered to provide the same level of protection. In addition, allowing the use of DOT containers is also consistent with the EPA's general objective of avoiding duplication and promoting consistency. The EPA has thoroughly evaluated the control requirements for DOT containers and has worked with DOT in developing these revisions. The EPA concluded that containers that meet applicable DOT requirements under 49 CFR parts 173, 178, 179, and 180 are equivalent in their overall emission reduction performance and therefore provide the same level of protection as do the initial requirements of the final subpart CC rules.

The revised container standards for the subpart CC RCRA air rules establish three levels of air emission control. The control level applicable to a container is determined by the container design capacity, the total organic content of the hazardous waste material in the container, and use of the container. For example, containers with a design capacity less than or equal to 0.1 m^3 (approximately 26 gallons) are not subject to any requirements under the rule, as was the case in the 1994 promulgated CC rule.

Under today's revised subpart CC rule, Level 1 controls are allowed for the following container categories (except when the container remains uncovered for waste stabilization or certain other treatment processes): (1) Containers having a design capacity greater than 0.1 m^3 and less than or equal to 0.46 m^3 (approximately 119 gallons); and (2) containers with a design capacity greater than 0.46 m^3 and used to manage hazardous wastes that do not meet the definition of ''in light material service'' (i.e., used to manage a hazardous waste where the vapor pressure of one or more of the components in the material is greater than 0.3 kPa at 20 °C, and the total concentration of the pure components having a vapor pressure greater than 0.3 kPa at 20 °C is equal to or greater than 20 percent by weight). Level 2 controls are required for containers with a design capacity greater than 0.46 m^3 and used ''in light material service,'' except when the container remains uncovered for waste stabilization or certain other treatment processes. Level 3 controls are required for containers having a design capacity greater than 0.1 m^3 that must remain uncovered for waste stabilization processes.

For the containers allowed to use Level 1 controls, the amended rule requires that the hazardous waste be managed either: (1) In a container that meets the relevant DOT regulations on packaging hazardous materials for transportation under 49 CFR parts 173, 178, 179, and 180; or (2) a covered container that meets the requirements specified in the 1994 final CC rule (40 CFR parts 264 and 265). No additional requirements are specified by today's revised final rule for containers complying with the applicable DOT regulations. In the case when an owner or operator elects to comply with the covered container requirements (i.e., non-DOT containers), the container must be equipped with a tight-fitting cover that has no visible gaps, spaces, holes, or other openings. The rule does require a visual inspection when the cover is applied and annually thereafter, if the container remains in on-site storage for a period longer than 1 year. No testing for detectable organic emissions using Method 21 is required. No recordkeeping and reporting are required under the revised final rule for containers using Level 1 controls. The EPA has agreed with commenters' suggestions that any increases in enforceability of the subpart CC standards does not justify the expense and time required by an owner or operator to make and maintain records for the subpart CC regulations for hazardous waste in containers. The vast majority of containers subject to the subpart CC standards are not at a given site for more than 90 days; therefore, the burden associated with maintaining additional records (that is, in addition to existing records required under other applicable regulations, such as the RCRA subpart I, or DOT container requirements) for all containers used to store hazardous waste was deemed to be considerably greater than the recordkeeping requirements for tanks or surface impoundments (particularly when compared with the relatively low volume of hazardous waste, nationwide, that is managed in containers versus tanks and surface impoundments).

For the containers required to use Level 2 controls, today's revised final rule requires that the hazardous waste be managed in one of the following: (1) A container that meets the relevant DOT regulations on packaging hazardous materials for transportation under 49 CFR parts 173, 178, 179, and 180; or (2) a container that operates with ''no detectable organic emissions''; or (3) a container that has been demonstrated within the preceding 12 months to be vapor-tight by using Method 27. Specific design, operating, inspection and monitoring, repair, recordkeeping, and reporting requirements for containers tested using either Method 21 or 27 are specified in the rule.

No additional requirements are specified in the final rule for containers complying with the applicable DOT regulations. However, for compliance with the subpart CC rules, no exceptions under the 40 CFR parts 178 or 179 regulations are allowed for DOT containers except for lab packs meeting the exceptions for combination packaging specified in 40 CFR 173.12(b). In addition, the EPA based its decision to allow use of DOT containers for compliance with the subpart CC rules on the specifications, testing, maintenance, and other requirements for containers that can be reused or refilled under DOT regulations (the typical practice at hazardous waste TSDF). For the purpose of complying with the subpart CC rules, the EPA does not consider it appropriate that a container which is a ''non-reusable container (NRC)'' or ''single-trip container (STC)'' according to DOT requirements, be repeatedly used while at the facility site (i.e., emptied and refilled) for the handling of hazardous waste subject to subpart CC rules. Before a DOT container can be reused, even within the boundaries of a facility site, it must comply with the DOT reconditioning and reuse provisions of the hazardous materials regulations in 49 CFR 173.28.

For the containers required to use Level 3 controls, the revised final rule requires that an open container be placed in an enclosure vented through a closed-vent system to a control device or a covered container be vented directly to a control device. If an enclosure is used, the enclosure is to be designed in accordance with the criteria for a permanent total enclosure as specified in 40 CFR 52.741, Appendix B, Procedure T—Criteria for and Verification of a Permanent or Temporary Total Enclosure. The use of a permanent total enclosure and the design and operating criteria for these enclosures are discussed further in Section G of this preamble.

2. Loading Operations

Requirements for loading hazardous waste into a container are also being revised by today's action in response to the numerous comments received by EPA on this topic. Under the revised final rule there are no requirements for

loading hazardous waste into containers using Level 1 controls. The rationale for this is explained in the preamble to the February 9, 1996 technical amendments (see 61 FR 4909). For containers using Level 2 controls, the loading requirements have been revised to allow the owner or operator the flexibility to use any appropriate loading method that will minimize exposure of the hazardous waste to the atmosphere and thereby reduce organic air emissions, to the extent practical considering the physical properties of the hazardous waste and good engineering and safety practices. Examples of container loading procedures that the EPA considers to meet these requirements include, but are not limited to, using a submerged-fill pipe or other submerged-fill method to load liquids into the container; or using a vapor-balancing or a vapor-recovery system to collect and control the vapors displaced from the container during filling operations.

3. Inspection, Monitoring, Recordkeeping, and Reporting

After consideration of the comments regarding the burden associated with certain aspects of the inspection, monitoring, recordkeeping, and reporting requirements for containers, and review of the effect of these requirements on the emission reduction achieved by these standards, the EPA has determined that it is appropriate to simplify these requirements in today's amendments. Owners and operators of containers using either Container Level 1 or Container Level 2 controls in accordance with the provisions of the rule are required to visually inspect the container and its cover and closure devices to check for defects at the time the owner or operator first manages a hazardous waste in the container or accepts possession of the container at the facility with the exception of those containers emptied within 24 hours of being received. Also, in the case when a container used for managing hazardous waste remains at the facility for a period of 1 year or more, the container and its cover and closure devices are to be visually inspected to check for defects at least once every 12 months.

Under the revisions published here, there are no requirements for periodic Method 21 leak monitoring of containers. The EPA considers this revision appropriate, in light of the relatively low volume of hazardous waste managed in containers (as compared to that volume managed in tanks and surface impoundments) and the transitory nature of containers (i.e. the vast majority of containers, nationwide, do not remain on a given site longer than 90 days). The time and expense required by operators to perform periodic Method 21 monitoring on containers does not seem to be warranted by any anticipated increase in emission reductions or enforceability of the subpart CC standards.

There is only one recordkeeping requirement and no reporting requirements under this rulemaking for containers using either Container Level 1 or Container Level 2 controls. The recordkeeping requirement is to maintain in the facility record a copy of the procedure used to determine that containers with capacities equal to or greater than 0.46 m^3 and do not meet the applicable DOT regulations are not managing hazardous waste in ''light material service.''

Information is also being added to the rule concerning the duration of time that the cover or closure devices can be open for the purpose of adding hazardous waste to or removing hazardous waste from the container or performing other routine activities, such as sampling the hazardous waste in the container. Opening of a spring-loaded pressure-vacuum relief valve, conservation vent, or similar type of pressure-relief device that vents to the atmosphere is allowed to maintain container internal pressure within design specifications during normal operating conditions, e.g., to release pressure resulting from loading operations or diurnal temperature changes. Opening of a safety device, as defined in the rule, is allowed at any time conditions require it to do so to avoid an unsafe condition.

J. Standards: Closed-Vent Systems and Control Devices

As previously discussed in this preamble under the revisions to the subpart AA provisions for control devices and closed-vent systems, the subpart CC control device and closed-vent system standards are being revised by today's technical amendments to incorporate changes so that these requirements are consistent and up-to-date with the general decisions the EPA has made regarding the inspection, monitoring, maintenance, repair, malfunctions, recordkeeping, and reporting requirements for organic emission control devices and which have been published in other related standards.

In the subpart CC standards for control devices and closed vent systems, provisions are being added to allow up to 240 hours per year for periods of planned routine maintenance of a control device during which time the control device is not required to meet the performance requirements for emission reductions specified in the rule and to exempt control devices from the substantive requirements of this section during a control device system malfunction. Recordkeeping requirements for these provisions are also being added. This change is being made in response to commenters' statements that good engineering and air pollution control practices include maintenance of air pollution control equipment, and that it is reasonable to assume that all such equipment will require either maintenance or repair at some time during the life of the equipment. The EPA is adding this allowance in an attempt to encourage good maintenance of such equipment, and in recognition that if maintenance periods are not allowed, repair periods will be unavoidable; it seems more reasonable to encourage the former, while accepting that both are realities. The value of 240 hours has been selected to be consistent with other air regulations developed under the CAA, such as the HON.

K. Inspection and Monitoring Requirements

The EPA is making revisions to the inspection and monitoring requirements for the final subpart CC RCRA air rules to reflect the revisions to the rule applicability and technical requirements and reduce the burden of these requirements on owners and operators. These revisions are explained in more detail throughout the preamble, above.

L. Recordkeeping and Reporting Requirements

The EPA is changing the recordkeeping and reporting requirements for the final subpart CC RCRA air rules to reflect the revisions to the rule applicability and technical requirements and reduce the burden of these requirements on owners and operators. These revisions are explained in more detail throughout the preamble, above.

V. Administrative Requirements

A. Docket

Six RCRA dockets contain information pertaining to today's rulemaking: (1) RCRA docket number F–91–CESP–FFFFF, which contains copies of all BID references and other information related to the development of the rule up through proposal; (2) RCRA docket number F–92–CESA–FFFFF, which contains copies of the supplemental data made available for public comment prior to promulgation;

(3) RCRA docket number F–94–CESF–FFFFF, which contains copies of all BID references and other information related to development of the final rule following proposal; (4) RCRA docket number F–94–CE2A–FFFFF, which contains information pertaining to waste stabilization operations performed in tanks; (5) RCRA docket number F–95–CE3A–FFFFF, which contains information about potential final rule revisions made available for public comment; and (6) RCRA docket number F–96–CE4A–FFFFF, which contains a copy of each of the comment letters submitted in regard to the revisions that the EPA was considering for the final subpart CC standards. The public may review all materials in these dockets at the EPA RCRA Docket Office.

The EPA RCRA Docket Office is located at Crystal Gateway, 1235 Jefferson Davis Highway, First Floor, Arlington, Virginia. Hand delivery of items and review of docket materials are made at the Virginia address. The public must have an appointment to review docket materials. Appointments can be scheduled by calling the Docket Office at (703) 603–9230. The mailing address for the RCRA Docket Office is RCRA Information Center (5305W), 401 M Street SW, Washington, DC 20460. The Docket Office is open from 9 a.m. to 4 p.m., Monday through Friday, except for Federal holidays.

B. Paperwork Reduction Act

The information collection requirements of the previously promulgated RCRA air rules were submitted to and approved by the Office of Management and Budget (OMB). A copy of this Information Collection Request (ICR) document (OMB control number 1593.02) may be obtained from Sandy Farmer, Information Policy Branch (2136); U.S. Environmental Protection Agency; 401 M Street, SW; Washington, DC 20460 or by calling (202) 260–2740.

Today's amendments to the RCRA air rules should have only a minor impact on the information collection burden estimates made previously, and that impact is expected to be a reduction. The changes consist of new definitions, alternative test procedures, clarifications of requirements, and additional compliance options. The changes are not additional requirements, but rather, are reductions in previously published requirements. The overall information-keeping requirements in the rule are being reduced. Consequently, the ICR has not been revised.

C. Executive Order 12866 Review

Under Executive Order 12866, the EPA must determine whether the proposed regulatory action is ''significant'' and, therefore, subject to the OMB review and the requirements of the Executive Order. The Order defines ''significant'' regulatory action as one that is likely to lead to a rule that may:

(1) Have an annual effect on the economy of $100 million or more or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety in State, local, or tribal governments or communities;

(2) Create a serious inconsistency or otherwise interfere with an action taken or planned by another agency;

(3) Materially alter the budgetary impact of entitlements, grants, user fees, or loan programs, or the rights and obligations of recipients thereof; or

(4) Raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in the Executive Order.

The RCRA Subpart CC air rules published on December 6, 1994, were considered significant under Executive Order 12866, and a regulatory impact analysis (RIA) was prepared. The amendments published today clarify the rule, provide more compliance alternatives, make certain regulatory provisions more lenient, and correct structural problems with the drafting of some sections. The OMB has evaluated this action, and determined it to be non-significant; thus it did not require their review.

D. Regulatory Flexibility Act

Pursuant to section 605(b) of the Regulatory Flexibility Act, 5 U.S.C. 605(b), as amended, Pub. L. 104–121, 110 Stat. 847, the EPA certifies that this rule will not have a significant economic impact on a substantial number of small entities and therefore no initial regulatory flexibility analysis under section 604(a) of the Act is required. For the reasons discussed in the December 6, 1994 Federal Register (59 FR 62923), this rule does not have a significant impact on a substantial number of small entities. The changes to the rule do not add new control requirements to the December 1994 rule. The amendments in fact reduce the already-existing requirements. Therefore, the amendments are also not considered significant.

Under 5 U.S.C. 801(a)(1)(A) as added by the Small Business Regulatory Enforcement Fairness Act of 1996, EPA submitted a report containing this rule and other required information to the U.S. Senate, the U.S. House of Representatives and the Comptroller General of the General Accounting Office prior to publication of the rule in today's Federal Register. This rule is not a ''major rule'' as defined by 5 U.S.C. 804(2) given that it amends the rule published in 1994 to reduce the extent of regulation.

E. Unfunded Mandates

Under section 202 of the Unfunded Mandates Reform Act of 1995 (''Unfunded Mandates Act''), the EPA must prepare a budgetary impact statement to accompany any proposed or final rule that includes a Federal mandate that may result in estimated costs to State, local, or tribal governments in the aggregate, or to the private sector, of $100 million or more. Under section 205, the EPA must select the most cost-effective and least burdensome alternative that achieves the objectives of the rule and is consistent with statutory requirements. Section 203 requires the EPA to establish a plan for informing and advising any small governments that may be significantly or uniquely impacted by the rule.

The EPA has determined that the action promulgated today does not include a Federal mandate that may result in estimated costs of $100 million or more to either State, local, or tribal governments in the aggregate or to the private sector. Therefore, the requirements of the Unfunded Mandates Act do not apply to this action.

VI. Legal Authority

These regulations are amended under the authority of sections 2002, 3001–3007, 3010, and 7004 of the Solid Waste Disposal Act of 1970, as amended by RCRA, as amended (42 U.S.C. 6921–6927, 6930, and 6974).

List of Subjects

40 CFR Part 261

Environmental protection, Air pollution control.

40 CFR Part 262

Air pollution control, Packaging and containers, Tank.

40 CFR Parts 264 and 265

Environmental protection, Air pollution control, Control device, Hazardous waste, Inspection, Monitoring, Packaging and containers, Reporting and recordkeeping requirements, Surface impoundment, Tank, TSDF, Waste determination.

40 CFR Part 270

Administrative practice and procedure, Air pollution, Confidential business information, Hazardous waste, Permit modification, Reporting and recordkeeping requirements.

Dated: October 4, 1996.

Carol M. Browner,

Administrator.

For the reasons set out in the preamble, title 40, chapter I, parts 261, 262, 264, 265, 270, and 271 of the Code of Federal Regulations are amended as follows:

PART 261—IDENTIFICATION AND LISTING OF HAZARDOUS WASTE

1a. The authority citation for part 261 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6921, 6922, and 6938.

1b. Section 261.6 is amended by revising paragraph (c)(1) to read as follows:

§ 261.6 Requirements for recyclable materials.

* * * * *

(c)(1) Owners and operators of facilities that store recyclable materials before they are recycled are regulated under all applicable provisions of subparts A though L, AA, BB, and CC of parts 264 and 265, and under parts 124, 266, 268, and 270 of this chapter and the notification requirements under section 3010 of RCRA, except as provided in paragraph (a) of this section. (The recycling process itself is exempt from regulation except as provided in § 261.6(d).)

* * * * *

PART 262—STANDARDS APPLICABLE TO GENERATORS OF HAZARDOUS WASTE

1c. The authority citation for part 262 continues to read as follows:

Authority: 42 U.S.C. 6906, 6912, 6922, 6923, 6925, 6937 and 6938, unless otherwise noted.

2. Section 262.34 is amended by revising paragraphs (a)(1)(i) and (a)(1)(ii) to read as follows:

§ 262.34 Accumulation time.

(a) * * *

(1) * * *

(i) In containers and the generator complies with subpart I of 40 CFR part 265; and/or

(ii) In tanks and the generator complies with subpart J of 40 CFR part 265, except §§ 265.197(c) and 265.200; and/or

* * * * *

PART 264—STANDARDS FOR OWNERS AND OPERATORS OF HAZARDOUS WASTE TREATMENT, STORAGE, AND DISPOSAL FACILITIES

3. The authority citation for part 264 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6924 and 6925.

Subpart I—Use and Management of Containers

4. Section 264.179 is revised to read as follows:

§ 264.179 Air emission standards.

The owner or operator shall manage all hazardous waste placed in a container in accordance with the applicable requirements of subparts AA, BB, and CC of this part.

Subpart J—Tank Systems

5. Section 264.200 is revised to read as follows:

§ 264.200 Air emission standards.

The owner or operator shall manage all hazardous waste placed in a tank in accordance with the applicable requirements of subparts AA, BB, and CC of this part.

Subpart K—Surface Impoundments

6. Section 264.232 is revised to read as follows:

§ 264.232 Air emission standards.

The owner or operator shall manage all hazardous waste placed in a surface impoundment in accordance with the applicable requirements of subparts BB and CC of this part.

Subpart AA—Air Emission Standards for Process Vents

7. Section 264.1030 is amended by revising paragraph (b); and removing the refererence ''262.34'' from the note at the end of the section to read as follows:

§ 264.1030 Applicability.

* * * * *

(b) Except for § 264.1034, paragraphs (d) and (e), this subpart applies to process vents associated with distillation, fractionation, thin-film evaporation, solvent extraction, or air or steam stripping operations that manage hazardous wastes with organic concentrations of at least 10 ppmw, if these operations are conducted in one of the following:

(1) A unit that is subject to the permitting requirements of 40 CFR part 270, or

(2) A unit (including a hazardous waste recycling unit) that is not exempt from permitting under the provisions of 40 CFR 262.34(a) (i.e., a hazardous waste recycling unit that is not a 90-day tank or container) and that is located at a hazardous waste management facility otherwise subject to the permitting requirements of 40 CFR part 270, or

(3) A unit that is exempt from permitting under the provisions of 40 CFR 262.34(a) (i.e., a 90-day tank or container).

* * * * *

8. Section 264.1033 is amended by revising paragraph (f)(2)(vi)(B); redesignating paragraphs (l) and (m) as paragraphs (m) and (n) and revising the newly designated paragraph (n); by revising paragraph (k); and by adding paragraphs (l) and (o) to read as follows:

§ 264.1033 Standards: Closed-vent systems and control devices

* * * * *

(f) * * *

(2) * * *

(vi) * * *

(B) A temperature monitoring device equipped with a continuous recorder. The device shall be capable of monitoring temperature with an accuracy of ±1 percent of the temperature being monitored in degrees Celsius (°C) or ±0.5 °C, whichever is greater. The temperature sensor shall be installed at a location in the exhaust vent stream from the condenser exit (i.e., product side).

* * * * *

(k) A closed-vent system shall meet either of the following design requirements:

(1) A closed-vent system shall be designed to operate with no detectable emissions, as indicated by an instrument reading of less than 500 ppmv above background as determined by the procedure in § 264.1034(b) of this subpart, and by visual inspections; or

(2) A closed-vent system shall be designed to operate at a pressure below atmospheric pressure. The system shall be equipped with at least one pressure gauge or other pressure measurement device that can be read from a readily accessible location to verify that negative pressure is being maintained in the closed-vent system when the control device is operating.

(l) The owner or operator shall monitor and inspect each closed-vent system required to comply with this section to ensure proper operation and maintenance of the closed-vent system by implementing the following requirements:

(1) Each closed-vent system that is used to comply with paragraph (k)(1) of

this section shall be inspected and monitored in accordance with the following requirements:

(i) An initial leak detection monitoring of the closed-vent system shall be conducted by the owner or operator on or before the date that the system becomes subject to this section. The owner or operator shall monitor the closed-vent system components and connections using the procedures specified in § 264.1034(b) of this subpart to demonstrate that the closed-vent system operates with no detectable emissions, as indicated by an instrument reading of less than 500 ppmv above background.

(ii) After initial leak detection monitoring required in paragraph (l)(1)(i) of this section, the owner or operator shall inspect and monitor the closed-vent system as follows:

(A) Closed-vent system joints, seams, or other connections that are permanently or semi-permanently sealed (e.g., a welded joint between two sections of hard piping or a bolted and gasketed ducting flange) shall be visually inspected at least once per year to check for defects that could result in air pollutant emissions. The owner or operator shall monitor a component or connection using the procedures specified in § 264.1034(b) of this subpart to demonstrate that it operates with no detectable emissions following any time the component is repaired or replaced (e.g., a section of damaged hard piping is replaced with new hard piping) or the connection is unsealed (e.g., a flange is unbolted).

(B) Closed-vent system components or connections other than those specified in paragraph (l)(1)(ii)(A) of this section shall be monitored annually and at other times as requested by the Regional Administrator, except as provided for in paragraph (o) of this section, using the procedures specified in § 264.1034(b) of this subpart to demonstrate that the components or connections operate with no detectable emissions.

(iii) In the event that a defect or leak is detected, the owner or operator shall repair the defect or leak in accordance with the requirements of paragraph (l)(3) of this section.

(iv) The owner or operator shall maintain a record of the inspection and monitoring in accordance with the requirements specified in § 264.1035 of this subpart.

(2) Each closed-vent system that is used to comply with paragraph (k)(2) of this section shall be inspected and monitored in accordance with the following requirements:

(i) The closed-vent system shall be visually inspected by the owner or operator to check for defects that could result in air pollutant emissions. Defects include, but are not limited to, visible cracks, holes, or gaps in ductwork or piping or loose connections.

(ii) The owner or operator shall perform an initial inspection of the closed-vent system on or before the date that the system becomes subject to this section. Thereafter, the owner or operator shall perform the inspections at least once every year.

(iii) In the event that a defect or leak is detected, the owner or operator shall repair the defect in accordance with the requirements of paragraph (l)(3) of this section.

(iv) The owner or operator shall maintain a record of the inspection and monitoring in accordance with the requirements specified in § 264.1035 of this subpart.

(3) The owner or operator shall repair all detected defects as follows:

(i) Detectable emissions, as indicated by visual inspection, or by an instrument reading greater than 500 ppmv above background, shall be controlled as soon as practicable, but not later than 15 calendar days after the emission is detected, except as provided for in paragraph (l)(3)(iii) of this section.

(ii) A first attempt at repair shall be made no later than 5 calendar days after the emission is detected.

(iii) Delay of repair of a closed-vent system for which leaks have been detected is allowed if the repair is technically infeasible without a process unit shutdown, or if the owner or operator determines that emissions resulting from immediate repair would be greater than the fugitive emissions likely to result from delay of repair. Repair of such equipment shall be completed by the end of the next process unit shutdown.

(iv) The owner or operator shall maintain a record of the defect repair in accordance with the requirements specified in § 264.1035 of this subpart.

(m) Closed-vent systems and control devices used to comply with provisions of this subpart shall be operated at all times when emissions may be vented to them.

(n) The owner or operator using a carbon adsorption system to control air pollutant emissions shall document that all carbon that is a hazardous waste and that is removed from the control device is managed in one of the following manners, regardless of the average volatile organic concentration of the carbon:

(1) Regenerated or reactivated in a thermal treatment unit that meets one of the following:

(i) The owner or operator of the unit has been issued a final permit under 40 CFR part 270 which implements the requirements of subpart X of this part; or

(ii) The unit is equipped with and operating air emission controls in accordance with the applicable requirements of subparts AA and CC of either this part or of 40 CFR part 265; or

(iii) The unit is equipped with and operating air emission controls in accordance with a national emission standard for hazardous air pollutants under 40 CFR part 61 or 40 CFR part 63.

(2) Incinerated in a hazardous waste incinerator for which the owner or operator either:

(i) Has been issued a final permit under 40 CFR part 270 which implements the requirements of subpart O of this part; or

(ii) Has designed and operates the incinerator in accordance with the interim status requirements of 40 CFR part 265, subpart O.

(3) Burned in a boiler or industrial furnace for which the owner or operator either:

(i) Has been issued a final permit under 40 CFR part 270 which implements the requirements of 40 CFR part 266, subpart H; or

(ii) Has designed and operates the boiler or industrial furnace in accordance with the interim status requirements of 40 CFR part 266, subpart H.

(o) Any components of a closed-vent system that are designated, as described in § 264.1035(c)(9) of this subpart, as unsafe to monitor are exempt from the requirements of paragraph (l)(1)(ii)(B) of this section if:

(1) The owner or operator of the closed-vent system determines that the components of the closed-vent system are unsafe to monitor because monitoring personnel would be exposed to an immediate danger as a consequence of complying with paragraph (l)(1)(ii)(B) of this section; and

(2) The owner or operator of the closed-vent system adheres to a written plan that requires monitoring the closed-vent system components using the procedure specified in paragraph (l)(1)(ii)(B) of this section as frequently as practicable during safe-to-monitor times.

9. Section 264.1034 is amended by revising paragraph (b), introductory text, to read as follows:

§ 264.1034 Test methods and procedures.

* * * * *

(b) When a closed-vent system is tested for compliance with no detectable

emissions, as required in § 264.1033(l) of this subpart, the test shall comply with the following requirements:

* * * * *

10. Section 264.1035 is amended by adding paragraphs (c)(9) and (c)(10) and revising paragraph (d) to read as follows:

§ 264.1035 Recordkeeping requirements.

* * * * *

(c) * * *

(9) An owner or operator designating any components of a closed-vent system as unsafe to monitor pursuant to § 264.1033(o) of this subpart shall record in a log that is kept in the facility operating record the identification of closed-vent system components that are designated as unsafe to monitor in accordance with the requirements of § 264.1033(o) of this subpart, an explanation for each closed-vent system component stating why the closed-vent system component is unsafe to monitor, and the plan for monitoring each closed-vent system component.

(10) When each leak is detected as specified in § 264.1033(l) of this subpart, the following information shall be recorded:

(i) The instrument identification number, the closed-vent system component identification number, and the operator name, initials, or identification number.

(ii) The date the leak was detected and the date of first attempt to repair the leak.

(iii) The date of successful repair of the leak.

(iv) Maximum instrument reading measured by Method 21 of 40 CFR part 60, appendix A after it is successfully repaired or determined to be nonrepairable.

(v) ''Repair delayed'' and the reason for the delay if a leak is not repaired within 15 calendar days after discovery of the leak.

(A) The owner or operator may develop a written procedure that identifies the conditions that justify a delay of repair. In such cases, reasons for delay of repair may be documented by citing the relevant sections of the written procedure.

(B) If delay of repair was caused by depletion of stocked parts, there must be documentation that the spare parts were sufficiently stocked on-site before depletion and the reason for depletion.

(d) Records of the monitoring, operating, and inspection information required by paragraphs (c)(3) through (c)(10) of this section shall be maintained by the owner or operator for at least 3 years following the date of each occurrence, measurement, maintenance, corrective action, or record.

* * * * *

Subpart BB—Air Emission Standards for Equipment Leaks

11. Section 264.1050 is amended by revising paragraph (b), adding paragraph (f), and by removing the reference ''262.34'' from the note at the end of the section to read as follows:

§ 264.1050 Applicability.

* * * * *

(b) Except as provided in § 264.1064(k), this subpart applies to equipment that contains or contacts hazardous wastes with organic concentrations of at least 10 percent by weight that are managed in one of the following:

(1) A unit that is subject to the permitting requirements of 40 CFR part 270, or

(2) A unit (including a hazardous waste recycling unit) that is not exempt from permitting under the provisions of 40 CFR 262.34(a) (i.e., a hazardous waste recycling unit that is not a ''90-day'' tank or container) and that is located at a hazardous waste management facility otherwise subject to the permitting requirements of 40 CFR part 270, or

(3) A unit that is exempt from permitting under the provisions of 40 CFR 262.34(a) (i.e., a ''90-day'' tank or container).

* * * * *

(f) Equipment that contains or contacts hazardous waste with an organic concentration of at least 10 percent by weight for a period of less than 300 hours per calendar year is excluded from the requirements of §§ 264.1052 through 264.1060 of this subpart if it is identified as required in § 264.1064(g)(6) of this subpart.

12. Section 264.1055 is revised to read as follows:

§ 264.1055 Standards: Sampling connection systems.

(a) Each sampling connection system shall be equipped with a closed-purge, closed-loop, or closed-vent system. This system shall collect the sample purge for return to the process or for routing to the appropriate treatment system. Gases displaced during filling of the sample container are not required to be collected or captured.

(b) Each closed-purge, closed-loop, or closed-vent system as required in paragraph (a) of this section shall meet one of the following requirements:

(1) Return the purged process fluid directly to the process line;

(2) Collect and recycle the purged process fluid; or

(3) Be designed and operated to capture and transport all the purged process fluid to a waste management unit that complies with the applicable requirements of § 264.1084 through § 264.1086 of this subpart or a control device that complies with the requirements of § 264.1060 of this subpart.

(c) *In-situ* sampling systems and sampling systems without purges are exempt from the requirements of paragraphs (a) and (b) of this section.

13. Section 264.1058 is amended by adding paragraph (e) to read as follows:

§ 264.1058 Standards: Pumps and valves in heavy liquid service, pressure relief devices in light liquid or heavy liquid service, and flanges and other connectors.

* * * * *

(e) Any connector that is inaccessible or is ceramic or ceramic-lined (e.g., porcelain, glass, or glass-lined) is exempt from the monitoring requirements of paragraph (a) of this section and from the recordkeeping requirements of § 264.1064 of this subpart.

14. Section 264.1064 is amended by adding paragraph (g)(6) to read as follows:

§ 264.1064 Recordkeeping requirements.

* * * * *

(g) * * *

(6) Identification, either by list or location (area or group) of equipment that contains or contacts hazardous waste with an organic concentration of at least 10 percent by weight for a period of less than 300 hours per year.

* * * * *

Subpart CC—Air Emission Standards for Tanks, Surface Impoundments, and Containers

15. Section 264.1080 is amended by adding paragraphs (b)(7) and (b)(8) to read as follows:

§ 264.1080 Applicability.

* * * * *

(b) * * *

(7) A hazardous waste management unit that the owner or operator certifies is equipped with and operating air emission controls in accordance with the requirements of an applicable Clean Air Act regulation codified under 40 CFR part 60, part 61, or part 63. For the purpose of complying with this paragraph, a tank for which the air emission control includes an enclosure, as opposed to a cover, must be in compliance with the enclosure and control device requirements of

§ 264.1084(i), except as provided in § 264.1082(c)(5).

(8) A tank that has a process vent as defined in 40 CFR 264.1031.

* * * * *

16. Section 264.1082 is revised to read as follows:

§ 264.1082 Standards: General.

(a) This section applies to the management of hazardous waste in tanks, surface impoundments, and containers subject to this subpart.

(b) The owner or operator shall control air pollutant emissions from each waste management unit in accordance with standards specified in § 264.1084 through § 264.1087 of this subpart, as applicable to the waste management unit, except as provided for in paragraph (c) of this section.

(c) A tank, surface impoundment, or container is exempt from standards specified in § 264.1084 through § 264.1087 of this subpart, as applicable, provided that the waste management unit is one of the following:

(1) A tank, surface impoundment, or container for which all hazardous waste entering the unit has an average VO concentration at the point of waste origination of less than 500 parts per million by weight (ppmw). The average VO concentration shall be determined using the procedures specified in § 264.1083(a) of this subpart. The owner or operator shall review and update, as necessary, this determination at least once every 12 months following the date of the initial determination for the hazardous waste streams entering the unit.

(2) A tank, surface impoundment, or container for which the organic content of all the hazardous waste entering the waste management unit has been reduced by an organic destruction or removal process that achieves any one of the following conditions:

(i) A process that removes or destroys the organics contained in the hazardous waste to a level such that the average VO concentration of the hazardous waste at the point of waste treatment is less than the exit concentration limit (C_t) established for the process. The average VO concentration of the hazardous waste at the point of waste treatment and the exit concentration limit for the process shall be determined using the procedures specified in § 264.1083(b) of this subpart.

(ii) A process that removes or destroys the organics contained in the hazardous waste to a level such that the organic reduction efficiency (R) for the process is equal to or greater than 95 percent, and the average VO concentration of the hazardous waste at the point of waste treatment is less than 100 ppmw. The organic reduction efficiency for the process and the average VO concentration of the hazardous waste at the point of waste treatment shall be determined using the procedures specified in § 264.1083(b) of this subpart.

(iii) A process that removes or destroys the organics contained in the hazardous waste to a level such that the actual organic mass removal rate (MR) for the process is equal to or greater than the required organic mass removal rate (RMR) established for the process. The required organic mass removal rate and the actual organic mass removal rate for the process shall be determined using the procedures specified in § 264.1083(b) of this subpart.

(iv) A biological process that destroys or degrades the organics contained in the hazardous waste, such that either of the following conditions is met:

(A) The organic reduction efficiency (R) for the process is equal to or greater than 95 percent, and the organic biodegradation efficiency (R_{bio}) for the process is equal to or greater than 95 percent. The organic reduction efficiency and the organic biodegradation efficiency for the process shall be determined using the procedures specified in § 264.1083(b) of this subpart.

(B) The total actual organic mass biodegradation rate (MR_{bio}) for all hazardous waste treated by the process is equal to or greater than the required organic mass removal rate (RMR). The required organic mass removal rate and the actual organic mass biodegradation rate for the process shall be determined using the procedures specified in § 264.1083(b) of this subpart.

(v) A process that removes or destroys the organics contained in the hazardous waste and meets all of the following conditions:

(A) From the point of waste origination through the point where the hazardous waste enters the treatment process, the hazardous waste is managed continuously in waste management units which use air emission controls in accordance with the standards specified in § 264.1084 through § 264.1087 of this subpart, as applicable to the waste management unit.

(B) From the point of waste origination through the point where the hazardous waste enters the treatment process, any transfer of the hazardous waste is accomplished through continuous hard-piping or other closed system transfer that does not allow exposure of the waste to the atmosphere. The EPA considers a drain system that meets the requirements of 40 CFR part 63, subpart RR—National Emission Standards for Individual Drain Systems to be a closed system.

(C) The average VO concentration of the hazardous waste at the point of waste treatment is less than the lowest average VO concentration at the point of waste origination determined for each of the individual waste streams entering the process or 500 ppmw, whichever value is lower. The average VO concentration of each individual waste stream at the point of waste origination shall be determined using the procedures specified in § 264.1083(a) of this subpart. The average VO concentration of the hazardous waste at the point of waste treatment shall be determined using the procedures specified in § 264.1083(b) of this subpart.

(vi) A process that removes or destroys the organics contained in the hazardous waste to a level such that the organic reduction efficiency (R) for the process is equal to or greater than 95 percent and the owner or operator certifies that the average VO concentration at the point of waste origination for each of the individual waste streams entering the process is less than 10,000 ppmw. The organic reduction efficiency for the process and the average VO concentration of the hazardous waste at the point of waste origination shall be determined using the procedures specified in § 264.1083(b) and § 264.1083(a) of this subpart, respectively.

(vii) A hazardous waste incinerator for which the owner or operator has either:

(A) Been issued a final permit under 40 CFR part 270 which implements the requirements of subpart O of this part; or

(B) Has designed and operates the incinerator in accordance with the interim status requirements of 40 CFR part 265, subpart O.

(viii) A boiler or industrial furnace for which the owner or operator has either:

(A) Been issued a final permit under 40 CFR part 270 which implements the requirements of 40 CFR part 266, subpart H, or

(B) Has designed and operates the boiler or industrial furnace in accordance with the interim status requirements of 40 CFR part 266, subpart H.

(ix) For the purpose of determining the performance of an organic destruction or removal process in accordance with the conditions in each of paragraphs (c)(2)(i) through (c)(2)(vi) of this section, the owner or operator shall account for VO concentrations

determined to be below the limit of detection of the analytical method by using the following VO concentration:

(A) If Method 25D in 40 CFR part 60, appendix A is used for the analysis, one-half the blank value determined in the method.

(B) If any other analytical method is used, one-half the limit of detection established for the method.

(3) A tank used for biological treatment of hazardous waste in accordance with the requirements of paragraph (c)(2)(iv) of this section.

(4) A tank, surface impoundment, or container for which all hazardous waste placed in the unit either:

(i) Meets the numerical concentration limits for organic hazardous constituents, applicable to the hazardous waste, as specified in 40 CFR part 268—Land Disposal Restrictions under Table ''Treatment Standards for Hazardous Waste'' in 40 CFR 268.40; or

(ii) Has been treated by the treatment technology established by EPA for the waste in 40 CFR 268.42(a), or treated by an equivalent method of treatment approved by EPA pursuant to 40 CFR 268.42(b).

(5) A tank used for bulk feed of hazardous waste to a waste incinerator and all of the following conditions are met:

(i) The tank is located inside an enclosure vented to a control device that is designed and operated in accordance with all applicable requirements specified under 40 CFR part 61, subpart FF—National Emission Standards for Benzene Waste Operations for a facility at which the total annual benzene quantity from the facility waste is equal to or greater than 10 megagrams per year;

(ii) The enclosure and control device serving the tank were installed and began operation prior to November 25, 1996 and

(iii) The enclosure is designed and operated in accordance with the criteria for a permanent total enclosure as specified in ''Procedure T—Criteria for and Verification of a Permanent or Temporary Total Enclosure'' under 40 CFR 52.741, appendix B. The enclosure may have permanent or temporary openings to allow worker access; passage of material into or out of the enclosure by conveyor, vehicles, or other mechanical or electrical equipment; or to direct air flow into the enclosure. The owner or operator shall perform the verification procedure for the enclosure as specified in Section 5.0 to ''Procedure T—Criteria for and Verification of a Permanent or Temporary Total Enclosure'' annually.

(d) The Regional Administrator may at any time perform or request that the owner or operator perform a waste determination for a hazardous waste managed in a tank, surface impoundment, or container exempted from using air emission controls under the provisions of this section as follows:

(1) The waste determination for average VO concentration of a hazardous waste at the point of waste origination shall be performed using direct measurement in accordance with the applicable requirements of § 264.1083(a) of this subpart. The waste determination for a hazardous waste at the point of waste treatment shall be performed in accordance with the applicable requirements of § 264.1083(b) of this subpart.

(2) In performing a waste determination pursuant to paragraph (d)(1) of this section, the sample preparation and analysis shall be conducted as follows:

(i) In accordance with the method used by the owner or operator to perform the waste analysis, except in the case specified in paragraph (d)(2)(ii) of this section.

(ii) If the Regional Administrator determines that the method used by the owner or operator was not appropriate for the hazardous waste managed in the tank, surface impoundment, or container, then the Regional Administrator may choose an appropriate method.

(3) In a case when the owner or operator is requested to perform the waste determination, the Regional Administrator may elect to have an authorized representative observe the collection of the hazardous waste samples used for the analysis.

(4) In a case when the results of the waste determination performed or requested by the Regional Administrator do not agree with the results of a waste determination performed by the owner or operator using knowledge of the waste, then the results of the waste determination performed in accordance with the requirements of paragraph (d)(1) of this section shall be used to establish compliance with the requirements of this subpart.

(5) In a case when the owner or operator has used an averaging period greater than 1 hour for determining the average VO concentration of a hazardous waste at the point of waste origination, the Regional Administrator may elect to establish compliance with this subpart by performing or requesting that the owner or operator perform a waste determination using direct measurement based on waste samples collected within a 1-hour period as follows:

(i) The average VO concentration of the hazardous waste at the point of waste origination shall be determined by direct measurement in accordance with the requirements of § 264.1083(a) of this subpart.

(ii) Results of the waste determination performed or requested by the Regional Administrator showing that the average VO concentration of the hazardous waste at the point of waste origination is equal to or greater than 500 ppmw shall constitute noncompliance with this subpart except in a case as provided for in paragraph (d)(5)(iii) of this section.

(iii) For the case when the average VO concentration of the hazardous waste at the point of waste origination previously has been determined by the owner or operator using an averaging period greater than 1 hour to be less than 500 ppmw but because of normal operating process variations the VO concentration of the hazardous waste determined by direct measurement for any given 1-hour period may be equal to or greater than 500 ppmw, information that was used by the owner or operator to determine the average VO concentration of the hazardous waste (e.g., test results, measurements, calculations, and other documentation) and recorded in the facility records in accordance with the requirements of § 264.1083(a) and § 264.1089 of this subpart shall be considered by the Regional Administrator together with the results of the waste determination performed or requested by the Regional Administrator in establishing compliance with this subpart.

17. Section 264.1083 is revised to read as follows:

§ 264.1083 Waste determination procedures.

(a) Waste determination procedure to determine average volatile organic (VO) concentration of a hazardous waste at the point of waste origination.

(1) An owner or operator shall determine the average VO concentration at the point of waste origination for each hazardous waste placed in a waste management unit exempted under the provisions of § 264.1082(c)(1) of this subpart from using air emission controls in accordance with standards specified in § 264.1084 through § 264.1087 of this subpart, as applicable to the waste management unit.

(2) The average VO concentration of a hazardous waste at the point of waste origination may be determined in accordance with the procedures

specified in 40 CFR 265.1084 (a)(2) through (a)(4).

(b) Waste determination procedures for treated hazardous waste.

(1) An owner or operator shall perform the applicable waste determination for each treated hazardous waste placed in a waste management unit exempted under the provisions of § 264.1082(c)(2) of this subpart from using air emission controls in accordance with standards specified in § 264.1084 through § 264.1087 of this subpart, as applicable to the waste management unit.

(2) The waste determination for a treated hazardous waste shall be performed in accordance with the procedures specified in 40 CFR 265.1084 (b)(2) through (b)(9), as applicable to the treated hazardous waste.

(c) Procedure to determine the maximum organic vapor pressure of a hazardous waste in a tank.

(1) An owner or operator shall determine the maximum organic vapor pressure for each hazardous waste placed in a tank using Tank Level 1 controls in accordance with standards specified in § 264.1084(c) of this subpart.

(2) The maximum organic vapor pressure of the hazardous waste may be determined in accordance with the procedures specified in 40 CFR 265.1084 (c)(2) through (c)(4).

(d) The procedure for determining no detectable organic emissions for the purpose of complying with this subpart shall be conducted in accordance with the procedures specified in 40 CFR 265.1084(d).

18. Section 264.1084 is revised to read as follows:

§ 264.1084 Standards: Tanks.

(a) The provisions of this section apply to the control of air pollutant emissions from tanks for which § 264.1082(b) of this subpart references the use of this section for such air emission control.

(b) The owner or operator shall control air pollutant emissions from each tank subject to this section in accordance with the following requirements as applicable:

(1) For a tank that manages hazardous waste that meets all of the conditions specified in paragraphs (b)(1)(i) through (b)(1)(iii) of this section, the owner or operator shall control air pollutant emissions from the tank in accordance with the Tank Level 1 controls specified in paragraph (c) of this section or the Tank Level 2 controls specified in paragraph (d) of this section.

(i) The hazardous waste in the tank has a maximum organic vapor pressure which is less than the maximum organic vapor pressure limit for the tank's design capacity category as follows:

(A) For a tank design capacity equal to or greater than 151 m^3, the maximum organic vapor pressure limit for the tank is 5.2 kPa.

(B) For a tank design capacity equal to or greater than 75 m^3 but less than 151 m^3, the maximum organic vapor pressure limit for the tank is 27.6 kPa.

(C) For a tank design capacity less than 75 m^3, the maximum organic vapor pressure limit for the tank is 76.6 kPa.

(ii) The hazardous waste in the tank is not heated by the owner or operator to a temperature that is greater than the temperature at which the maximum organic vapor pressure of the hazardous waste is determined for the purpose of complying with paragraph (b)(1)(i) of this section.

(iii) The hazardous waste in the tank is not treated by the owner or operator using a waste stabilization process, as defined in 40 CFR 265.1081.

(2) For a tank that manages hazardous waste that does not meet all of the conditions specified in paragraphs (b)(1)(i) through (b)(1)(iii) of this section, the owner or operator shall control air pollutant emissions from the tank by using Tank Level 2 controls in accordance with the requirements of paragraph (d) of this section. Examples of tanks required to use Tank Level 2 controls include: A tank used for a waste stabilization process; and a tank for which the hazardous waste in the tank has a maximum organic vapor pressure that is equal to or greater than the maximum organic vapor pressure limit for the tank's design capacity category as specified in paragraph (b)(1)(i) of this section.

(c) Owners and operators controlling air pollutant emissions from a tank using Tank Level 1 controls shall meet the requirements specified in paragraphs (c)(1) through (c)(4) of this section:

(1) The owner or operator shall determine the maximum organic vapor pressure for a hazardous waste to be managed in the tank using Tank Level 1 controls before the first time the hazardous waste is placed in the tank. The maximum organic vapor pressure shall be determined using the procedures specified in § 264.1083(c) of this subpart. Thereafter, the owner or operator shall perform a new determination whenever changes to the hazardous waste managed in the tank could potentially cause the maximum organic vapor pressure to increase to a level that is equal to or greater than the maximum organic vapor pressure limit for the tank design capacity category specified in paragraph (b)(1)(i) of this section, as applicable to the tank.

(2) The tank shall be equipped with a fixed roof designed to meet the following specifications:

(i) The fixed roof and its closure devices shall be designed to form a continuous barrier over the entire surface area of the hazardous waste in the tank. The fixed roof may be a separate cover installed on the tank (e.g., a removable cover mounted on an open-top tank) or may be an integral part of the tank structural design (e.g., a horizontal cylindrical tank equipped with a hatch).

(ii) The fixed roof shall be installed in a manner such that there are no visible cracks, holes, gaps, or other open spaces between roof section joints or between the interface of the roof edge and the tank wall.

(iii) Each opening in the fixed roof shall be either:

(A) Equipped with a closure device designed to operate such that when the closure device is secured in the closed position there are no visible cracks, holes, gaps, or other open spaces in the closure device or between the perimeter of the opening and the closure device; or

(B) Connected by a closed-vent system that is vented to a control device. The control device shall remove or destroy organics in the vent stream, and it shall be operating whenever hazardous waste is managed in the tank.

(iv) The fixed roof and its closure devices shall be made of suitable materials that will minimize exposure of the hazardous waste to the atmosphere, to the extent practical, and will maintain the integrity of the fixed roof and closure devices throughout their intended service life. Factors to be considered when selecting the materials for and designing the fixed roof and closure devices shall include: Organic vapor permeability, the effects of any contact with the hazardous waste or its vapors managed in the tank; the effects of outdoor exposure to wind, moisture, and sunlight; and the operating practices used for the tank on which the fixed roof is installed.

(3) Whenever a hazardous waste is in the tank, the fixed roof shall be installed with each closure device secured in the closed position except as follows:

(i) Opening of closure devices or removal of the fixed roof is allowed at the following times:

(A) To provide access to the tank for performing routine inspection, maintenance, or other activities needed for normal operations. Examples of such

activities include those times when a worker needs to open a port to sample the liquid in the tank, or when a worker needs to open a hatch to maintain or repair equipment. Following completion of the activity, the owner or operator shall promptly secure the closure device in the closed position or reinstall the cover, as applicable, to the tank.

(B) To remove accumulated sludge or other residues from the bottom of tank.

(ii) Opening of a spring-loaded pressure-vacuum relief valve, conservation vent, or similar type of pressure relief device which vents to the atmosphere is allowed during normal operations for the purpose of maintaining the tank internal pressure in accordance with the tank design specifications. The device shall be designed to operate with no detectable organic emissions when the device is secured in the closed position. The settings at which the device opens shall be established such that the device remains in the closed position whenever the tank internal pressure is within the internal pressure operating range determined by the owner or operator based on the tank manufacturer recommendations, applicable regulations, fire protection and prevention codes, standard engineering codes and practices, or other requirements for the safe handling of flammable, ignitable, explosive, reactive, or hazardous materials. Examples of normal operating conditions that may require these devices to open are during those times when the tank internal pressure exceeds the internal pressure operating range for the tank as a result of loading operations or diurnal ambient temperature fluctuations.

(iii) Opening of a safety device, as defined in 40 CFR 265.1081, is allowed at any time conditions require doing so to avoid an unsafe condition.

(4) The owner or operator shall inspect the air emission control equipment in accordance with the following requirements.

(i) The fixed roof and its closure devices shall be visually inspected by the owner or operator to check for defects that could result in air pollutant emissions. Defects include, but are not limited to, visible cracks, holes, or gaps in the roof sections or between the roof and the tank wall; broken, cracked, or otherwise damaged seals or gaskets on closure devices; and broken or missing hatches, access covers, caps, or other closure devices.

(ii) The owner or operator shall perform an initial inspection of the fixed roof and its closure devices on or before the date that the tank becomes subject to this section. Thereafter, the owner or operator shall perform the inspections at least once every year except under the special conditions provided for in paragraph (l) of this section.

(iii) In the event that a defect is detected, the owner or operator shall repair the defect in accordance with the requirements of paragraph (k) of this section.

(iv) The owner or operator shall maintain a record of the inspection in accordance with the requirements specified in § 264.1089(b) of this subpart.

(d) Owners and operators controlling air pollutant emissions from a tank using Tank Level 2 controls shall use one of the following tanks:

(1) A fixed-roof tank equipped with an internal floating roof in accordance with the requirements specified in paragraph (e) of this section;

(2) A tank equipped with an external floating roof in accordance with the requirements specified in paragraph (f) of this section;

(3) A tank vented through a closed-vent system to a control device in accordance with the requirements specified in paragraph (g) of this section;

(4) A pressure tank designed and operated in accordance with the requirements specified in paragraph (h) of this section; or

(5) A tank located inside an enclosure that is vented through a closed-vent system to an enclosed combustion control device in accordance with the requirements specified in paragraph (i) of this section.

(e) The owner or operator who controls air pollutant emissions from a tank using a fixed roof with an internal floating roof shall meet the requirements specified in paragraphs (e)(1) through (e)(3) of this section.

(1) The tank shall be equipped with a fixed roof and an internal floating roof in accordance with the following requirements:

(i) The internal floating roof shall be designed to float on the liquid surface except when the floating roof must be supported by the leg supports.

(ii) The internal floating roof shall be equipped with a continuous seal between the wall of the tank and the floating roof edge that meets either of the following requirements:

(A) A single continuous seal that is either a liquid-mounted seal or a metallic shoe seal, as defined in 40 CFR 265.1081; or

(B) Two continuous seals mounted one above the other. The lower seal may be a vapor-mounted seal.

(iii) The internal floating roof shall meet the following specifications:

(A) Each opening in a noncontact internal floating roof except for automatic bleeder vents (vacuum breaker vents) and the rim space vents is to provide a projection below the liquid surface.

(B) Each opening in the internal floating roof shall be equipped with a gasketed cover or a gasketed lid except for leg sleeves, automatic bleeder vents, rim space vents, column wells, ladder wells, sample wells, and stub drains.

(C) Each penetration of the internal floating roof for the purpose of sampling shall have a slit fabric cover that covers at least 90 percent of the opening.

(D) Each automatic bleeder vent and rim space vent shall be gasketed.

(E) Each penetration of the internal floating roof that allows for passage of a ladder shall have a gasketed sliding cover.

(F) Each penetration of the internal floating roof that allows for passage of a column supporting the fixed roof shall have a flexible fabric sleeve seal or a gasketed sliding cover.

(2) The owner or operator shall operate the tank in accordance with the following requirements:

(i) When the floating roof is resting on the leg supports, the process of filling, emptying, or refilling shall be continuous and shall be completed as soon as practical.

(ii) Automatic bleeder vents are to be set closed at all times when the roof is floating, except when the roof is being floated off or is being landed on the leg supports.

(iii) Prior to filling the tank, each cover, access hatch, gauge float well or lid on any opening in the internal floating roof shall be bolted or fastened closed (i.e., no visible gaps). Rim space vents are to be set to open only when the internal floating roof is not floating or when the pressure beneath the rim exceeds the manufacturer's recommended setting.

(3) The owner or operator shall inspect the internal floating roof in accordance with the procedures specified as follows:

(i) The floating roof and its closure devices shall be visually inspected by the owner or operator to check for defects that could result in air pollutant emissions. Defects include, but are not limited to: The internal floating roof is not floating on the surface of the liquid inside the tank; liquid has accumulated on top of the internal floating roof; any portion of the roof seals have detached from the roof rim; holes, tears, or other openings are visible in the seal fabric; the gaskets no longer close off the

hazardous waste surface from the atmosphere; or the slotted membrane has more than 10 percent open area.

(ii) The owner or operator shall inspect the internal floating roof components as follows except as provided in paragraph (e)(3)(iii) of this section:

(A) Visually inspect the internal floating roof components through openings on the fixed-roof (e.g., manholes and roof hatches) at least once every 12 months after initial fill, and

(B) Visually inspect the internal floating roof, primary seal, secondary seal (if one is in service), gaskets, slotted membranes, and sleeve seals (if any) each time the tank is emptied and degassed and at least every 10 years.

(iii) As an alternative to performing the inspections specified in paragraph (e)(3)(ii) of this section for an internal floating roof equipped with two continuous seals mounted one above the other, the owner or operator may visually inspect the internal floating roof, primary and secondary seals, gaskets, slotted membranes, and sleeve seals (if any) each time the tank is emptied and degassed and at least every 5 years.

(iv) Prior to each inspection required by paragraph (e)(3)(ii) or (e)(3)(iii) of this section, the owner or operator shall notify the Regional Administrator in advance of each inspection to provide the Regional Administrator with the opportunity to have an observer present during the inspection. The owner or operator shall notify the Regional Administrator of the date and location of the inspection as follows:

(A) Prior to each visual inspection of an internal floating roof in a tank that has been emptied and degassed, written notification shall be prepared and sent by the owner or operator so that it is received by the Regional Administrator at least 30 calendar days before refilling the tank except when an inspection is not planned as provided for in paragraph (e)(3)(iv)(B) of this section.

(B) When a visual inspection is not planned and the owner or operator could not have known about the inspection 30 calendar days before refilling the tank, the owner or operator shall notify the Regional Administrator as soon as possible, but no later than 7 calendar days before refilling of the tank. This notification may be made by telephone and immediately followed by a written explanation for why the inspection is unplanned. Alternatively, written notification, including the explanation for the unplanned inspection, may be sent so that it is received by the Regional Administrator at least 7 calendar days before refilling the tank.

(v) In the event that a defect is detected, the owner or operator shall repair the defect in accordance with the requirements of paragraph (k) of this section.

(vi) The owner or operator shall maintain a record of the inspection in accordance with the requirements specified in § 264.1089(b) of this subpart.

(f) The owner or operator who controls air pollutant emissions from a tank using an external floating roof shall meet the requirements specified in paragraphs (f)(1) through (f)(3) of this section.

(1) The owner or operator shall design the external floating roof in accordance with the following requirements:

(i) The external floating roof shall be designed to float on the liquid surface except when the floating roof must be supported by the leg supports.

(ii) The floating roof shall be equipped with two continuous seals, one above the other, between the wall of the tank and the roof edge. The lower seal is referred to as the primary seal, and the upper seal is referred to as the secondary seal.

(A) The primary seal shall be a liquid-mounted seal or a metallic shoe seal, as defined in 40 CFR 265.1081. The total area of the gaps between the tank wall and the primary seal shall not exceed 212 square centimeters (cm^2) per meter of tank diameter, and the width of any portion of these gaps shall not exceed 3.8 centimeters (cm). If a metallic shoe seal is used for the primary seal, the metallic shoe seal shall be designed so that one end extends into the liquid in the tank and the other end extends a vertical distance of at least 61 centimeters above the liquid surface.

(B) The secondary seal shall be mounted above the primary seal and cover the annular space between the floating roof and the wall of the tank. The total area of the gaps between the tank wall and the secondary seal shall not exceed 21.2 square centimeters (cm^2) per meter of tank diameter, and the width of any portion of these gaps shall not exceed 1.3 centimeters (cm).

(iii) The external floating roof shall meet the following specifications:

(A) Except for automatic bleeder vents (vacuum breaker vents) and rim space vents, each opening in a noncontact external floating roof shall provide a projection below the liquid surface.

(B) Except for automatic bleeder vents, rim space vents, roof drains, and leg sleeves, each opening in the roof shall be equipped with a gasketed cover, seal, or lid.

(C) Each access hatch and each gauge float well shall be equipped with a cover designed to be bolted or fastened when the cover is secured in the closed position.

(D) Each automatic bleeder vent and each rim space vent shall be equipped with a gasket.

(E) Each roof drain that empties into the liquid managed in the tank shall be equipped with a slotted membrane fabric cover that covers at least 90 percent of the area of the opening.

(F) Each unslotted and slotted guide pole well shall be equipped with a gasketed sliding cover or a flexible fabric sleeve seal.

(G) Each unslotted guide pole shall be equipped with a gasketed cap on the end of the pole.

(H) Each slotted guide pole shall be equipped with a gasketed float or other device which closes off the liquid surface from the atmosphere.

(I) Each gauge hatch and each sample well shall be equipped with a gasketed cover.

(2) The owner or operator shall operate the tank in accordance with the following requirements:

(i) When the floating roof is resting on the leg supports, the process of filling, emptying, or refilling shall be continuous and shall be completed as soon as practical.

(ii) Except for automatic bleeder vents, rim space vents, roof drains, and leg sleeves, each opening in the roof shall be secured and maintained in a closed position at all times except when the closure device must be open for access.

(iii) Covers on each access hatch and each gauge float well shall be bolted or fastened when secured in the closed position.

(iv) Automatic bleeder vents shall be set closed at all times when the roof is floating, except when the roof is being floated off or is being landed on the leg supports.

(v) Rim space vents shall be set to open only at those times that the roof is being floated off the roof leg supports or when the pressure beneath the rim seal exceeds the manufacturer's recommended setting.

(vi) The cap on the end of each unslotted guide pole shall be secured in the closed position at all times except when measuring the level or collecting samples of the liquid in the tank.

(vii) The cover on each gauge hatch or sample well shall be secured in the closed position at all times except when the hatch or well must be opened for access.

(viii) Both the primary seal and the secondary seal shall completely cover

the annular space between the external floating roof and the wall of the tank in a continuous fashion except during inspections.

(3) The owner or operator shall inspect the external floating roof in accordance with the procedures specified as follows:

(i) The owner or operator shall measure the external floating roof seal gaps in accordance with the following requirements:

(A) The owner or operator shall perform measurements of gaps between the tank wall and the primary seal within 60 calendar days after initial operation of the tank following installation of the floating roof and, thereafter, at least once every 5 years.

(B) The owner or operator shall perform measurements of gaps between the tank wall and the secondary seal within 60 calendar days after initial operation of the tank following installation of the floating roof and, thereafter, at least once every year.

(C) If a tank ceases to hold hazardous waste for a period of 1 year or more, subsequent introduction of hazardous waste into the tank shall be considered an initial operation for the purposes of paragraphs (f)(3)(i)(A) and (f)(3)(i)(B) of this section.

(D) The owner or operator shall determine the total surface area of gaps in the primary seal and in the secondary seal individually using the following procedure:

(*1*) The seal gap measurements shall be performed at one or more floating roof levels when the roof is floating off the roof supports.

(*2*) Seal gaps, if any, shall be measured around the entire perimeter of the floating roof in each place where a 0.32-centimeter (cm) diameter uniform probe passes freely (without forcing or binding against the seal) between the seal and the wall of the tank and measure the circumferential distance of each such location.

(*3*) For a seal gap measured under paragraph (f)(3) of this section, the gap surface area shall be determined by using probes of various widths to measure accurately the actual distance from the tank wall to the seal and multiplying each such width by its respective circumferential distance.

(*4*) The total gap area shall be calculated by adding the gap surface areas determined for each identified gap location for the primary seal and the secondary seal individually, and then dividing the sum for each seal type by the nominal perimeter of the tank. These total gap areas for the primary seal and secondary seal are then compared to the respective standards for the seal type as specified in paragraph (f)(1)(ii) of this section.

(E) In the event that the seal gap measurements do not conform to the specifications in paragraph (f)(1)(ii) of this section, the owner or operator shall repair the defect in accordance with the requirements of paragraph (k) of this section.

(F) The owner or operator shall maintain a record of the inspection in accordance with the requirements specified in § 264.1089(b) of this subpart.

(ii) The owner or operator shall visually inspect the external floating roof in accordance with the following requirements:

(A) The floating roof and its closure devices shall be visually inspected by the owner or operator to check for defects that could result in air pollutant emissions. Defects include, but are not limited to: Holes, tears, or other openings in the rim seal or seal fabric of the floating roof; a rim seal detached from the floating roof; all or a portion of the floating roof deck being submerged below the surface of the liquid in the tank; broken, cracked, or otherwise damaged seals or gaskets on closure devices; and broken or missing hatches, access covers, caps, or other closure devices.

(B) The owner or operator shall perform an initial inspection of the external floating roof and its closure devices on or before the date that the tank becomes subject to this section. Thereafter, the owner or operator shall perform the inspections at least once every year except for the special conditions provided for in paragraph (l) of this section.

(C) In the event that a defect is detected, the owner or operator shall repair the defect in accordance with the requirements of paragraph (k) of this section.

(D) The owner or operator shall maintain a record of the inspection in accordance with the requirements specified in § 264.1089(b) of this subpart.

(iii) Prior to each inspection required by paragraph (f)(3)(i) or (f)(3)(ii) of this subpart, the owner or operator shall notify the Regional Administrator in advance of each inspection to provide the Regional Administrator with the opportunity to have an observer present during the inspection. The owner or operator shall notify the Regional Administrator of the date and location of the inspection as follows:

(A) Prior to each inspection to measure external floating roof seal gaps as required under paragraph (f)(3)(i) of this section, written notification shall be prepared and sent by the owner or operator so that it is received by the Regional Administrator at least 30 calendar days before the date the measurements are scheduled to be performed.

(B) Prior to each visual inspection of an external floating roof in a tank that has been emptied and degassed, written notification shall be prepared and sent by the owner or operator so that it is received by the Regional Administrator at least 30 calendar days before refilling the tank except when an inspection is not planned as provided for in paragraph (f)(3)(iii)(C) of this section.

(C) When a visual inspection is not planned and the owner or operator could not have known about the inspection 30 calendar days before refilling the tank, the owner or operator shall notify the Regional Administrator as soon as possible, but no later than 7 calendar days before refilling of the tank. This notification may be made by telephone and immediately followed by a written explanation for why the inspection is unplanned. Alternatively, written notification, including the explanation for the unplanned inspection, may be sent so that it is received by the Regional Administrator at least 7 calendar days before refilling the tank.

(g) The owner or operator who controls air pollutant emissions from a tank by venting the tank to a control device shall meet the requirements specified in paragraphs (g)(1) through (g)(3) of this section.

(1) The tank shall be covered by a fixed roof and vented directly through a closed-vent system to a control device in accordance with the following requirements:

(i) The fixed roof and its closure devices shall be designed to form a continuous barrier over the entire surface area of the liquid in the tank.

(ii) Each opening in the fixed roof not vented to the control device shall be equipped with a closure device. If the pressure in the vapor headspace underneath the fixed roof is less than atmospheric pressure when the control device is operating, the closure devices shall be designed to operate such that when the closure device is secured in the closed position there are no visible cracks, holes, gaps, or other open spaces in the closure device or between the perimeter of the cover opening and the closure device. If the pressure in the vapor headspace underneath the fixed roof is equal to or greater than atmospheric pressure when the control device is operating, the closure device shall be designed to operate with no detectable organic emissions.

(iii) The fixed roof and its closure devices shall be made of suitable materials that will minimize exposure of the hazardous waste to the atmosphere, to the extent practical, and will maintain the integrity of the fixed roof and closure devices throughout their intended service life. Factors to be considered when selecting the materials for and designing the fixed roof and closure devices shall include: Organic vapor permeability, the effects of any contact with the liquid and its vapor managed in the tank; the effects of outdoor exposure to wind, moisture, and sunlight; and the operating practices used for the tank on which the fixed roof is installed.

(iv) The closed-vent system and control device shall be designed and operated in accordance with the requirements of § 264.1087 of this subpart.

(2) Whenever a hazardous waste is in the tank, the fixed roof shall be installed with each closure device secured in the closed position and the vapor headspace underneath the fixed roof vented to the control device except as follows:

(i) Venting to the control device is not required, and opening of closure devices or removal of the fixed roof is allowed at the following times:

(A) To provide access to the tank for performing routine inspection, maintenance, or other activities needed for normal operations. Examples of such activities include those times when a worker needs to open a port to sample liquid in the tank, or when a worker needs to open a hatch to maintain or repair equipment. Following completion of the activity, the owner or operator shall promptly secure the closure device in the closed position or reinstall the cover, as applicable, to the tank.

(B) To remove accumulated sludge or other residues from the bottom of a tank.

(ii) Opening of a safety device, as defined in 40 CFR 265.1081, is allowed at any time conditions require doing so to avoid an unsafe condition.

(3) The owner or operator shall inspect and monitor the air emission control equipment in accordance with the following procedures:

(i) The fixed roof and its closure devices shall be visually inspected by the owner or operator to check for defects that could result in air pollutant emissions. Defects include, but are not limited to, visible cracks, holes, or gaps in the roof sections or between the roof and the tank wall; broken, cracked, or otherwise damaged seals or gaskets on closure devices; and broken or missing hatches, access covers, caps, or other closure devices.

(ii) The closed-vent system and control device shall be inspected and monitored by the owner or operator in accordance with the procedures specified in § 264.1087 of this subpart.

(iii) The owner or operator shall perform an initial inspection of the air emission control equipment on or before the date that the tank becomes subject to this section. Thereafter, the owner or operator shall perform the inspections at least once every year except for the special conditions provided for in paragraph (l) of this section.

(iv) In the event that a defect is detected, the owner or operator shall repair the defect in accordance with the requirements of paragraph (k) of this section.

(v) The owner or operator shall maintain a record of the inspection in accordance with the requirements specified in § 264.1089(b) of this subpart.

(h) The owner or operator who controls air pollutant emissions by using a pressure tank shall meet the following requirements.

(1) The tank shall be designed not to vent to the atmosphere as a result of compression of the vapor headspace in the tank during filling of the tank to its design capacity.

(2) All tank openings shall be equipped with closure devices designed to operate with no detectable organic emissions as determined using the procedure specified in § 264.1083(d) of this subpart.

(3) Whenever a hazardous waste is in the tank, the tank shall be operated as a closed system that does not vent to the atmosphere except in the event that a safety device, as defined in 40 CFR 265.1081, is required to open to avoid an unsafe condition.

(i) The owner or operator who controls air pollutant emissions by using an enclosure vented through a closed-vent system to an enclosed combustion control device shall meet the requirements specified in paragraphs (i)(1) through (i)(4) of this section.

(1) The tank shall be located inside an enclosure. The enclosure shall be designed and operated in accordance with the criteria for a permanent total enclosure as specified in ''Procedure T—Criteria for and Verification of a Permanent or Temporary Total Enclosure'' under 40 CFR 52.741, appendix B. The enclosure may have permanent or temporary openings to allow worker access; passage of material into or out of the enclosure by conveyor, vehicles, or other mechanical means; entry of permanent mechanical or electrical equipment; or direct airflow into the enclosure. The owner or operator shall perform the verification procedure for the enclosure as specified in Section 5.0 to ''Procedure T—Criteria for and Verification of a Permanent or Temporary Total Enclosure'' initially when the enclosure is first installed and, thereafter, annually.

(2) The enclosure shall be vented through a closed-vent system to an enclosed combustion control device that is designed and operated in accordance with the standards for either a vapor incinerator, boiler, or process heater specified in § 264.1087 of this subpart.

(3) Safety devices, as defined in 40 CFR 265.1081, may be installed and operated as necessary on any enclosure, closed-vent system, or control device used to comply with the requirements of paragraphs (i)(1) and (i)(2) of this section.

(4) The owner or operator shall inspect and monitor the closed-vent system and control device as specified in § 264.1087 of this subpart.

(j) The owner or operator shall transfer hazardous waste to a tank subject to this section in accordance with the following requirements:

(1) Transfer of hazardous waste, except as provided in paragraph (j)(2) of this section, to the tank from another tank subject to this section or from a surface impoundment subject to § 264.1085 of this subpart shall be conducted using continuous hard-piping or another closed system that does not allow exposure of the hazardous waste to the atmosphere. For the purpose of complying with this provision, an individual drain system is considered to be a closed system when it meets the requirements of 40 CFR part 63, subpart RR—National Emission Standards for Individual Drain Systems.

(2) The requirements of paragraph (j)(1) of this section do not apply when transferring a hazardous waste to the tank under any of the following conditions:

(i) The hazardous waste meets the average VO concentration conditions specified in § 264.1082(c)(1) of this subpart at the point of waste origination.

(ii) The hazardous waste has been treated by an organic destruction or removal process to meet the requirements in § 264.1082(c)(2) of this subpart.

(k) The owner or operator shall repair each defect detected during an inspection performed in accordance with the requirements of paragraph (c)(4), (e)(3), (f)(3), or (g)(3) of this section as follows:

(1) The owner or operator shall make first efforts at repair of the defect no later than 5 calendar days after

detection, and repair shall be completed as soon as possible but no later than 45 calendar days after detection except as provided in paragraph (k)(2) of this section.

(2) Repair of a defect may be delayed beyond 45 calendar days if the owner or operator determines that repair of the defect requires emptying or temporary removal from service of the tank and no alternative tank capacity is available at the site to accept the hazardous waste normally managed in the tank. In this case, the owner or operator shall repair the defect the next time the process or unit that is generating the hazardous waste managed in the tank stops operation. Repair of the defect shall be completed before the process or unit resumes operation.

(l) Following the initial inspection and monitoring of the cover as required by the applicable provisions of this subpart, subsequent inspection and monitoring may be performed at intervals longer than 1 year under the following special conditions:

(1) In the case when inspecting or monitoring the cover would expose a worker to dangerous, hazardous, or other unsafe conditions, then the owner or operator may designate a cover as an ''unsafe to inspect and monitor cover'' and comply with all of the following requirements:

(i) Prepare a written explanation for the cover stating the reasons why the cover is unsafe to visually inspect or to monitor, if required.

(ii) Develop and implement a written plan and schedule to inspect and monitor the cover, using the procedures specified in the applicable section of this subpart, as frequently as practicable during those times when a worker can safely access the cover.

(2) In the case when a tank is buried partially or entirely underground, an owner or operator is required to inspect and monitor, as required by the applicable provisions of this section, only those portions of the tank cover and those connections to the tank (e.g., fill ports, access hatches, gauge wells, etc.) that are located on or above the ground surface.

19. Section 264.1085 is revised to read as follows:

§ 264.1085 Standards: Surface impoundments.

(a) The provisions of this section apply to the control of air pollutant emissions from surface impoundments for which § 264.1082(b) of this subpart references the use of this section for such air emission control.

(b) The owner or operator shall control air pollutant emissions from the surface impoundment by installing and operating either of the following:

(1) A floating membrane cover in accordance with the provisions specified in paragraph (c) of this section; or

(2) A cover that is vented through a closed-vent system to a control device in accordance with the provisions specified in paragraph (d) of this sections.

(c) The owner or operator who controls air pollutant emissions from a surface impoundment using a floating membrane cover shall meet the requirements specified in paragraphs (c)(1) through (c)(3) of this section.

(1) The surface impoundment shall be equipped with a floating membrane cover designed to meet the following specifications:

(i) The floating membrane cover shall be designed to float on the liquid surface during normal operations and form a continuous barrier over the entire surface area of the liquid.

(ii) The cover shall be fabricated from a synthetic membrane material that is either:

(A) High density polyethylene (HDPE) with a thickness no less than 2.5 millimeters (mm); or

(B) A material or a composite of different materials determined to have both organic permeability properties that are equivalent to those of the material listed in paragraph (c)(1)(ii)(A) of this section and chemical and physical properties that maintain the material integrity for the intended service life of the material.

(iii) The cover shall be installed in a manner such that there are no visible cracks, holes, gaps, or other open spaces between cover section seams or between the interface of the cover edge and its foundation mountings.

(iv) Except as provided for in paragraph (c)(1)(v) of this section, each opening in the floating membrane cover shall be equipped with a closure device designed to operate such that when the closure device is secured in the closed position there are no visible cracks, holes, gaps, or other open spaces in the closure device or between the perimeter of the cover opening and the closure device.

(v) The floating membrane cover may be equipped with one or more emergency cover drains for removal of stormwater. Each emergency cover drain shall be equipped with a slotted membrane fabric cover that covers at least 90 percent of the area of the opening or a flexible fabric sleeve seal.

(vi) The closure devices shall be made of suitable materials that will minimize exposure of the hazardous waste to the atmosphere, to the extent practical, and will maintain the integrity of the closure devices throughout their intended service life. Factors to be considered when selecting the materials of construction and designing the cover and closure devices shall include: Organic vapor permeability; the effects of any contact with the liquid and its vapor managed in the surface impoundment; the effects of outdoor exposure to wind, moisture, and sunlight; and the operating practices used for the surface impoundment on which the floating membrane cover is installed.

(2) Whenever a hazardous waste is in the surface impoundment, the floating membrane cover shall float on the liquid and each closure device shall be secured in the closed position except as follows:

(i) Opening of closure devices or removal of the cover is allowed at the following times:

(A) To provide access to the surface impoundment for performing routine inspection, maintenance, or other activities needed for normal operations. Examples of such activities include those times when a worker needs to open a port to sample the liquid in the surface impoundment, or when a worker needs to open a hatch to maintain or repair equipment. Following completion of the activity, the owner or operator shall promptly replace the cover and secure the closure device in the closed position, as applicable.

(B) To remove accumulated sludge or other residues from the bottom of surface impoundment.

(ii) Opening of a safety device, as defined in 40 CFR 265.1081, is allowed at any time conditions require doing so to avoid an unsafe condition.

(3) The owner or operator shall inspect the floating membrane cover in accordance with the following procedures:

(i) The floating membrane cover and its closure devices shall be visually inspected by the owner or operator to check for defects that could result in air pollutant emissions. Defects include, but are not limited to, visible cracks, holes, or gaps in the cover section seams or between the interface of the cover edge and its foundation mountings; broken, cracked, or otherwise damaged seals or gaskets on closure devices; and broken or missing hatches, access covers, caps, or other closure devices.

(ii) The owner or operator shall perform an initial inspection of the floating membrane cover and its closure devices on or before the date that the surface impoundment becomes subject to this section. Thereafter, the owner or

operator shall perform the inspections at least once every year except for the special conditions provided for in paragraph (g) of this section.

(iii) In the event that a defect is detected, the owner or operator shall repair the defect in accordance with the requirements of paragraph (f) of this section.

(iv) The owner or operator shall maintain a record of the inspection in accordance with the requirements specified in § 264.1089(c) of this subpart.

(d) The owner or operator who controls air pollutant emissions from a surface impoundment using a cover vented to a control device shall meet the requirements specified in paragraphs (d)(1) through (d)(3) of this section.

(1) The surface impoundment shall be covered by a cover and vented directly through a closed-vent system to a control device in accordance with the following requirements:

(i) The cover and its closure devices shall be designed to form a continuous barrier over the entire surface area of the liquid in the surface impoundment.

(ii) Each opening in the cover not vented to the control device shall be equipped with a closure device. If the pressure in the vapor headspace underneath the cover is less than atmospheric pressure when the control device is operating, the closure devices shall be designed to operate such that when the closure device is secured in the closed position there are no visible cracks, holes, gaps, or other open spaces in the closure device or between the perimeter of the cover opening and the closure device. If the pressure in the vapor headspace underneath the cover is equal to or greater than atmospheric pressure when the control device is operating, the closure device shall be designed to operate with no detectable organic emissions using the procedure specified in § 264.1083(d) of this subpart.

(iii) The cover and its closure devices shall be made of suitable materials that will minimize exposure of the hazardous waste to the atmosphere, to the extent practical, and will maintain the integrity of the cover and closure devices throughout their intended service life. Factors to be considered when selecting the materials for and designing the cover and closure devices shall include: Organic vapor permeability; the effects of any contact with the liquid or its vapors managed in the surface impoundment; the effects of outdoor exposure to wind, moisture, and sunlight; and the operating practices used for the surface impoundment on which the cover is installed.

(iv) The closed-vent system and control device shall be designed and operated in accordance with the requirements of § 264.1087 of this subpart.

(2) Whenever a hazardous waste is in the surface impoundment, the cover shall be installed with each closure device secured in the closed position and the vapor headspace underneath the cover vented to the control device except as follows:

(i) Venting to the control device is not required, and opening of closure devices or removal of the cover is allowed at the following times:

(A) To provide access to the surface impoundment for performing routine inspection, maintenance, or other activities needed for normal operations. Examples of such activities include those times when a worker needs to open a port to sample liquid in the surface impoundment, or when a worker needs to open a hatch to maintain or repair equipment. Following completion of the activity, the owner or operator shall promptly secure the closure device in the closed position or reinstall the cover, as applicable, to the surface impoundment.

(B) To remove accumulated sludge or other residues from the bottom of surface impoundment.

(ii) Opening of a safety device, as defined in 40 CFR 265.1081, is allowed at any time conditions require doing so to avoid an unsafe condition.

(3) The owner or operator shall inspect and monitor the air emission control equipment in accordance with the following procedures:

(i) The surface impoundment cover and its closure devices shall be visually inspected by the owner or operator to check for defects that could result in air pollutant emissions. Defects include, but are not limited to, visible cracks, holes, or gaps in the cover section seams or between the interface of the cover edge and its foundation mountings; broken, cracked, or otherwise damaged seals or gaskets on closure devices; and broken or missing hatches, access covers, caps, or other closure devices.

(ii) The closed-vent system and control device shall be inspected and monitored by the owner or operator in accordance with the procedures specified in § 264.1087 of this subpart.

(iii) The owner or operator shall perform an initial inspection of the air emission control equipment on or before the date that the surface impoundment becomes subject to this section. Thereafter, the owner or operator shall perform the inspections at least once every year except for the special conditions provided for in paragraph (g) of this section.

(iv) In the event that a defect is detected, the owner or operator shall repair the defect in accordance with the requirements of paragraph (f) of this section.

(v) The owner or operator shall maintain a record of the inspection in accordance with the requirements specified in § 264.1089(c) of this subpart.

(e) The owner or operator shall transfer hazardous waste to a surface impoundment subject to this section in accordance with the following requirements:

(1) Transfer of hazardous waste, except as provided in paragraph (e)(2) of this section, to the surface impoundment from another surface impoundment subject to this section or from a tank subject to § 264.1084 of this subpart shall be conducted using continuous hard-piping or another closed system that does not allow exposure of the waste to the atmosphere. For the purpose of complying with this provision, an individual drain system is considered to be a closed system when it meets the requirements of 40 CFR part 63, subpart RR—National Emission Standards for Individual Drain Systems.

(2) The requirements of paragraph (e)(1) of this section do not apply when transferring a hazardous waste to the surface impoundment under either of the following conditions:

(i) The hazardous waste meets the average VO concentration conditions specified in § 264.1082(c)(1) of this subpart at the point of waste origination.

(ii) The hazardous waste has been treated by an organic destruction or removal process to meet the requirements in § 264.1082(c)(2) of this subpart.

(f) The owner or operator shall repair each defect detected during an inspection performed in accordance with the requirements of paragraph (c)(3) or (d)(3) of this section as follows:

(1) The owner or operator shall make first efforts at repair of the defect no later than 5 calendar days after detection and repair shall be completed as soon as possible but no later than 45 calendar days after detection except as provided in paragraph (f)(2) of this section.

(2) Repair of a defect may be delayed beyond 45 calendar days if the owner or operator determines that repair of the defect requires emptying or temporary removal from service of the surface impoundment and no alternative capacity is available at the site to accept

the hazardous waste normally managed in the surface impoundment. In this case, the owner or operator shall repair the defect the next time the process or unit that is generating the hazardous waste managed in the surface impoundment stops operation. Repair of the defect shall be completed before the process or unit resumes operation.

(g) Following the initial inspection and monitoring of the cover as required by the applicable provisions of this subpart, subsequent inspection and monitoring may be performed at intervals longer than 1 year in the case when inspecting or monitoring the cover would expose a worker to dangerous, hazardous, or other unsafe conditions. In this case, the owner or operator may designate the cover as an ''unsafe to inspect and monitor cover'' and comply with all of the following requirements:

(1) Prepare a written explanation for the cover stating the reasons why the cover is unsafe to visually inspect or to monitor, if required.

(2) Develop and implement a written plan and schedule to inspect and monitor the cover using the procedures specified in the applicable section of this subpart as frequently as practicable during those times when a worker can safely access the cover.

20. Section 264.1086 is revised to read as follows:

§ 264.1086 Standards: Containers.

(a) The provisions of this section apply to the control of air pollutant emissions from containers for which § 264.1082(b) of this subpart references the use of this section for such air emission control.

(b) General requirements.

(1) The owner or operator shall control air pollutant emissions from each container subject to this section in accordance with the following requirements, as applicable to the container, except when the special provisions for waste stabilization processes specified in paragraph (b)(2) of this section apply to the container.

(i) For a container having a design capacity greater than 0.1 m^3 and less than or equal to 0.46 m^3, the owner or operator shall control air pollutant emissions from the container in accordance with the Container Level 1 standards specified in paragraph (c) of this section.

(ii) For a container having a design capacity greater than 0.46 m^3 that is not in light material service, the owner or operator shall control air pollutant emissions from the container in accordance with the Container Level 1 standards specified in paragraph (c) of this section.

(iii) For a container having a design capacity greater than 0.46 m^3 that is in light material service, the owner or operator shall control air pollutant emissions from the container in accordance with the Container Level 2 standards specified in paragraph (d) of this section.

(2) When a container having a design capacity greater than 0.1 m^3 is used for treatment of a hazardous waste by a waste stabilization process, the owner or operator shall control air pollutant emissions from the container in accordance with the Container Level 3 standards specified in paragraph (e) of this section at those times during the waste stabilization process when the hazardous waste in the container is exposed to the atmosphere.

(c) Container Level 1 standards.

(1) A container using Container Level 1 controls is one of the following:

(i) A container that meets the applicable U.S. Department of Transportation (DOT) regulations on packaging hazardous materials for transportation as specified in paragraph (f) of this section.

(ii) A container equipped with a cover and closure devices that form a continuous barrier over the container openings such that when the cover and closure devices are secured in the closed position there are no visible holes, gaps, or other open spaces into the interior of the container. The cover may be a separate cover installed on the container (e.g., a lid on a drum or a suitably secured tarp on a roll-off box) or may be an integral part of the container structural design (e.g., a ''portable tank'' or bulk cargo container equipped with a screw-type cap).

(iii) An open-top container in which an organic-vapor suppressing barrier is placed on or over the hazardous waste in the container such that no hazardous waste is exposed to the atmosphere. One example of such a barrier is application of a suitable organic-vapor suppressing foam.

(2) A container used to meet the requirements of paragraph (c)(1)(ii) or (c)(1)(iii) of this section shall be equipped with covers and closure devices, as applicable to the container, that are composed of suitable materials to minimize exposure of the hazardous waste to the atmosphere and to maintain the equipment integrity for as long as it is in service. Factors to be considered in selecting the materials of construction and designing the cover and closure devices shall include: Organic vapor permeability, the effects of contact with the hazardous waste or its vapor managed in the container; the effects of outdoor exposure of the closure device or cover material to wind, moisture, and sunlight; and the operating practices for which the container is intended to be used.

(3) Whenever a hazardous waste is in a container using Container Level 1 controls, the owner or operator shall install all covers and closure devices for the container, as applicable to the container, and secure and maintain each closure device in the closed position except as follows:

(i) Opening of a closure device or cover is allowed for the purpose of adding hazardous waste or other material to the container as follows:

(A) In the case when the container is filled to the intended final level in one continuous operation, the owner or operator shall promptly secure the closure devices in the closed position and install the covers, as applicable to the container, upon conclusion of the filling operation.

(B) In the case when discrete quantities or batches of material intermittently are added to the container over a period of time, the owner or operator shall promptly secure the closure devices in the closed position and install covers, as applicable to the container, upon either the container being filled to the intended final level; the completion of a batch loading after which no additional material will be added to the container within 15 minutes; the person performing the loading operation leaving the immediate vicinity of the container; or the shutdown of the process generating the material being added to the container, whichever condition occurs first.

(ii) Opening of a closure device or cover is allowed for the purpose of removing hazardous waste from the container as follows:

(A) For the purpose of meeting the requirements of this section, an empty container as defined in 40 CFR 261.7(b) may be open to the atmosphere at any time (i.e., covers and closure devices are not required to be secured in the closed position on an empty container).

(B) In the case when discrete quantities or batches of material are removed from the container but the container does not meet the conditions to be an empty container as defined in 40 CFR 261.7(b), the owner or operator shall promptly secure the closure devices in the closed position and install covers, as applicable to the container, upon the completion of a batch removal after which no additional material will be removed from the container within 15 minutes or the person performing the unloading

operation leaves the immediate vicinity of the container, whichever condition occurs first.

(iii) Opening of a closure device or cover is allowed when access inside the container is needed to perform routine activities other than transfer of hazardous waste. Examples of such activities include those times when a worker needs to open a port to measure the depth of or sample the material in the container, or when a worker needs to open a manhole hatch to access equipment inside the container. Following completion of the activity, the owner or operator shall promptly secure the closure device in the closed position or reinstall the cover, as applicable to the container.

(iv) Opening of a spring-loaded pressure-vacuum relief valve, conservation vent, or similar type of pressure relief device which vents to the atmosphere is allowed during normal operations for the purpose of maintaining the internal pressure of the container in accordance with the container design specifications. The device shall be designed to operate with no detectable organic emissions when the device is secured in the closed position. The settings at which the device opens shall be established such that the device remains in the closed position whenever the internal pressure of the container is within the internal pressure operating range determined by the owner or operator based on container manufacturer recommendations, applicable regulations, fire protection and prevention codes, standard engineering codes and practices, or other requirements for the safe handling of flammable, ignitable, explosive, reactive, or hazardous materials. Examples of normal operating conditions that may require these devices to open are during those times when the internal pressure of the container exceeds the internal pressure operating range for the container as a result of loading operations or diurnal ambient temperature fluctuations.

(v) Opening of a safety device, as defined in 40 CFR 265.1081, is allowed at any time conditions require doing so to avoid an unsafe condition.

(4) The owner or operator of containers using Container Level 1 controls shall inspect the containers and their covers and closure devices as follows:

(i) In the case when a hazardous waste already is in the container at the time the owner or operator first accepts possession of the container at the facility and the container is not emptied (i.e., does not meet the conditions for an empty container as specified in 40 CFR 261.7(b)) within 24 hours after the container is accepted at the facility, the owner or operator shall visually inspect the container and its cover and closure devices to check for visible cracks, holes, gaps, or other open spaces into the interior of the container when the cover and closure devices are secured in the closed position. If a defect is detected, the owner or operator shall repair the defect in accordance with the requirements of paragraph (c)(4)(iii) of this section.

(ii) In the case when a container used for managing hazardous waste remains at the facility for a period of 1 year or more, the owner or operator shall visually inspect the container and its cover and closure devices initially and thereafter, at least once every 12 months, to check for visible cracks, holes, gaps, or other open spaces into the interior of the container when the cover and closure devices are secured in the closed position. If a defect is detected, the owner or operator shall repair the defect in accordance with the requirements of paragraph (c)(4)(iii) of this section.

(iii) When a defect is detected for the container, cover, or closure devices, the owner or operator shall make first efforts at repair of the defect no later than 24 hours after detection and repair shall be completed as soon as possible but no later than 5 calendar days after detection. If repair of a defect cannot be completed within 5 calendar days, then the hazardous waste shall be removed from the container and the container shall not be used to manage hazardous waste until the defect is repaired.

(5) The owner or operator shall maintain at the facility a copy of the procedure used to determine that containers with capacity of 0.46 m^3 or greater, which do not meet applicable DOT regulations as specified in paragraph (f) of this section, are not managing hazardous waste in light material service.

(d) Container Level 2 standards.

(1) A container using Container Level 2 controls is one of the following:

(i) A container that meets the applicable U.S. Department of Transportation (DOT) regulations on packaging hazardous materials for transportation as specified in paragraph (f) of this section.

(ii) A container that operates with no detectable organic emissions as defined in 40 CFR 265.1081 and determined in accordance with the procedure specified in paragraph (g) of this section.

(iii) A container that has been demonstrated within the preceding 12 months to be vapor-tight by using 40 CFR part 60, appendix A, Method 27 in accordance with the procedure specified in paragraph (h) of this section.

(2) Transfer of hazardous waste in or out of a container using Container Level 2 controls shall be conducted in such a manner as to minimize exposure of the hazardous waste to the atmosphere, to the extent practical, considering the physical properties of the hazardous waste and good engineering and safety practices for handling flammable, ignitable, explosive, reactive, or other hazardous materials. Examples of container loading procedures that the EPA considers to meet the requirements of this paragraph include using any one of the following: a submerged-fill pipe or other submerged-fill method to load liquids into the container; a vapor-balancing system or a vapor-recovery system to collect and control the vapors displaced from the container during filling operations; or a fitted opening in the top of a container through which the hazardous waste is filled and subsequently purging the transfer line before removing it from the container opening.

(3) Whenever a hazardous waste is in a container using Container Level 2 controls, the owner or operator shall install all covers and closure devices for the container, and secure and maintain each closure device in the closed position except as follows:

(i) Opening of a closure device or cover is allowed for the purpose of adding hazardous waste or other material to the container as follows:

(A) In the case when the container is filled to the intended final level in one continuous operation, the owner or operator shall promptly secure the closure devices in the closed position and install the covers, as applicable to the container, upon conclusion of the filling operation.

(B) In the case when discrete quantities or batches of material intermittently are added to the container over a period of time, the owner or operator shall promptly secure the closure devices in the closed position and install covers, as applicable to the container, upon either the container being filled to the intended final level; the completion of a batch loading after which no additional material will be added to the container within 15 minutes; the person performing the loading operation leaving the immediate vicinity of the container; or the shutdown of the process generating the material being added to the container, whichever condition occurs first.

(ii) Opening of a closure device or cover is allowed for the purpose of

removing hazardous waste from the container as follows:

(A) For the purpose of meeting the requirements of this section, an empty container as defined in 40 CFR 261.7(b) may be open to the atmosphere at any time (i.e., covers and closure devices are not required to be secured in the closed position on an empty container).

(B) In the case when discrete quantities or batches of material are removed from the container but the container does not meet the conditions to be an empty container as defined in 40 CFR 261.7(b), the owner or operator shall promptly secure the closure devices in the closed position and install covers, as applicable to the container, upon the completion of a batch removal after which no additional material will be removed from the container within 15 minutes or the person performing the unloading operation leaves the immediate vicinity of the container, whichever condition occurs first.

(iii) Opening of a closure device or cover is allowed when access inside the container is needed to perform routine activities other than transfer of hazardous waste.

Examples of such activities include those times when a worker needs to open a port to measure the depth of or sample the material in the container, or when a worker needs to open a manhole hatch to access equipment inside the container. Following completion of the activity, the owner or operator shall promptly secure the closure device in the closed position or reinstall the cover, as applicable to the container.

(iv) Opening of a spring-loaded, pressure-vacuum relief valve, conservation vent, or similar type of pressure relief device which vents to the atmosphere is allowed during normal operations for the purpose of maintaining the internal pressure of the container in accordance with the container design specifications. The device shall be designed to operate with no detectable organic emission when the device is secured in the closed position. The settings at which the device opens shall be established such that the device remains in the closed position whenever the internal pressure of the container is within the internal pressure operating range determined by the owner or operator based on container manufacturer recommendations, applicable regulations, fire protection and prevention codes, standard engineering codes and practices, or other requirements for the safe handling of flammable, ignitable, explosive, reactive, or hazardous materials. Examples of normal operating conditions that may require these devices to open are during those times when the internal pressure of the container exceeds the internal pressure operating range for the container as a result of loading operations or diurnal ambient temperature fluctuations.

(v) Opening of a safety device, as defined in 40 CFR 265.1081, is allowed at any time conditions require doing so to avoid an unsafe condition.

(4) The owner or operator of containers using Container Level 2 controls shall inspect the containers and their covers and closure devices as follows:

(i) In the case when a hazardous waste already is in the container at the time the owner or operator first accepts possession of the container at the facility and the container is not emptied (i.e., does not meet the conditions for an empty container as specified in 40 CFR 261.7(b)) within 24 hours after the container arrives at the facility, the owner or operator shall visually inspect the container and its cover and closure devices to check for visible cracks, holes, gaps, or other open spaces into the interior of the container when the cover and closure devices are secured in the closed position. If a defect is detected, the owner or operator shall repair the defect in accordance with the requirements of paragraph (d)(4)(iii) of this section.

(ii) In the case when a container used for managing hazardous waste remains at the facility for a period of 1 year or more, the owner or operator shall visually inspect the container and its cover and closure devices initially and thereafter, at least once every 12 months, to check for visible cracks, holes, gaps, or other open spaces into the interior of the container when the cover and closure devices are secured in the closed position. If a defect is detected, the owner or operator shall repair the defect in accordance with the requirements of paragraph (d)(4)(iii) of this section.

(iii) When a defect is detected for the container, cover, or closure devices, the owner or operator shall make first efforts at repair of the defect no later than 24 hours after detection, and repair shall be completed as soon as possible but no later than 5 calendar days after detection. If repair of a defect cannot be completed within 5 calendar days, then the hazardous waste shall be removed from the container and the container shall not be used to manage hazardous waste until the defect is repaired.

(e) Container Level 3 standards.

(1) A container using Container Level 3 controls is one of the following:

(i) A container that is vented directly through a closed-vent system to a control device in accordance with the requirements of paragraph (e)(2)(ii) of this section.

(ii) A container that is vented inside an enclosure which is exhausted through a closed-vent system to a control device in accordance with the requirements of paragraphs (e)(2)(i) and (e)(2)(ii) of this section.

(2) The owner or operator shall meet the following requirements, as applicable to the type of air emission control equipment selected by the owner or operator:

(i) The container enclosure shall be designed and operated in accordance with the criteria for a permanent total enclosure as specified in ''Procedure T—Criteria for and Verification of a Permanent or Temporary Total Enclosure'' under 40 CFR 52.741, appendix B. The enclosure may have permanent or temporary openings to allow worker access; passage of containers through the enclosure by conveyor or other mechanical means; entry of permanent mechanical or electrical equipment; or direct airflow into the enclosure. The owner or operator shall perform the verification procedure for the enclosure as specified in Section 5.0 to ''Procedure T—Criteria for and Verification of a Permanent or Temporary Total Enclosure'' initially when the enclosure is first installed and, thereafter, annually.

(ii) The closed-vent system and control device shall be designed and operated in accordance with the requirements of § 264.1087 of this subpart.

(3) Safety devices, as defined in 40 CFR 265.1081, may be installed and operated as necessary on any container, enclosure, closed-vent system, or control device used to comply with the requirements of paragraph (e)(1) of this section.

(4) Owners and operators using Container Level 3 controls in accordance with the provisions of this subpart shall inspect and monitor the closed-vent systems and control devices as specified in § 264.1087 of this subpart.

(5) Owners and operators that use Container Level 3 controls in accordance with the provisions of this subpart shall prepare and maintain the records specified in § 264.1089(d) of this subpart.

(f) For the purpose of compliance with paragraph (c)(1)(i) or (d)(1)(i) of this section, containers shall be used that meet the applicable U.S. Department of Transportation (DOT)

regulations on packaging hazardous materials for transportation as follows:

(1) The container meets the applicable requirements specified in 49 CFR part 178—Specifications for Packaging or 49 CFR part 179—Specifications for Tank Cars.

(2) Hazardous waste is managed in the container in accordance with the applicable requirements specified in 49 CFR part 107, subpart B—Exemptions; 49 CFR part 172—Hazardous Materials Table, Special Provisions, Hazardous Materials Communications, Emergency Response Information, and Training Requirements; 49 CFR part 173—Shippers—General Requirements for Shipments and Packages; and 49 CFR part 180—Continuing Qualification and Maintenance of Packagings.

(3) For the purpose of complying with this subpart, no exceptions to the 49 CFR part 178 or part 179 regulations are allowed except as provided for in paragraph (f)(4) of this section.

(4) For a lab pack that is managed in accordance with the requirements of 49 CFR part 178 for the purpose of complying with this subpart, an owner or operator may comply with the exceptions for combination packagings specified in 49 CFR 173.12(b).

(g) The owner or operator shall use the procedure specified in § 264.1083(d) of this subpart for determining a container operates with no detectable organic emissions for the purpose of complying with paragraph (d)(1)(ii) of this section.

(1) Each potential leak interface (i.e., a location where organic vapor leakage could occur) on the container, its cover, and associated closure devices, as applicable to the container, shall be checked. Potential leak interfaces that are associated with containers include, but are not limited to: The interface of the cover rim and the container wall; the periphery of any opening on the container or container cover and its associated closure device; and the sealing seat interface on a spring-loaded pressure-relief valve.

(2) The test shall be performed when the container is filled with a material having a volatile organic concentration representative of the range of volatile organic concentrations for the hazardous wastes expected to be managed in this type of container. During the test, the container cover and closure devices shall be secured in the closed position.

(h) Procedure for determining a container to be vapor-tight using Method 27 of 40 CFR part 60, appendix A for the purpose of complying with paragraph (d)(1)(iii) of this section.

(1) The test shall be performed in accordance with Method 27 of 40 CFR part 60, appendix A of this chapter.

(2) A pressure measurement device shall be used that has a precision of ± 2.5 mm water and that is capable of measuring above the pressure at which the container is to be tested for vapor tightness.

(3) If the test results determined by Method 27 indicate that the container sustains a pressure change less than or equal to 750 Pascals within 5 minutes after it is pressurized to a minimum of 4,500 Pascals, then the container is determined to be vapor-tight.

21. Section 264.1087 is amended by revising paragraph (b)(3), adding paragraph (b)(4), revising paragraphs (c)(2), (c)(3)(ii), and (c)(5)(i) (D)–(E), and adding paragraph (c)(7) to read as follows:

§ 264.1087 Standards: Closed-vent systems and control devices.

* * * * *

(b) * * *

(3) In the case when the closed-vent system includes bypass devices that could be used to divert the gas or vapor stream to the atmosphere before entering the control device, each bypass device shall be equipped with either a flow indicator as specified in paragraph (b)(3)(i) of this section or a seal or locking device as specified in paragraph (b)(3)(ii) of this section. For the purpose of complying with this paragraph, low leg drains, high point bleeds, analyzer vents, open-ended valves or lines, spring loaded pressure relief valves, and other fittings used for safety purposes are not considered to be bypass devices.

(i) If a flow indicator is used to comply with paragraph (b)(3) of this section, the indicator shall be installed at the inlet to the bypass line used to divert gases and vapors from the closed-vent system to the atmosphere at a point upstream of the control device inlet. For this paragraph, a flow indicator means a device which indicates the presence of either gas or vapor flow in the bypass line.

(ii) If a seal or locking device is used to comply with paragraph (b)(3) of this section, the device shall be placed on the mechanism by which the bypass device position is controlled (e.g., valve handle, damper lever) when the bypass device is in the closed position such that the bypass device cannot be opened without breaking the seal or removing the lock. Examples of such devices include, but are not limited to, a car-seal or a lock-and-key configuration valve. The owner or operator shall visually inspect the seal or closure mechanism at least once every month to verify that the bypass mechanism is maintained in the closed position.

(4) The closed-vent system shall be inspected and monitored by the owner or operator in accordance with the procedure specified in § 264.1033(l).

(c) * * *

(2) The owner or operator who elects to use a closed-vent system and control device to comply with the requirements of this section shall comply with the requirements specified in paragraphs (c)(2)(i) through (c)(2)(vi) of this section.

(i) Periods of planned routine maintenance of the control device, during which the control device does not meet the specifications of paragraphs (c)(1)(i), (c)(1)(ii), or (c)(1)(iii) of this section, as applicable, shall not exceed 240 hours per year.

(ii) The specifications and requirements in paragraphs (c)(1)(i), (c)(1)(ii), and (c)(1)(iii) of this section for control devices do not apply during periods of planned routine maintenance.

(iii) The specifications and requirements in paragraphs (c)(1)(i), (c)(1)(ii), and (c)(1)(iii) of this section for control devices do not apply during a control device system malfunction.

(iv) The owner or operator shall demonstrate compliance with the requirements of paragraph (c)(2)(i) of this section (i.e., planned routine maintenance of a control device, during which the control device does not meet the specifications of paragraphs (c)(1)(i), (c)(1)(ii), or (c)(1)(iii) of this section, as applicable, shall not exceed 240 hours per year) by recording the information specified in § 264.1089(e)(1)(v) of this subpart.

(v) The owner or operator shall correct control device system malfunctions as soon as practicable after their occurrence in order to minimize excess emissions of air pollutants.

(vi) The owner or operator shall operate the closed-vent system such that gases, vapors, or fumes are not actively vented to the control device during periods of planned maintenance or control device system malfunction (i.e., periods when the control device is not operating or not operating normally) except in cases when it is necessary to vent the gases, vapors, and/or fumes to avoid an unsafe condition or to implement malfunction corrective actions or planned maintenance actions.

(3) * * *

(i) * * *

(ii) All carbon removed from the control device shall be managed in accordance with the requirements of 40 CFR 264.1033(n).

* * * * *

(5) * * *

(i) * * *

(D) A boiler or industrial furnace burning hazardous waste for which the owner or operator has been issued a final permit under 40 CFR part 270 and has designed and operates the unit in accordance with the requirements of 40 CFR part 266, subpart H; or

(E) A boiler or industrial furnace burning hazardous waste for which the owner or operator has designed and operates in accordance with the interim status requirements of 40 CFR part 266, subpart H.

* * * * *

(7) The control device shall be inspected and monitored by the owner or operator in accordance with the procedures specified in 40 CFR 264.1033(f)(2) and 40 CFR 264.1033(l). The readings from each monitoring device required by 40 CFR 264.1033(f)(2) shall be inspected at least once each operating day to check control device operation. Any necessary corrective measures shall be immediately implemented to ensure the control device is operated in compliance with the requirements of this section.

22. Section 264.1088 is revised to read as follows:

§ 264.1088 Inspection and monitoring requirements.

(a) The owner or operator shall inspect and monitor air emission control equipment used to comply with this subpart in accordance with the applicable requirements specified in § 264.1084 through § 264.1087 of this subpart.

(b) The owner or operator shall develop and implement a written plan and schedule to perform the inspections and monitoring required by paragraph (a) of this section. The owner or operator shall incorporate this plan and schedule into the facility inspection plan required under 40 CFR 264.15.

23. Section 264.1089 is revised to read as follows:

§ 264.1089 Recordkeeping requirements.

(a) Each owner or operator of a facility subject to requirements in this subpart shall record and maintain the information specified in paragraphs (b) through (i) of this section, as applicable to the facility. Except for air emission control equipment design documentation and information required by paragraph (i) of this section, records required by this section shall be maintained in the operating record for a minimum of 3 years. Air emission control equipment design documentation shall be maintained in the operating record until the air emission control equipment is replaced or otherwise no longer in service. Information required by paragraph (i) of this section shall be maintained in the operating record for as long as the tank or container is not using air emission controls specified in §§ 264.1084 through 264.1087 of this subpart in accordance with the conditions specified in § 264.1084(d) of this subpart.

(b) The owner or operator of a tank using air emission controls in accordance with the requirements of § 264.1084 of this subpart shall prepare and maintain records for the tank that include the following information:

(1) For each tank using air emission controls in accordance with the requirements of § 264.1084 of this subpart, the owner or operator shall record:

(i) A tank identification number (or other unique identification description as selected by the owner or operator).

(ii) A record for each inspection required by § 264.1084 of this subpart that includes the following information:

(A) Date inspection was conducted.

(B) For each defect detected during the inspection, the following information: The location of the defect, a description of the defect, the date of detection, and corrective action taken to repair the defect. In the event that repair of the defect is delayed in accordance with the provisions of § 264.1084 of this subpart, the owner or operator shall also record the reason for the delay and the date that completion of repair of the defect is expected.

(2) In addition to the information required by paragraph (b)(1) of this section, the owner or operator shall record the following information, as applicable to the tank:

(i) The owner or operator using a fixed roof to comply with the Tank Level 1 control requirements specified in § 264.1084(c) of this subpart shall prepare and maintain records for each determination for the maximum organic vapor pressure of the hazardous waste in the tank performed in accordance with the requirements of § 264.1084(c) of this subpart. The records shall include the date and time the samples were collected, the analysis method used, and the analysis results.

(ii) The owner or operator using an internal floating roof to comply with the Tank Level 2 control requirements specified in § 264.1084(e) of this subpart shall prepare and maintain documentation describing the floating roof design.

(iii) Owners and operators using an external floating roof to comply with the Tank Level 2 control requirements specified in § 264.1084(f) of this subpart shall prepare and maintain the following records:

(A) Documentation describing the floating roof design and the dimensions of the tank.

(B) Records for each seal gap inspection required by § 264.1084(f)(3) of this subpart describing the results of the seal gap measurements. The records shall include the date that the measurements were performed, the raw data obtained for the measurements, and the calculations of the total gap surface area. In the event that the seal gap measurements do not conform to the specifications in § 264.1084(f)(1) of this subpart, the records shall include a description of the repairs that were made, the date the repairs were made, and the date the tank was emptied, if necessary.

(iv) Each owner or operator using an enclosure to comply with the Tank Level 2 control requirements specified in § 264.1084(i) of this subpart shall prepare and maintain the following records:

(A) Records for the most recent set of calculations and measurements performed by the owner or operator to verify that the enclosure meets the criteria of a permanent total enclosure as specified in ''Procedure T—Criteria for and Verification of a Permanent or Temporary Total Enclosure'' under 40 CFR 52.741, appendix B.

(B) Records required for the closed-vent system and control device in accordance with the requirements of paragraph (e) of this section.

(c) The owner or operator of a surface impoundment using air emission controls in accordance with the requirements of § 264.1085 of this subpart shall prepare and maintain records for the surface impoundment that include the following information:

(1) A surface impoundment identification number (or other unique identification description as selected by the owner or operator).

(2) Documentation describing the floating membrane cover or cover design, as applicable to the surface impoundment, that includes information prepared by the owner or operator or provided by the cover manufacturer or vendor describing the cover design, and certification by the owner or operator that the cover meets the specifications listed in § 264.1085(c) of this subpart.

(3) A record for each inspection required by § 264.1085 of this subpart that includes the following information:

(i) Date inspection was conducted.

(ii) For each defect detected during the inspection the following information: The location of the defect, a description of the defect, the date of detection, and corrective action taken to repair the defect. In the event that repair of the defect is delayed in accordance with the provisions of § 264.1085(f) of this subpart, the owner or operator shall also record the reason for the delay and the date that completion of repair of the defect is expected.

(4) For a surface impoundment equipped with a cover and vented through a closed-vent system to a control device, the owner or operator shall prepare and maintain the records specified in paragraph (e) of this section.

(d) The owner or operator of containers using Container Level 3 air emission controls in accordance with the requirements of § 264.1086 of this subpart shall prepare and maintain records that include the following information:

(1) Records for the most recent set of calculations and measurements performed by the owner or operator to verify that the enclosure meets the criteria of a permanent total enclosure as specified in ''Procedure T—Criteria for and Verification of a Permanent or Temporary Total Enclosure'' under 40 CFR 52.741, appendix B.

(2) Records required for the closed-vent system and control device in accordance with the requirements of paragraph (e) of this section.

(e) The owner or operator using a closed-vent system and control device in accordance with the requirements of § 264.1087 of this subpart shall prepare and maintain records that include the following information:

(1) Documentation for the closed-vent system and control device that includes:

(i) Certification that is signed and dated by the owner or operator stating that the control device is designed to operate at the performance level documented by a design analysis as specified in paragraph (e)(1)(ii) of this section or by performance tests as specified in paragraph (e)(1)(iii) of this section when the tank, surface impoundment, or container is or would be operating at capacity or the highest level reasonably expected to occur.

(ii) If a design analysis is used, then design documentation as specified in 40 CFR 264.1035(b)(4). The documentation shall include information prepared by the owner or operator or provided by the control device manufacturer or vendor that describes the control device design in accordance with 40 CFR 264.1035(b)(4)(iii) and certification by the owner or operator that the control equipment meets the applicable specifications.

(iii) If performance tests are used, then a performance test plan as specified in 40 CFR 264.1035(b)(3) and all test results.

(iv) Information as required by 40 CFR 264.1035(c)(1) and 40 CFR 264.1035(c)(2), as applicable.

(v) An owner or operator shall record, on a semiannual basis, the information specified in paragraphs (e)(1)(v)(A) and (e)(1)(v)(B) of this section for those planned routine maintenance operations that would require the control device not to meet the requirements of § 264.1087(c)(1)(i), (c)(1)(ii), or (c)(1)(iii) of this subpart, as applicable.

(A) A description of the planned routine maintenance that is anticipated to be performed for the control device during the next 6-month period. This description shall include the type of maintenance necessary, planned frequency of maintenance, and lengths of maintenance periods.

(B) A description of the planned routine maintenance that was performed for the control device during the previous 6-month period. This description shall include the type of maintenance performed and the total number of hours during those 6 months that the control device did not meet the requirements of § 264.1087 (c)(1)(i), (c)(1)(ii), or (c)(1)(iii) of this subpart, as applicable, due to planned routine maintenance.

(vi) An owner or operator shall record the information specified in paragraphs (e)(1)(vi)(A) through (e)(1)(vi)(C) of this section for those unexpected control device system malfunctions that would require the control device not to meet the requirements of § 264.1087 (c)(1)(i), (c)(1)(ii), or (c)(1)(iii) of this subpart, as applicable.

(A) The occurrence and duration of each malfunction of the control device system.

(B) The duration of each period during a malfunction when gases, vapors, or fumes are vented from the waste management unit through the closed-vent system to the control device while the control device is not properly functioning.

(C) Actions taken during periods of malfunction to restore a malfunctioning control device to its normal or usual manner of operation.

(vii) Records of the management of carbon removed from a carbon adsorption system conducted in accordance with § 264.1087(c)(3)(ii) of this subpart.

(f) The owner or operator of a tank, surface impoundment, or container exempted from standards in accordance with the provisions of § 264.1082(c) of this subpart shall prepare and maintain the following records, as applicable:

(1) For tanks, surface impoundments, or containers exempted under the hazardous waste organic concentration conditions specified in § 264.1082 (c)(1) or (c)(2) of this subpart, the owner or operator shall record the information used for each waste determination (e.g., test results, measurements, calculations, and other documentation) in the facility operating log. If analysis results for waste samples are used for the waste determination, then the owner or operator shall record the date, time, and location that each waste sample is collected in accordance with applicable requirements of § 264.1083 of this subpart.

(2) For tanks, surface impoundments, or containers exempted under the provisions of § 264.1082(c)(2)(vii) or § 264.1082(c)(2)(viii) of this subpart, the owner or operator shall record the identification number for the incinerator, boiler, or industrial furnace in which the hazardous waste is treated.

(g) An owner or operator designating a cover as ''unsafe to inspect and monitor'' pursuant to § 264.1084(l) or § 264.1085(g) of this subpart shall record in a log that is kept in the facility operating record the following information: The identification numbers for waste management units with covers that are designated as ''unsafe to inspect and monitor,'' the explanation for each cover stating why the cover is unsafe to inspect and monitor, and the plan and schedule for inspecting and monitoring each cover.

(h) The owner or operator of a facility that is subject to this subpart and to the control device standards in 40 CFR part 60, subpart VV, or 40 CFR part 61, subpart V, may elect to demonstrate compliance with the applicable sections of this subpart by documentation either pursuant to this subpart, or pursuant to the provisions of 40 CFR part 60, subpart VV or 40 CFR part 61, subpart V, to the extent that the documentation required by 40 CFR parts 60 or 61 duplicates the documentation required by this section.

(i) For each tank or container not using air emission controls specified in §§ 264.1084 through 264.1087 of this subpart in accordance with the conditions specified in § 264.1080(d) of this subpart, the owner or operator shall record and maintain the following information:

(1) A list of the individual organic peroxide compounds manufactured at the facility that meet the conditions specified in § 264.1080(d)(1).

(2) A description of how the hazardous waste containing the organic peroxide compounds identified in paragraph (i)(1) of this section are managed at the facility in tanks and containers. This description shall include:

(i) For the tanks used at the facility to manage this hazardous waste, sufficient information shall be provided to describe for each tank: A facility identification number for the tank; the purpose and placement of this tank in the management train of this hazardous waste; and the procedures used to ultimately dispose of the hazardous waste managed in the tanks.

(ii) For containers used at the facility to manage these hazardous wastes, sufficient information shall be provided to describe: A facility identification number for the container or group of containers; the purpose and placement of this container, or group of containers, in the management train of this hazardous waste; and the procedures used to ultimately dispose of the hazardous waste handled in the containers.

(3) An explanation of why managing the hazardous waste containing the organic peroxide compounds identified in paragraph (i)(1) of this section in the tanks and containers as described in paragraph (i)(2) of this section would create an undue safety hazard if the air emission controls, as required under §§ 264.1084 through 264.1087 of this subpart, are installed and operated on these waste management units. This explanation shall include the following information:

(i) For tanks used at the facility to manage these hazardous wastes, sufficient information shall be provided to explain: How use of the required air emission controls on the tanks would affect the tank design features and facility operating procedures currently used to prevent an undue safety hazard during the management of this hazardous waste in the tanks; and why installation of safety devices on the required air emission controls, as allowed under this subpart, will not address those situations in which evacuation of tanks equipped with these air emission controls is necessary and consistent with good engineering and safety practices for handling organic peroxides.

(ii) For containers used at the facility to manage these hazardous wastes, sufficient information shall be provided to explain: How use of the required air emission controls on the containers would affect the container design features and handling procedures currently used to prevent an undue safety hazard during the management of this hazardous waste in the containers; and why installation of safety devices on the required air emission controls, as allowed under this subpart, will not address those situations in which evacuation of containers equipped with these air emission controls is necessary and consistent with good engineering and safety practices for handling organic peroxides.

24. Section 264.1090 is amended by revising paragraphs (a) and (b) to read as follows:

§ 264.1090 Reporting requirements.

(a) Each owner or operator managing hazardous waste in a tank, surface impoundment, or container exempted from using air emission controls under the provisions of § 264.1082(c) of this subpart shall report to the Regional Administrator each occurrence when hazardous waste is placed in the waste management unit in noncompliance with the conditions specified in § 264.1082 (c)(1) or (c)(2) of this subpart, as applicable. Examples of such occurrences include placing in the waste management unit a hazardous waste having an average VO concentration equal to or greater than 500 ppmw at the point of waste origination; or placing in the waste management unit a treated hazardous waste of which the organic content has been reduced by an organic destruction or removal process that fails to achieve the applicable conditions specified in § 264.1082 (c)(2)(i) through (c)(2)(vi) of this subpart. The owner or operator shall submit a written report within 15 calendar days of the time that the owner or operator becomes aware of the occurrence. The written report shall contain the EPA identification number, facility name and address, a description of the noncompliance event and the cause, the dates of the noncompliance, and the actions taken to correct the noncompliance and prevent recurrence of the noncompliance. The report shall be signed and dated by an authorized representative of the owner or operator.

(b) Each owner or operator using air emission controls on a tank in accordance with the requirements § 264.1084(c) of this subpart shall report to the Regional Administrator each occurrence when hazardous waste is managed in the tank in noncompliance with the conditions specified in § 264.1084(b) of this subpart. The owner or operator shall submit a written report within 15 calendar days of the time that the owner or operator becomes aware of the occurrence. The written report shall contain the EPA identification number, facility name and address, a description of the noncompliance event and the cause, the dates of the noncompliance, and the actions taken to correct the noncompliance and prevent recurrence of the noncompliance. The report shall be signed and dated by an authorized representative of the owner or operator.

* * * * *

§ 264.1091 [Removed and reserved]

25. Part 264 is amended by removing and reserving § 264.1091.

PART 265—INTERIM STATUS STANDARDS FOR OWNERS AND OPERATORS OF HAZARDOUS WASTE TREATMENT, STORAGE, AND DISPOSAL FACILITIES

26. The authority citation for part 265 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6924, 6925, and 6935.

Subpart I—Use and Management of Containers

27. Section 265.178 is revised to read as follows:

§ 265.178 Air emission standards.

The owner or operator shall manage all hazardous waste placed in a container in accordance with the applicable requirements of subparts AA, BB, and CC of this part.

Subpart J—Tank Systems

28. Section 265.202 is revised to read as follows:

§ 265.202 Air emission standards.

The owner or operator shall manage all hazardous waste placed in a tank in accordance with the applicable requirements of subparts AA, BB, and CC of this part.

Subpart K—Surface Impoundments

29. Section 265.231 is revised to read as follows:

§ 265.231 Air emission standards.

The owner or operator shall manage all hazardous waste placed in a surface impoundment in accordance with the applicable requirements of subparts BB and CC of this part.

Subpart AA—Air Emission Standards for Process Vents

30. Section 265.1030 is amended by revising paragraph (b); and by removing the reference ''262.34'' from the note at the end of the section to read as follows:

§ 265.1030 Applicability.

* * * * *

(b) Except for §§ 265.1034, paragraphs (d) and (e), this subpart applies to

process vents associated with distillation, fractionation, thin-film evaporation, solvent extraction, or air or steam stripping operations that manage hazardous wastes with organic concentrations of at least 10 ppmw, if these operations are conducted in one of the following:

(1) A unit that is subject to the permitting requirements of 40 CFR part 270, or

(2) A unit (including a hazardous waste recycling unit) that is not exempt from permitting under the provisions of 40 CFR 262.34(a) (i.e., a hazardous waste recycling unit that is not a 90-day tank or container) and that is located at a hazardous waste management facility otherwise subject to the permitting requirements of 40 CFR part 270, or

(3) A unit that is exempt from permitting under the provisions of 40 CFR 262.34(a) (i.e., a 90-day tank or container).

* * * * *

31. Section 265.1033 is amended by revising paragraph (f)(2)(vi)(B); redesignating paragraphs (k) and (l) as paragraphs (l) and (m) and revising the newly designated paragraph (m); by revising paragraph (j); and by adding paragraphs (k) and (n) to read as follows:

§ 265.1033 Standards: Closed-vent systems and control devices.

* * * * *

(f) * * *

(2) * * *

(vi) * * *

(B) A temperature monitoring device equipped with a continuous recorder. The device shall be capable of monitoring temperature with an accuracy of ± 1 percent of the temperature being monitored in degrees Celsius (oC) or ± 0.5 oC, whichever is greater. The temperature sensor shall be installed at a location in the exhaust vent stream from the condenser exit (i.e., product side).

* * * * *

(j) A closed-vent system shall meet either of the following design requirements:

(1) A closed-vent system shall be designed to operate with no detectable emissions, as indicated by an instrument reading of less than 500 ppmv above background as determined by the procedure in § 265.1034(b) of this subpart, and by visual inspections; or

(2) A closed-vent system shall be designed to operate at a pressure below atmospheric pressure. The system shall be equipped with at least one pressure gauge or other pressure measurement device that can be read from a readily accessible location to verify that negative pressure is being maintained in the closed-vent system when the control device is operating.

(k) The owner or operator shall monitor and inspect each closed-vent system required to comply with this section to ensure proper operation and maintenance of the closed-vent system by implementing the following requirements:

(1) Each closed-vent system that is used to comply with paragraph (j)(1) of this section shall be inspected and monitored in accordance with the following requirements:

(i) An initial leak detection monitoring of the closed-vent system shall be conducted by the owner or operator on or before the date that the system becomes subject to this section. The owner or operator shall monitor the closed-vent system components and connections using the procedures specified in § 265.1034(b) of this subpart to demonstrate that the closed-vent system operates with no detectable emissions, as indicated by an instrument reading of less than 500 ppmv above background.

(ii) After initial leak detection monitoring required in paragraph (k)(1)(i) of this section, the owner or operator shall inspect and monitor the closed-vent system as follows:

(A) Closed-vent system joints, seams, or other connections that are permanently or semi-permanently sealed (e.g., a welded joint between two sections of hard piping or a bolted and gasketed ducting flange) shall be visually inspected at least once per year to check for defects that could result in air pollutant emissions. The owner or operator shall monitor a component or connection using the procedures specified in § 265.1034(b) of this subpart to demonstrate that it operates with no detectable emissions following any time the component is repaired or replaced (e.g., a section of damaged hard piping is replaced with new hard piping) or the connection is unsealed (e.g., a flange is unbolted).

(B) Closed-vent system components or connections other than those specified in paragraph (k)(1)(ii)(A) of this section shall be monitored annually and at other times as requested by the Regional Administrator, except as provided for in paragraph (n) of this section, using the procedures specified in § 265.1034(b) of this subpart to demonstrate that the components or connections operate with no detectable emissions.

(iii) In the event that a defect or leak is detected, the owner or operator shall repair the defect or leak in accordance with the requirements of paragraph (k)(3) of this section.

(iv) The owner or operator shall maintain a record of the inspection and monitoring in accordance with the requirements specified in § 265.1035 of this subpart.

(2) Each closed-vent system that is used to comply with paragraph (j)(2) of this section shall be inspected and monitored in accordance with the following requirements:

(i) The closed-vent system shall be visually inspected by the owner or operator to check for defects that could result in air pollutant emissions. Defects include, but are not limited to, visible cracks, holes, or gaps in ductwork or piping or loose connections.

(ii) The owner or operator shall perform an initial inspection of the closed-vent system on or before the date that the system becomes subject to this section. Thereafter, the owner or operator shall perform the inspections at least once every year.

(iii) In the event that a defect or leak is detected, the owner or operator shall repair the defect in accordance with the requirements of paragraph (k)(3) of this section.

(iv) The owner or operator shall maintain a record of the inspection and monitoring in accordance with the requirements specified in § 265.1035 of this subpart.

(3) The owner or operator shall repair all detected defects as follows:

(i) Detectable emissions, as indicated by visual inspection, or by an instrument reading greater than 500 ppmv above background, shall be controlled as soon as practicable, but not later than 15 calendar days after the emission is detected, except as provided for in paragraph (k)(3)(iii) of this section.

(ii) A first attempt at repair shall be made no later than 5 calendar days after the emission is detected.

(iii) Delay of repair of a closed-vent system for which leaks have been detected is allowed if the repair is technically infeasible without a process unit shutdown, or if the owner or operator determines that emissions resulting from immediate repair would be greater than the fugitive emissions likely to result from delay of repair. Repair of such equipment shall be completed by the end of the next process unit shutdown.

(iv) The owner or operator shall maintain a record of the defect repair in accordance with the requirements specified in § 265.1035 of this subpart.

(l) Closed-vent systems and control devices used to comply with provisions of this subpart shall be operated at all times when emissions may be vented to them.

(m) The owner or operator using a carbon adsorption system to control air pollutant emissions shall document that all carbon that is a hazardous waste and that is removed from the control device is managed in one of the following manners, regardless of the average volatile organic concentration of the carbon:

(1) Regenerated or reactivated in a thermal treatment unit that meets one of the following:

(i) The owner or operator of the unit has been issued a final permit under 40 CFR part 270 which implements the requirements of 40 CFR part 264 subpart X; or

(ii) The unit is equipped with and operating air emission controls in accordance with the applicable requirements of subparts AA and CC of either this part or of 40 CFR part 264; or

(iii) The unit is equipped with and operating air emission controls in accordance with a national emission standard for hazardous air pollutants under 40 CFR part 61 or 40 CFR part 63.

(2) Incinerated in a hazardous waste incinerator for which the owner or operator either:

(i) Has been issued a final permit under 40 CFR part 270 which implements the requirements of 40 CFR part 264, subpart O; or

(ii) Has designed and operates the incinerator in accordance with the interim status requirements of subpart O of this part.

(3) Burned in a boiler or industrial furnace for which the owner or operator either:

(i) Has been issued a final permit under 40 CFR part 270 which implements the requirements of 40 CFR part 266, subpart H; or

(ii) Has designed and operates the boiler or industrial furnace in accordance with the interim status requirements of 40 CFR part 266, subpart H.

(n) Any components of a closed-vent system that are designated, as described in § 265.1035(c)(9) of this subpart, as unsafe to monitor are exempt from the requirements of paragraph (k)(1)(ii)(B) of this section if:

(1) The owner or operator of the closed-vent system determines that the components of the closed-vent system are unsafe to monitor because monitoring personnel would be exposed to an immediate danger as a consequence of complying with paragraph (k)(1)(ii)(B) of this section; and

(2) The owner or operator of the closed-vent system adheres to a written plan that requires monitoring the closed-vent system components using the procedure specified in paragraph (k)(1)(ii)(B) of this section as frequently as practicable during safe-to-monitor times.

32. Section 265.1034 is amended by revising paragraph (b) introductory text to read as follows:

§ 265.1034 Test methods and procedures.

* * * * *

(b) When a closed-vent system is tested for compliance with no detectable emissions, as required in § 265.1033(k) of this subpart, the test shall comply with the following requirements:

* * * * *

33. Section 265.1035 is amended by revising paragraph (c)(3), adding paragraphs (c)(9) and (c)(10) and revising paragraph (d) to read as follows:

§ 265.1035 Recordkeeping requirements.

* * * * *

(c) * * *

(3) Monitoring, operating and inspection information required by paragraphs (f) through (k) of § 265.1033 of this subpart.

* * * * *

(9) An owner or operator designating any components of a closed-vent system as unsafe to monitor pursuant to § 265.1033(n) of this subpart shall record in a log that is kept in the facility operating record the identification of closed-vent system components that are designated as unsafe to monitor in accordance with the requirements of § 265.1033(n) of this subpart, an explanation for each closed-vent system component stating why the closed-vent system component is unsafe to monitor, and the plan for monitoring each closed-vent system component.

(10) When each leak is detected as specified in § 265.1033(k) of this subpart, the following information shall be recorded:

(i) The instrument identification number, the closed-vent system component identification number, and the operator name, initials, or identification number.

(ii) The date the leak was detected and the date of first attempt to repair the leak.

(iii) The date of successful repair of the leak.

(iv) Maximum instrument reading measured by Method 21 of 40 CFR part 60, appendix A after it is successfully repaired or determined to be nonrepairable.

(v) ''Repair delayed'' and the reason for the delay if a leak is not repaired within 15 calendar days after discovery of the leak.

(A) The owner or operator may develop a written procedure that identifies the conditions that justify a delay of repair. In such cases, reasons for delay of repair may be documented by citing the relevant sections of the written procedure.

(B) If delay of repair was caused by depletion of stocked parts, there must be documentation that the spare parts were sufficiently stocked on-site before depletion and the reason for depletion.

(d) Records of the monitoring, operating, and inspection information required by paragraphs (c)(3) through (c)(10) of this section shall be maintained by the owner or operator for at least 3 years following the date of each occurrence, measurement, maintenance, corrective action, or record.

* * * * *

Subpart BB—Air Emission Standards for Equipment Leaks

34. Section 265.1050 is amended by revising paragraph (b), adding paragraph (e) and removing the reference ''262.34'' from the note at the end of the section to read as follows:

§ 265.1050 Applicability.

* * * * *

(b) Except as provided in § 265.1064(k), this subpart applies to equipment that contains or contacts hazardous wastes with organic concentrations of at least 10 percent by weight that are managed in one of the following:

(1) A unit that is subject to the permitting requirements of 40 CFR part 270, or

(2) A unit (including a hazardous waste recycling unit) that is not exempt from permitting under the provisions of 40 CFR 262.34(a) (i.e., a hazardous waste recycling unit that is not a 90-day tank or container) and that is located at a hazardous waste management facility otherwise subject to the permitting requirements of 40 CFR part 270, or

(3) A unit that is exempt from permitting under the provisions of 40 CFR 262.34(a) (i.e., a 90-day tank or container).

* * * * *

(e) Equipment that contains or contacts hazardous waste with an organic concentration of at least 10 percent by weight for a period of less than 300 hours per calendar year is excluded from the requirements of § 265.1052 through § 265.1060 of this subpart if it is identified as required in § 265.1064(g)(6) of this subpart.

35. Section 265.1055 is revised to read as follows:

§ 265.1055 Standards: Sampling connection systems.

(a) Each sampling connection system shall be equipped with a closed-purge, closed-loop, or closed-vent system. This system shall collect the sample purge for return to the process or for routing to the appropriate treatment system. Gases displaced during filling of the sample container are not required to be collected or captured.

(b) Each closed-purge, closed-loop, or closed-vent system as required in paragraph (a) of this section shall:

(1) Return the purged process fluid directly to the process line; or

(2) Collect and recycle the purged process fluid; or

(3) Be designed and operated to capture and transport all the purged process fluid to a waste management unit that complies with the applicable requirements of § 265.1085 through § 265.1087 of this subpart or a control device that complies with the requirements of § 265.1060 of this subpart.

(c) *In-situ* sampling systems and sampling systems without purges are exempt from the requirements of paragraphs (a) and (b) of this section.

36. Section 265.1058 is amended by adding paragraph (e) to read as follows:

§ 265.1058 Standards: Pumps and valves in heavy liquid service, pressure relief devices in light liquid or heavy liquid service, and flanges and other connectors.

* * * * *

(e) Any connector that is inaccessible or is ceramic or ceramic-lined (e.g., porcelain, glass, or glass-lined) is exempt from the monitoring requirements of paragraph (a) of this section and from the recordkeeping requirements of § 265.1064 of this subpart.

37. Section 265.1064 is amended by adding paragraph (g)(6) to read as follows:

§ 265.1064 Recordkeeping requirements.

* * * * *

(g) * * *

(6) Identification, either by list or location (area or group) of equipment that contains or contacts hazardous waste with an organic concentration of at least 10 percent by weight for a period of less than 300 hours per year.

* * * * *

Subpart CC—Air Emission Standards for Tanks, Surface Impoundments, and Containers

38. Section 265.1080 is amended by adding paragraphs (b)(7) and (b)(8) to read as follows:

§ 265.1080 Applicability.

* * * * *

(b) * * *

(7) A hazardous waste management unit that the owner or operator certifies is equipped with and operating air emission controls in accordance with the requirements of an applicable Clean Air Act regulation codified under 40 CFR part 60, part 61, or part 63. For the purpose of complying with this paragraph, a tank for which the air emission control includes an enclosure, as opposed to a cover, must be in compliance with the enclosure and control device requirements of § 265.1085(i), except as provided in § 265.1083(c)(5).

(8) A tank that has a process vent as defined in 40 CFR 264.1031.

* * * * *

39. Section 265.1081 is amended by revising the definitions of cover, external floating roof, fixed roof, floating roof, internal floating roof, maximum organic vapor pressure, point of waste treatment, vapor-mounted seal and volatile organic concentration and by adding definitions in alphabetical order to read as follows:

§ 265.1081 Definitions.

* * * * *

Closure device means a cap, hatch, lid, plug, seal, valve, or other type of fitting that blocks an opening in a cover such that when the device is secured in the closed position it prevents or reduces air pollutant emissions to the atmosphere. Closure devices include devices that are detachable from the cover (e.g., a sampling port cap), manually operated (e.g., a hinged access lid or hatch), or automatically operated (e.g., a spring-loaded pressure relief valve).

* * * * *

Continuous seal means a seal that forms a continuous closure that completely covers the space between the edge of the floating roof and the wall of a tank. A continuous seal may be a vapor-mounted seal, liquid-mounted seal, or metallic shoe seal. A continuous seal may be constructed of fastened segments so as to form a continuous seal.

* * * * *

Cover means a device that provides a continuous barrier over the hazardous waste managed in a unit to prevent or reduce air pollutant emissions to the atmosphere. A cover may have openings (such as access hatches, sampling ports, gauge wells) that are necessary for operation, inspection, maintenance, and repair of the unit on which the cover is used. A cover may be a separate piece of equipment which can be detached and removed from the unit or a cover may be formed by structural features permanently integrated into the design of the unit.

* * * * *

Enclosure means a structure that surrounds a tank or container, captures organic vapors emitted from the tank or container, and vents the captured vapors through a closed-vent system to a control device.

* * * * *

External floating roof means a pontoon-type or double-deck type cover that rests on the surface of the material managed in a tank with no fixed roof.

* * * * *

Fixed roof means a cover that is mounted on a unit in a stationary position and does not move with fluctuations in the level of the material managed in the unit.

* * * * *

Floating roof means a cover consisting of a double deck, pontoon single deck, or internal floating cover which rests upon and is supported by the material being contained, and is equipped with a continuous seal.

* * * * *

Hard-piping means pipe or tubing that is manufactured and properly installed in accordance with relevant standards and good engineering practices.

* * * * *

In light material service means the container is used to manage a material for which both of the following conditions apply: the vapor pressure of one or more of the organic constituents in the material is greater than 0.3 kilopascals (kPa) at 20 °C; and the total concentration of the pure organic constituents having a vapor pressure greater than 0.3 kPa at 20 °C is equal to or greater than 20 percent by weight.

* * * * *

Internal floating roof means a cover that rests or floats on the material surface (but not necessarily in complete contact with it) inside a tank that has a fixed roof.

* * * * *

Malfunction means any sudden, infrequent, and not reasonably preventable failure of air pollution control equipment, process equipment, or a process to operate in a normal or usual manner. Failures that are caused in part by poor maintenance or careless operation are not malfunctions.

* * * * *

Maximum organic vapor pressure means the sum of the individual organic constituent partial pressures exerted by the material contained in a tank, at the

maximum vapor pressure-causing conditions (i.e., temperature, agitation, pH effects of combining wastes, etc.) reasonably expected to occur in the tank. For the purpose of this subpart, maximum organic vapor pressure is determined using the procedures specified in § 265.1084(c) of this subpart.

* * * * *

Metallic shoe seal means a continuous seal that is constructed of metal sheets which are held vertically against the wall of the tank by springs, weighted levers, or other mechanisms and is connected to the floating roof by braces or other means. A flexible coated fabric (envelope) spans the annular space between the metal sheet and the floating roof.

* * * * *

No detectable organic emissions means no escape of organics to the atmosphere as determined using the procedure specified in § 265.1084(d) of this subpart.

* * * * *

Point of waste treatment means the point where a hazardous waste to be treated in accordance with § 265.1083(c)(2) of this subpart exits the treatment process. Any waste determination shall be made before the waste is conveyed, handled, or otherwise managed in a manner that allows the waste to volatilize to the atmosphere.

* * * * *

Safety device means a closure device such as a pressure relief valve, frangible disc, fusible plug, or any other type of device which functions exclusively to prevent physical damage or permanent deformation to a unit or its air emission control equipment by venting gases or vapors directly to the atmosphere during unsafe conditions resulting from an unplanned, accidental, or emergency event. For the purpose of this subpart, a safety device is not used for routine venting of gases or vapors from the vapor headspace underneath a cover such as during filling of the unit or to adjust the pressure in this vapor headspace in response to normal daily diurnal ambient temperature fluctuations. A safety device is designed to remain in a closed position during normal operations and open only when the internal pressure, or another relevant parameter, exceeds the device threshold setting applicable to the air emission control equipment as determined by the owner or operator based on manufacturer recommendations, applicable regulations, fire protection and prevention codes, standard engineering codes and practices, or other requirements for the safe handling of flammable, ignitable, explosive, reactive, or hazardous materials.

* * * * *

Single-seal system means a floating roof having one continuous seal. This seal may be vapor-mounted, liquid-mounted, or a metallic shoe seal.

* * * * *

Vapor-mounted seal means a continuous seal that is mounted such that there is a vapor space between the hazardous waste in the unit and the bottom of the seal.

* * * * *

Volatile organic concentration or *VO concentration* means the fraction by weight of the volatile organic compounds contained in a hazardous waste expressed in terms of parts per million (ppmw) as determined by direct measurement or by knowledge of the waste in accordance with the requirements of § 265.1084 of this subpart. For the purpose of determining the VO concentration of a hazardous waste, organic compounds with a Henry's law constant value of at least 0.1 mole-fraction-in-the-gas-phase/mole-fraction-in the liquid-phase (0.1 Y/X) (which can also be expressed as 1.8×10^{-6} atmospheres/gram-mole/m^3) at 25 degrees Celsius must be included. Appendix VI of this subpart presents a list of compounds known to have a Henry's law constant value less than the cutoff level.

* * * * *

40. Section 265.1083 is revised to read as follows:

§ 265.1083 Standards: General.

(a) This section applies to the management of hazardous waste in tanks, surface impoundments, and containers subject to this subpart.

(b) The owner or operator shall control air pollutant emissions from each waste management unit in accordance with standards specified in § 265.1085 through § 265.1088 of this subpart, as applicable to the waste management unit, except as provided for in paragraph (c) of this section.

(c) A tank, surface impoundment, or container is exempt from standards specified in § 265.1085 through § 265.1088 of this subpart, as applicable, provided that the waste management unit is one of the following:

(1) A tank, surface impoundment, or container for which all hazardous waste entering the unit has an average VO concentration at the point of waste origination of less than 500 parts per million by weight (ppmw). The average VO concentration shall be determined using the procedures specified in § 265.1084(a) of this subpart. The owner or operator shall review and update, as necessary, this determination at least once every 12 months following the date of the initial determination for the hazardous waste streams entering the unit.

(2) A tank, surface impoundment, or container for which the organic content of all the hazardous waste entering the waste management unit has been reduced by an organic destruction or removal process that achieves any one of the following conditions:

(i) A process that removes or destroys the organics contained in the hazardous waste to a level such that the average VO concentration of the hazardous waste at the point of waste treatment is less than the exit concentration limit (C^t) established for the process. The average VO concentration of the hazardous waste at the point of waste treatment and the exit concentration limit for the process shall be determined using the procedures specified in § 265.1084(b) of this subpart.

(ii) A process that removes or destroys the organics contained in the hazardous waste to a level such that the organic reduction efficiency (R) for the process is equal to or greater than 95 percent, and the average VO concentration of the hazardous waste at the point of waste treatment is less than 100 ppmw. The organic reduction efficiency for the process and the average VO concentration of the hazardous waste at the point of waste treatment shall be determined using the procedures specified in § 265.1084(b) of this subpart.

(iii) A process that removes or destroys the organics contained in the hazardous waste to a level such that the actual organic mass removal rate (MR) for the process is equal to or greater than the required organic mass removal rate (RMR) established for the process. The required organic mass removal rate and the actual organic mass removal rate for the process shall be determined using the procedures specified in § 265.1084(b) of this subpart.

(iv) A biological process that destroys or degrades the organics contained in the hazardous waste, such that either of the following conditions is met:

(A) The organic reduction efficiency (R) for the process is equal to or greater than 95 percent, and the organic biodegradation efficiency (R_{bio}) for the process is equal to or greater than 95 percent. The organic reduction efficiency and the organic biodegradation efficiency for the process shall be determined using the

procedures specified in § 265.1084(b) of this subpart.

(B) The total actual organic mass biodegradation rate (MR_{bio}) for all hazardous waste treated by the process is equal to or greater than the required organic mass removal rate (RMR). The required organic mass removal rate and the actual organic mass biodegradation rate for the process shall be determined using the procedures specified in § 265.1084(b) of this subpart.

(v) A process that removes or destroys the organics contained in the hazardous waste and meets all of the following conditions:

(A) From the point of waste origination through the point where the hazardous waste enters the treatment process, the hazardous waste is managed continuously in waste management units which use air emission controls in accordance with the standards specified in § 265.1085 through § 265.1088 of this subpart, as applicable to the waste management unit.

(B) From the point of waste origination through the point where the hazardous waste enters the treatment process, any transfer of the hazardous waste is accomplished through continuous hard-piping or other closed system transfer that does not allow exposure of the waste to the atmosphere. The EPA considers a drain system that meets the requirements of 40 CFR part 63, subpart RR—National Emission Standards for Individual Drain Systems to be a closed system.

(C) The average VO concentration of the hazardous waste at the point of waste treatment is less than the lowest average VO concentration at the point of waste origination determined for each of the individual waste streams entering the process or 500 ppmw, whichever value is lower. The average VO concentration of each individual waste stream at the point of waste origination shall be determined using the procedures specified in § 265.1084(a) of this subpart. The average VO concentration of the hazardous waste at the point of waste treatment shall be determined using the procedures specified in § 265.1084(b) of this subpart.

(vi) A process that removes or destroys the organics contained in the hazardous waste to a level such that the organic reduction efficiency (R) for the process is equal to or greater than 95 percent and the owner or operator certifies that the average VO concentration at the point of waste origination for each of the individual waste streams entering the process is less than 10,000 ppmw. The organic reduction efficiency for the process and the average VO concentration of the hazardous waste at the point of waste origination shall be determined using the procedures specified in § 265.1084(b) and § 265.1084(a) of this subpart, respectively.

(vii) A hazardous waste incinerator for which the owner or operator has either:

(A) Been issued a final permit under 40 CFR part 270 which implements the requirements of 40 CFR part 264, subpart O; or

(B) Has designed and operates the incinerator in accordance with the interim status requirements of subpart O of this part.

(viii) A boiler or industrial furnace for which the owner or operator has either:

(A) Been issued a final permit under 40 CFR part 270 which implements the requirements of 40 CFR part 266, subpart H, or

(B) Has designed and operates the boiler or industrial furnace in accordance with the interim status requirements of 40 CFR part 266, subpart H.

(ix) For the purpose of determining the performance of an organic destruction or removal process in accordance with the conditions in each of paragraphs (c)(2)(i) through (c)(2)(vi) of this section, the owner or operator shall account for VO concentrations determined to be below the limit of detection of the analytical method by using the following VO concentration:

(A) If Method 25D in 40 CFR part 60, appendix A is used for the analysis, one-half the blank value determined in the method.

(B) If any other analytical method is used, one-half the limit of detection established for the method.

(3) A tank used for biological treatment of hazardous waste in accordance with the requirements of paragraph (c)(2)(iv) of this section.

(4) A tank, surface impoundment, or container for which all hazardous waste placed in the unit either:

(i) Meets the numerical concentration limits for organic hazardous constituents, applicable to the hazardous waste, as specified in 40 CFR part 268—Land Disposal Restrictions under Table ''Treatment Standards for Hazardous Waste'' in 40 CFR 268.40; or

(ii) Has been treated by the treatment technology established by EPA for the waste in 40 CFR 268.42(a), or treated by an equivalent method of treatment approved by EPA pursuant to 40 CFR 268.42(b).

(5) A tank used for bulk feed of hazardous waste to a waste incinerator and all of the following conditions are met:

(i) The tank is located inside an enclosure vented to a control device that is designed and operated in accordance with all applicable requirements specified under 40 CFR part 61, subpart FF—National Emission Standards for Benzene Waste Operations for a facility at which the total annual benzene quantity from the facility waste is equal to or greater than 10 megagrams per year;

(ii) The enclosure and control device serving the tank were installed and began operation prior to November 25, 1996; and

(iii) The enclosure is designed and operated in accordance with the criteria for a permanent total enclosure as specified in ''Procedure T—Criteria for and Verification of a Permanent or Temporary Total Enclosure'' under 40 CFR 52.741, Appendix B. The enclosure may have permanent or temporary openings to allow worker access; passage of material into or out of the enclosure by conveyor, vehicles, or other mechanical or electrical equipment; or to direct air flow into the enclosure. The owner or operator shall perform the verification procedure for the enclosure as specified in Section 5.0 to ''Procedure T—Criteria for and Verification of a Permanent or Temporary Total Enclosure'' annually.

(d) The Regional Administrator may at any time perform or request that the owner or operator perform a waste determination for a hazardous waste managed in a tank, surface impoundment, or container exempted from using air emission controls under the provisions of this section as follows:

(1) The waste determination for average VO concentration of a hazardous waste at the point of waste origination shall be performed using direct measurement in accordance with the applicable requirements of § 265.1084(a) of this subpart. The waste determination for a hazardous waste at the point of waste treatment shall be performed in accordance with the applicable requirements of § 265.1084(b) of this subpart.

(2) In performing a waste determination pursuant to paragraph (d)(1) of this section, the sample preparation and analysis shall be conducted as follows:

(i) In accordance with the method used by the owner or operator to perform the waste analysis, except in the case specified in paragraph (d)(2)(ii) of this section.

(ii) If the Regional Administrator determines that the method used by the owner or operator was not appropriate

for the hazardous waste managed in the tank, surface impoundment, or container, then the Regional Administrator may choose an appropriate method.

(3) In a case when the owner or operator is requested to perform the waste determination, the Regional Administrator may elect to have an authorized representative observe the collection of the hazardous waste samples used for the analysis.

(4) In a case when the results of the waste determination performed or requested by the Regional Administrator do not agree with the results of a waste determination performed by the owner or operator using knowledge of the waste, then the results of the waste determination performed in accordance with the requirements of paragraph (d)(1) of this section shall be used to establish compliance with the requirements of this subpart.

(5) In a case when the owner or operator has used an averaging period greater than 1 hour for determining the average VO concentration of a hazardous waste at the point of waste origination, the Regional Administrator may elect to establish compliance with this subpart by performing or requesting that the owner or operator perform a waste determination using direct measurement based on waste samples collected within a 1-hour period as follows:

(i) The average VO concentration of the hazardous waste at the point of waste origination shall be determined by direct measurement in accordance with the requirements of § 265.1084(a) of this subpart.

(ii) Results of the waste determination performed or requested by the Regional Administrator showing that the average VO concentration of the hazardous waste at the point of waste origination is equal to or greater than 500 ppmw shall constitute noncompliance with this subpart except in a case as provided for in paragraph (d)(5)(iii) of this section.

(iii) For the case when the average VO concentration of the hazardous waste at the point of waste origination previously has been determined by the owner or operator using an averaging period greater than 1 hour to be less than 500 ppmw but because of normal operating process variations the VO concentration of the hazardous waste determined by direct measurement for any given 1-hour period may be equal to or greater than 500 ppmw, information that was used by the owner or operator to determine the average VO concentration of the hazardous waste (e.g., test results, measurements, calculations, and other documentation) and recorded in the facility records in accordance with the requirements of § 265.1084(a) and § 265.1090 of this subpart shall be considered by the Regional Administrator together with the results of the waste determination performed or requested by the Regional Administrator in establishing compliance with this subpart.

41. Section 265.1084 is revised to read as follows:

§ 265.1084 Waste determination procedures.

(a) Waste determination procedure to determine average volatile organic (VO) concentration of a hazardous waste at the point of waste origination.

(1) An owner or operator shall determine the average VO concentration at the point of waste origination for each hazardous waste placed in a waste management unit exempted under the provisions of § 265.1083(c)(1) of this subpart from using air emission controls in accordance with standards specified in § 265.1085 through § 265.1088 of this subpart, as applicable to the waste management unit.

(2) The average VO concentration of a hazardous waste at the point of waste origination shall be determined using either direct measurement as specified in paragraph (a)(3) of this section or by knowledge as specified in paragraph (a)(4) of this section.

(3) Direct measurement to determine average VO concentration of a hazardous waste at the point of waste origination.

(i) Identification. The owner or operator shall identify and record the point of waste origination for the hazardous waste.

(ii) Sampling. Samples of the hazardous waste stream shall be collected at the point of waste origination in a manner such that volatilization of organics contained in the waste and in the subsequent sample is minimized and an adequately representative sample is collected and maintained for analysis by the selected method.

(A) The averaging period to be used for determining the average VO concentration for the hazardous waste stream on a mass-weighted average basis shall be designated and recorded. The averaging period can represent any time interval that the owner or operator determines is appropriate for the hazardous waste stream but shall not exceed 1 year.

(B) A sufficient number of samples, but no less than four samples, shall be collected for the hazardous waste stream to represent the complete range of compositions and quantities that occur during the entire averaging period due to normal variations in the operating conditions for the source or process generating the hazardous waste stream. Examples of such normal variations are seasonal variations in waste quantity or fluctuations in ambient temperature.

(C) All samples shall be collected and handled in accordance with written procedures prepared by the owner or operator and documented in a site sampling plan. This plan shall describe the procedure by which representative samples of the hazardous waste stream are collected such that a minimum loss of organics occurs throughout the sample collection and handling process, and by which sample integrity is maintained. A copy of the written sampling plan shall be maintained on-site in the facility operating records. An example of an acceptable sampling plan includes a plan incorporating sample collection and handling procedures in accordance with the requirements specified in ''Test Methods for Evaluating Solid Waste, Physical/Chemical Methods,'' EPA Publication SW–846, (incorporated by reference—refer to § 260.11(a) of this chapter), or in Method 25D in 40 CFR part 60, appendix A.

(iii) Analysis. Each collected sample shall be prepared and analyzed in accordance with one or more of the methods listed in paragraphs (a)(3)(iii)(A) through (a)(3)(iii)(I) of this section, including appropriate quality assurance and quality control (QA/QC) checks and use of target compounds for calibration. If Method 25D in 40 CFR part 60, appendix A is not used, then one or more methods should be chosen that are appropriate to ensure that the waste determination accounts for and reflects all organic compounds in the waste with Henry's law constant values at least 0.1 mole-fraction-in-the-gas-phase/mole-fraction-in-the-liquid-phase (0.1 Y/X) [which can also be expressed as 1.8×10^{-6} atmospheres/gram-mole/m^3] at 25 degrees Celsius. Each of the analytical methods listed in paragraphs (a)(3)(iii)(B) through (a)(3)(iii)(G) of this section has an associated list of approved chemical compounds, for which EPA considers the method appropriate for measurement. If an owner or operator uses EPA Method 624, 625, 1624, or 1625 in 40 CFR part 136, appendix A to analyze one or more compounds that are not on that method's published list, the Alternative Test Procedure contained in 40 CFR 136.4 and 136.5 must be followed. If an owner or operator uses EPA Method 8260(B) or 8270(C) in ''Test Methods for Evaluating Solid Waste, Physical/

Chemical Methods'', EPA Publication SW–846, (incorporated by reference—refer to § 260.11(a) of this chapter) to analyze one or more compounds that are not on that method's published list, the procedures in paragraph (a)(3)(iii)(H) of this section must be followed. At the owner's or operator's discretion, the concentration of each individual chemical constituent measured in the waste by a method other than Method 25D may be corrected to the concentration had it been measured using Method 25D by multiplying the measured concentration by the constituent-specific adjustment factor (f_{m25D}) as specified in paragraph (a)(4)(iii) of this section. Constituent-specific adjustment factors (f_{m25D}) can be obtained by contacting the Waste and Chemical Processes Group, Office of Air Quality Planning and Standards, Research Triangle Park, NC 27711. (A) Method 25D in 40 CFR part 60, appendix A.

(B) Method 624 in 40 CFR part 136, appendix A.

(C) Method 625 in 40 CFR part 136, appendix A. Perform corrections to the compounds for which the analysis is being conducted based on the ''accuracy as recovery'' using the factors in Table 7 of the method.

(D) Method 1624 in 40 CFR part 136, appendix A.

(E) Method 1625 in 40 CFR part 136, appendix A.

(F) Method 8260(B) in ''Test Methods for Evaluating Solid Waste, Physical/Chemical Methods'', EPA Publication SW–846, (incorporated by reference—refer to § 260.11(a) of this chapter). Maintain a formal quality assurance program consistent with the requirements of Method 8260(B). The quality assurance program shall include the following elements:

(*1*) Documentation of site-specific procedures to minimize the loss of compounds due to volatilization, biodegradation, reaction, or sorption during the sample collection, storage, preparation, introduction, and analysis steps.

(*2*) Measurement of the overall accuracy and precision of the specific procedures.

(G) Method 8270(C) in ''Test Methods for Evaluating Solid Waste, Physical/Chemical Methods'', EPA Publication SW–846, (incorporated by reference—refer to § 260.11(a) of this chapter). Maintain a formal quality assurance program consistent with the requirements of Method 8270(C). The quality assurance program shall include the following elements:

(*1*) Documentation of site-specific procedures to minimize the loss of compounds due to volatilization, biodegradation, reaction, or sorption during the sample collection, storage, and preparation steps.

(*2*) Measurement of the overall accuracy and precision of the specific procedures.

(H) Any other EPA standard method that has been validated in accordance with ''Alternative Validation Procedure for EPA Waste and Wastewater Methods'', 40 CFR part 63, appendix D. As an alternative, other EPA standard methods may be validated by the procedure specified in paragraph (a)(3)(iii)(I) of this section.

(I) Any other analysis method that has been validated in accordance with the procedures specified in Section 5.1 or Section 5.3, and the corresponding calculations in Section 6.1 or Section 6.3, of Method 301 in 40 CFR part 63, appendix A. The data are acceptable if they meet the criteria specified in Section 6.1.5 or Section 6.3.3 of Method 301. If correction is required under section 6.3.3 of Method 301, the data are acceptable if the correction factor is within the range 0.7 to 1.30. Other sections of Method 301 are not required.

(iv) Calculations. The average VO concentration ($\overline{C}$) on a mass-weighted basis shall be calculated by using the results for all samples analyzed in accordance with paragraph (a)(3)(iii) of this section and the following equation:

$$\overline{C} = \frac{1}{Q_T} \times \sum_{i=1}^{n} \left(Q_i \times C_i \right)$$

Where:

$\overline{C}$ = Average VO concentration of the hazardous waste at the point of waste origination on a mass-weighted basis, ppmw.

i = Individual sample ''i'' of the hazardous waste.

n = Total number of samples of the hazardous waste collected (at least 4) for the averaging period (not to exceed 1 year).

Q_i = Mass quantity of hazardous waste stream represented by C_i, kg/hr.

Q_T = Total mass quantity of hazardous waste during the averaging period, kg/hr.

C_i = Measured VO concentration of sample ''i'' as determined in accordance with the requirements of § 265.1084(a)(3)(iii) of this subpart, ppmw.

(4) Use of owner or operator knowledge to determine average VO concentration of a hazardous waste at the point of waste origination.

(i) Documentation shall be prepared that presents the information used as the basis for the owner's or operator's knowledge of the hazardous waste stream's average VO concentration. Examples of information that may be used as the basis for knowledge include: Material balances for the source or process generating the hazardous waste stream; constituent-specific chemical test data for the hazardous waste stream from previous testing that are still applicable to the current waste stream; previous test data for other locations managing the same type of waste stream; or other knowledge based on information included in manifests, shipping papers, or waste certification notices.

(ii) If test data are used as the basis for knowledge, then the owner or operator shall document the test method, sampling protocol, and the means by which sampling variability and analytical variability are accounted for in the determination of the average VO concentration. For example, an owner or operator may use organic concentration test data for the hazardous waste stream that are validated in accordance with Method 301 in 40 CFR part 63, appendix A as the basis for knowledge of the waste.

(iii) An owner or operator using chemical constituent-specific concentration test data as the basis for knowledge of the hazardous waste may adjust the test data to the corresponding average VO concentration value which would have been obtained had the waste samples been analyzed using Method 25D in 40 CFR part 60, appendix A. To adjust these data, the measured concentration for each individual chemical constituent contained in the waste is multiplied by the appropriate constituent-specific adjustment factor (f_{m25D}).

(iv) In the event that the Regional Administrator and the owner or operator disagree on a determination of the average VO concentration for a hazardous waste stream using knowledge, then the results from a determination of average VO concentration using direct measurement as specified in paragraph (a)(3) of this section shall be used to establish compliance with the applicable requirements of this subpart. The Regional Administrator may perform or request that the owner or operator perform this determination using direct measurement.

(b) Waste determination procedures for treated hazardous waste.

(1) An owner or operator shall perform the applicable waste determination for each treated hazardous waste placed in a waste management unit exempted under the provisions of § 265.1083(c)(2) of this

subpart from using air emission controls in accordance with standards specified in § 265.1085 through § 265.1088 of this subpart, as applicable to the waste management unit.

(2) The owner or operator shall designate and record the specific provision in § 265.1083(c)(2) of this subpart under which the waste determination is being performed. The waste determination for the treated hazardous waste shall be performed using the applicable procedures specified in paragraphs (b)(3) through (b)(9) of this section.

(3) Procedure to determine the average VO concentration of a hazardous waste at the point of waste treatment.

(i) Identification. The owner or operator shall identify and record the point of waste treatment for the hazardous waste.

(ii) Sampling. Samples of the hazardous waste stream shall be collected at the point of waste treatment in a manner such that volatilization of organics contained in the waste and in the subsequent sample is minimized and an adequately representative sample is collected and maintained for analysis by the selected method.

(A) The averaging period to be used for determining the average VO concentration for the hazardous waste stream on a mass-weighted average basis shall be designated and recorded. The averaging period can represent any time interval that the owner or operator determines is appropriate for the hazardous waste stream but shall not exceed 1 year.

(B) A sufficient number of samples, but no less than four samples, shall be collected for the hazardous waste stream to represent the complete range of compositions and quantities that occur during the entire averaging period due to normal variations in the operating conditions for the process treating the hazardous waste stream. Examples of such normal variations are seasonal variations in waste quantity or fluctuations in ambient temperature.

(C) All samples shall be collected and handled in accordance with written procedures prepared by the owner or operator and documented in a site sampling plan. This plan shall describe the procedure by which representative samples of the hazardous waste stream are collected such that a minimum loss of organics occurs throughout the sample collection and handling process, and by which sample integrity is maintained. A copy of the written sampling plan shall be maintained on-site in the facility operating records. An example of an acceptable sampling plan includes a plan incorporating sample collection and handling procedures in accordance with the requirements specified in ''Test Methods for Evaluating Solid Waste, Physical/Chemical Methods,'' EPA Publication No. SW–846 (incorporated by reference—refer to § 260.11(a) of this chapter), or in Method 25D in 40 CFR part 60, appendix A.

(iii) Analysis. Each collected sample shall be prepared and analyzed in accordance with one or more of the methods listed in paragraphs (b)(3)(iii)(A) through (b)(3)(iii)(I) of this section, including appropriate quality assurance and quality control (QA/QC) checks and use of target compounds for calibration. If Method 25D in 40 CFR part 60, appendix A is not used, then one or more methods should be chosen that are appropriate to ensure that the waste determination accounts for and reflects all organic compounds in the waste with Henry's law constant values at least 0.1 mole-fraction-in-the-gas-phase/mole-fraction-in-the-liquid-phase (0.1 Y/X) [which can also be expressed as 1.8×10^{-6} atmospheres/gram-mole/m^3] at 25 degrees Celsius. Each of the analytical methods listed in paragraphs (b)(3)(iii)(B) through (b)(3)(iii)(G) of this section has an associated list of approved chemical compounds, for which EPA considers the method appropriate for measurement. If an owner or operator uses EPA Method 624, 625, 1624, or 1625 in 40 CFR part 136, appendix A to analyze one or more compounds that are not on that method's published list, the Alternative Test Procedure contained in 40 CFR 136.4 and 136.5 must be followed. If an owner or operator uses EPA Method 8260(B) or 8270(C) in ''Test Methods for Evaluating Solid Waste, Physical/Chemical Methods'', EPA Publication SW–846 (incorporated by reference—refer to § 260.11(a) of this chapter) to analyze one or more compounds that are not on that method's published list, the procedures in paragraph (b)(3)(iii)(H) of this section must be followed. At the owner's or operator's discretion, the concentration of each individual chemical constituent measured in the waste by a method other than Method 25D may be corrected to the concentration had it been measured using Method 25D by multiplying the measured concentration by the constituent-specific adjustment factor (f_{m25D}) as specified in paragraph (a)(4)(iii) of this section. Constituent-specific adjustment factors (f_{m25D}) can be obtained by contacting the Waste and Chemical Processes Group, Office of Air Quality Planning and Standards, Research Triangle Park, NC 27711.

(A) Method 25D in 40 CFR part 60, appendix A.

(B) Method 624 in 40 CFR part 136, appendix A.

(C) Method 625 in 40 CFR part 136, appendix A. Perform corrections to the compounds for which the analysis is being conducted based on the ''accuracy as recovery'' using the factors in Table 7 of the method.

(D) Method 1624 in 40 CFR part 136, appendix A.

(E) Method 1625 in 40 CFR part 136, appendix A.

(F) Method 8260(B) in ''Test Methods for Evaluating Solid Waste, Physical/Chemical Methods'', EPA Publication SW–846, (incorporated by reference—refer to § 260.11(a) of this chapter). Maintain a formal quality assurance program consistent with the requirements of Method 8260(B). The quality assurance program shall include the following elements:

(*1*) Documentation of site-specific procedures to minimize the loss of compounds due to volatilization, biodegradation, reaction, or sorption during the sample collection, storage, preparation, introduction, and analysis steps.

(*2*) Measurement of the overall accuracy and precision of the specific procedures.

(G) Method 8270(C) in ''Test Methods for Evaluating Solid Waste, Physical/Chemical Methods'', EPA Publication SW–846, (incorporated by reference—refer to § 260.11(a) of this chapter). Maintain a formal quality assurance program consistent with the requirements of Method 8270(C). The quality assurance program shall include the following elements:

(*1*) Documentation of site-specific procedures to minimize the loss of compounds due to volatilization, biodegradation, reaction, or sorption during the sample collection, storage, preparation, introduction, and analysis steps.

(*2*) Measurement of the overall accuracy and precision of the specific procedures.

(H) Any other EPA standard method that has been validated in accordance with ''Alternative Validation Procedure for EPA Waste and Wastewater Methods'', 40 CFR part 63, appendix D. As an alternative, other EPA standard methods may be validated by the procedure specified in paragraph (b)(3)(iii)(I) of this section.

(I) Any other analysis method that has been validated in accordance with the procedures specified in Section 5.1 or Section 5.3, and the corresponding

calculations in Section 6.1 or Section 6.3, of Method 301 in 40 CFR part 63, appendix A. The data are acceptable if they meet the criteria specified in Section 6.1.5 or Section 6.3.3 of Method 301. If correction is required under section 6.3.3 of Method 301, the data are acceptable if the correction factor is within the range 0.7 to 1.30. Other sections of Method 301 are not required.

(iv) Calculations. The average VO concentration ($\overline{C}$) on a mass-weighted basis shall be calculated by using the results for all samples analyzed in accordance with paragraph (b)(3)(iii) of this section and the following equation:

$$\overline{C} = \frac{1}{Q_T} \times \sum_{i=1}^{n} \left(Q_i \times C_i \right)$$

Where:

$\overline{C}$= Average VO concentration of the hazardous waste at the point of waste treatment on a mass-weighted basis, ppmw.

i = Individual sample ''i'' of the hazardous waste.

n = Total number of samples of the hazardous waste collected (at least 4) for the averaging period (not to exceed 1 year).

Q_i = Mass quantity of hazardous waste stream represented by C_i, kg/hr.

Q_T = Total mass quantity of hazardous waste during the averaging period, kg/hr.

C_i = Measured VO concentration of sample ''i'' as determined in accordance with the requirements of § 265.1084(b)(3)(iii) of this subpart, ppmw.

(4) Procedure to determine the exit concentration limit (C_t) for a treated hazardous waste.

(i) The point of waste origination for each hazardous waste treated by the process at the same time shall be identified.

(ii) If a single hazardous waste stream is identified in paragraph (b)(4)(i) of this section, then the exit concentration limit (C_t) shall be 500 ppmw.

(iii) If more than one hazardous waste stream is identified in paragraph (b)(4)(i) of this section, then the average VO concentration of each hazardous waste stream at the point of waste origination shall be determined in accordance with the requirements of paragraph (a) of this section. The exit concentration limit (C_t) shall be calculated by using the results determined for each individual hazardous waste stream and the following equation:

$$C_t = \frac{\sum_{x=1}^{m} \left(Q_x \times \overline{C_x} \right) + \sum_{y=1}^{n} \left(Q_y \times 500 \text{ ppmw} \right)}{\sum_{x=1}^{m} Q_x + \sum_{y=1}^{n} Q_y}$$

Where:

C_t = Exit concentration limit for treated hazardous waste, ppmw.

x = Individual hazardous waste stream ''x'' that has an average VO concentration less than 500 ppmw at the point of waste origination as determined in accordance with the requirements of § 265.1084(a) of this subpart.

y = Individual hazardous waste stream ''y'' that has an average VO concentration equal to or greater than 500 ppmw at the point of waste origination as determined in accordance with the requirements of § 265.1084(a) of this subpart.

m = Total number of ''x'' hazardous waste streams treated by process.

n = Total number of ''y'' hazardous waste streams treated by process.

Q_x = Annual mass quantity of hazardous waste stream ''x,'' kg/yr.

Q_y = Annual mass quantity of hazardous waste stream ''y,'' kg/yr.

$\overline{C}_x$ = Average VO concentration of hazardous waste stream ''x'' at the point of waste origination as determined in accordance with the requirements of § 265.1084(a) of this subpart, ppmw.

(5) Procedure to determine the organic reduction efficiency (R) for a treated hazardous waste.

(i) The organic reduction efficiency (R) for a treatment process shall be determined based on results for a minimum of three consecutive runs.

(ii) All hazardous waste streams entering the treatment process and all hazardous waste streams exiting the treatment process shall be identified. The owner or operator shall prepare a sampling plan for measuring these streams that accurately reflects the retention time of the hazardous waste in the process.

(iii) For each run, information shall be determined for each hazardous waste stream identified in paragraph (b)(5)(ii) of this section using the following procedures:

(A) The mass quantity of each hazardous waste stream entering the process (Q_b) and the mass quantity of each hazardous waste stream exiting the process (Q_a) shall be determined.

(B) The average VO concentration at the point of waste origination of each hazardous waste stream entering the process ($\overline{C}_b$) during the run shall be determined in accordance with the requirements of paragraph (a)(3) of this section. The average VO concentration at the point of waste treatment of each waste stream exiting the process ($\overline{C}_a$) during the run shall be determined in accordance with the requirements of paragraph (b)(3) of this section.

(iv) The waste volatile organic mass flow entering the process (E_b) and the waste volatile organic mass flow exiting the process (E_a) shall be calculated by using the results determined in accordance with paragraph (b)(5)(iii) of this section and the following equations:

$$E_b = \frac{1}{10^6} \sum_{j=1}^{m} \left(Q_{bj} \times \overline{C_{bj}} \right)$$

$$E_a = \frac{1}{10^6} \sum_{j=1}^{m} \left(Q_{aj} \times \overline{C_{aj}} \right)$$

Where:

E_a = Waste volatile organic mass flow exiting process, kg/hr.

E_b = Waste volatile organic mass flow entering process, kg/hr.

m = Total number of runs (at least 3)

j = Individual run ''j''

Q_b = Mass quantity of hazardous waste entering process during run ''j,'' kg/hr.

Q_a = Average mass quantity of hazardous waste exiting process during run ''j,'' kg/hr.

$\overline{C}_a$ = Average VO concentration of hazardous waste exiting process during run ''j'' as determined in accordance with the requirements of § 265.1084(b)(3) of this subpart, ppmw.

$\overline{C}_b$ = Average VO concentration of hazardous waste entering process during run ''j'' as determined in accordance with the requirements of § 265.1084(a)(3) of this subpart, ppmw.

(v) The organic reduction efficiency of the process shall be calculated by using the results determined in accordance with paragraph (b)(5)(iv) of this section and the following equation:

$$R = \frac{E_b - E_a}{E_b} \times 100\%$$

Where:

R = Organic reduction efficiency, percent.

E_b = Waste volatile organic mass flow entering process as determined in accordance with the requirements of paragraph (b)(5)(iv) of this section, kg/hr.

E_a = Waste volatile organic mass flow exiting process as determined in accordance with the requirements of paragraph (b)(5)(iv) of this section, kg/hr.

(6) Procedure to determine the organic biodegradation efficiency (R_{bio}) for a treated hazardous waste.

(i) The fraction of organics biodegraded (F_{bio}) shall be determined using the procedure specified in 40 CFR part 63, appendix C of this chapter.

(ii) The R_{bio} shall be calculated by using the following equation:

$$R_{bio} = F_{bio} \times 100\%$$

Where:

R_{bio} = Organic biodegradation efficiency, percent.

F_{bio} = Fraction of organic biodegraded as determined in accordance with the requirements of paragraph (b)(6)(i) of this section.

(7) Procedure to determine the required organic mass removal rate (RMR) for a treated hazardous waste.

(i) All of the hazardous waste streams entering the treatment process shall be identified.

(ii) The average VO concentration of each hazardous waste stream at the point of waste origination shall be determined in accordance with the requirements of paragraph (a) of this section.

(iii) For each individual hazardous waste stream that has an average VO concentration equal to or greater than 500 ppmw at the point of waste origination, the average volumetric flow rate and the density of the hazardous waste stream at the point of waste origination shall be determined.

(iv) The RMR shall be calculated by using the average VO concentration, average volumetric flow rate, and density determined for each individual hazardous waste stream, and the following equation:

$$RMR = \sum_{y=1}^{n} \left[V_y \times k_y \times \frac{\left(\overline{C_y} - 500 \text{ ppmw}\right)}{10^6} \right]$$

Where:

RMR = Required organic mass removal rate, kg/hr.

y = Individual hazardous waste stream ''y'' that has an average VO concentration equal to or greater than 500 ppmw at the point of waste origination as determined in accordance with the requirements of § 265.1084(a) of this subpart.

n = Total number of ''y'' hazardous waste streams treated by process.

V_y = Average volumetric flow rate of hazardous waste stream ''y'' at the point of waste origination, m^3/hr.

k_y = Density of hazardous waste stream ''y,'' kg/m^3

$\overline{C_y}$ = Average VO concentration of hazardous waste stream ''y'' at the point of waste origination as determined in accordance with the requirements of § 265.1084(a) of this subpart, ppmw.

(8) Procedure to determine the actual organic mass removal rate (MR) for a treated hazardous waste.

(i) The MR shall be determined based on results for a minimum of three consecutive runs. The sampling time for each run shall be 1 hour.

(ii) The waste volatile organic mass flow entering the process (E_b) and the waste volatile organic mass flow exiting the process (E_a) shall be determined in accordance with the requirements of paragraph (b)(5)(iv) of this section.

(iii) The MR shall be calculated by using the mass flow rate determined in accordance with the requirements of paragraph (b)(8)(ii) of this section and the following equation:

Where:

$MR = E_b - E_a$

MR = Actual organic mass removal rate, kg/hr.

E_b = Waste volatile organic mass flow entering process as determined in accordance with the requirements of paragraph (b)(5)(iv) of this section, kg/hr.

E_a = Waste volatile organic mass flow exiting process as determined in accordance with the requirements of paragraph (b)(5)(iv) of this section, kg/hr.

(9) Procedure to determine the actual organic mass biodegradation rate (MR_{bio}) for a treated hazardous waste.

(i) The MR_{bio} shall be determined based on results for a minimum of three consecutive runs. The sampling time for each run shall be 1 hour.

(ii) The waste organic mass flow entering the process (E_b) shall be determined in accordance with the requirements of paragraph (b)(5)(iv) of this section.

(iii) The fraction of organic biodegraded (F_{bio}) shall be determined using the procedure specified in 40 CFR part 63, appendix C of this chapter.

(iv) The MR_{bio} shall be calculated by using the mass flow rates and fraction of organic biodegraded determined in accordance with the requirements of paragraphs (b)(9)(ii) and (b)(9)(iii), respectively, of this section and the following equation:

Where:

$MR_{bio} = E_b \times F_{bio}$

MR_{bio} = Actual organic mass biodegradation rate, kg/hr.

E_b = Waste organic mass flow entering process as determined in accordance with the requirements of paragraph (b)(5)(iv) of this section, kg/hr.

F_{bio} = Fraction of organic biodegraded as determined in accordance with the requirements of paragraph (b)(9)(iii) of this section.

(c) Procedure to determine the maximum organic vapor pressure of a hazardous waste in a tank.

(1) An owner or operator shall determine the maximum organic vapor pressure for each hazardous waste placed in a tank using Tank Level 1 controls in accordance with the standards specified in § 265.1085(c) of this subpart.

(2) An owner or operator shall use either direct measurement as specified in paragraph (c)(3) of this section or knowledge of the waste as specified by paragraph (c)(4) of this section to determine the maximum organic vapor pressure which is representative of the hazardous waste composition stored or treated in the tank.

(3) Direct measurement to determine the maximum organic vapor pressure of a hazardous waste.

(i) Sampling. A sufficient number of samples shall be collected to be representative of the waste contained in the tank. All samples shall be collected and handled in accordance with written procedures prepared by the owner or operator and documented in a site sampling plan. This plan shall describe the procedure by which representative samples of the hazardous waste are collected such that a minimum loss of organics occurs throughout the sample collection and handling process and by which sample integrity is maintained. A copy of the written sampling plan shall be maintained on-site in the facility operating records. An example of an acceptable sampling plan includes a plan incorporating sample collection and handling procedures in accordance with the requirements specified in ''Test

Methods for Evaluating Solid Waste, Physical/Chemical Methods,'' EPA Publication No. SW–846, (incorporated by reference—refer to § 260.11(a) of this chapter), or in Method 25D in 40 CFR part 60, appendix A.

(ii) Analysis. Any appropriate one of the following methods may be used to analyze the samples and compute the maximum organic vapor pressure of the hazardous waste:

(A) Method 25E in 40 CFR part 60 appendix A;

(B) Methods described in American Petroleum Institute Publication 2517, Third Edition, February 1989, ''Evaporative Loss from External Floating-Roof Tanks,'' (incorporated by reference—refer to § 260.11 of this chapter);

(C) Methods obtained from standard reference texts;

(D) ASTM Method 2879–92 (incorporated by reference—refer to § 260.11 of this chapter); and

(E) Any other method approved by the Regional Administrator.

(4) Use of knowledge to determine the maximum organic vapor pressure of the hazardous waste. Documentation shall be prepared and recorded that presents the information used as the basis for the owner's or operator's knowledge that the maximum organic vapor pressure of the hazardous waste is less than the maximum vapor pressure limit listed in § 265.1085(b)(1)(i) of this subpart for the applicable tank design capacity category. An example of information that may be used is documentation that the hazardous waste is generated by a process for which at other locations it previously has been determined by direct measurement that the waste maximum organic vapor pressure is less than the maximum vapor pressure limit for the appropriate tank design capacity category.

(d) Procedure for determining no detectable organic emissions for the purpose of complying with this subpart:

(1) The test shall be conducted in accordance with the procedures specified in Method 21 of 40 CFR part 60, appendix A. Each potential leak interface (i.e., a location where organic vapor leakage could occur) on the cover and associated closure devices shall be checked. Potential leak interfaces that are associated with covers and closure devices include, but are not limited to: The interface of the cover and its foundation mounting; the periphery of any opening on the cover and its associated closure device; and the sealing seat interface on a spring-loaded pressure relief valve.

(2) The test shall be performed when the unit contains a hazardous waste having an organic concentration representative of the range of concentrations for the hazardous waste expected to be managed in the unit. During the test, the cover and closure devices shall be secured in the closed position.

(3) The detection instrument shall meet the performance criteria of Method 21 of 40 CFR part 60, appendix A, except the instrument response factor criteria in section 3.1.2(a) of Method 21 shall be for the average composition of the organic constituents in the hazardous waste placed in the waste management unit, not for each individual organic constituent.

(4) The detection instrument shall be calibrated before use on each day of its use by the procedures specified in Method 21 of 40 CFR part 60, appendix A.

(5) Calibration gases shall be as follows:

(i) Zero air (less than 10 ppmv hydrocarbon in air), and

(ii) A mixture of methane in air at a concentration of approximately, but less than 10,000 ppmv.

(6) The background level shall be determined according to the procedures in Method 21 of 40 CFR part 60, appendix A.

(7) Each potential leak interface shall be checked by traversing the instrument probe around the potential leak interface as close to the interface as possible, as described in Method 21 of 40 CFR part 60, appendix A. In the case when the configuration of the cover or closure device prevents a complete traverse of the interface, all accessible portions of the interface shall be sampled. In the case when the configuration of the closure device prevents any sampling at the interface and the device is equipped with an enclosed extension or horn (e.g., some pressure relief devices), the instrument probe inlet shall be placed at approximately the center of the exhaust area to the atmosphere.

(8) The arithmetic difference between the maximum organic concentration indicated by the instrument and the background level shall be compared with the value of 500 ppmv except when monitoring a seal around a rotating shaft that passes through a cover opening, in which case the comparison shall be as specified in paragraph (d)(9) of this section. If the difference is less than 500 ppmv, then the potential leak interface is determined to operate with no detectable organic emissions.

(9) For the seals around a rotating shaft that passes through a cover opening, the arithmetic difference between the maximum organic concentration indicated by the instrument and the background level shall be compared with the value of 10,000 ppmw. If the difference is less than 10,000 ppmw, then the potential leak interface is determined to operate with no detectable organic emissions.

42. Section 265.1085 is revised to read as follows:

§ 265.1085 Standards: Tanks.

(a) The provisions of this section apply to the control of air pollutant emissions from tanks for which § 265.1083(b) of this subpart references the use of this section for such air emission control.

(b) The owner or operator shall control air pollutant emissions from each tank subject to this section in accordance with the following requirements, as applicable:

(1) For a tank that manages hazardous waste that meets all of the conditions specified in paragraphs (b)(1)(i) through (b)(1)(iii) of this section, the owner or operator shall control air pollutant emissions from the tank in accordance with the Tank Level 1 controls specified in paragraph (c) of this section or the Tank Level 2 controls specified in paragraph (d) of this section.

(i) The hazardous waste in the tank has a maximum organic vapor pressure which is less than the maximum organic vapor pressure limit for the tank's design capacity category as follows:

(A) For a tank design capacity equal to or greater than 151 m^3, the maximum organic vapor pressure limit for the tank is 5.2 kPa.

(B) For a tank design capacity equal to or greater than 75 m^3 but less than 151 m^3, the maximum organic vapor pressure limit for the tank is 27.6 kPa.

(C) For a tank design capacity less than 75 m^3, the maximum organic vapor pressure limit for the tank is 76.6 kPa.

(ii) The hazardous waste in the tank is not heated by the owner or operator to a temperature that is greater than the temperature at which the maximum organic vapor pressure of the hazardous waste is determined for the purpose of complying with paragraph (b)(1)(i) of this section.

(iii) The hazardous waste in the tank is not treated by the owner or operator using a waste stabilization process, as defined in § 265.1081 of this subpart.

(2) For a tank that manages hazardous waste that does not meet all of the conditions specified in paragraphs (b)(1)(i) through (b)(1)(iii) of this section, the owner or operator shall control air pollutant emissions from the tank by using Tank Level 2 controls in accordance with the requirements of

paragraph (d) of this section. Examples of tanks required to use Tank Level 2 controls include: A tank used for a waste stabilization process; and a tank for which the hazardous waste in the tank has a maximum organic vapor pressure that is equal to or greater than the maximum organic vapor pressure limit for the tank's design capacity category as specified in paragraph (b)(1)(i) of this section.

(c) Owners and operators controlling air pollutant emissions from a tank using Tank Level 1 controls shall meet the requirements specified in paragraphs (c)(1) through (c)(4) of this section:

(1) The owner or operator shall determine the maximum organic vapor pressure for a hazardous waste to be managed in the tank using Tank Level 1 controls before the first time the hazardous waste is placed in the tank. The maximum organic vapor pressure shall be determined using the procedures specified in § 265.1084(c) of this subpart. Thereafter, the owner or operator shall perform a new determination whenever changes to the hazardous waste managed in the tank could potentially cause the maximum organic vapor pressure to increase to a level that is equal to or greater than the maximum organic vapor pressure limit for the tank design capacity category specified in paragraph (b)(1)(i) of this section, as applicable to the tank.

(2) The tank shall be equipped with a fixed roof designed to meet the following specifications:

(i) The fixed roof and its closure devices shall be designed to form a continuous barrier over the entire surface area of the hazardous waste in the tank. The fixed roof may be a separate cover installed on the tank (e.g., a removable cover mounted on an open-top tank) or may be an integral part of the tank structural design (e.g., a horizontal cylindrical tank equipped with a hatch).

(ii) The fixed roof shall be installed in a manner such that there are no visible cracks, holes, gaps, or other open spaces between roof section joints or between the interface of the roof edge and the tank wall.

(iii) Each opening in the fixed roof shall be either:

(A) Equipped with a closure device designed to operate such that when the closure device is secured in the closed position there are no visible cracks, holes, gaps, or other open spaces in the closure device or between the perimeter of the opening and the closure device; or

(B) Connected by a closed-vent system that is vented to a control device. The control device shall remove or destroy organics in the vent stream, and it shall be operating whenever hazardous waste is managed in the tank.

(iv) The fixed roof and its closure devices shall be made of suitable materials that will minimize exposure of the hazardous waste to the atmosphere, to the extent practical, and will maintain the integrity of the fixed roof and closure devices throughout their intended service life. Factors to be considered when selecting the materials for and designing the fixed roof and closure devices shall include: Organic vapor permeability, the effects of any contact with the hazardous waste or its vapors managed in the tank; the effects of outdoor exposure to wind, moisture, and sunlight; and the operating practices used for the tank on which the fixed roof is installed.

(3) Whenever a hazardous waste is in the tank, the fixed roof shall be installed with each closure device secured in the closed position except as follows:

(i) Opening of closure devices or removal of the fixed roof is allowed at the following times:

(A) To provide access to the tank for performing routine inspection, maintenance, or other activities needed for normal operations. Examples of such activities include those times when a worker needs to open a port to sample the liquid in the tank, or when a worker needs to open a hatch to maintain or repair equipment. Following completion of the activity, the owner or operator shall promptly secure the closure device in the closed position or reinstall the cover, as applicable, to the tank.

(B) To remove accumulated sludge or other residues from the bottom of tank.

(ii) Opening of a spring-loaded pressure-vacuum relief valve, conservation vent, or similar type of pressure relief device which vents to the atmosphere is allowed during normal operations for the purpose of maintaining the tank internal pressure in accordance with the tank design specifications. The device shall be designed to operate with no detectable organic emissions when the device is secured in the closed position. The settings at which the device opens shall be established such that the device remains in the closed position whenever the tank internal pressure is within the internal pressure operating range determined by the owner or operator based on the tank manufacturer recommendations, applicable regulations, fire protection and prevention codes, standard engineering codes and practices, or other requirements for the safe handling of flammable, ignitable, explosive, reactive, or hazardous materials. Examples of normal operating conditions that may require these devices to open are during those times when the tank internal pressure exceeds the internal pressure operating range for the tank as a result of loading operations or diurnal ambient temperature fluctuations.

(iii) Opening of a safety device, as defined in § 265.1081 of this subpart, is allowed at any time conditions require doing so to avoid an unsafe condition.

(4) The owner or operator shall inspect the air emission control equipment in accordance with the following requirements.

(i) The fixed roof and its closure devices shall be visually inspected by the owner or operator to check for defects that could result in air pollutant emissions. Defects include, but are not limited to, visible cracks, holes, or gaps in the roof sections or between the roof and the tank wall; broken, cracked, or otherwise damaged seals or gaskets on closure devices; and broken or missing hatches, access covers, caps, or other closure devices.

(ii) The owner or operator shall perform an initial inspection of the fixed roof and its closure devices on or before the date that the tank becomes subject to this section. Thereafter, the owner or operator shall perform the inspections at least once every year except under the special conditions provided for in paragraph (l) of this section.

(iii) In the event that a defect is detected, the owner or operator shall repair the defect in accordance with the requirements of paragraph (k) of this section.

(iv) The owner or operator shall maintain a record of the inspection in accordance with the requirements specified in § 265.1090(b) of this subpart.

(d) Owners and operators controlling air pollutant emissions from a tank using Tank Level 2 controls shall use one of the following tanks:

(1) A fixed-roof tank equipped with an internal floating roof in accordance with the requirements specified in paragraph (e) of this section;

(2) A tank equipped with an external floating roof in accordance with the requirements specified in paragraph (f) of this section;

(3) A tank vented through a closed-vent system to a control device in accordance with the requirements specified in paragraph (g) of this section;

(4) A pressure tank designed and operated in accordance with the

requirements specified in paragraph (h) of this section; or

(5) A tank located inside an enclosure that is vented through a closed-vent system to an enclosed combustion control device in accordance with the requirements specified in paragraph (i) of this section.

(e) The owner or operator who controls air pollutant emissions from a tank using a fixed-roof with an internal floating roof shall meet the requirements specified in paragraphs (e)(1) through (e)(3) of this section.

(1) The tank shall be equipped with a fixed roof and an internal floating roof in accordance with the following requirements:

(i) The internal floating roof shall be designed to float on the liquid surface except when the floating roof must be supported by the leg supports.

(ii) The internal floating roof shall be equipped with a continuous seal between the wall of the tank and the floating roof edge that meets either of the following requirements:

(A) A single continuous seal that is either a liquid-mounted seal or a metallic shoe seal, as defined in § 265.1081 of this subpart; or

(B) Two continuous seals mounted one above the other. The lower seal may be a vapor-mounted seal.

(iii) The internal floating roof shall meet the following specifications:

(A) Each opening in a noncontact internal floating roof except for automatic bleeder vents (vacuum breaker vents) and the rim space vents is to provide a projection below the liquid surface.

(B) Each opening in the internal floating roof shall be equipped with a gasketed cover or a gasketed lid except for leg sleeves, automatic bleeder vents, rim space vents, column wells, ladder wells, sample wells, and stub drains.

(C) Each penetration of the internal floating roof for the purpose of sampling shall have a slit fabric cover that covers at least 90 percent of the opening.

(D) Each automatic bleeder vent and rim space vent shall be gasketed.

(E) Each penetration of the internal floating roof that allows for passage of a ladder shall have a gasketed sliding cover.

(F) Each penetration of the internal floating roof that allows for passage of a column supporting the fixed roof shall have a flexible fabric sleeve seal or a gasketed sliding cover.

(2) The owner or operator shall operate the tank in accordance with the following requirements:

(i) When the floating roof is resting on the leg supports, the process of filling, emptying, or refilling shall be continuous and shall be completed as soon as practical.

(ii) Automatic bleeder vents are to be set closed at all times when the roof is floating, except when the roof is being floated off or is being landed on the leg supports.

(iii) Prior to filling the tank, each cover, access hatch, gauge float well or lid on any opening in the internal floating roof shall be bolted or fastened closed (i.e., no visible gaps). Rim space vents are to be set to open only when the internal floating roof is not floating or when the pressure beneath the rim exceeds the manufacturer's recommended setting.

(3) The owner or operator shall inspect the internal floating roof in accordance with the procedures specified as follows:

(i) The floating roof and its closure devices shall be visually inspected by the owner or operator to check for defects that could result in air pollutant emissions. Defects include, but are not limited to: The internal floating roof is not floating on the surface of the liquid inside the tank; liquid has accumulated on top of the internal floating roof; any portion of the roof seals have detached from the roof rim; holes, tears, or other openings are visible in the seal fabric; the gaskets no longer close off the hazardous waste surface from the atmosphere; or the slotted membrane has more than 10 percent open area.

(ii) The owner or operator shall inspect the internal floating roof components as follows except as provided in paragraph (e)(3)(iii) of this section:

(A) Visually inspect the internal floating roof components through openings on the fixed-roof (e.g., manholes and roof hatches) at least once every 12 months after initial fill, and

(B) Visually inspect the internal floating roof, primary seal, secondary seal (if one is in service), gaskets, slotted membranes, and sleeve seals (if any) each time the tank is emptied and degassed and at least every 10 years.

(iii) As an alternative to performing the inspections specified in paragraph (e)(3)(ii) of this section for an internal floating roof equipped with two continuous seals mounted one above the other, the owner or operator may visually inspect the internal floating roof, primary and secondary seals, gaskets, slotted membranes, and sleeve seals (if any) each time the tank is emptied and degassed and at least every 5 years.

(iv) Prior to each inspection required by paragraph (e)(3)(ii) or (e)(3)(iii) of this section, the owner or operator shall notify the Regional Administrator in advance of each inspection to provide the Regional Administrator with the opportunity to have an observer present during the inspection. The owner or operator shall notify the Regional Administrator of the date and location of the inspection as follows:

(A) Prior to each visual inspection of an internal floating roof in a tank that has been emptied and degassed, written notification shall be prepared and sent by the owner or operator so that it is received by the Regional Administrator at least 30 calendar days before refilling the tank except when an inspection is not planned as provided for in paragraph (e)(3)(iv)(B) of this section.

(B) When a visual inspection is not planned and the owner or operator could not have known about the inspection 30 calendar days before refilling the tank, the owner or operator shall notify the Regional Administrator as soon as possible, but no later than 7 calendar days before refilling of the tank. This notification may be made by telephone and immediately followed by a written explanation for why the inspection is unplanned. Alternatively, written notification, including the explanation for the unplanned inspection, may be sent so that it is received by the Regional Administrator at least 7 calendar days before refilling the tank.

(v) In the event that a defect is detected, the owner or operator shall repair the defect in accordance with the requirements of paragraph (k) of this section.

(vi) The owner or operator shall maintain a record of the inspection in accordance with the requirements specified in § 265.1090(b) of this subpart.

(f) The owner or operator who controls air pollutant emissions from a tank using an external floating roof shall meet the requirements specified in paragraphs (f)(1) through (f)(3) of this section.

(1) The owner or operator shall design the external floating roof in accordance with the following requirements:

(i) The external floating roof shall be designed to float on the liquid surface except when the floating roof must be supported by the leg supports.

(ii) The floating roof shall be equipped with two continuous seals, one above the other, between the wall of the tank and the roof edge. The lower seal is referred to as the primary seal, and the upper seal is referred to as the secondary seal.

(A) The primary seal shall be a liquid-mounted seal or a metallic shoe seal, as defined in § 265.1081 of this subpart. The total area of the gaps between the

tank wall and the primary seal shall not exceed 212 square centimeters (cm^2) per meter of tank diameter, and the width of any portion of these gaps shall not exceed 3.8 centimeters (cm). If a metallic shoe seal is used for the primary seal, the metallic shoe seal shall be designed so that one end extends into the liquid in the tank and the other end extends a vertical distance of at least 61 centimeters above the liquid surface.

(B) The secondary seal shall be mounted above the primary seal and cover the annular space between the floating roof and the wall of the tank. The total area of the gaps between the tank wall and the secondary seal shall not exceed 21.2 square centimeters (cm^2) per meter of tank diameter, and the width of any portion of these gaps shall not exceed 1.3 centimeters (cm).

(iii) The external floating roof shall meet the following specifications:

(A) Except for automatic bleeder vents (vacuum breaker vents) and rim space vents, each opening in a noncontact external floating roof shall provide a projection below the liquid surface.

(B) Except for automatic bleeder vents, rim space vents, roof drains, and leg sleeves, each opening in the roof shall be equipped with a gasketed cover, seal, or lid.

(C) Each access hatch and each gauge float well shall be equipped with a cover designed to be bolted or fastened when the cover is secured in the closed position.

(D) Each automatic bleeder vent and each rim space vent shall be equipped with a gasket.

(E) Each roof drain that empties into the liquid managed in the tank shall be equipped with a slotted membrane fabric cover that covers at least 90 percent of the area of the opening.

(F) Each unslotted and slotted guide pole well shall be equipped with a gasketed sliding cover or a flexible fabric sleeve seal.

(G) Each unslotted guide pole shall be equipped with a gasketed cap on the end of the pole.

(H) Each slotted guide pole shall be equipped with a gasketed float or other device which closes off the liquid surface from the atmosphere.

(I) Each gauge hatch and each sample well shall be equipped with a gasketed cover.

(2) The owner or operator shall operate the tank in accordance with the following requirements:

(i) When the floating roof is resting on the leg supports, the process of filling, emptying, or refilling shall be continuous and shall be completed as soon as practical.

(ii) Except for automatic bleeder vents, rim space vents, roof drains, and leg sleeves, each opening in the roof shall be secured and maintained in a closed position at all times except when the closure device must be open for access.

(iii) Covers on each access hatch and each gauge float well shall be bolted or fastened when secured in the closed position.

(iv) Automatic bleeder vents shall be set closed at all times when the roof is floating, except when the roof is being floated off or is being landed on the leg supports.

(v) Rim space vents shall be set to open only at those times that the roof is being floated off the roof leg supports or when the pressure beneath the rim seal exceeds the manufacturer's recommended setting.

(vi) The cap on the end of each unslotted guide pole shall be secured in the closed position at all times except when measuring the level or collecting samples of the liquid in the tank.

(vii) The cover on each gauge hatch or sample well shall be secured in the closed position at all times except when the hatch or well must be opened for access.

(viii) Both the primary seal and the secondary seal shall completely cover the annular space between the external floating roof and the wall of the tank in a continuous fashion except during inspections.

(3) The owner or operator shall inspect the external floating roof in accordance with the procedures specified as follows:

(i) The owner or operator shall measure the external floating roof seal gaps in accordance with the following requirements:

(A) The owner or operator shall perform measurements of gaps between the tank wall and the primary seal within 60 calendar days after initial operation of the tank following installation of the floating roof and, thereafter, at least once every 5 years.

(B) The owner or operator shall perform measurements of gaps between the tank wall and the secondary seal within 60 calendar days after initial operation of the tank following installation of the floating roof and, thereafter, at least once every year.

(C) If a tank ceases to hold hazardous waste for a period of 1 year or more, subsequent introduction of hazardous waste into the tank shall be considered an initial operation for the purposes of paragraphs (f)(3)(i)(A) and (f)(3)(i)(B) of this section.

(D) The owner or operator shall determine the total surface area of gaps in the primary seal and in the secondary seal individually using the following procedure:

(*1*) The seal gap measurements shall be performed at one or more floating roof levels when the roof is floating off the roof supports.

(*2*) Seal gaps, if any, shall be measured around the entire perimeter of the floating roof in each place where a 0.32-centimeter (cm) diameter uniform probe passes freely (without forcing or binding against the seal) between the seal and the wall of the tank and measure the circumferential distance of each such location.

(*3*) For a seal gap measured under paragraph (f)(3) of this section, the gap surface area shall be determined by using probes of various widths to measure accurately the actual distance from the tank wall to the seal and multiplying each such width by its respective circumferential distance.

(*4*) The total gap area shall be calculated by adding the gap surface areas determined for each identified gap location for the primary seal and the secondary seal individually, and then dividing the sum for each seal type by the nominal perimeter of the tank. These total gap areas for the primary seal and secondary seal are then are compared to the respective standards for the seal type as specified in paragraph (f)(1)(ii) of this section.

(E) In the event that the seal gap measurements do not conform to the specifications in paragraph (f)(1)(ii) of this section, the owner or operator shall repair the defect in accordance with the requirements of paragraph (k) of this section.

(F) The owner or operator shall maintain a record of the inspection in accordance with the requirements specified in § 265.1090(b) of this subpart.

(ii) The owner or operator shall visually inspect the external floating roof in accordance with the following requirements:

(A) The floating roof and its closure devices shall be visually inspected by the owner or operator to check for defects that could result in air pollutant emissions. Defects include, but are not limited to: Holes, tears, or other openings in the rim seal or seal fabric of the floating roof; a rim seal detached from the floating roof; all or a portion of the floating roof deck being submerged below the surface of the liquid in the tank; broken, cracked, or otherwise damaged seals or gaskets on closure devices; and broken or missing hatches, access covers, caps, or other closure devices.

(B) The owner or operator shall perform an initial inspection of the external floating roof and its closure devices on or before the date that the tank becomes subject to this section. Thereafter, the owner or operator shall perform the inspections at least once every year except for the special conditions provided for in paragraph (l) of this section.

(C) In the event that a defect is detected, the owner or operator shall repair the defect in accordance with the requirements of paragraph (k) of this section.

(D) The owner or operator shall maintain a record of the inspection in accordance with the requirements specified in § 265.1090(b) of this subpart.

(iii) Prior to each inspection required by paragraph (f)(3)(i) or (f)(3)(ii) of this section, the owner or operator shall notify the Regional Administrator in advance of each inspection to provide the Regional Administrator with the opportunity to have an observer present during the inspection. The owner or operator shall notify the Regional Administrator of the date and location of the inspection as follows:

(A) Prior to each inspection to measure external floating roof seal gaps as required under paragraph (f)(3)(i) of this section, written notification shall be prepared and sent by the owner or operator so that it is received by the Regional Administrator at least 30 calendar days before the date the measurements are scheduled to be performed.

(B) Prior to each visual inspection of an external floating roof in a tank that has been emptied and degassed, written notification shall be prepared and sent by the owner or operator so that it is received by the Regional Administrator at least 30 calendar days before refilling the tank except when an inspection is not planned as provided for in paragraph (f)(3)(iii)(C) of this section.

(C) When a visual inspection is not planned and the owner or operator could not have known about the inspection 30 calendar days before refilling the tank, the owner or operator shall notify the Regional Administrator as soon as possible, but no later than 7 calendar days before refilling of the tank. This notification may be made by telephone and immediately followed by a written explanation for why the inspection is unplanned. Alternatively, written notification, including the explanation for the unplanned inspection, may be sent so that it is received by the Regional Administrator at least 7 calendar days before refilling the tank.

(g) The owner or operator who controls air pollutant emissions from a tank by venting the tank to a control device shall meet the requirements specified in paragraphs (g)(1) through (g)(3) of this section.

(1) The tank shall be covered by a fixed roof and vented directly through a closed-vent system to a control device in accordance with the following requirements:

(i) The fixed roof and its closure devices shall be designed to form a continuous barrier over the entire surface area of the liquid in the tank.

(ii) Each opening in the fixed roof not vented to the control device shall be equipped with a closure device. If the pressure in the vapor headspace underneath the fixed roof is less than atmospheric pressure when the control device is operating, the closure devices shall be designed to operate such that when the closure device is secured in the closed position there are no visible cracks, holes, gaps, or other open spaces in the closure device or between the perimeter of the cover opening and the closure device. If the pressure in the vapor headspace underneath the fixed roof is equal to or greater than atmospheric pressure when the control device is operating, the closure device shall be designed to operate with no detectable organic emissions.

(iii) The fixed roof and its closure devices shall be made of suitable materials that will minimize exposure of the hazardous waste to the atmosphere, to the extent practical, and will maintain the integrity of the fixed roof and closure devices throughout their intended service life. Factors to be considered when selecting the materials for and designing the fixed roof and closure devices shall include: Organic vapor permeability, the effects of any contact with the liquid and its vapor managed in the tank; the effects of outdoor exposure to wind, moisture, and sunlight; and the operating practices used for the tank on which the fixed roof is installed.

(iv) The closed-vent system and control device shall be designed and operated in accordance with the requirements of § 265.1088 of this subpart.

(2) Whenever a hazardous waste is in the tank, the fixed roof shall be installed with each closure device secured in the closed position and the vapor headspace underneath the fixed roof vented to the control device except as follows:

(i) Venting to the control device is not required, and opening of closure devices or removal of the fixed roof is allowed at the following times:

(A) To provide access to the tank for performing routine inspection, maintenance, or other activities needed for normal operations. Examples of such activities include those times when a worker needs to open a port to sample liquid in the tank, or when a worker needs to open a hatch to maintain or repair equipment. Following completion of the activity, the owner or operator shall promptly secure the closure device in the closed position or reinstall the cover, as applicable, to the tank.

(B) To remove accumulated sludge or other residues from the bottom of a tank.

(ii) Opening of a safety device, as defined in § 265.1081 of this subpart, is allowed at any time conditions require doing so to avoid an unsafe condition.

(3) The owner or operator shall inspect and monitor the air emission control equipment in accordance with the following procedures:

(i) The fixed roof and its closure devices shall be visually inspected by the owner or operator to check for defects that could result in air pollutant emissions. Defects include, but are not limited to, visible cracks, holes, or gaps in the roof sections or between the roof and the tank wall; broken, cracked, or otherwise damaged seals or gaskets on closure devices; and broken or missing hatches, access covers, caps, or other closure devices.

(ii) The closed-vent system and control device shall be inspected and monitored by the owner or operator in accordance with the procedures specified in § 265.1088 of this subpart.

(iii) The owner or operator shall perform an initial inspection of the air emission control equipment on or before the date that the tank becomes subject to this section. Thereafter, the owner or operator shall perform the inspections at least once every year except for the special conditions provided for in paragraph (l) of this section.

(iv) In the event that a defect is detected, the owner or operator shall repair the defect in accordance with the requirements of paragraph (k) of this section.

(v) The owner or operator shall maintain a record of the inspection in accordance with the requirements specified in § 265.1090(b) of this subpart.

(h) The owner or operator who controls air pollutant emissions by using a pressure tank shall meet the following requirements.

(1) The tank shall be designed not to vent to the atmosphere as a result of compression of the vapor headspace in the tank during filling of the tank to its design capacity.

(2) All tank openings shall be equipped with closure devices designed to operate with no detectable organic emissions as determined using the procedure specified in § 265.1084(d) of this subpart.

(3) Whenever a hazardous waste is in the tank, the tank shall be operated as a closed system that does not vent to the atmosphere except in the event that a safety device, as defined in § 265.1081 of this subpart, is required to open to avoid an unsafe condition.

(i) The owner or operator who controls air pollutant emissions by using an enclosure vented through a closed-vent system to an enclosed combustion control device shall meet the requirements specified in paragraphs (i)(1) through (i)(4) of this section.

(1) The tank shall be located inside an enclosure. The enclosure shall be designed and operated in accordance with the criteria for a permanent total enclosure as specified in ''Procedure T—Criteria for and Verification of a Permanent or Temporary Total Enclosure'' under 40 CFR 52.741, Appendix B. The enclosure may have permanent or temporary openings to allow worker access; passage of material into or out of the enclosure by conveyor, vehicles, or other mechanical means; entry of permanent mechanical or electrical equipment; or direct airflow into the enclosure. The owner or operator shall perform the verification procedure for the enclosure as specified in Section 5.0 to ''Procedure T—Criteria for and Verification of a Permanent or Temporary Total Enclosure'' initially when the enclosure is first installed and, thereafter, annually.

(2) The enclosure shall be vented through a closed-vent system to an enclosed combustion control device that is designed and operated in accordance with the standards for either a vapor incinerator, boiler, or process heater specified in § 265.1088 of this subpart.

(3) Safety devices, as defined in § 265.1081 of this subpart, may be installed and operated as necessary on any enclosure, closed-vent system, or control device used to comply with the requirements of paragraphs (i)(1) and (i)(2) of this section.

(4) The owner or operator shall inspect and monitor the closed-vent system and control device as specified in § 265.1088 of this subpart.

(j) The owner or operator shall transfer hazardous waste to a tank subject to this section in accordance with the following requirements:

(1) Transfer of hazardous waste, except as provided in paragraph (j)(2) of this section, to the tank from another tank subject to this section or from a surface impoundment subject to § 265.1086 of this subpart shall be conducted using continuous hard-piping or another closed system that does not allow exposure of the hazardous waste to the atmosphere. For the purpose of complying with this provision, an individual drain system is considered to be a closed system when it meets the requirements of 40 CFR part 63, subpart RR—National Emission Standards for Individual Drain Systems.

(2) The requirements of paragraph (j)(1) of this section do not apply when transferring a hazardous waste to the tank under any of the following conditions:

(i) The hazardous waste meets the average VO concentration conditions specified in § 265.1083(c)(1) of this subpart at the point of waste origination.

(ii) The hazardous waste has been treated by an organic destruction or removal process to meet the requirements in § 265.1083(c)(2) of this subpart.

(k) The owner or operator shall repair each defect detected during an inspection performed in accordance with the requirements of paragraphs (c)(4), (e)(3), (f)(3), or (g)(3) of this section as follows:

(1) The owner or operator shall make first efforts at repair of the defect no later than 5 calendar days after detection, and repair shall be completed as soon as possible but no later than 45 calendar days after detection except as provided in paragraph (k)(2) of this section.

(2) Repair of a defect may be delayed beyond 45 calendar days if the owner or operator determines that repair of the defect requires emptying or temporary removal from service of the tank and no alternative tank capacity is available at the site to accept the hazardous waste normally managed in the tank. In this case, the owner or operator shall repair the defect the next time the process or unit that is generating the hazardous waste managed in the tank stops operation. Repair of the defect shall be completed before the process or unit resumes operation.

(l) Following the initial inspection and monitoring of the cover as required by the applicable provisions of this subpart, subsequent inspection and monitoring may be performed at intervals longer than 1 year under the following special conditions:

(1) In the case when inspecting or monitoring the cover would expose a worker to dangerous, hazardous, or other unsafe conditions, then the owner or operator may designate a cover as an ''unsafe to inspect and monitor cover'' and comply with all of the following requirements:

(i) Prepare a written explanation for the cover stating the reasons why the cover is unsafe to visually inspect or to monitor, if required.

(ii) Develop and implement a written plan and schedule to inspect and monitor the cover, using the procedures specified in the applicable section of this subpart, as frequently as practicable during those times when a worker can safely access the cover.

(2) In the case when a tank is buried partially or entirely underground, an owner or operator is required to inspect and monitor, as required by the applicable provisions of this section, only those portions of the tank cover and those connections to the tank (e.g., fill ports, access hatches, gauge wells, etc.) that are located on or above the ground surface.

43. Section 265.1086 is revised to read as follows:

§ 265.1086 Standards: surface impoundments.

(a) The provisions of this section apply to the control of air pollutant emissions from surface impoundments for which § 265.1083(b) of this subpart references the use of this section for such air emission control.

(b) The owner or operator shall control air pollutant emissions from the surface impoundment by installing and operating either of the following:

(1) A floating membrane cover in accordance with the provisions specified in paragraph (c) of this section; or

(2) A cover that is vented through a closed-vent system to a control device in accordance with the provisions specified in paragraph (d) of this sections.

(c) The owner or operator who controls air pollutant emissions from a surface impoundment using a floating membrane cover shall meet the requirements specified in paragraphs (c)(1) through (c)(3) of this section.

(1) The surface impoundment shall be equipped with a floating membrane cover designed to meet the following specifications:

(i) The floating membrane cover shall be designed to float on the liquid surface during normal operations and form a continuous barrier over the entire surface area of the liquid.

(ii) The cover shall be fabricated from a synthetic membrane material that is either:

(A) High density polyethylene (HDPE) with a thickness no less than 2.5 millimeters (mm); or

(B) A material or a composite of different materials determined to have

both organic permeability properties that are equivalent to those of the material listed in paragraph (c)(1)(ii)(A) of this section and chemical and physical properties that maintain the material integrity for the intended service life of the material.

(iii) The cover shall be installed in a manner such that there are no visible cracks, holes, gaps, or other open spaces between cover section seams or between the interface of the cover edge and its foundation mountings.

(iv) Except as provided for in paragraph (c)(1)(v) of this section, each opening in the floating membrane cover shall be equipped with a closure device designed to operate such that when the closure device is secured in the closed position there are no visible cracks, holes, gaps, or other open spaces in the closure device or between the perimeter of the cover opening and the closure device.

(v) The floating membrane cover may be equipped with one or more emergency cover drains for removal of stormwater. Each emergency cover drain shall be equipped with a slotted membrane fabric cover that covers at least 90 percent of the area of the opening or a flexible fabric sleeve seal.

(vi) The closure devices shall be made of suitable materials that will minimize exposure of the hazardous waste to the atmosphere, to the extent practical, and will maintain the integrity of the closure devices throughout their intended service life. Factors to be considered when selecting the materials of construction and designing the cover and closure devices shall include: Organic vapor permeability; the effects of any contact with the liquid and its vapor managed in the surface impoundment; the effects of outdoor exposure to wind, moisture, and sunlight; and the operating practices used for the surface impoundment on which the floating membrane cover is installed.

(2) Whenever a hazardous waste is in the surface impoundment, the floating membrane cover shall float on the liquid and each closure device shall be secured in the closed position except as follows:

(i) Opening of closure devices or removal of the cover is allowed at the following times:

(A) To provide access to the surface impoundment for performing routine inspection, maintenance, or other activities needed for normal operations. Examples of such activities include those times when a worker needs to open a port to sample the liquid in the surface impoundment, or when a worker needs to open a hatch to maintain or repair equipment. Following completion of the activity, the owner or operator shall promptly replace the cover and secure the closure device in the closed position, as applicable.

(B) To remove accumulated sludge or other residues from the bottom of surface impoundment.

(ii) Opening of a safety device, as defined in § 265.1081 of this subpart, is allowed at any time conditions require doing so to avoid an unsafe condition.

(3) The owner or operator shall inspect the floating membrane cover in accordance with the following procedures:

(i) The floating membrane cover and its closure devices shall be visually inspected by the owner or operator to check for defects that could result in air pollutant emissions. Defects include, but are not limited to, visible cracks, holes, or gaps in the cover section seams or between the interface of the cover edge and its foundation mountings; broken, cracked, or otherwise damaged seals or gaskets on closure devices; and broken or missing hatches, access covers, caps, or other closure devices.

(ii) The owner or operator shall perform an initial inspection of the floating membrane cover and its closure devices on or before the date that the surface impoundment becomes subject to this section. Thereafter, the owner or operator shall perform the inspections at least once every year except for the special conditions provided for in paragraph (g) of this section.

(iii) In the event that a defect is detected, the owner or operator shall repair the defect in accordance with the requirements of paragraph (f) of this section.

(iv) The owner or operator shall maintain a record of the inspection in accordance with the requirements specified in § 265.1090(c) of this subpart.

(d) The owner or operator who controls air pollutant emissions from a surface impoundment using a cover vented to a control device shall meet the requirements specified in paragraphs (d)(1) through (d)(3) of this section.

(1) The surface impoundment shall be covered by a cover and vented directly through a closed-vent system to a control device in accordance with the following requirements:

(i) The cover and its closure devices shall be designed to form a continuous barrier over the entire surface area of the liquid in the surface impoundment.

(ii) Each opening in the cover not vented to the control device shall be equipped with a closure device. If the pressure in the vapor headspace underneath the cover is less than atmospheric pressure when the control device is operating, the closure devices shall be designed to operate such that when the closure device is secured in the closed position there are no visible cracks, holes, gaps, or other open spaces in the closure device or between the perimeter of the cover opening and the closure device. If the pressure in the vapor headspace underneath the cover is equal to or greater than atmospheric pressure when the control device is operating, the closure device shall be designed to operate with no detectable organic emissions using the procedure specified in § 265.1084(d) of this subpart.

(iii) The cover and its closure devices shall be made of suitable materials that will minimize exposure of the hazardous waste to the atmosphere, to the extent practical, and will maintain the integrity of the cover and closure devices throughout their intended service life. Factors to be considered when selecting the materials for and designing the cover and closure devices shall include: Organic vapor permeability; the effects of any contact with the liquid or its vapors managed in the surface impoundment; the effects of outdoor exposure to wind, moisture, and sunlight; and the operating practices used for the surface impoundment on which the cover is installed.

(iv) The closed-vent system and control device shall be designed and operated in accordance with the requirements of § 265.1088 of this subpart.

(2) Whenever a hazardous waste is in the surface impoundment, the cover shall be installed with each closure device secured in the closed position and the vapor headspace underneath the cover vented to the control device except as follows:

(i) Venting to the control device is not required, and opening of closure devices or removal of the cover is allowed at the following times:

(A) To provide access to the surface impoundment for performing routine inspection, maintenance, or other activities needed for normal operations. Examples of such activities include those times when a worker needs to open a port to sample liquid in the surface impoundment, or when a worker needs to open a hatch to maintain or repair equipment. Following completion of the activity, the owner or operator shall promptly secure the closure device in the closed position or reinstall the cover, as applicable, to the surface impoundment.

(B) To remove accumulated sludge or other residues from the bottom of surface impoundment.

(ii) Opening of a safety device, as defined in § 265.1081 of this subpart, is allowed at any time conditions require doing so to avoid an unsafe condition.

(3) The owner or operator shall inspect and monitor the air emission control equipment in accordance with the following procedures:

(i) The surface impoundment cover and its closure devices shall be visually inspected by the owner or operator to check for defects that could result in air pollutant emissions. Defects include, but are not limited to, visible cracks, holes, or gaps in the cover section seams or between the interface of the cover edge and its foundation mountings; broken, cracked, or otherwise damaged seals or gaskets on closure devices; and broken or missing hatches, access covers, caps, or other closure devices.

(ii) The closed-vent system and control device shall be inspected and monitored by the owner or operator in accordance with the procedures specified in § 265.1088 of this subpart.

(iii) The owner or operator shall perform an initial inspection of the air emission control equipment on or before the date that the surface impoundment becomes subject to this section. Thereafter, the owner or operator shall perform the inspections at least once every year except for the special conditions provided for in paragraph (g) of this section.

(iv) In the event that a defect is detected, the owner or operator shall repair the defect in accordance with the requirements of paragraph (f) of this section.

(v) The owner or operator shall maintain a record of the inspection in accordance with the requirements specified in § 265.1090(c) of this subpart.

(e) The owner or operator shall transfer hazardous waste to a surface impoundment subject to this section in accordance with the following requirements:

(1) Transfer of hazardous waste, except as provided in paragraph (e)(2) of this section, to the surface impoundment from another surface impoundment subject to this section or from a tank subject to § 265.1085 of this subpart shall be conducted using continuous hard-piping or another closed system that does not allow exposure of the waste to the atmosphere. For the purpose of complying with this provision, an individual drain system is considered to be a closed system when it meets the requirements of 40 CFR part 63, subpart RR—National Emission Standards for Individual Drain Systems.

(2) The requirements of paragraph (e)(1) of this section do not apply when transferring a hazardous waste to the surface impoundment under either of the following conditions:

(i) The hazardous waste meets the average VO concentration conditions specified in § 265.1083(c)(1) of this subpart at the point of waste origination.

(ii) The hazardous waste has been treated by an organic destruction or removal process to meet the requirements in § 265.1083(c)(2) of this subpart.

(f) The owner or operator shall repair each defect detected during an inspection performed in accordance with the requirements of paragraph (c)(3) or (d)(3) of this section as follows:

(1) The owner or operator shall make first efforts at repair of the defect no later than 5 calendar days after detection, and repair shall be completed as soon as possible but no later than 45 calendar days after detection except as provided in paragraph (f)(2) of this section.

(2) Repair of a defect may be delayed beyond 45 calendar days if the owner or operator determines that repair of the defect requires emptying or temporary removal from service of the surface impoundment and no alternative capacity is available at the site to accept the hazardous waste normally managed in the surface impoundment. In this case, the owner or operator shall repair the defect the next time the process or unit that is generating the hazardous waste managed in the tank stops operation. Repair of the defect shall be completed before the process or unit resumes operation.

(g) Following the initial inspection and monitoring of the cover as required by the applicable provisions of this subpart, subsequent inspection and monitoring may be performed at intervals longer than 1 year in the case when inspecting or monitoring the cover would expose a worker to dangerous, hazardous, or other unsafe conditions. In this case, the owner or operator may designate the cover as an ''unsafe to inspect and monitor cover'' and comply with all of the following requirements:

(1) Prepare a written explanation for the cover stating the reasons why the cover is unsafe to visually inspect or to monitor, if required.

(2) Develop and implement a written plan and schedule to inspect and monitor the cover using the procedures specified in the applicable section of this subpart as frequently as practicable during those times when a worker can safely access the cover.

44. Section 265.1087 is revised to read as follows:

§ 265.1087 Standards: Containers.

(a) The provisions of this section apply to the control of air pollutant emissions from containers for which § 265.1083(b) of this subpart references the use of this section for such air emission control.

(b) General requirements.

(1) The owner or operator shall control air pollutant emissions from each container subject to this section in accordance with the following requirements, as applicable to the container, except when the special provisions for waste stabilization processes specified in paragraph (b)(2) of this section apply to the container.

(i) For a container having a design capacity greater than 0.1 m^3 and less than or equal to 0.46 m^3, the owner or operator shall control air pollutant emissions from the container in accordance with the Container Level 1 standards specified in paragraph (c) of this section.

(ii) For a container having a design capacity greater than 0.46 m^3 that is not in light material service, the owner or operator shall control air pollutant emissions from the container in accordance with the Container Level 1 standards specified in paragraph (c) of this section.

(iii) For a container having a design capacity greater than 0.46 m^3 that is in light material service, the owner or operator shall control air pollutant emissions from the container in accordance with the Container Level 2 standards specified in paragraph (d) of this section.

(2) When a container having a design capacity greater than 0.1 m^3 is used for treatment of a hazardous waste by a waste stabilization process, the owner or operator shall control air pollutant emissions from the container in accordance with the Container Level 3 standards specified in paragraph (e) of this section at those times during the waste stabilization process when the hazardous waste in the container is exposed to the atmosphere.

(c) Container Level 1 standards.

(1) A container using Container Level 1 controls is one of the following:

(i) A container that meets the applicable U.S. Department of Transportation (DOT) regulations on packaging hazardous materials for transportation as specified in paragraph (f) of this section.

(ii) A container equipped with a cover and closure devices that form a

continuous barrier over the container openings such that when the cover and closure devices are secured in the closed position there are no visible holes, gaps, or other open spaces into the interior of the container. The cover may be a separate cover installed on the container (e.g., a lid on a drum or a suitably secured tarp on a roll-off box) or may be an integral part of the container structural design (e.g., a ''portable tank'' or bulk cargo container equipped with a screw-type cap).

(iii) An open-top container in which an organic-vapor suppressing barrier is placed on or over the hazardous waste in the container such that no hazardous waste is exposed to the atmosphere. One example of such a barrier is application of a suitable organic-vapor suppressing foam.

(2) A container used to meet the requirements of paragraph (c)(1)(ii) or (c)(1)(iii) of this section shall be equipped with covers and closure devices, as applicable to the container, that are composed of suitable materials to minimize exposure of the hazardous waste to the atmosphere and to maintain the equipment integrity for as long as it is in service. Factors to be considered in selecting the materials of construction and designing the cover and closure devices shall include: Organic vapor permeability, the effects of contact with the hazardous waste or its vapor managed in the container; the effects of outdoor exposure of the closure device or cover material to wind, moisture, and sunlight; and the operating practices for which the container is intended to be used.

(3) Whenever a hazardous waste is in a container using Container Level 1 controls, the owner or operator shall install all covers and closure devices for the container, as applicable to the container, and secure and maintain each closure device in the closed position except as follows:

(i) Opening of a closure device or cover is allowed for the purpose of adding hazardous waste or other material to the container as follows:

(A) In the case when the container is filled to the intended final level in one continuous operation, the owner or operator shall promptly secure the closure devices in the closed position and install the covers, as applicable to the container, upon conclusion of the filling operation.

(B) In the case when discrete quantities or batches of material intermittently are added to the container over a period of time, the owner or operator shall promptly secure the closure devices in the closed position and install covers, as applicable to the container, upon either the container being filled to the intended final level; the completion of a batch loading after which no additional material will be added to the container within 15 minutes; the person performing the loading operation leaving the immediate vicinity of the container; or the shutdown of the process generating the material being added to the container, whichever condition occurs first.

(ii) Opening of a closure device or cover is allowed for the purpose of removing hazardous waste from the container as follows:

(A) For the purpose of meeting the requirements of this section, an empty container as defined in 40 CFR 261.7(b) may be open to the atmosphere at any time (i.e., covers and closure devices are not required to be secured in the closed position on an empty container).

(B) In the case when discrete quantities or batches of material are removed from the container but the container does not meet the conditions to be an empty container as defined in 40 CFR 261.7(b), the owner or operator shall promptly secure the closure devices in the closed position and install covers, as applicable to the container, upon the completion of a batch removal after which no additional material will be removed from the container within 15 minutes or the person performing the unloading operation leaves the immediate vicinity of the container, whichever condition occurs first.

(iii) Opening of a closure device or cover is allowed when access inside the container is needed to perform routine activities other than transfer of hazardous waste. Examples of such activities include those times when a worker needs to open a port to measure the depth of or sample the material in the container, or when a worker needs to open a manhole hatch to access equipment inside the container. Following completion of the activity, the owner or operator shall promptly secure the closure device in the closed position or reinstall the cover, as applicable to the container.

(iv) Opening of a spring-loaded, pressure-vacuum relief valve, conservation vent, or similar type of pressure relief device which vents to the atmosphere is allowed during normal operations for the purpose of maintaining the container internal pressure in accordance with the design specifications of the container. The device shall be designed to operate with no detectable organic emissions when the device is secured in the closed position. The settings at which the device opens shall be established such that the device remains in the closed position whenever the internal pressure of the container is within the internal pressure operating range determined by the owner or operator based on container manufacturer recommendations, applicable regulations, fire protection and prevention codes, standard engineering codes and practices, or other requirements for the safe handling of flammable, ignitable, explosive, reactive, or hazardous materials. Examples of normal operating conditions that may require these devices to open are during those times when the internal pressure of the container exceeds the internal pressure operating range for the container as a result of loading operations or diurnal ambient temperature fluctuations.

(v) Opening of a safety device, as defined in § 265.1081 of this subpart, is allowed at any time conditions require doing so to avoid an unsafe condition.

(4) The owner or operator of containers using Container Level 1 controls shall inspect the containers and their covers and closure devices as follows:

(i) In the case when a hazardous waste already is in the container at the time the owner or operator first accepts possession of the container at the facility and the container is not emptied (i.e., does not meet the conditions for an empty container as specified in 40 CFR 261.7(b)) within 24 hours after the container is accepted at the facility, the owner or operator shall visually inspect the container and its cover and closure devices to check for visible cracks, holes, gaps, or other open spaces into the interior of the container when the cover and closure devices are secured in the closed position. If a defect is detected, the owner or operator shall repair the defect in accordance with the requirements of paragraph (c)(4)(iii) of this section.

(ii) In the case when a container used for managing hazardous waste remains at the facility for a period of 1 year or more, the owner or operator shall visually inspect the container and its cover and closure devices initially and thereafter, at least once every 12 months, to check for visible cracks, holes, gaps, or other open spaces into the interior of the container when the cover and closure devices are secured in the closed position. If a defect is detected, the owner or operator shall repair the defect in accordance with the requirements of paragraph (c)(4)(iii) of this section.

(iii) When a defect is detected for the container, cover, or closure devices, the owner or operator shall make first

efforts at repair of the defect no later than 24 hours after detection, and repair shall be completed as soon as possible but no later than 5 calendar days after detection. If repair of a defect cannot be completed within 5 calendar days, then the hazardous waste shall be removed from the container and the container shall not be used to manage hazardous waste until the defect is repaired.

(5) The owner or operator shall maintain at the facility a copy of the procedure used to determine that containers with capacity of 0.46 m^3 or greater, which do not meet applicable DOT regulations as specified in paragraph (f) of this section, are not managing hazardous waste in light material service.

(d) Container Level 2 standards.

(1) A container using Container Level 2 controls is one of the following:

(i) A container that meets the applicable U.S. Department of Transportation (DOT) regulations on packaging hazardous materials for transportation as specified in paragraph (f) of this section.

(ii) A container that operates with no detectable organic emissions as defined in § 265.1081 of this subpart and determined in accordance with the procedure specified in paragraph (g) of this section.

(iii) A container that has been demonstrated within the preceding 12 months to be vapor-tight by using 40 CFR part 60, appendix A, Method 27 in accordance with the procedure specified in paragraph (h) of this section.

(2) Transfer of hazardous waste in or out of a container using Container Level 2 controls shall be conducted in such a manner as to minimize exposure of the hazardous waste to the atmosphere, to the extent practical, considering the physical properties of the hazardous waste and good engineering and safety practices for handling flammable, ignitable, explosive, reactive or other hazardous materials. Examples of container loading procedures that the EPA considers to meet the requirements of this paragraph include using any one of the following: A submerged-fill pipe or other submerged-fill method to load liquids into the container; a vapor-balancing system or a vapor-recovery system to collect and control the vapors displaced from the container during filling operations; or a fitted opening in the top of a container through which the hazardous waste is filled and subsequently purging the transfer line before removing it from the container opening.

(3) Whenever a hazardous waste is in a container using Container Level 2 controls, the owner or operator shall install all covers and closure devices for the container, and secure and maintain each closure device in the closed position except as follows:

(i) Opening of a closure device or cover is allowed for the purpose of adding hazardous waste or other material to the container as follows:

(A) In the case when the container is filled to the intended final level in one continuous operation, the owner or operator shall promptly secure the closure devices in the closed position and install the covers, as applicable to the container, upon conclusion of the filling operation.

(B) In the case when discrete quantities or batches of material intermittently are added to the container over a period of time, the owner or operator shall promptly secure the closure devices in the closed position and install covers, as applicable to the container, upon either the container being filled to the intended final level; the completion of a batch loading after which no additional material will be added to the container within 15 minutes; the person performing the loading operation leaving the immediate vicinity of the container; or the shutdown of the process generating the material being added to the container, whichever condition occurs first.

(ii) Opening of a closure device or cover is allowed for the purpose of removing hazardous waste from the container as follows:

(A) For the purpose of meeting the requirements of this section, an empty container as defined in 40 CFR 261.7(b) may be open to the atmosphere at any time (i.e., covers and closure devices are not required to be secured in the closed position on an empty container).

(B) In the case when discrete quantities or batches of material are removed from the container but the container does not meet the conditions to be an empty container as defined in 40 CFR 261.7(b), the owner or operator shall promptly secure the closure devices in the closed position and install covers, as applicable to the container, upon the completion of a batch removal after which no additional material will be removed from the container within 15 minutes or the person performing the unloading operation leaves the immediate vicinity of the container, whichever condition occurs first.

(iii) Opening of a closure device or cover is allowed when access inside the container is needed to perform routine activities other than transfer of hazardous waste. Examples of such activities include those times when a worker needs to open a port to measure the depth of or sample the material in the container, or when a worker needs to open a manhole hatch to access equipment inside the container. Following completion of the activity, the owner or operator shall promptly secure the closure device in the closed position or reinstall the cover, as applicable to the container.

(iv) Opening of a spring-loaded, pressure-vacuum relief valve, conservation vent, or similar type of pressure relief device which vents to the atmosphere is allowed during normal operations for the purpose of maintaining the internal pressure of the container in accordance with the container design specifications. The device shall be designed to operate with no detectable organic emission when the device is secured in the closed position. The settings at which the device opens shall be established such that the device remains in the closed position whenever the internal pressure of the container is within the internal pressure operating range determined by the owner or operator based on container manufacturer recommendations, applicable regulations, fire protection and prevention codes, standard engineering codes and practices, or other requirements for the safe handling of flammable, ignitable, explosive, reactive, or hazardous materials. Examples of normal operating conditions that may require these devices to open are during those times when the internal pressure of the container exceeds the internal pressure operating range for the container as a result of loading operations or diurnal ambient temperature fluctuations.

(v) Opening of a safety device, as defined in § 265.1081 of this subpart, is allowed at any time conditions require doing so to avoid an unsafe condition.

(4) The owner or operator of containers using Container Level 2 controls shall inspect the containers and their covers and closure devices as follows:

(i) In the case when a hazardous waste already is in the container at the time the owner or operator first accepts possession of the container at the facility and the container is not emptied (i.e., does not meet the conditions for an empty container as specified in 40 CFR 261.7(b)) within 24 hours after the container arrives at the facility, the owner or operator shall visually inspect the container and its cover and closure devices to check for visible cracks, holes, gaps, or other open spaces into the interior of the container when the cover and closure devices are secured in the closed position. If a defect is

detected, the owner or operator shall repair the defect in accordance with the requirements of paragraph (d)(4)(iii) of this section.

(ii) In the case when a container used for managing hazardous waste remains at the facility for a period of 1 year or more, the owner or operator shall visually inspect the container and its cover and closure devices initially and thereafter, at least once every 12 months, to check for visible cracks, holes, gaps, or other open spaces into the interior of the container when the cover and closure devices are secured in the closed position. If a defect is detected, the owner or operator shall repair the defect in accordance with the requirements of paragraph (d)(4)(iii) of this section.

(iii) When a defect is detected for the container, cover, or closure devices, the owner or operator shall make first efforts at repair of the defect no later than 24 hours after detection, and repair shall be completed as soon as possible but no later than 5 calendar days after detection. If repair of a defect cannot be completed within 5 calendar days, then the hazardous waste shall be removed from the container and the container shall not be used to manage hazardous waste until the defect is repaired.

(e) Container Level 3 standards.

(1) A container using Container Level 3 controls is one of the following:

(i) A container that is vented directly through a closed-vent system to a control device in accordance with the requirements of paragraph (e)(2)(ii) of this section.

(ii) A container that is vented inside an enclosure which is exhausted through a closed-vent system to a control device in accordance with the requirements of paragraphs (e)(2)(i) and (e)(2)(ii) of this section.

(2) The owner or operator shall meet the following requirements, as applicable to the type of air emission control equipment selected by the owner or operator:

(i) The container enclosure shall be designed and operated in accordance with the criteria for a permanent total enclosure as specified in ''Procedure T—Criteria for and Verification of a Permanent or Temporary Total Enclosure'' under 40 CFR 52.741, appendix B. The enclosure may have permanent or temporary openings to allow worker access; passage of containers through the enclosure by conveyor or other mechanical means; entry of permanent mechanical or electrical equipment; or direct airflow into the enclosure. The owner or operator shall perform the verification procedure for the enclosure as specified in Section 5.0 to ''Procedure T—Criteria for and Verification of a Permanent or Temporary Total Enclosure'' initially when the enclosure is first installed and, thereafter, annually.

(ii) The closed-vent system and control device shall be designed and operated in accordance with the requirements of § 265.1088 of this subpart.

(3) Safety devices, as defined in § 265.1081 of this subpart, may be installed and operated as necessary on any container, enclosure, closed-vent system, or control device used to comply with the requirements of paragraph (e)(1) of this section.

(4) Owners and operators using Container Level 3 controls in accordance with the provisions of this subpart shall inspect and monitor the closed-vent systems and control devices as specified in § 265.1088 of this subpart.

(5) Owners and operators that use Container Level 3 controls in accordance with the provisions of this subpart shall prepare and maintain the records specified in § 265.1090(d) of this subpart.

(f) For the purpose of compliance with paragraph (c)(1)(i) or (d)(1)(i) of this section, containers shall be used that meet the applicable U.S. Department of Transportation (DOT) regulations on packaging hazardous materials for transportation as follows:

(1) The container meets the applicable requirements specified in 49 CFR part 178—Specifications for Packaging or 49 CFR part 179—Specifications for Tank Cars.

(2) Hazardous waste is managed in the container in accordance with the applicable requirements specified in 49 CFR part 107, subpart B—Exemptions; 49 CFR part 172—Hazardous Materials Table, Special Provisions, Hazardous Materials Communications, Emergency Response Information, and Training Requirements; 49 CFR part 173—Shippers—General Requirements for Shipments and Packages; and 49 CFR part 180—Continuing Qualification and Maintenance of Packagings.

(3) For the purpose of complying with this subpart, no exceptions to the 49 CFR part 178 or part 179 regulations are allowed except as provided for in paragraph (f)(4) of this section.

(4) For a lab pack that is managed in accordance with the requirements of 49 CFR part 178 for the purpose of complying with this subpart, an owner or operator may comply with the exceptions for combination packagings specified in 49 CFR 173.12(b).

(g) The owner or operator shall use the procedure specified in § 265.1084(d) of this subpart for determining a container operates with no detectable organic emissions for the purpose of complying with paragraph (d)(1)(ii) of this section.

(1) Each potential leak interface (i.e., a location where organic vapor leakage could occur) on the container, its cover, and associated closure devices, as applicable to the container, shall be checked. Potential leak interfaces that are associated with containers include, but are not limited to: The interface of the cover rim and the container wall; the periphery of any opening on the container or container cover and its associated closure device; and the sealing seat interface on a spring-loaded pressure-relief valve.

(2) The test shall be performed when the container is filled with a material having a volatile organic concentration representative of the range of volatile organic concentrations for the hazardous wastes expected to be managed in this type of container. During the test, the container cover and closure devices shall be secured in the closed position.

(h) Procedure for determining a container to be vapor-tight using Method 27 of 40 CFR part 60, appendix A for the purpose of complying with paragraph (d)(1)(iii) of this section.

(1) The test shall be performed in accordance with Method 27 of 40 CFR part 60, appendix A of this chapter.

(2) A pressure measurement device shall be used that has a precision of ±2.5 mm water and that is capable of measuring above the pressure at which the container is to be tested for vapor tightness.

(3) If the test results determined by Method 27 indicate that the container sustains a pressure change less than or equal to 750 Pascals within 5 minutes after it is pressurized to a minimum of 4,500 Pascals, then the container is determined to be vapor-tight.

45. Section 265.1088 is amended by revising paragraph (b)(3), adding paragraph (b)(4), revising paragraphs (c)(2), (c)(3)(ii), and (c)(5)(i) (D)–(E), and adding paragraph (c)(7) to read as follows:

§ 265.1088 Standards: Closed-vent systems and control devices.

* * * * *

(b) * * *

(3) In the case when the closed-vent system includes bypass devices that could be used to divert the gas or vapor stream to the atmosphere before entering the control device, each bypass device shall be equipped with either a flow indicator as specified in paragraph (b)(3)(i) of this section or a seal or

locking device as specified in paragraph (b)(3)(ii) of this section. For the purpose of complying with this paragraph, low leg drains, high point bleeds, analyzer vents, open-ended valves or lines, spring-loaded pressure relief valves, and other fittings used for safety purposes are not considered to be bypass devices.

(i) If a flow indicator is used to comply with paragraph (b)(3) of this section, the indicator shall be installed at the inlet to the bypass line used to divert gases and vapors from the closed-vent system to the atmosphere at a point upstream of the control device inlet. For this paragraph, a flow indicator means a device which indicates the presence of either gas or vapor flow in the bypass line.

(ii) If a seal or locking device is used to comply with paragraph (b)(3) of this section, the device shall be placed on the mechanism by which the bypass device position is controlled (e.g., valve handle, damper lever) when the bypass device is in the closed position such that the bypass device cannot be opened without breaking the seal or removing the lock. Examples of such devices include, but are not limited to, a car-seal or a lock-and-key configuration valve. The owner or operator shall visually inspect the seal or closure mechanism at least once every month to verify that the bypass mechanism is maintained in the closed position.

(4) The closed-vent system shall be inspected and monitored by the owner or operator in accordance with the procedure specified in 40 CFR 265.1033(k).

(c) * * *

(2) The owner or operator who elects to use a closed-vent system and control device to comply with the requirements of this section shall comply with the requirements specified in paragraphs (c)(2)(i) through (c)(2)(vi) of this section.

(i) Periods of planned routine maintenance of the control device, during which the control device does not meet the specifications of paragraphs (c)(1)(i), (c)(1)(ii), or (c)(1)(iii) of this section, as applicable, shall not exceed 240 hours per year.

(ii) The specifications and requirements in paragraphs (c)(1)(i), (c)(1)(ii), and (c)(1)(iii) of this section for control devices do not apply during periods of planned routine maintenance.

(iii) The specifications and requirements in paragraphs (c)(1)(i), (c)(1)(ii), and (c)(1)(iii) of this section for control devices do not apply during a control device system malfunction.

(iv) The owner or operator shall demonstrate compliance with the requirements of paragraph (c)(2)(i) of this section (i.e., planned routine maintenance of a control device, during which the control device does not meet the specifications of paragraphs (c)(1)(i), (c)(1)(ii), or (c)(1)(iii) of this section, as applicable, shall not exceed 240 hours per year) by recording the information specified in § 265.1090(e)(1)(v) of this subpart.

(v) The owner or operator shall correct control device system malfunctions as soon as practicable after their occurrence in order to minimize excess emissions of air pollutants.

(vi) The owner or operator shall operate the closed-vent system such that gases, vapors, and/or fumes are not actively vented to the control device during periods of planned maintenance or control device system malfunction (i.e., periods when the control device is not operating or not operating normally) except in cases when it is necessary to vent the gases, vapors, or fumes to avoid an unsafe condition or to implement malfunction corrective actions or planned maintenance actions.

* * * * *

(3) * * *

(i) * * *

(ii) All carbon removed from the control device shall be managed in accordance with the requirements of 40 CFR 265.1033(m).

* * * * *

(5) * * *

(i) * * *

(D) A boiler or industrial furnace burning hazardous waste for which the owner or operator has been issued a final permit under 40 CFR part 270 and has designed and operates the unit in accordance with the requirements of 40 CFR part 266, subpart H; or

(E) A boiler or industrial furnace burning hazardous waste for which the owner or operator has designed and operates in accordance with the interim status requirements of 40 CFR part 266, subpart H.

* * * * *

(7) The control device shall be inspected and monitored by the owner or operator in accordance with the procedures specified in 40 CFR 265.1033(f)(2) and 40 CFR 265.1033(k). The readings from each monitoring device required by 40 CFR 265.1033(f)(2) shall be inspected at least once each operating day to check control device operation. Any necessary corrective measures shall be immediately implemented to ensure the control device is operated in compliance with the requirements of this section.

46. Section 265.1089 is revised to read as follows:

§ 265.1089 Inspection and monitoring requirements.

(a) The owner or operator shall inspect and monitor air emission control equipment used to comply with this subpart in accordance with the applicable requirements specified in § 265.1085 through § 265.1088 of this subpart.

(b) The owner or operator shall develop and implement a written plan and schedule to perform the inspections and monitoring required by paragraph (a) of this section. The owner or operator shall incorporate this plan and schedule into the facility inspection plan required under 40 CFR 265.15.

47. Section 265.1090 is revised to read as follows:

§ 265.1090 Recordkeeping requirements.

(a) Each owner or operator of a facility subject to requirements in this subpart shall record and maintain the information specified in paragraphs (b) through (i) of this section, as applicable to the facility. Except for air emission control equipment design documentation and information required by paragraph (i) of this section, records required by this section shall be maintained in the operating record for a minimum of 3 years. Air emission control equipment design documentation shall be maintained in the operating record until the air emission control equipment is replaced or otherwise no longer in service. Information required by paragraph (i) of this section shall be maintained in the operating record for as long as the tank or container is not using air emission controls specified in §§ 264.1084 through 264.1087 of this subpart in accordance with the conditions specified in § 264.1084(d) of this subpart.

(b) The owner or operator of a tank using air emission controls in accordance with the requirements of § 265.1085 of this subpart shall prepare and maintain records for the tank that include the following information:

(1) For each tank using air emission controls in accordance with the requirements of § 265.1085 of this subpart, the owner or operator shall record:

(i) A tank identification number (or other unique identification description as selected by the owner or operator).

(ii) A record for each inspection required by § 265.1085 of this subpart that includes the following information:

(A) Date inspection was conducted.

(B) For each defect detected during the inspection, the following information: the location of the defect, a description of the defect, the date of

detection, and corrective action taken to repair the defect. In the event that repair of the defect is delayed in accordance with the provisions of § 265.1085 of this subpart, the owner or operator shall also record the reason for the delay and the date that completion of repair of the defect is expected.

(2) In addition to the information required by paragraph (b)(1) of this section, the owner or operator shall record the following information, as applicable to the tank:

(i) The owner or operator using a fixed roof to comply with the Tank Level 1 control requirements specified in § 265.1085(c) of this subpart shall prepare and maintain records for each determination for the maximum organic vapor pressure of the hazardous waste in the tank performed in accordance with the requirements of § 265.1085(c) of this subpart. The records shall include the date and time the samples were collected, the analysis method used, and the analysis results.

(ii) The owner or operator using an internal floating roof to comply with the Tank Level 2 control requirements specified in § 265.1085(e) of this subpart shall prepare and maintain documentation describing the floating roof design.

(iii) Owners and operators using an external floating roof to comply with the Tank Level 2 control requirements specified in § 265.1085(f) of this subpart shall prepare and maintain the following records:

(A) Documentation describing the floating roof design and the dimensions of the tank.

(B) Records for each seal gap inspection required by § 265.1085(f)(3) of this subpart describing the results of the seal gap measurements. The records shall include the date that the measurements were performed, the raw data obtained for the measurements, and the calculations of the total gap surface area. In the event that the seal gap measurements do not conform to the specifications in § 265.1085(f)(1) of this subpart, the records shall include a description of the repairs that were made, the date the repairs were made, and the date the tank was emptied, if necessary.

(iv) Each owner or operator using an enclosure to comply with the Tank Level 2 control requirements specified in § 265.1085(i) of this subpart shall prepare and maintain the following records:

(A) Records for the most recent set of calculations and measurements performed by the owner or operator to verify that the enclosure meets the criteria of a permanent total enclosure as specified in ''Procedure T—Criteria for and Verification of a Permanent or Temporary Total Enclosure'' under 40 CFR 52.741, appendix B.

(B) Records required for the closed-vent system and control device in accordance with the requirements of paragraph (e) of this section.

(c) The owner or operator of a surface impoundment using air emission controls in accordance with the requirements of § 265.1086 of this subpart shall prepare and maintain records for the surface impoundment that include the following information:

(1) A surface impoundment identification number (or other unique identification description as selected by the owner or operator).

(2) Documentation describing the floating membrane cover or cover design, as applicable to the surface impoundment, that includes information prepared by the owner or operator or provided by the cover manufacturer or vendor describing the cover design, and certification by the owner or operator that the cover meets the specifications listed in § 265.1086(c) of this subpart.

(3) A record for each inspection required by § 265.1086 of this subpart that includes the following information:

(i) Date inspection was conducted.

(ii) For each defect detected during the inspection the following information: The location of the defect, a description of the defect, the date of detection, and corrective action taken to repair the defect. In the event that repair of the defect is delayed in accordance with the provisions of § 265.1086(f) of this subpart, the owner or operator shall also record the reason for the delay and the date that completion of repair of the defect is expected.

(4) For a surface impoundment equipped with a cover and vented through a closed-vent system to a control device, the owner or operator shall prepare and maintain the records specified in paragraph (e) of this section.

(d) The owner or operator of containers using Container Level 3 air emission controls in accordance with the requirements of § 265.1087 of this subpart shall prepare and maintain records that include the following information:

(1) Records for the most recent set of calculations and measurements performed by the owner or operator to verify that the enclosure meets the criteria of a permanent total enclosure as specified in ''Procedure T—Criteria for and Verification of a Permanent or Temporary Total Enclosure'' under 40 CFR 52.741, appendix B.

(2) Records required for the closed-vent system and control device in accordance with the requirements of paragraph (e) of this section.

(e) The owner or operator using a closed-vent system and control device in accordance with the requirements of § 265.1088 of this subpart shall prepare and maintain records that include the following information:

(1) Documentation for the closed-vent system and control device that includes:

(i) Certification that is signed and dated by the owner or operator stating that the control device is designed to operate at the performance level documented by a design analysis as specified in paragraph (e)(1)(ii) of this section or by performance tests as specified in paragraph (e)(1)(iii) of this section when the tank, surface impoundment, or container is or would be operating at capacity or the highest level reasonably expected to occur.

(ii) If a design analysis is used, then design documentation as specified in 40 CFR 265.1035(b)(4). The documentation shall include information prepared by the owner or operator or provided by the control device manufacturer or vendor that describes the control device design in accordance with 40 CFR 265.1035(b)(4)(iii) and certification by the owner or operator that the control equipment meets the applicable specifications.

(iii) If performance tests are used, then a performance test plan as specified in 40 CFR 265.1035(b)(3) and all test results.

(iv) Information as required by 40 CFR 265.1035(c)(1) and 40 CFR 265.1035(c)(2), as applicable.

(v) An owner or operator shall record, on a semiannual basis, the information specified in paragraphs (e)(1)(v)(A) and (e)(1)(v)(B) of this section for those planned routine maintenance operations that would require the control device not to meet the requirements of § 265.1088 (c)(1)(i), (c)(1)(ii), or (c)(1)(iii) of this subpart, as applicable.

(A) A description of the planned routine maintenance that is anticipated to be performed for the control device during the next 6-month period. This description shall include the type of maintenance necessary, planned frequency of maintenance, and lengths of maintenance periods.

(B) A description of the planned routine maintenance that was performed for the control device during the previous 6-month period. This description shall include the type of maintenance performed and the total number of hours during those 6 months

that the control device did not meet the requirements of § 265.1088 (c)(1)(i), (c)(1)(ii), or (c)(1)(iii) of this subpart, as applicable, due to planned routine maintenance.

(vi) An owner or operator shall record the information specified in paragraphs (e)(1)(vi)(A) through (e)(1)(vi)(C) of this section for those unexpected control device system malfunctions that would require the control device not to meet the requirements of § 265.1088 (c)(1)(i), (c)(1)(ii), or (c)(1)(iii) of this subpart, as applicable.

(A) The occurrence and duration of each malfunction of the control device system.

(B) The duration of each period during a malfunction when gases, vapors, or fumes are vented from the waste management unit through the closed-vent system to the control device while the control device is not properly functioning.

(C) Actions taken during periods of malfunction to restore a malfunctioning control device to its normal or usual manner of operation.

(vii) Records of the management of carbon removed from a carbon adsorption system conducted in accordance with § 265.1088(c)(3)(ii) of this subpart.

(f) The owner or operator of a tank, surface impoundment, or container exempted from standards in accordance with the provisions of § 265.1083(c) of this subpart shall prepare and maintain the following records, as applicable:

(1) For tanks, surface impoundments, or containers exempted under the hazardous waste organic concentration conditions specified in § 265.1083 (c)(1) or (c)(2) of this subpart, the owner or operator shall record the information used for each waste determination (e.g., test results, measurements, calculations, and other documentation) in the facility operating log. If analysis results for waste samples are used for the waste determination, then the owner or operator shall record the date, time, and location that each waste sample is collected in accordance with applicable requirements of § 265.1084 of this subpart.

(2) For tanks, surface impoundments, or containers exempted under the provisions of § 265.1083(c)(2)(vii) or § 265.1083(c)(2)(viii) of this subpart, the owner or operator shall record the identification number for the incinerator, boiler, or industrial furnace in which the hazardous waste is treated.

(g) An owner or operator designating a cover as ''unsafe to inspect and monitor'' pursuant to § 265.1085(l) or § 265.1086(g) of this subpart shall record in a log that is kept in the facility operating record the following information: The identification numbers for waste management units with covers that are designated as ''unsafe to inspect and monitor,'' the explanation for each cover stating why the cover is unsafe to inspect and monitor, and the plan and schedule for inspecting and monitoring each cover.

(h) The owner or operator of a facility that is subject to this subpart and to the control device standards in 40 CFR part 60, subpart VV, or 40 CFR part 61, subpart V, may elect to demonstrate compliance with the applicable sections of this subpart by documentation either pursuant to this subpart, or pursuant to the provisions of 40 CFR part 60, subpart VV or 40 CFR part 61, subpart V, to the extent that the documentation required by 40 CFR parts 60 or 61 duplicates the documentation required by this section.

(i) For each tank or container not using air emission controls specified in §§ 265.1085 through 265.1088 of this subpart in accordance with the conditions specified in § 265.1080(d) of this subpart, the owner or operator shall record and maintain the following information:

(1) A list of the individual organic peroxide compounds manufactured at the facility that meet the conditions specified in § 265.1080(d)(1).

(2) A description of how the hazardous waste containing the organic peroxide compounds identified in paragraph (i)(1) of this section are managed at the facility in tanks and containers. This description shall include the following information:

(i) For the tanks used at the facility to manage this hazardous waste, sufficient information shall be provided to describe for each tank: A facility identification number for the tank; the purpose and placement of this tank in the management train of this hazardous waste; and the procedures used to ultimately dispose of the hazardous waste managed in the tanks.

(ii) For containers used at the facility to manage these hazardous wastes, sufficient information shall be provided to describe: A facility identification number for the container or group of containers; the purpose and placement of this container, or group of containers, in the management train of this hazardous waste; and the procedures used to ultimately dispose of the hazardous waste handled in the containers.

(3) An explanation of why managing the hazardous waste containing the organic peroxide compounds identified in paragraph (i)(1) of this section in the tanks and containers as described in paragraph (i)(2) of this section would create an undue safety hazard if the air emission controls, as required under §§ 265.1085 through 265.1088 of this subpart, are installed and operated on these waste management units. This explanation shall include the following information:

(i) For tanks used at the facility to manage these hazardous wastes, sufficient information shall be provided to explain: How use of the required air emission controls on the tanks would affect the tank design features and facility operating procedures currently used to prevent an undue safety hazard during the management of this hazardous waste in the tanks; and why installation of safety devices on the required air emission controls, as allowed under this subpart, will not address those situations in which evacuation of tanks equipped with these air emission controls is necessary and consistent with good engineering and safety practices for handling organic peroxides.

(ii) For containers used at the facility to manage these hazardous wastes, sufficient information shall be provided to explain: How use of the required air emission controls on the containers would affect the container design features and handling procedures currently used to prevent an undue safety hazard during the management of this hazardous waste in the containers; and why installation of safety devices on the required air emission controls, as allowed under this subpart, will not address those situations in which evacuation of containers equipped with these air emission controls is necessary and consistent with good engineering and safety practices for handling organic peroxides.

§ 265.1091 [Removed and reserved]

48. Part 265 is amended by removing and reserving § 265.1091.

49. Part 265 is amended by adding Appendix VI to read as follows:

APPENDIX VI TO PART 265.—COMPOUNDS WITH HENRY'S LAW CONSTANT LESS THAN 0.1 Y/X

[At 25 degrees Celsius]

Compound name	CAS No.
TRICHLORO(1,1,2)TRIFLUORO	
FORMALDEHYDE	50–00–0
HYDROCYANIC ACID	74–90–8

PART 270—EPA ADMINISTERED PERMIT PROGRAMS: THE HAZARDOUS WASTE MANAGEMENT PROGRAM

50. The authority citation for Part 270 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912, 6925, 6927, 6939, and 6974.

Subpart B—Permit Application

51. Section 270.14 is amended by revising paragraph (b)(5) to read as follows:

§ 270.14 Contents of Part B: General requirements.

* * * * *

(b) * * *

(5) A copy of the general inspection schedule required by § 264.15(b). Include where applicable, as part of the inspection schedule, specific requirements in §§ 264.174, 245.193(i), 264.195, 264.226, 264.254, 264.273, 264.303, 264.602, 264.1033, 264.1052, 264.1053, 264.1058, 264.1084, 264.1085, 264.1086, and 264.1088.

* * * * *

52. Section 270.27 is revised to read as follows:

§ 270.27 Specific Part B information requirements for air emission controls for tanks, surface impoundments, and containers.

(a) Except as otherwise provided in 40 CFR 264.1, owners and operators of tanks, surface impoundments, or containers that use air emission controls in accordance with the requirements of 40 CFR part 264, subpart CC shall provide the following additional information:

(1) Documentation for each floating roof cover installed on a tank subject to 40 CFR 264.1084(d)(1) or 40 CFR 264.1084(d)(2) that includes information prepared by the owner or operator or provided by the cover manufacturer or vendor describing the cover design, and certification by the owner or operator that the cover meets the applicable design specifications as listed in 40 CFR 264.1084(e)(1) or 40 CFR 264.1084(f)(1).

(2) Identification of each container area subject to the requirements of 40 CFR part 264, subpart CC and certification by the owner or operator that the requirements of this subpart are met.

(3) Documentation for each enclosure used to control air pollutant emissions from tanks or containers in accordance with the requirements of 40 CFR 264.1084(d)(5) or 40 CFR 264.1086(e)(1)(ii) that includes records for the most recent set of calculations and measurements performed by the owner or operator to verify that the enclosure meets the criteria of a permanent total enclosure as specified in ''Procedure T—Criteria for and Verification of a Permanent or Temporary Total Enclosure'' under 40 CFR 52.741, appendix B.

(4) Documentation for each floating membrane cover installed on a surface impoundment in accordance with the requirements of 40 CFR 264.1085(c) that includes information prepared by the owner or operator or provided by the cover manufacturer or vendor describing the cover design, and certification by the owner or operator that the cover meets the specifications listed in 40 CFR 264.1085(c)(1).

(5) Documentation for each closed-vent system and control device installed in accordance with the requirements of 40 CFR 264.1087 that includes design and performance information as specified in § 270.24 (c) and (d) of this part.

(6) An emission monitoring plan for both Method 21 in 40 CFR part 60, appendix A and control device monitoring methods. This plan shall include the following information: monitoring point(s), monitoring methods for control devices, monitoring frequency, procedures for documenting exceedances, and procedures for mitigating noncompliances.

(7) When an owner or operator of a facility subject to 40 CFR part 265, subpart CC cannot comply with 40 CFR part 264, subpart CC by the date of permit issuance, the schedule of implementation required under 40 CFR 265.1082.

PART 271—REQUIREMENTS FOR AUTHORIZATION OF STATE HAZARDOUS WASTE PROGRAMS

53. The authority citation for part 271 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), and 6926.

Subpart A—Requirements for Final Authorization

54. Section 271.1(j) is amended by revising the effective date of the following entry in Table 1 to read as follows:

Hazardous Waste Treatment, Storage, and Disposal Facilities and Hazardous Waste Generators; Organic Air Emission Standards for Tanks, Surface Impoundments, and Containers

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: Under the authority of the Resource Conservation and Recovery Act (RCRA), as amended, the EPA is promulgating air standards that will further reduce organic emissions from hazardous waste management activities. The air standards apply to owners and operators of hazardous waste treatment, storage, and disposal facilities (TSDF) subject to RCRA subtitle C permitting requirements and to certain hazardous waste generators accumulating waste on-site in RCRA permitexempt tanks and containers. Under these standards, air emission controls must be used for tanks, surface impoundments, and containers in which hazardous waste is placed on or after June 5, 1995 except under certain conditions specified in the rule. Air emission control requirements are also added to the RCRA permit terms and provisions specified for TSDF miscellaneous units. In addition, this action establishes a new EPA reference test method (Method 25E) to determine the organic vapor pressure of a waste.

EFFECTIVE DATE: The final rule is effective as of June 5, 1995. The EPA has specified in the final rule a schedule that establishes the compliance dates by which different requirements of the rule must be met. These compliance dates and requirements are explained further under SUPPLEMENTARY INFORMATION.
The incorporation by reference of certain publications listed in the regulations is approved by the Director of the Federal Register as of June 5, 1995.

ADDRESSES: Background information document. The background information document (BID) for the final rule may be obtained from the U.S. EPA Library (MD-35), Research Triangle Park, North Carolina 27711, telephone (919) 541-2777. Please refer to ``Hazardous Waste Treatment, Storage, and Disposal Facilities (TSDF)--Background Information for Promulgated Organic Air Emission Standards for Tanks, Surface Impoundments, and Containers'', EPA document number EPA-453/R-94-076b. This document and the BID are also available on the EPA's Clean-up Information Bulletin Board (CLU-IN). To access CLU-IN with a modem of up to 28,800 baud, dial (301) 589-8366.

First-time users will be asked to input some initial registration information. Next, select ``D'' (download) from the main menu. Input the file name ``RCRAAIR1.ZIP'' to download this notice. Input the file name ``RCRAAIR2.ZIP'' to download the BID. Follow the on-line instructions to complete the download. More information about the download procedure is located in Bulletin 104; to read this type ``B 104'' from the main menu. For additional help with these instructions, telephone the CLU-IN help line at (301) 589-8368. Docket. The supporting information used for this rulemaking is available for public inspection and copying in the RCRA docket. The RCRA docket numbers pertaining to this rulemaking are F-91-CESP-FFFFF, F-92-CESA-FFFFF, F-94-CESF-FFFFF, and F-94-CE2A-FFFFF. The RCRA docket is located at the EPA RCRA Docket Office (5305) in room 2616 of the U.S. Environmental Protection Agency, 401 M Street SW, Washington, DC 20460.

FOR FURTHER INFORMATION CONTACT:
The RCRA Hotline, toll-free at (800) 424-9346. For further information on the specific air standards and test method promulgated by this action, contact Ms. Michele Aston, Emission Standards Division (MD-13), Office of Air Quality Planning and Standards, U.S. Environmental Protection Agency, Research Triangle Park, North Carolina 27711, telephone number (919) 541-2363.

SUPPLEMENTARY INFORMATION: The information presented in this preamble is organized as follows:

I. Compliance Dates

The final rule promulgated today establishes additional air standards for TSDF owners and operators subject to 40 CFR part 264 or 40 CFR part 265. In addition, this rule amends the conditions for hazardous waste generators accumulating waste on-site in RCRA permitexempt tanks and containers pursuant to 40 CFR 262.34(a) to include air emission control requirements. All of these rule requirements are effective as of June 5, 1995. All hazardous waste placed in the affected tanks, surface impoundments, containers, and other affected units on and after this date must be managed in accordance with the requirements of the final rule. This includes implementing the required air emission controls on an affected unit or performing the required waste determinations and recordkeeping to indicate that the affected unit is exempted from these air emission control requirements. Under circumstances when the air emission control equipment required to comply with the rule cannot be operational at an existing TSDF by June 5, 1995, an implementation schedule for installation of the equipment must be developed and placed in the facility operating records no later than June 5, 1995. In such cases, the facility owner or operator must have all air emission controls required by the final rule in operation no later than December 8, 1997.
Today's action amends 40 CFR 270.4 to require that owners and operators of TSDF for which a final permit has been issued by the EPA prior to June 5, 1995 must comply with the air emission control requirements for interim-status TSDF under 40 CFR 265 subparts AA, BB, and CC until the facility's permit is reviewed or reissued by the EPA. The EPA's rationale for adopting this implementation practice for today's rulemaking is explained in section VI.E of this preamble. For tanks in which waste stabilization activities (sometimes referred to as waste fixation) are performed as of December 6, 1994, be the effective date of the final rules will December 6, 1995. As of the extended effective date for stabilization tanks, each TSDF owner or operator and each hazardous waste generator subject to the final rules must either install and operate the specified air emission control requirements on all affected tanks used for stabilization, or begin performing the specified waste determinations and recordkeeping to indicate that a stabilization tank is exempted from these requirements. Under circumstances where required air emission control equipment cannot be operational on stabilization tanks by December 6, 1995, an implementation schedule for installation of the required air emission controls must be developed and placed in the facility operating records no later than December 6, 1995.
In such cases, for stabilization tanks, the facility must have all air emission controls required by the final rules in operation no later than June 8, 1998.

II. Summary of Rule Changes Since Proposal

The EPA proposed the rule on July 22, 1991 (refer to 56 FR 33491). Based on public comments received by the EPA at proposal as well as the EPA's evaluation of additional information obtained after proposal, certain requirements of the rulemaking have been changed from those proposed. The major changes affect provisions establishing the rule applicability, the procedures for determining the average volatile organic concentration of a waste, and the air emission control requirements for containers. In addition, the EPA has made many changes to the specific regulatory text to clarify the EPA's intent in the application and implementation of the rule requirements. The substantive changes to the rulemaking since proposal are summarized below. A summary of the requirements of the rule as promulgated is presented in section VII of this preamble.

A. TSDF Tanks, Surface Impoundments, and Containers

A new subpart CC is added by today's action to both 40 CFR parts 264 and

265. Subpart CC under 40 CFR part 264 applies to owners and operators of permitted TSDF while subpart CC under 40 CFR part 265 applies to owners and operators of interim-status TSDF. All changes since proposal to subpart CC in 40 CFR part 264 and to subpart CC in 40 CFR part 265 are identical with the exception of changes to the rule reporting requirements. There are no reporting requirements under 40 CFR 265 subpart CC for owners and operators of interim-status TSDF. Hereafter for convenience in this preamble, the term ``subpart CC standards'' is used collectively to refer to both subpart CC in 40 CFR part 264 and subpart CC in 40 CFR part 265. The compliance time for the subpart CC standards has been revised since proposal to allow up to an additional 30 months after June 5, 1995 to install and begin operation of air emission control equipment required by the rule provided that the owner or operator develops and places in the facility operating records by this date an implementation schedule for installation of the equipment. Compliance dates and implementation requirements for the final rule are explained in sections I and VIII of this preamble.

1. Applicability
   The applicability of the subpart CC standards has been revised since proposal to specifically exempt from the rule certain tanks surface impoundments, and containers in which the owner or operator has stopped adding hazardous waste. The subpart CC standards do not apply to a tank, surface impoundment, or container that meets either of the following conditions:
   (1) No hazardous waste is added to the waste management unit on or after June 5, 1995 (see generally 55 FR 39409, September 27, 1990); or
   (2) Addition to hazardous waste to the waste management unit is stopped and the owner or operator has begun implementing or completed closure pursuant to an approved closure plan. In addition, the applicability of the subpart CC standards has been changed such that the rule is not applicable to any container having a design capacity less than 0.1 m\3\ (approximately 26 gallons) regardless of the organic content of the hazardous waste handled in the container. In response to comments on the proposed rule, the EPA reviewed the types of small containers commonly used to accumulate and transfer hazardous waste. Considering the small quantity of hazardous waste handled in a sample collection vial, safety can, disposal can, and other types of small containers and the short periods of time that the waste normally remains in one of these containers, the EPA concluded that existing rules for containers having a design capacity less than 0.1 m\3\ are sufficient to protect human health and the environment.
   Finally, the EPA has decided to temporarily defer application of the subpart CC standards to tanks, surface impoundments, and containers managing hazardous wastes under certain special circumstances. For now, the EPA is deferring application of the subpart CC standards to waste management units that are used solely to treat or store hazardous wastes generated on-site from remedial activities required under RCRA corrective action or CERCLA response authorities (or similar State remediation authorities). Also, the EPA is deferring application of the subpart CC standards to waste management units that are used solely to manage radioactive mixed wastes. The EPA's rationale for these deferrals is explained in section VIII.A.1 of this preamble.
2. General Standards
   For each tank, surface impoundment, or container to which the subpart CC standards apply (referred to here as an ``affected unit''), the owner or operator is required to use the air emission controls specified in the rule except when the hazardous waste placed in an affected unit meets certain conditions. As explained in the following paragraphs, the conditions under which an affected unit is exempted from the air emission control requirements of the subpart CC standards have been revised since proposal.
   a. Waste volatile organic concentration exemption. Under the final

subpart CC standards, an affected unit is exempt from the air emission control requirements of the rule if all hazardous waste placed in the unit is determined to have an average volatile organic concentration less than 100 parts per million by weight (ppmw) based on the organic composition of the hazardous waste at the point of waste origination. This waste volatile organic concentration limit incorporates several revisions that have been made by the EPA since proposal. First, the format for the limit has been changed to be the average volatile organic concentration of the hazardous waste on a massweighted basis during normal operating conditions for the source or process generating the waste (in contrast to the proposed format of the maximum volatile organic concentration for the hazardous waste never to be exceeded). Averaging periods up to 1 year in duration are allowed for each individual waste stream under the final rule. The procedures for determining the average volatile organic concentration of a waste are explained further under ``Waste Determination Procedures'' in this section and in section VII.A.3 of this preamble. Second, determination of the volatile organic concentration of the waste under the final rule is based on the organic composition of the waste at the ``point of waste origination'' (instead of the ``point of waste generation'' as proposed). The ``point of waste origination'' is defined in the final rule with respect to the point where the TSDF owner or operator first has possession of a hazardous waste. When the TSDF owner or operator is the generator of the hazardous waste, the ``point of waste origination'' means the point where a solid waste produced by a system, process, or waste management unit is determined to be a hazardous waste as defined in 40 CFR part 261. In this case, this term is being used in a similar manner to the use of the term ``point of generation'' in waste operations air standards established under authority of the Clean Air Act in 40 CFR parts 60, 61, and 63 of this chapter. When neither the TSDF owner nor operator is the generator of the hazardous waste, the ``point of waste origination'' means the point where the owner or operator accepts delivery or takes possession of the hazardous waste.

Finally, the EPA revised the impact analysis used for this rulemaking after proposal to incorporate additional TSDF industry data. An opportunity for public comment on this analysis was provided by the EPA (refer to sections III.B and VI.B of this preamble). Based on the revised analysis results, the EPA selected a new value for the volatile organic concentration limit. Section V.C of this preamble presents the rationale for the selection of the control option used as the basis for the final rule.

b. Treated hazardous waste exemption. Under the subpart CC standards, each affected tank, surface impoundment, and container that manages hazardous waste having an average volatile organic concentration equal to or greater than 100 ppmw, as determined by the procedures specified in the rule, is required to use air emission controls in accordance with the rule requirements. The owner or operator must install and operate the specified air emission controls on every affected tank, surface impoundment, and container used in the waste management sequence from the point of waste origination (as applies to the specific hazardous waste stream) through the point where the organics in the waste are removed or destroyed by a process in accordance with the requirements of the rule. If a particular hazardous waste is not treated to meet these requirements, then all affected units at the TSDF used in the waste management sequence for this hazardous waste are required to use the air emission controls specified by the subpart CC standards.

If the hazardous waste is treated to remove or destroy the organics in the waste by a process that meets or exceeds a minimum level of performance as specified in the rule, then affected units at the TSDF operated downstream of the treatment process in the waste management sequence for this hazardous waste are not required to use the air

emission controls specified by the subpart CC standards. It is important to emphasize that tanks, surface impoundments, and containers (subject to the rule) in which the treatment process is conducted are required to use the applicable air emission controls specified by the subpart CC standards with the exception of certain tanks and surface impoundments used for active biological treatment of hazardous waste and achieving the performance requirements specified in the rule (this exception is explained further in section VII.A.4 of this preamble). The conditions under which a treated hazardous waste no longer is required to be managed in affected units using air emission controls under the subpart CC standards have been revised and expanded since proposal to include many alternatives from which an owner or operator can choose one with which to comply. The final subpart CC standards allow an owner or operator to use any type of treatment process that can continuously achieve one of the specified sets of performance conditions. These conditions have been changed to include: (1) The average volatile organic concentration of the hazardous waste exiting the process is less than 100 ppmw (except for certain site-specific situations where multiple hazardous waste streams are treated by a single process in which case a volatile organic concentration limit for the waste exiting the process is established by the rule procedures at a value lower than 100 ppmw); (2) The organic reduction efficiency for a process treating multiple hazardous waste streams is equal to or greater than 95 percent, and the average volatile organic concentration of the hazardous waste exiting the treatment process is less than 50 ppmw; or (3) The actual organic mass removal rate for the process is greater than the required mass removal rate established for the process. The alternative treatment process performance requirements specified in the final subpart CC standards are discussed further in section VII.A.2 of this preamble.

The proposed explicit exemption for hazardous wastes complying with the land disposal restriction (LDR) treatment standards is not included in the final subpart CC standards. The EPA concluded that the expanded number of alternatives for treated hazardous waste and other provisions added to the final rule provide a reasonable regulatory mechanism by which a TSDF owner or operator can determine whether a hazardous waste complying with the LDR treatment standards is exempted from being managed in accordance with the air emission control requirements of the subpart CC standards.

3. Waste Determination Procedures

As already noted, the procedures that a TSDF owner or operator may use to determine the volatile organic concentration of a hazardous waste have been revised for the final subpart CC standards. For a case when direct measurement is chosen for determining the volatile organic concentration of a hazardous waste, the proposed statistical calculation procedure using Method 25D results is not included in the final subpart CC standards. Instead, procedures are specified in the final rule to compute the mass-weighted average volatile organic concentration of a hazardous waste using Method 25D results for waste generated as part of a continuous process and for waste generated as part of a batch process. Under circumstances when the same batch process is performed repeatedly but not necessarily continuously, the final rule allows the owner or operator to determine the average volatile organic concentration of the waste from this process by averaging results for one or more representative waste batches generated by the process. In all cases, a sufficient number of waste samples for analysis (with a minimum of four samples) must be collected to be representative of the normal range of the operating conditions for the source or process generating the hazardous waste. Normal operating conditions for the source or process generating the waste include cyclic process operations such as startup and shutdown. Process malfunctions, maintenance activities, or equipment cleaning

are not considered to be normal operating conditions for the purpose of determining the average volatile organic concentration of a waste. These waste determination procedures are discussed further in section VII.A.3 of this preamble.
The proposed explicit requirements for determining the volatile organic concentration of a hazardous waste using information in a waste certification notice prepared by the waste generator are not included in the final rule. Instead, for hazardous waste that is not generated by the TSDF owner or operator (i.e., waste shipped to the TSDF from off-site sources under different ownership), the final rule allows the TSDF owner or operator to determine the waste volatile organic concentration by either testing the waste when he or she accepts delivery of the hazardous waste or using appropriate information about the waste composition that is prepared by the generator of the waste. The generator prepared information can be included in manifests, shipping papers, or waste certification notices accompanying the waste shipment, as agreed upon between the waste generator and the TSDF owner or operator.

4. Tank Standards
Several changes to the tank standards have been made since proposal. An exemption from the tank standards has been added for those affected tanks used for biological treatment of a hazardous waste in accordance with requirements specified in the rule. Changes have been made to clarify the regulatory text regarding the tank cover design and operating requirements. Also, the conditions have been clarified that must be met for a particular tank to use a fixed-roof type cover without any additional controls in accordance with the subpart CC standards. Finally, provisions have been added to the rule to address those special situations in which emergency venting of the tank or the air emission controls installed on the tank is necessary for safety.
5. Surface Impoundment Standards
Changes to the surface impoundments standards have been made to be consistent with the changes to the tank standards as applicable.
6. Container Standards
Several changes have been made to the container standards since proposal in addition to limiting the applicability of the subpart CC standards to containers having a design capacity equal to or greater than 0.1 m\3\. The air emission control requirements for affected containers have been revised to provide several air emission control alternatives from which an owner or operator may choose one with which to comply. For containers having a design capacity less than or equal to 0.46 m\3\ (approximately 119 gallons), an owner or operator may place the hazardous waste in drums that meet U.S. Department of Transportation (DOT) specifications under 49 CFR part 178 without any additional testing, inspection, or monitoring requirements. An owner or operator is also allowed under the final rule to place the hazardous waste in tank trucks and tank railcars that are annually demonstrated to be vapor tight using Method 27 in 40 CFR part 60, appendix A without any additional testing, inspection, or monitoring requirements. The requirements for waste transfer operations for containers have been revised under the final subpart CC standards. Submerged-fill of hazardous waste that is loaded into containers by pumping is required only when transferring the waste into containers having a design capacity greater than 0.46 m\3\. Submerged fill of the waste is not required when filling smaller size containers such as 55-gallon drums. The air emission control requirements for owners and operators treating hazardous waste in open containers have been revised. Whenever it is necessary for the container to be open during the treatment process, the container is required to be located in an enclosure connected to a closed-vent system with an operating organic emission control device. The final subpart CC standards include specific enclosure design and operation requirements which allow the enclosure to have permanent openings for worker access. Finally, the

container standards have been revised to be consistent with the safety venting provisions added to the tank and surface impoundment standards.

7. Closed-Vent System and Control Device Standards The design and operating requirements for closed-vent systems and control devices have been changed to be consistent with those requirements already applicable to TSDF owners and operators under subpart AA in 40 CFR parts 264 and 265. The subpart AA standards have been in effect since 1990 and establish RCRA air standards to control organic emissions from process vents on certain types of hazardous waste treatment units.
8. Inspection and Monitoring Requirements The inspection and monitoring requirements under the subpart CC standards have been revised since proposal. The requirements for inspection and monitoring of closed-vent systems and control devices have been changed to be identical to the inspection and monitoring requirements under subpart AA in 40 CFR parts 264 and 265. The required interval for the visual inspection of covers installed on tanks, surface impoundments, and certain containers has been changed to once every 6 months. After the initial cover inspection and monitoring for detectable organic emissions is completed, the owner or operator is only required to inspect and monitor those cover openings that have been opened (i.e., have not continuously remained in a closed, sealed position) since the last visual inspection and monitoring. Special inspection and monitoring provisions have been added for cover fittings that are unsafe or difficult, as defined in the rule, for facility personnel to inspect and monitor.
   The subpart CC standards have been changed to allow leak repair on tank and surface impoundment covers to be delayed beyond 15 calendar days if both of the following conditions occur: (1) Repair of the leak requires first emptying the contents of the tank or surface impoundment; and (2) temporary removal of the tank or surface impoundment from service will result in the unscheduled cessation of production from the process unit, or operation of the waste management unit, that is generating the hazardous waste managed in the tank or surface impoundment. Repair of a leak must be performed at the next time the process, system, or waste management unit that is generating the hazardous waste managed in the tank or surface impoundment stops operation for any reason.
9. Recordkeeping Requirements
   The subpart CC standards have been changed to require cover design documentation only for floating roof-type tank covers, surface impoundment covers, and enclosures used for control of air emissions from containers. Also, the recordkeeping requirements have been revised as appropriate to address the changes to the final rule described previously in this section of the preamble.
10. Reporting Requirements
    The reporting requirements in the subpart CC standards are the same as proposed with one exception. The time interval within which TSDF owners and operators subject to the subpart CC standards under 40 CFR part 264 must report to the Regional Administrator all circumstances resulting in noncompliance with the applicable conditions has been changed to within 15 calendar days of the time that an owner or operator becomes aware of the circumstances.

B. TSDF Miscellaneous Units

Today's action amends 40 CFR 264.601 by adding to the permit terms and provisions required for RCRA permitting of a miscellaneous unit the appropriate air emission control requirements in 40 CFR part 264, subparts AA, BB, and CC. This amendment is the same as proposed.

C. Generator 90-Day Tanks and Containers

The conditions with which a hazardous waste generator must comply, pursuant to 40 CFR 262.34(a), to exempt tanks and containers accumulating hazardous waste on-site for no more than 90 days from the RCRA subtitle C permitting requirements are amended by today's action to include compliance with the air emission control requirements of 40 CFR part 265, subparts AA, BB, and CC. This amendment is the same as proposed.

D. Other RCRA Regulatory Actions

The EPA proposed several amendments to existing RCRA air standards. One amendment proposed adding requirements for the management of spent carbon removed from a carbon adsorption system to the closed-vent system and control device standards under 40 CFR part 264, subparts AA and BB, and 40 CFR part 265, subparts AA and BB. The final amendment has been revised to allow the owner or operator the additional option of burning the spent carbon in a boiler or industrial furnace that is permitted under subpart H of 40 CFR part 266. A second amendment promulgated today updates the leak detection monitoring provisions under 40 CFR part 264, subparts AA and BB, and 40 CFR part 265, subparts AA and BB for closed-vent systems to be consistent with other air standards recently promulgated by the EPA. Under this amendment, annual leak detection monitoring is not required for those closed-vent system components which continuously operate in vacuum service or those closed-vent system joints, seams, or other connections that are permanently or semi-permanently sealed (e.g., a welded joint between two sections of metal pipe, a bolted and gasketed pipe flange).

E. Test Methods

As part of this rulemaking, the EPA proposed two new reference test methods (Method 25D and Method 25E) to be added to 40 CFR part 60, Appendix A. Method 25D is a test method for the determination of the volatile organic concentration of waste materials. Since proposal, the EPA decided it is also appropriate to use method 25D to implement other EPA air standards being developed under authority of the Clean Air Act. The promulgation of some of these other air standards prior to today's action required the EPA to promulgate Method 25D in a separate rulemaking (refer to 59 FR 19402, April 22, 1994). Comments and responses relevant to Method 25D for this rulemaking are in the BID for the final rule and in the dockets pertaining to this rulemaking. Method 25E is being promulgated today. Method 25E is the test method for determining the organic vapor pressure of wastes. The sampling requirements for Method 25E have been revised since proposal to provide for sampling of the waste in a tank.

III. Summary of Final Rule Impacts

The EPA estimates that implementation of the subpart CC standards will reduce nationwide organic emissions from TSDF tanks, surface impoundments, and containers by approximately 970,000 Mg/yr. In addition, the EPA estimates that nationwide organic emissions from 90- day tanks and containers will be reduced by approximately 73,000 Mg/yr. Control of organic air emissions addresses many air quality problems including ambient ozone formation, adverse human health effects from inhalation of air toxics, and, to a lesser extent, depletion of stratospheric ozone. Ambient ozone concentrations exceed the National Ambient Air Quality Standards (NAAQS) in many metropolitan areas throughout the United States. Thus, the rule promulgated today will contribute to progress in attaining the NAAQS for ozone in nonattainment areas and also in preventing significant deterioration of the air quality in those areas of the United States currently in attainment with the NAAQS for ozone.
Today's action will also significantly reduce the risk to the public of contracting cancer posed by exposure to toxic constituents contained in the organic emissions from hazardous waste management activities. The cancer

risk to the entire exposed population nationwide (i.e., annual cancer incidence) from exposure to organic emissions from TSDF is estimated by the EPA to be reduced from approximately 48 cases per year to a level of 2 cases per year. Annual cancer incidence as a result of exposure to organic emissions from 90-day tanks and containers is estimated by the EPA to be reduced from approximately four cases per year to less than one case per year. Maximum individual risk (MIR) is a measure of the added probability of a person contracting cancer if exposed continuously over a 70-year period to the highest annual average ambient concentration of the air toxics emitted from a TSDF site. There are approximately 2,300 TSDF locations in the United States. The MIR for all but approximately 20 of these facilities is estimated by the EPA to be reduced by implementation of the subpart CC standards to a level that is less than 1 x 10<difference>\4\. The target MIR levels historically used by the EPA for other promulgated RCRA standards range from 1 x 10<difference>\4\ to 1 x 10<difference>\6\. Because the MIR values for a few TSDF are estimated to remain higher than the historical RCRA target, the EPA is continuing to evaluate the waste management practices and the individual chemical compounds composing the organic emissions at these TSDF. Following this evaluation, the EPA will determine what other actions are necessary to attain the health-based goals of RCRA section 3004(n). The omnibus permitting authority in section 3005(c)(3) can be invoked to supplement or add to the requirements in today's rule, should the rule be determined to be insufficient to assure protection of human health and the environment at a particular facility.

The total nationwide capital investment cost to TSDF owners and operators to implement the subpart CC standards is estimated by the EPA to be approximately $290 million. The total nationwide annual cost for these standards is estimated to be approximately $110 million per year. The total nationwide capital costs to hazardous waste generators of installing the required air emission controls on 90-day tanks and containers is estimated by the EPA to be approximately $23 million. Total nationwide annual cost for the 90-day tank and container controls is estimated to be approximately $7 million. The EPA concludes that the rule promulgated today will not have a significant economic impact on hazardous waste generators or TSDF owners and operators. Prices for commercial hazardous waste management services are estimated by the EPA to increase by less than 1 percent on a nationwide annualized basis. The quantity of hazardous waste handled by commercial hazardous waste management companies is projected to be reduced by less than 1 percent on a nationwide annualized basis. Few, if any, facility closures are anticipated. Job losses in the hazardous waste industry are estimated to be less than 1.5 percent. Furthermore, this impact on employment does not reflect positive employment effects on industries producing the air emission control equipment that will be used to comply with the rule. No significant impacts are expected on small businesses.

IV. Background

A. Implementation of RCRA Section 3004(n)

The Hazardous and Solid Waste Amendments of 1984 added section 3004(n) to RCRA. Section 3004(n) directs the EPA to promulgate regulations for the monitoring and control of air emissions from TSDF as may be necessary to protect human health and the environment. The EPA completed the first phase of its regulatory development program to implement this Congressional directive with the promulgation of RCRA air standards that control organic emissions vented from certain hazardous waste treatment processes (i.e., distillation, fractionation, thin-film evaporation, solvent extraction, steam stripping, and air stripping) as well as from leaks in certain ancillary equipment used for hazardous waste management processes (55 FR 25454, June 21, 1990). Today's action completes the second phase of the EPA's regulatory development program with the promulgation of RCRA air standards for tanks, surface impoundments, containers, and miscellaneous

units operated at TSDF. This rulemaking also adds air emission control requirements for certain hazardous waste generators accumulating waste on-site in RCRA permit-exempt tanks and containers. As described at proposal (56 FR 33496, July 22, 1991), the EPA decided in both the first and second phases to develop standards that control organic emissions as a class (as opposed to constituent-byconstituent). Implementation of these nationwide standards will achieve significant organic emission and cancer risk reductions. However, the EPA estimates the cancer risk at a few TSDF after implementation of these nationwide standards to remain at a level that is higher than the range of target risk levels for other promulgated RCRA standards (refer to section V.C of this preamble.) The third phase of this regulatory development program is to determine what other actions are necessary to attain the health-based goals of RCRA section 3004(n). To make this determination, the EPA is evaluating hazardous waste operations at those individual TSDF estimated to have MIR values greater than the historical RCRA target MIR levels.

B. Public Participation in Rulemaking

The EPA is promulgating today's final rule after careful consideration of public comments on the proposed rule (56 FR 33491, July 22, 1991). The preamble to the proposed rule discussed the availability of the background information document (BID) pertaining to the health effects of organic emissions from hazardous waste TSDF using tanks, surface impoundments, and containers. The EPA mailed copies of the Federal Register notice and the BID for the proposed rule to industry representatives, environmental groups, and State and Federal agencies.
The EPA solicited comments from the public at the time of proposal and provided a 90-day comment period, from July 22, 1991 to October 21, 1991, for the public to prepare and submit written comments on the proposed rule. In addition, the EPA provided the opportunity for a public hearing to allow interested persons to present oral comments to the EPA concerning the proposed rule. However, no one requested that the EPA hold a public hearing on the proposed rule. The EPA did receive written comments from more than 80 companies, industrial trade associations, environmental groups, and State and Federal agencies. The BID for the final rule summarizes all of the comments on the proposed rule and presents the EPA's response to each of the comments. Section VI of this preamble presents responses to selected major comments. Following the EPA's review of public comments received on the proposed rule, the EPA revised the impact analysis used for its final determination regarding today's rulemaking. This analysis used additional TSDF industry data obtained by the EPA. The EPA provided an opportunity for public comment on the additional TSDF industry data used for the impact modeling revisions. A Federal Register Notice of Data Availability (57 FR 43171, September 18, 1992) listed these additional data. The EPA also made the data available for public inspection at the EPA RCRA Docket Office. A 30-day comment period, from September 18, 1992 to October 19, 1992, provided the public the opportunity to comment on the additional data. The EPA received comments on the additional data from one industrial trade association. Section VI.B of this preamble presents a summary of these comments.

C. Relationship to Other RCRA Standards

1. RCRA Rules for TSDF Owners and Operators Today's action establishes organic air emission control requirements for TSDF tanks, surface impoundments, and certain containers. Other types of waste management units operated at TSDF may be subject to these air emission control requirements as follows. a. Miscellaneous units. Under RCRA in 40 CFR 260.10, the EPA defines a ``miscellaneous unit'' as a hazardous waste management unit where waste is treated, stored, or disposed of that is not a container, tank, surface impoundment, wastepile, land treatment unit, landfill, incinerator, boiler, industrial furnace, underground

injection well with appropriate technical standards under 40 CFR part 146, or a unit eligible for a research, development, and demonstration permit under 40 CFR 270.65. The EPA has established provisions under 40 CFR part 264, subpart X to allow TSDF owners and operators to obtain permits to operate miscellaneous units. The EPA permits miscellaneous units on a case-by-case basis with terms and provisions as needed to protect public health and the environment through generic performance standards specified in 40 CFR 264.601.

Today's rule amends Sec. 264.601 to state that the air emission controls required by the standards under 40 CFR 264 subparts AA, BB, and CC are among the ``appropriate'' controls a permit writer may require for a miscellaneous unit ``to ensure protection of human health and the environment.'' Applicability of today's rule to miscellaneous units is discussed further in Section VII.B of this preamble. b. Land disposal restrictions. The RCRA LDR treatment standards under 40 CFR part 268 require TSDF owners and operators to treat hazardous waste to reduce the toxicity or mobility of specific constituents in the waste before the TSDF owner or operator can place the waste in a land disposal unit. Under certain conditions, the EPA may grant a TSDF owner or operator permission to land dispose a hazardous waste that does not meet the LDR treatment standards in a particular land treatment unit, landfill, wastepile, or surface impoundment. This action is referred to as the ``no migration'' variance. To obtain a ``no migration'' variance, a TSDF owner or operator must demonstrate in a petition to the EPA that, with a reasonable degree of certainty, there will be no migration of hazardous constituents from the disposal unit for as long as the waste remains hazardous.

On August 11, 1992, the EPA proposed its interpretation of the term ``no migration'', the procedures and substantive requirements for submitting to the EPA a petition to demonstrate ``no migration'' from a land disposal unit, and the EPA's criteria for evaluating the petitions (57 FR 35940). This proposal includes amending 40 CFR 268.6 to add as a condition for receiving a no migration variance that the applicant demonstrate that the subject land disposal unit complies with the applicable air emission standards the EPA has developed under 40 CFR parts 264 and 265.

c. Corrective action requirements. The EPA is temporarily deferring applicability of the subpart CC standards to any tank, surface impoundment, or container which is used solely for on-site treatment or storage of hazardous waste that is generated as the result of implementing remedial activities required under the RCRA corrective action authorities of 3004(u), 3004(v) or 3008(h). The EPA's rationale for this temporary deferral is explained in section VII.A.1 of this preamble.

2. RCRA Rules for Hazardous Waste Generators Hazardous waste generators who accumulate waste on-site in containers or tanks for short periods of time can elect to be exempted from RCRA subtitle C permitting requirements provided that a generator complies with provisions specified in 40 CFR 262.34. The EPA allows a generator who generates 1,000 kilograms or more of hazardous waste per month to accumulate the hazardous waste on-site for up to 90 days in tanks and containers without a permit provided the generator complies with certain conditions specified in 40 CFR 262.34(a). These conditions include compliance with the requirements of 40 CFR part 265, subpart I when the waste is accumulated in a container and 40 CFR part 265, subpart J when the waste is accumulate in a tank. Tanks and containers used to accumulate hazardous waste on-site for 90 days or less pursuant to the conditions of 40 CFR 262.34(a) are hereafter referred to in this preamble as ``90-day tanks and containers.'' The rule promulgated today only amends the RCRA permit exemption requirements for generators operating 90-day tanks and containers. This action does not affect the existing RCRA permit exemption requirements for generators

operating tanks and containers for on-site accumulation of hazardous waste in accordance with the provisions of 40 CFR 262.34 (d) or (e). Applicability of today's rule to 90-day tanks and containers is discussed further in Section VI.D of this preamble.

3. RCRA Rules for Hazardous Waste Transporters Regulations in 40 CFR part 263 establish standards that apply to persons transporting hazardous waste within the United States if the transportation requires a manifest under 40 CFR part 262. Today's action does not change the RCRA rules under 40 CFR part 263. However, the air standards promulgated today may indirectly affect transporters accepting certain organic-containing hazardous wastes from TSDF owners and operators. The final subpart CC standards require that TSDF owners and operators only load these hazardous wastes into containers (including tank truck, railcars, and roll-off boxes) that use air emission controls as specified in the rule. Consequently, to continue accepting hazardous waste from a TSDF owner or operator, in some cases, transporters may need to ensure that their containers meet the subpart CC standards.

D. Relationship to CERCLA Standards

The Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), authorizes the EPA to undertake removal and remedial actions to clean up hazardous substance releases. Under CERCLA, on-site remedial actions are required to comply with the requirement of Federal and more stringent State environmental laws that are applicable or relevant and appropriate (ARAR) to the remedial action unless certain statutory waivers apply. In addition, the National Oil and Hazardous Substances Contingency Plan (NCP) provides that removal actions shall attain ARAR to the extent practicable considering the exigencies of the situation. [40 CFR 300.415(i)]. As explained in section VII.A.1 of this preamble, the EPA has decided to temporarily defer application of the subpart CC standards to tanks, containers and surface impoundments which are being used to treat or store hazardous wastes containing organics generated on-site from remedial activities required under RCRA corrective action or CERCLA response authorities, or similar State remediation authorities, provided that the wastes are managed in units that do not also manage other hazardous waste containing organics. However, after the temporary deferral has been lifted, today's rules may be considered an ARAR for certain types of remedial and removal actions. A requirement under a Federal or State environmental law may be either ``applicable'' or ``relevant and appropriate,'' but not both, to a remedial or removal action conducted at a CERCLA site. An ARAR is identified on a site-specific basis in a two-part analysis that considers first, whether a given requirement is applicable; then, if it is not applicable, whether it is nevertheless both relevant and appropriate. ``Applicable'' requirements as defined in the NCP are those that specifically address a hazardous substance, pollutant, contaminant, remedial action, location, or other circumstances found at a CERCLA site. [40 CFR 300.415(i)]. ``Relevant and appropriate'' requirements are those that, while not ``applicable'' at a CERCLA site, address problems or situations sufficiently similar to those encountered at the CERCLA site that their use is well suited to the particular site. [40 CFR 300.415(i)]. Some waste management activities used for remedial and removal actions of hazardous organic substances require the use of tanks, surface impoundments, and containers. For example, a TSDF may treat hazardous organic liquids and surface water contaminated with hazardous organic waste on site using destruction, detoxification, or organic removal processes that occur in tanks or surface impoundments. The facility may perform on-site solvent washing of soils contaminated with hazardous organic sludges in a tank or container. At a TSDF, hazardous waste in leaking drums may be repacked in new containers for treatment and disposal at another site.

Once today's deferral is lifted, the air emission control requirements of the subpart CC standards are likely to be ``applicable'' to on-site

remedial and removal actions that use tanks, surface impoundments, and containers to manage substances exhibiting characteristics or listed under RCRA as hazardous waste and having an average volatile organic concentration equal to or greater than 100 ppmw. In other cases, the standards may be ``relevant and appropriate''; this determination must be made on a site specific basis.
On the other hand, the subpart CC standards do not specify control requirements for wastepiles, landfills, and land treatment units that manage hazardous wastes at TSDF. Therefore, the standards are not likely to be ``applicable'' to excavation, capping of wastes, land treatment, land farming, in situ treatment activities, and other activities involving wastepiles and landfills at CERCLA sites. Although in most cases the EPA does not expect the subpart CC standards to be ``relevant and appropriate'' to these types of units at CERCLA sites, remedial and removal actions performed in wastepiles may in some cases be similar in nature and scale to the waste management activities performed in surface impoundments; and waste stabilization may involve the basic process and air emission mechanism regardless of whether the mixing of the waste and binder is conducted in a tank, surface impoundment, container, wastepile, landfill, or land treatment unit. Thus, in some cases the subpart CC standards may be ``relevant and appropriate'' for such actions; this determination must be made on a site specific basis.

E. Relationship to Clean Air Act Standards

Section 112 of the Clean Air Act (CAA) regulates stationary sources of hazardous air pollutants (HAP). This section was comprehensively amended under Title III of the 1990 Amendments to the CAA. Under the amended CAA section 112(b), Congress listed 189 chemicals, compounds, or groups of chemicals as HAP. The EPA is directed by the CAA to regulate HAP emissions from stationary sources by establishing national emission standards for hazardous air pollutants (NESHAP). The 1990 Amendments to the CAA required the EPA to develop and publish a list of source categories that emit HAP for which NESHAP will be developed. The EPA published its initial list of NESHAP source categories on July 16, 1992 (refer to 57 FR 31576). Many industrial sectors that may manage hazardous wastes are listed as specific NESHAP source categories. Consequently, facilities at which hazardous wastes are managed may be subject to both NESHAP and the RCRA air standards under 40 CFR part 264 and 265. At these facilities, some waste management units would be subject to either air emission control requirements under the NESHAP or the air emission control requirements under the RCRA air standards. However, in certain situations, some waste management units would be subject to air emission control requirements under both sets of rules.
The CAA requires that the requirements of standards developed under the Act be consistent, but avoid duplication, with requirements of standards developed under RCRA. Consequently, the EPA is taking into account the air standards promulgated under RCRA section 3004(n) in determining the requirements for NESHAP affecting air emission sources at which hazardous waste could be managed.

F. Relationship to Nuclear Regulatory Commission Standards

Radioactive mixed wastes are wastes that contain radioactive materials as well as materials listed or identified as hazardous under RCRA. Radioactive mixed wastes must be managed in accordance with RCRA regulations, in addition, these wastes also are subject to standards administered by the Nuclear Regulatory Commission (NRC) under the Atomic Energy Act and Nuclear Waste Policy Act of 1982 that address the safe handling and disposal of radioactive waste. The EPA has previously stated its general position that the management of radioactive mixed waste at TSDF is subject to regulation under subtitle C of RCRA (51 FR 24504, July 3, 1986; 53 FR 37045, September 23, 1988). In developing the RCRA standards applicable to radioactive mixed

wastes, the EPA considers the management practices required for these wastes to avoid inconsistencies between the EPA's hazardous waste management requirements and the NRC's radioactive waste management requirements. Furthermore, RCRA section 1006(a) precludes any solid or hazardous waste regulation by the EPA or a State that is ``inconsistent'' with the requirements of the Atomic Energy Act. Thus, in a case where the regulatory requirements for radioactive mixed waste are conflicting, the NRC requirement takes precedence over the RCRA requirement. Because of the potential that air emission control equipment required by the subpart CC standards promulgated today may conflict with certain radioactive waste management requirements under NRC standards, the EPA has decided to temporarily defer application of the subpart CC standards to tanks, containers, and surface impoundments which are being used solely to manage radioactive mixed wastes. This deferral is discussed further in section VII.A.1 of this preamble.

V. Basis for Final Rule

A. New Control Options

The EPA developed a national impacts model specific to the air emission sources affected by this rulemaking to compare the human health and environmental protection provided by the different air emission control options. Following proposal of the rule, the EPA revised this model to incorporate new information obtained by the EPA and to address public comments on the impact analysis methodology received at proposal. Section VI.B of this preamble presents a further discussion of the impact analysis revisions. At proposal, the EPA gave notice that consideration of new results from revisions to the national impacts analysis could lead to selection of any one of the control options considered at proposal or possibly a new control option (56 FR 33516). Upon reviewing preliminary results for the revised national impacts model, the EPA decided to expand the number of control options considered for the final rule. The EPA first performed a screening evaluation by using the revised national impacts model to estimate the nationwide organic emission and cancer incidence reductions for the original five control option configurations described at proposal (56 FR 33512), plus nine new control option configurations. The EPA included a summary of the impacts model results for these 14 control options in the information listed in the Notice of Data Availability (57 FR 43171) and made available for public inspection at the EPA RCRA Docket Office (refer to RCRA docket entry number F-92-CESA-00018). The EPA used the screening evaluation results to select a final group of control options selected for further analysis. The EPA eliminated a control option from further consideration if another one of the control options was estimated to provide the same level of nationwide organic emission or cancer incidence reduction but at a lower cost. This is the same control option selection approach the EPA used at proposal.
Based on the screening evaluation results, the EPA selected four control options for further analysis. In addition to the control option used as the basis for the proposed rule, the EPA also analyzed ``baseline'' impacts. These ``baseline'' impacts represent the estimated nationwide organic emissions and other impacts that would occur in the absence of implementing any of the control options. The final group of five control options (designated Options A through E) differ by the value used for the volatile organic concentration limit and the type of air emission controls used for surface impoundments. Option A requires air emission controls on all TSDF tanks, surface impoundments, and containers managing hazardous waste with any detectable volatile organic concentration as determined at the point where the waste is generated (i.e., a volatile organic concentration action level of 0 ppmw). Under Option A, tanks use a cover vented to a control device except for tanks handling certain hazardous wastes. Tanks in which the organic vapor pressure of the hazardous waste in the tank is less than 10.4 kPa (approximately 1.5 psi) may use a cover without additional

controls. All surface impoundments use a cover vented to a control device. Containers use cover and submerged fill for loading hazardous wastes into the containers. Option B requires air emission controls only on those TSDF tanks, surface impoundments, and containers used to manage hazardous wastes having a volatile organic concentration at the point where the waste is generated equal to or greater than 100 ppmw. The control requirements are the same as described for Option A with one exception; surface impoundments used for storage of hazardous waste and surface impoundments used for treatment of hazardous waste by a process not requiring aeration or agitation of the waste require covers only. Option C requires air emission controls only on those TSDF tanks, surface impoundments, and containers used to manage hazardous wastes having a volatile organic concentration at the point where the waste is generated greater than 500 ppmw. The air emission control requirements are the same as described for Option B. Option C is the same control option selected as the basis for the proposed rule. Option D requires air emission controls only on those TSDF tanks, surface impoundments, and containers used to manage hazardous wastes having a volatile organic concentration at the point where the waste is generated greater than 1,500 ppmw. The air emission control requirements are the same as described for Options B and C. Option E requires air emission controls only on those TSDF tanks, surface impoundments, and containers used to manage hazardous wastes having a volatile organic concentration at the point where the waste is generated greater than 3,000 ppmw. The air emission control requirements are the same as described for Options B, C, and D.

B. Control Option Impacts

The EPA estimated nationwide organic emission and cancer risk reductions that would be achieved if air standards were implemented for each of the five control options. The ``baseline'' nationwide organic emissions from TSDF are estimated to be approximately 1 million Mg/yr. The estimated nationwide TSDF organic emissions assuming implementation of the individual control options are 30,000 Mg/yr for Option A, 41,000 Mg/yr for Option B, 48,000 Mg/yr for Option C, 51,000 Mg/yr for Option D, and 90,000 Mg/yr for Option E.

To assess the risk of contracting cancer posed by exposure to organic emissions from TSDF, the EPA used two measures of health risk: Annual cancer incidence and maximum individual risk (MIR). The annual cancer incidence parameter represents an estimate of population risk and, as such, measures the aggregate risk to all people in the United States estimated to be living within the vicinity of TSDF. The MIR parameter represents the potential of air emissions from a particular source to cause cancer in the most exposed hypothetical individual under the assumptions used in the risk and exposure assessments. Estimation of these health risk parameters requires the EPA to make several critical assumptions regarding the TSDF plant configurations and operating practices, the composition of wastes managed at these TSDF, the cancer potency of the organics contained in these wastes, the emission of these organics to the atmosphere from TSDF sources, and the exposure of people living near TSDF to these air toxic emissions. The complex interrelationship of the various assumptions prevents the EPA from definitively characterizing the estimated health risk parameter values as being overestimates or underestimates. The EPA estimated annual cancer incidence for baseline and the five control options using the EPA's Human Exposure Model (HEM), the sitespecific cancer risk factors, and TSDF industry profile data bases. This risk value is based on the estimated number of excess cancers occurring in the nationwide population after a lifetime exposure (defined to be 70 years). For statistical convenience, the EPA divided the aggregate risk by 70 and expressed the risk as cancer incidence per year. The information provided in RCRA docket entry numbers F-92-CESAS 00014 and S00015 describes the estimation methodology in more detail. The EPA estimates baseline nationwide annual cancer incidence from exposure to TSDF organic emissions

to be 48 cases per year. The estimated nationwide TSDF cancer incidences, assuming implementation of the individual control options, are two cases per year for Option A, two cases per year for Option B, four cases per year for Option C, five cases per year for Option D, and nine cases per year for Option E. The EPA uses the MIR parameter for relative comparisons of pollutants, emission sources, and control alternatives. For the impact analysis, the EPA estimated the MIR parameter assuming that exposure of the individual to the ambient air toxic concentrations occurs for 24 hours per day for a lifetime of 70 years. The EPA realizes that this is a conservative assumption since most people do not spend their entire lives at one location. However, it is completely possible for an individual to live in the same place for his or her entire life. Furthermore, other uncertainties in the analysis could lead to underestimating the risk. For example, the actual exposed subpopulations (such as children or asthmatics) may be more sensitive to the emitted air toxics than the reference adult male for which the unit risk factor extrapolations are based. In addition, the analysis does not address potential indirect exposure pathways to humans, or potential harm to environmental receptors. The MIR parameter reflects the added probability that a person would contract cancer if exposed continuously over a 70-year period to the highest annual average ambient concentration of the air toxics emitted from a TSDF. Baseline MIR from exposure to TSDF organic emissions is estimated to be 3 x 10\2\. The estimated MIR's, assuming implementation of the individual control options, are: 4 x 10<SUP>-3 for Option A, 4 x 10<SUP>-3 for Option B, 2 x 10<SUP>-2 for Option C, 3 x 10<SUP>-2 for Option D, and 3 x 10<SUP>-2 for Option E. These MIR values apply only to the very few TSDF, of the approximately 2,300 TSDF operating in the United States, that are estimated to have the potential to cause the highest risk. The values do not represent actuarially measured risks nor do they apply to all TSDF in the United States. The EPA is not attempting to estimate any specific individual's potential of developing cancer. Finally, the EPA is not interpreting any of these estimates as indicators of the absolute risks of contracting cancer. Rather, the purpose of this cancer risk assessment, both for incidence and MIR, is to compare relative differences among the individual control options (i.e., ``degree'' of human health protection).

In addition to estimating organic emissions and cancer risk parameters, the national impacts model provides an estimate of the total nationwide capital costs and annual costs to the TSDF owners and operators to install and operate the air emission controls specified by each control option. For these nationwide cost estimates, the EPA assumed that, at every TSDF location, treatment of all hazardous wastes to remove or destroy the organics in the waste occurs as the last step prior to disposal of the waste. In actuality, the EPA expects that, at many TSDF, the owner or operator (after becoming aware of the air standards) will elect to treat waste at an earlier step in the waste management sequence. By treating organics in compliance with one of the waste treatment alternatives provided in final rule, the owner or operator could avoid the costs of installing and operating control equipment on the downstream tanks, surface impoundments, and containers.

Capital investment cost represents the cost to TSDF owners and operators to purchase and install the air emission control equipment. The estimated nationwide capital costs in 1986 dollars to implement the control options are: $520 million for Option A, $290 million for Option B, $240 million for Option C, $200 million for Option D, and $140 million for Option E. Annual cost represents the total cost to TSDF owners and operators each year to pay for operating and maintaining the air emission controls as well as to repay the capital investment for the air emission controls. The capital recovery was estimated using an interest rate of 10 percent applied over a period ranging from 10 to 20 years depending on the expected service life for each type of air emission control equipment. The estimated nationwide annual costs to implement the control options are: $190 million/yr for Option A, $110 million/yr for Option B, $90 million/yr for Option C, $80 million/yr for Option D, and $60 million/yr for Option E.

C. Selection Rationale

From Options A through E, the EPA selected one control option to serve as the basis for today's final rule. The EPA applied the same decision rationale used at proposal for this rulemaking (56 FR 33515- 33516, July 22, 1991) as well as for RCRA air standards promulgated under subparts AA and BB to 40 CFR parts 264 and 265 (refer to 55 FR 25470, June 21, 1990). This decision rationale requires the EPA to select, whenever possible, the level of control that provides an acceptable degree of protection of human health and the environment. If no control option is available to achieve acceptable levels of protection, the EPA's approach historically has considered cost under RCRA only for equally protective control options. All five of the control options considered for the final rule are estimated to achieve similar levels of substantial reductions in nationwide organic emissions from TSDF. The nationwide organic emission reductions for the control options are estimated to be approximately 970,000 Mg/yr for Option A, 960,000 Mg/yr for Option B, 950,000 Mg/yr for Option C, 950,000 Mg/yr for Option D, and 910,000 Mg/yr for Option E.

Both Options A and B are estimated to achieve the lowest cancer MIR and greatest reduction in annual cancer incidence of the five options. However, none of the control options reduces MIR to the target cancer risk levels used for other promulgated RCRA standards, which have been in the range of 1 x 10<SUP>-4 to 1 x 10<SUP>-6. The estimated MIR is an order-of-magnitude higher for Options C, D, and E (2 x 10<SUP>-2 for Option C, 3 x 10<SUP>-2 for Options C and D) compared to Options A and B (4 x 10<SUP>-3). Annual cancer incidence reductions estimated for Option C (44 cases per year), Option D (43 cases per year), and Option E (39 cases per year) are lower than the annual cancer incidence reductions estimated for Options A and B (46 cases per year). On the basis of the estimated annual cancer incidence and MIR, the EPA concluded that Options A and B are more protective of human health than Options C, D, or E. Therefore, the EPA eliminated Options C, D, and E from further consideration as the basis for the final rule.

Both Options A and B are estimated to achieve the same level of cancer risk reduction (MIR to 4 x 10<difference><SUP>3 and annual cancer incidence to two cases per year). Therefore, the EPA concluded that Options A and B are equally protective of human health and the environment (to the extent ascertainable by this modelling methodology). Historically under RCRA, the EPA has considered control option costs only to select between options estimated to achieve equivalent levels of protection. Therefore, to select between Options A and B, the EPA compared the estimated costs to implement each of the control options. Option B requires the use of air emission controls only on those TSDF tanks, surface impoundments, and containers used to manage hazardous wastes with a volatile organic concentration at the point where the waste is generated equal to or greater than 100 ppmw. Because TSDF owners and operators would need to install and operate air emission controls on fewer TSDF tanks, surface impoundments, and containers, Option B would be less expensive for the TSDF industry to implement than Option A. Therefore, the EPA selected Option B as the basis for the final rule.

While Option B does not achieve the target MIR levels historically used for other promulgated RCRA rules, Option B does achieve substantial reductions in cancer risk. The annual cancer incidence is estimated to be reduced by greater than 95 percent from the baseline value. Furthermore, the MIR for most of the 2,300 TSDF nationwide are estimated to achieve the target MIR levels. To address the remaining cancer risk at TSDF after implementation of the air standards promulgated today, the EPA is further evaluating the waste management practices and the specific chemical compounds composing the organic emissions from those individual TSDF for which the MIR values are estimated to be greater than the historical RCRA target MIR levels. Following this evaluation, the EPA will determine what other actions, such as the use of section 3005(c)(3) omnibus permitting authority or additional rulemaking, are necessary to attain the health-based goals of RCRA section

3004(n).

VI. Summary of Responses to Comments on Proposed Rule

All of the comments on the proposed rule and the EPA's response to each of these comments is presented in ``Hazardous Waste Treatment, Storage, and Disposal Facilities (TSDF)--Background Information for Promulgated Organic Air Emission Standards for Tanks, Surface Impoundments, and Containers'', EPA document number EPA-453/R-94-076b (to obtain a copy of this document refer to the ADDRESSES section of this preamble). The EPA's responses to topics addressed by many of the commenters are summarized below.

A. Development of Air Standards Under RCRA

Comment: Many comments were received regarding the extent to which the congressional directive of RCRA section 3004(n) should be implemented using air standards established by the EPA under Clean Air Act (CAA) authority. Commenters stated the position that protection of human health and the environment from TSDF air emissions is most appropriately, effectively, and efficiently addressed by developing air standards under the CAA authority. Therefore, commenters believe that the EPA should make the determination that the requirements of RCRA section 3004(n) are best fulfilled by deferring to air standards established under CAA authority. Commenters stated that the air standards proposed by the EPA under authority of RCRA section 3004(n) are:
(1) Not needed because existing CAA programs adequately address the control of TSDF organic emissions;
(2) Duplicative or contradictory of new programs now being implemented by the EPA to control hazardous air pollutants as directed by section 112 of the CAA;
(3) Not in compliance with RCRA section 1006(b) regarding duplication or contradiction of CAA requirements; (4) Inconsistent with CAA programs that establish ozone precursor control requirements depending on the national ambient air quality standards attainment status of the region in which a source is located; (5) Inconsistent with the EPA's pollution prevention policy; (6) Contrary to the EPA's ``cluster concept'' of examining and coordinating regulations addressing the same emission source to minimize duplicative or contradictory requirements; and (7) Difficult to administer and enforce because, traditionally, one State regulatory agency administers rules regulating air emissions while another administers rules regulating hazardous waste management. Response: The Hazardous and Solid Waste Amendments to RCRA added section 3004(n), which directs the EPA to ``* * * promulgate regulations for the monitoring and control of air emissions from hazardous waste treatment, storage, and disposal facilities, including but not limited to open tanks, surface impoundments, and landfills, as may be necessary to protect human health and the environment.'' The EPA considers the most appropriate, effective, and efficient way to fulfill this congressional mandate is to develop air standards for TSDF that are implemented under the existing RCRA subtitle C permitting program already in place for these facilities. However, the EPA disagrees with one commenter's assertion that, in establishing these RCRA air standards, the EPA cannot consider the impact of air standards promulgated or currently being developed under other statutory authorities such as the CAA. On the contrary, RCRA section 1006(b) requires the EPA to coordinate its regulations under RCRA statutes and to avoid duplication, to the maximum extent practicable, with appropriate provisions of the CAA.
The EPA disagrees that the requirements of RCRA section 3004(n) are best fulfilled by deferring to air standards established under CAA authority. There is no indication that Congress intended for air standards to be issued only within the authority granted to the EPA by the CAA. If this was the case, then Congress would not have amended RCRA section 3004(n) under HSWA after Congress had already authorized the EPA to control air emissions under the CAA. Refer to S. Rep. No. 284, 98th Cong. 1st sess. 63. Thus,

both RCRA and the CAA authorize the EPA to control air emissions from TSDF. Although historically many standards promulgated by the EPA under authority of RCRA have addressed the prevention of soil and water contamination from improper management of hazardous waste, the EPA is not limited by RCRA to promulgating standards only for certain media (e.g., surface waters, groundwater, and soils). Indeed, RCRA section 3004(n) specifically directs the EPA to issue regulations controlling air emissions from TSDF as necessary to protect human health and the environment.

The selection of TSDF air emission sources for control by establishing air standards under RCRA section 3004(n) is based on controlling those TSDF air emission sources determined by the EPA to have significant toxic and ozone precursor emission potential but for which emission control is not adequately addressed by other standards promulgated by the EPA such as NESHAP and NSPS established under the CAA. At proposal, the EPA concluded that additional air emission control requirements for TSDF tanks, surface impoundments, and containers are needed. This decision was based on the EPA's determination that existing and future Federal standards under the CAA and State air standards do not adequately address the control of TSDF organic air emissions.

As previous described in section III.E of this preamble, CAA section 112 has been amended by Congress since RCRA section 3004(n) was enacted. Section 112 of the CAA as amended requires the EPA to identify major sources and area sources of HAP emissions and to develop NESHAP for these sources. To date for this air standards development program, the EPA has either promulgated or proposed several NESHAP that may apply to some hazardous waste management activities at TSDF. However, in general, these NESHAP added requirements to address HAP emissions from certain waste and material recovery operations that are not subject to or exempted from regulation under the RCRA air standards in 40 CFR parts 264 and 265. Thus, the NESHAP and other air standards being developed under CAA are not intended to duplicate the RCRA air standards, but instead to integrate with the RCRA air standards to create a comprehensive air program for addressing organic air emissions from all waste and related material recovery operations. For example, on-site wastewater treatment operations at synthetic organic chemicals manufacturing industry (SOCMI) facilities are regulated under the hazardous organic NESHAP (``the HON'') promulgated on April 22, 1994 (see 59 FR 19402). At many of these facilities, the hazardous wastewaters generated by process units and resulting wastewater treatment sludges are managed in tank systems that are exempted from RCRA permitting requirements under provisions in 40 CFR 264.1(g)(6) or 40 CFR 265.1(c)(10). Thus, the air emission control requirements under the HON, in most cases, affect wastewater treatment tanks not subject to the RCRA air standards. A second example is the recently proposed NESHAP for off-site waste and recovery operations (59 FR 51913, October 13, 1994). This NESHAP would apply to owners and operators of facilities, with certain exceptions, that manage wastes or recoverable materials which have been generated off-site at another facility and contain specific organic HAP. The rule would apply to operations managing solid wastes as defined under RCRA (hazardous and nonhazardous wastes) as well as operations handling recovered materials excluded from the RCRA definition of solid waste (e.g., recycled materials containing organic HAP, used oil reprocessed for sale as a fuel). As a result, certain off-site waste and recovery operations with organic HAP emissions, but exempted from regulation under the RCRA air standards, would be required to use air emission controls under this NESHAP. In contrast to the NESHAP now being developed under CAA section 112, the EPA has already achieved progress toward full implementation of RCRA section 3004(n), which requires a ``cradle to grave'' approach to hazardous waste management that addresses protection of air, water, and groundwater. Air standards have been promulgated for TSDF treatment process vents (subpart AA in 40 CFR parts 264 and 265) and for TSDF process equipment leaks (subpart BB in 40 CFR parts 264 and 265) in addition to the development of these air standards for TSDF tanks, surface impoundments, and containers. There is no benefit to delaying implementation of air

standards for TSDF tanks, containers, and surface impoundments to a future rulemaking under amended CAA section 112 when the EPA can proceed now with the promulgation of effective air standards under RCRA section 3004(n) for these air emission sources. The RCRA air standards adopted today do comply with RCRA section 1006(b). This section requires that the air standards be consistent with and not duplicative of CAA standards. Although RCRA section 1006(b) requires some accommodation with existing regulatory standards, it ``does not permit the substantive standards of RCRA to be compromised.'' Chemical Waste Management v. EPA, 976 F.2d at 23 (D.C. Cir. 1992). It is obviously reasonable for the EPA to view the RCRA section 3004(n) mandate as a standard which cannot (or at least need not) be compromised.
Similarly, the CAA Amendments of 1990 require that air standards developed under the CAA be consistent with RCRA rules. To conform with the dual RCRA and CAA requirements that standards be consistent, the air standards developed under RCRA section 3004(n) do not duplicate or contradict existing NESHAP or NSPS. The EPA is fully aware that at many facilities where hazardous wastes are managed, the RCRA air standards under 40 CFR part 264 and 265 as well as NESHAP and NSPS for specific source categories may be applicable to a particular TSDF. Certain testing, monitoring, inspection, recordkeeping, and other requirements under the RCRA air standards may be similar to or duplicative of requirements under the applicable NESHAP or NSPS. In many cases at a TSDF, individual waste operations will be subject to either the air emission control requirements under the RCRA air standards or the air emission control requirements under the applicable NESHAP or NSPS. Thus, it is necessary to include testing, monitoring, inspection, recordkeeping, and other implementation requirements in each rule to assure compliance with and enforcement of the rule. However, in certain situations, some individual waste operations at a TSDF could be subject to air emission control requirements under both the RCRA air standards as well as a NESHAP or NSPS. In such cases, the EPA believes it is unnecessary for owners and operators of these waste management units to conduct duplicative waste testing, keep duplicate sets of records, or perform other duplicative actions to demonstrate compliance with both sets of rules. Therefore, to be consistent with RCRA section 1006(b) to the maximum extent practicable, the EPA is coordinating the testing, recordkeeping, reporting, and other implementation activities required under the RCRA air standards and related rules developed under the CAA. The EPA has requested public comment in a related proposed NESHAP rulemkaing (the off-site waste and recovery operations NESHAP, see 59 FR 51919, October 13, 1994) on how the applicable requirements included in the RCRA air standards should be incorporated into CAA rules being developed by the EPA for waste and recovery operations that will allow owners and operators subject to both sets of rules to demonstrate compliance with all applicable rules without having to repeat the duplicative requirements. Nevertheless, RCRA section 1006(b) cannot be used to ignore key elements of RCRA; see Chemical Waste Management v. EPA, 976 F.2d at 23. In this case, Congress has indicated that TSDF air emissions need to be controlled on the RCRA timetable, not that of the CAA. Deferring totally to the CAA would vitiate this key RCRA requirement. [See also RCRA section 3004(q) and CAA section 112(n)(7) in which Congress indicated that pendency of CAA air standards for RCRA units does not vitiate RCRA requirements.]
The EPA's approach to developing air standards for TSDF under RCRA is consistent with CAA programs to achieve attainment and to maintain national ambient air quality standards (NAAQS). The NAAQS specify limits to pollutant concentrations in the ambient air to protect public health and welfare. A NAAQS has been established for ozone. Ambient ozone concentrations in many metropolitan regions of the United States exceed the NAAQS. Organic emissions from TSDF as well as other sources react photochemically with other chemical compounds in the atmosphere to form ozone. The CAA requires that States develop and the EPA approve air emission control plans called ``State implementation plans'' (SIP's). For those regions within a State that are in nonattainment with the NAAQS for ozone, the SIP specifies the standards and other control measures to be

implemented by the State to attain the NAAQS. However, the CAA requires the EPA not only to implement programs to attain the NAAQS in nonattainment areas but also to maintain, and prevent significant deterioration of, the air quality in those areas of the Nation currently in attainment with the NAAQS. Consequently, in addition to the CAA control programs to address specific regional NAAQS attainment problems, the EPA also develops under the CAA authority minimum national emission standards applicable to stationary sources independent of whether the source is located in a NAAQS attainment or nonattainment area. The EPA considers the subpart CC standards to be reasonable national standards needed to control emissions of air toxics as well as to attain and maintain NAAQS for ozone. The subpart CC standards are consistent with the EPA's pollution prevention policy. Pollution prevention involves reducing the quantity of pollution produced for a given quantity of product prior to recycling, treatment, or control of emissions. Activities defined as source reduction measures in the Pollution Prevention Act include technology modifications, process and procedure modifications, reformulation or redesign of products, and substitution of raw materials. A decrease in production alone does not qualify as pollution prevention. Under the subpart CC standards, a TSDF owner or operator is not required to manage a hazardous waste in a tank, surface impoundment, or container using the specified air emission controls in cases when the owner or operator determines that the organic content of all hazardous waste placed in the unit meets certain conditions specified in the rule. Thus, the subpart CC standards encourage pollution prevention by providing an incentive to generators to initiate source reduction measures that will reduce the concentration of organics in a hazardous waste.

The development of TSDF air standards under RCRA is not contrary to the EPA's ``cluster'' approach of examining and coordinating regulations addressing the same emission source to minimize duplicative or contradictory requirements. The different EPA Offices responsible for implementing RCRA and CAA requirements are coordinating the development of this rulemaking to ensure that subpart CC standards are compatible with other rules and programs applicable to TSDF owners and operators.

The air emission control requirements for tanks under the subpart CC standards incorporate provisions of NSPS that were promulgated under the authority of the CAA and apply to storage tanks constructed or modified after July 23, 1984, that contain volatile organic liquids (40 CFR part 60, subpart Kb). Therefore, air emission controls already in use on a TSDF tank in compliance with 40 CFR part 60, subpart Kb will comply with air emission control requirements of the subpart CC standards. Also, the subpart CC standards for closed-vent systems and control devices cross reference the requirements for closed-vent systems and control devices promulgated under subpart AA in 40 CFR parts 264 and 265. The subpart AA requirements are consistent with the requirements for closed-vent systems and control devices under several CAA air standards.

The implementation of air standards under RCRA does not create difficulties in administration and enforcement of the rules by State regulatory agencies. Although many existing RCRA standards focus on preventing the contamination of soil and water, other existing RCRA regulations regulate air emissions from some TSDF sources (e.g., combustion of hazardous waste is regulated under 40 CFR part 264, subpart O for hazardous waste incinerators and under 40 CFR part 266 subpart H for boilers and industrial furnaces). Air emissions are also sometimes addressed through the EPA's omnibus permitting authority under RCRA section 3005(c)(3). States authorized by the EPA administer and enforce the requirements of RCRA rules in lieu of the EPA administering the rules in that State. The EPA is aware that, in many States, one State agency administers air standards while another State agency administers rules regulating the management of hazardous waste in the State. Similarly, it is common for yet another State agency to administer water quality rules. The experience of authorized States administrating existing RCRA rules shows that responsibility for administrating these rules can be delegated to a separate State agency

without impeding the administration and enforcement of non-RCRA air and water rules by other State agencies.

B. Revised Impacts Analysis

Comment: The commenter on the Notice of Data Availability (NDA) (57 FR 43171, September 18, 1992) supports the EPA's use of the updated waste data base for the national impacts analysis and the EPA's changes to the emission models for biological treatment processes. In addition, the commenter agrees with the EPA's conclusion that many surface impoundments reported in the waste data base to be managing waste at TSDF have been or are being replaced with tanks to comply with the RCRA land disposal restriction and other regulations. However, the commenter believes that the EPA's assumption that 75 percent of the total waste quantity reported in the waste data base to be managed in surface impoundments is now managed in tanks is too low. The commenter agrees with the EPA's revised approach in the impact analysis of using sitespecific cancer risk factors to estimate cancer risk due to exposure to TSDF emissions. However, the commenter states that some of the specific assumptions made by the EPA for the risk analysis are implausible (e.g., assuming exposure of the individual for 70 years) and the analysis should be conducted in accordance with the EPA's own Exposure Assessment Guidelines. Finally, the commenter does not believe that any MIR estimate is necessary to assess the need for and effectiveness of the rule.

Response: For the national impacts analysis, the EPA believes that 75 percent is a reasonable assumption for the amount of waste that is converted from surface impoundment to tank management. As discussed further in the BID for the final rule, the EPA selected the 75 percent value based on information obtained by the EPA from a telephone survey of owners and operators of large TSDF and from TSDF site visits as well as information provided to the EPA by several TSDF owners and operators in comments on the proposed rule. The EPA did not find nor receive any additional information from the commenter that justifies increasing the percentage of waste converted from surface impoundment to tank management.

The cancer risk impact analysis for this rulemaking was conducted in accordance with the EPA's Exposure Assessment Guidelines. With regard to the 70 year lifetime assumption used in the impact analysis, the EPA believes 70 years to be conservative, but plausible. The EPA did however conduct a second risk assessment assuming a 33 year exposure scenario (95 percentile). Using this assumption reduced risk estimates by one-half, but did not change the decision to control these facilities, nor the choice of control options. Furthermore, the risk assessment conducted here was for the purpose of determining relative differences in risk estimates between the control options. For this application, the exposure scenario would not matter; the results, i.e., the relative differences in risk estimates, would not change. The EPA holds that the assumptions used to determine the MIR are, as with the 70 year exposure scenario, conservative, but plausible, and result in a reasonable overall estimate of risk. In addition, while the EPA acknowledges the uncertainties associated with the MIR, such uncertainties cancel out when the risk assessment is used to discern relative risk, as in this case. Thus the EPA believes that the use of the MIR is an appropriate tool to apply in the impact analysis for this rulemaking to both estimate risk and to discern differences between risk estimates associated with the various control options.

C. Container Air Standards

Comment: Many commenters disagree with the EPA's decision to require air emission controls for containers under the subpart CC standards. One group of commenters argues that the organic emission potential from TSDF containers does not warrant the application of additional controls beyond those already required by existing RCRA standards. A second group of commenters contends that TSDF containers should not be subject to this

rulemaking because the EPA analysis does not show organic emissions from TSDF containers to be a significant emission source warranting controls.
Response: The EPA maintains that the management of organiccontaining wastes in containers at TSDF is a potentially significant source of organic emissions that is not adequately regulated by existing regulations. Control requirements for containers under the subpart CC standards are needed to: (1) Ensure that containers used for storage of organic-containing waste use covers effective for organic emission control; (2) Control organic emissions from treatment of organic-containing wastes in containers by waste stabilization and other processes; and (3) Prevent circumvention of the containment and control strategy that serves as a key component of the integrated approach to implementing RCRA section 3004(n).
The EPA disagrees with the commenters' conclusion that existing regulations are sufficient to control organic emissions from containers used to manage hazardous waste at TSDF. Existing RCRA regulations under 40 CFR 264.173 require containers used to store hazardous waste at TSDF to be closed except when necessary to add or remove waste. This requirement for closed containers during storage does not specify organic air emission controls for these covers. Furthermore, no RCRA requirements exist that address organic emissions associated with other container operations such as hazardous waste transfer or treatment in open containers.
The EPA also disagrees with the commenters' conclusion that managing hazardous wastes in containers is not a significant potential source of organic air emissions. The baseline analysis to estimate nationwide TSDF organic emissions by waste management category is not the only factor that the EPA considered in assessing the organic emission potential of containers. The revised nationwide baseline emissions from storage of hazardous waste in TSDF containers is estimated to be approximately 5,000 Mg/yr. However, this emission estimate for containers does not include organic emissions from hazardous waste treatment in containers. As described in the BID for the final rule, the EPA estimates the total organic emissions from waste fixation operations performed in containers to be approximately 11,000 Mg/yr. Information obtained by the EPA representatives during site visits to TSDF conducting waste fixation operations indicates that use of containers for waste fixation continues to be a common industry practice. Thus, treatment of hazardous waste in containers is a large potential source of organic emissions that is not regulated by the existing RCRA regulations.
The air emission control requirements for the subpart CC standards are based on applying a containment and control strategy to TSDF tanks, surface impoundments, and containers from generation of the waste through treatment of the waste to remove or destroy the organics in the waste. Requiring control of only TSDF tanks and surface impoundments but not containers creates a significant potential organic emission source if large quantities of hazardous waste currently stored or treated in tanks required to use air emission controls under subpart CC standards are transferred to containers not using air emission controls. This would allow organics in the hazardous waste managed in uncontrolled containers to escape to the atmosphere prior to treatment and, thus, reduce the effectiveness of the containment and control approach.

D. Generator 90-Day Tanks and Containers

Comment: Many commenters disagree with the EPA's decision to apply the proposed air standards to 90-day tanks and containers for the following reasons:
(1) The EPA is not authorized under RCRA section 3004(n), or under other provision, to extend the air standards to 90-day tanks and containers; (2) The proposed rule failed to cite authority to extend the requirements to 90-day tanks and containers, in violation of section 553(b)(2) of the Administrative Procedures Act; (3) If the EPA imposes air emission controls on generators, this must be accomplished pursuant to the pre-HSWA authorization process and thus should not become effective in authorized

States until enacted and implemented as State law; and
(4) Application of air emission control requirements to 90-day tanks and containers impermissibly interferes with manufacturing processes.
Response: The EPA disagrees with each of these comments. The provisions of 40 CFR 262.34 (promulgated under the authority of RCRA section 2002, 3001-3005, and 3007) allow generators to accumulate hazardous waste in tanks and containers for specified time periods without obtaining RCRA permits, provided the generator meets certain conditions. Amending these conditions is a valid exercise of the EPA's authority under RCRA section 3004(n).
The intent of including the provisions of 40 CFR 262.34 in the RCRA requirements for hazardous waste generators is to obtain a reasonable balance between the Congress's desire not to interfere with the generator's manufacturing or production processes with the need to provide adequate protection of human health and the environment (45 FR 12730, February 26, 1980). Thus, 40 CFR 262.34 does not provide a hazardous waste generator with a complete exemption from all RCRA requirements. On the contrary, it incorporates most of the relevant tank and container requirements under 40 CFR part 265 and requires compliance with these standards as a condition for maintaining RCRA permit-exempt status [refer to 40 CFR 262.34(a)(1)]. The intent of these provisions is not to exclude 90-day tanks and containers from future technical TSDF requirements. Therefore, it is wholly appropriate for the EPA to update the technical requirements for tanks and containers that serve as the basis for the RCRA permit exemption. The EPA has already done so, for example, when tank standards were amended in 1986. Although 90-day tanks and containers are not required to be permitted under RCRA subtitle C, the EPA rejects the commenters' narrow reading of RCRA section 3004(n) as limiting the EPA's authority to extend the requirements to these units. Section 3004(n) of RCRA requires the EPA to promulgate standards for the control of air emissions from ``hazardous waste treatment, storage, and disposal facilities.'' The EPA does not agree that RCRA section 3004(n) reflects a congressional intend that the EPA regulate air emissions only from permitted and interim-status TSDF and not from 90-day tanks and containers. These tanks and containers are physically identical (i.e., the same types of tanks and containers are used by generators to accumulate and by TSDF owners and operators to store and treat waste). There is no environmental basis for not considering them subject to the section 3004(n) mandate. Such units are, in fact, storing or treating hazardous waste and are subject to numerous standards promulgated under the authority of both RCRA sections 3002 and 3004. The exemption of 90- day tanks and containers from the permitting requirements of RCRA subtitle C is regulatory, not statutory; there is no directive in the RCRA legislation that precludes the EPA from imposing any or all of the TSDF requirements on them. The use of the term ``facility'' in RCRA section 3004(n) can certainly be read to encompass 90-day tanks and containers, given the EPA's flexibility to construe that term (see United Technologies v. EPA, 821 F.2d at 814 (D.C. Cir. 1988) and the fact that 90-day tanks and containers are already subject to the substantive standards for tanks and containers and pose precisely the same potential environmental risks as other tanks and containers holding hazardous waste. In addition, the EPA sees to reason that Congress intended 90-day tanks and containers to be subject to air emission controls at a different time than other tanks and containers (which would be the case if the 90-day units are not regulated pursuant to a HSWA provision).
Therefore, it is proper for the EPA to use its authority under RCRA section 3004(n) to amend 40 CFR 262.34(a) by adding air emission control requirements to the conditions required for a 90-day tank or container to be exempted from the RCRA permitting requirements. For these reasons, the EPA rejects the commenters' arguments that the Agency is not authorized or failed to cite authority to use this rulemaking to amend the exemption requirements for 90-day tanks and containers. In addition, the EPA rejects the argument that the exemption requirements are under the EPA's pre-HSWA authority and, therefore, are not applicable in authorized States until the

individual States are authorized to implement the rule (See 51 FR 25464, July 14, 1986, where the EPA indicated that the modifications to 40 CFR 262.34, to reflect amended tank standards, were HSWA rules). As a variation of the argument that 90-day tanks and containers should not be regulated, one commenter asserts that RCRA section 3004(n) reflects a congressional intent that the EPA regulate air emissions only from permitted and interim-status TSDF and not from 90- day tanks and containers. The commenter apparently argues that the explicit inclusion of such authority under RCRA section 3004(n) and not under RCRA section 3002 implies a congressional finding that waste accumulation does not significantly contribute to air pollution. The EPA finds no indication, in the legislative history of RCRA, or elsewhere, that Congress ever made such a finding, and the EPA's conclusion, as discussed later in this section, is that on-site accumulation of hazardous waste in 90-day units is a significant source of organic air emissions. Again, the EPA finds no indication that Congress intended to preclude the EPA from regulating air emissions from nonpermitted hazardous waste storage and treatment under RCRA section 3004(n).

In addition to RCRA section 3004(n), the EPA has authority under RCRA section 3002 to amend 40 FR 262.34(a). One commenter states that, although RCRA section 3002(a)(3) authorizes the EPA to require the use of appropriate containers, RCRA section 3002 provides no authority to regulate air emissions. The EPA disagrees with this statement. The RCRA section 3002(a)(3) authority, as well as the general authority under RCRA section 3002 to promulgate such rules regulating generators ``as may be necessary to protect human health and the environment,'' is broad enough to encompass the regulation of air emissions from units storing or treating hazardous waste at generator facilities. Finally, the EPA cited both RCRA sections 3002 and 3004 as the statutory authority for the proposed rule. Therefore, this rulemaking is in full conformance with section 553(b)(2) of the Administrative Procedures Act.

The EPA also rejects the argument that the application of air emission controls to 90-day tanks and containers impermissibly interferes with manufacturing processes. The EPA concluded in 1980, as cited above, that the appropriate balance between protection of the environment and noninterference with manufacturing processes was achieved by requiring 90-day tanks and containers to comply with certain technical requirements as a condition of being exempt from the requirement to have a RCRA permit. The EPA estimates that nationwide baseline organic emissions from 90-day tanks and containers are approximately 76,000 Mg/yr. Given the significant organic emissions from 90-day tanks and containers, the same rationale has led the EPA to require that these units comply with the appropriate air emission control requirements of the subparts AA, BB, and CC standards to maintain an exemption from RCRA permitting. In contrast, the EPA decided not to extend under this rulemaking the requirements of these air standards to containers used for satellite accumulation because of the widespread use of these containers by manufacturing process operators to collect small quantities of hazardous waste as generated, and the integrated use of these containers with the manufacturing operations (discussed further in section 7.2 of the BID for today's rule). The EPA believes that this regulatory framework maintains the appropriate balance between environmental protection and noninterference with manufacturing processes.

E. Implementation of RCRA Air Standards

Comment: A total of 24 commenters addressed the EPA's proposed action of modifying the ``permit-as-a-shield'' practice to require that owners and operators of TSDF that have been issued final permits prior to the effective date of this rulemaking comply with the air standards under 40 CFR 265 subparts AA, BB, and CC until the facility's permit is reviewed or reissued by the EPA. Four of the commenters support the EPA's proposed modification. The other 20 commenters oppose the proposed modification and maintain that ``permit-as-a-shield'' practice should remain unchanged

because any action by the EPA to remove this practice:
(1) Is without the legal authority and that to do so would be contrary to congressional intent;
(2) Violates the due process rights of permittees, which are normally protected through the permit process; (3) Negates the purpose and importance of the RCRA permit because the ``permit-as-a-shield'' practice serves to unify all the regulatory requirements in the permit for a TSDF;
(4) Is contrary to previously stated policy whereby the EPA binds itself to the principle of using ``permit-as-a-shield'' (45 FR 33290, May 19, 1980); and
(5) Is disruptive to TSDF owner and operator planning, burdensome to comply with, and has an adverse effect on the availability and cost of control equipment.
Response: The practice known as ``permit-as-a-shield'' is derived from an exercise of the EPA's regulatory authority and was first codified in the 1980 implementing regulations of the RCRA permit program (45 FR 33290, May 19, 1980). It is not a provision of RCRA and is therefore no part of the statutory mandate by Congress to manage the Nation's hazardous wastes. Shell Oil v. EPA, 950 F.2d at 741, 762 (D.C. Cir. 1991). Because it is a regulatory and not a statutory provision, the EPA can modify the ``permit-as-a-shield'' practice in any situation where the Agency determines that the practice does not serve the EPA's mandate to protect human health and the environment. For the final subpart CC standards, the EPA estimates that baseline nationwide excess cancer incidence resulting from exposure to TSDF organic emissions is 48 cases per year. In addition, total nationwide organic emissions from TSDF are estimated to be approximately 1 million Mg/yr and, thus, contribute significantly to the formation of atmospheric ozone. These health and environmental impacts are very high relative to the impacts of emissions from other sources regulated under RCRA and the CAA. Accordingly, the EPA has determined that the health and environmental impacts resulting from organic air emissions from TSDF are of a magnitude to warrant narrowly rescinding the ``permit-as-a-shield'' practice for this limited case.
The ``permit-as-a-shield'' practice is not a consequence of Constitutional or statutory obligations of the EPA to any individual and its removal does not violate any substantive or procedural due process rights of individuals. The ``permit-as-a-shield'' practice was established by regulations promulgated by the EPA and therefore can be modified when the EPA determines it is necessary to do so for the protection of human health and the environment. Numerous government regulations have a direct effect on regulated entities, and the EPA's ``permit-as-a-shield'' practice does not vest the regulated community with a right to a variance from all new RCRA regulations. Furthermore, the proposal put the public on notice that the EPA was planning to modify the ``permit-as-a-shield'' practice in this rule, and the public has therefore had an opportunity for meaningful comment on the issue. The EPA continues to believe that the permit process and requirements are fundamental components of the RCRA program and that, by and large, compliance with the permits should constitute compliance with the RCRA program. For the other rulemakings for which the EPA rescinded the ``permit-as-a-shield'' practice, the EPA determined that the risk to human health and the environment was too high to allow the practice to continue (for remaining permit periods), and required that all TSDF comply with the new requirements regardless of their permit status. The EPA has determined that allowing owners and operators of permitted TSDF to be shielded from compliance with the regulatory requirements of subparts AA, BB, and CC standards will allow excessively high risks. Today's action by the EPA does not negate the value of the RCRA permit program or the ``permit-as-a-shield'' practice. Instead, the EPA is making a distinction between a provision that is sufficiently protective in most cases and one that, under specific situations, is not sufficiently protective. The EPA disagrees with the commenters' claims that the permit modification process can adequately accommodate the timely implementation of the subpart CC standards. For the EPA to apply the subpart CC standards into permits by

way of modifications would require a significant and unreasonable resource commitment. Furthermore, the fact that existing permits can be modified to incorporate new regulatory requirements [per 40 CFR 270.41(a)(3), which implements RCRA section 3005(c)(3)] shows that ``permit-as-a-shield'' is hardly an inviolate principle. The ruelmaking simply accomplishes nationally what a modification would accomplish individually. Accordingly, the EPA developed the subpart AA, BB, and CC standards to be ``selfimplementing'' so that State and Regional permit writers will not be required to reopen and rewrite permits to incorporate the provisions. Permitted facilities will be able to comply directly with the regulatory standards in the same way that interim-status facilities must comply. Modifying ``permit-as-a shield'' for these rules eliminates any confusion or ambiguity as to which TSDF is subject to the requirements.

As noted by the commenters, the EPA stated a policy for ``permitas -a-shield'' in the so-called consolidated permit regulations issued in 1980 (45 FR 33290). However, this does not mean that the policy for ``permit-as-a-shield'' can never be amended. The EPA has never agreed to ``bind'' itself to any particular policy or provision. Instead, the EPA may adhere to a general practice or policy with the understanding that, if the circumstances warrant and the EPA provides a rational explanation, it can modify or rescind a particular provision. It should be noted, for example, that Congress has since amended RCRA to require that air emissions from TSDF be controlled, and in the same amendments provide that the EPA may reopen permits to add conditions reflecting new control practices and to redress potential risks posed by the facility (RCRA section 3005(c)(3) and S. Rep. No. 284, 98th Cong. 1st Sess. at 31). Here, the EPA is determining that there are excessively high risks from these facilities, and therefore that these more protective provisions should become effective immediately. It should also be noted that the EPA does not intend to rescind ``permit-as-a-shield'' on a regular or frequent basis for other rulemakings. As stated earlier, the EPA generally does view ``permitas -a-shield'' as a beneficial and legitimate part of the RCRA program and that, in most cases, it will apply. The EPA believes that the commenters claiming that removing ``permit-as-a-shield'' will be disruptive to TSDF implementation planning are greatly overstating the adverse or disruptive effects that an accelerated implementation will have on TSDF owner and operator planning and operations because the control technologies for the different kinds of management units are varied and widely available. The EPA specifically considered the costs and economic impacts of the various control options in the regulatory impact analysis for the proposed rule (RCRA docket entry number F-91-CESP-S00494). Based on this analysis, the EPA found that the costs of installing and operating air emission control equipment required by the control options are projected to be less than 1 percent of the total cost of hazardous waste management at TSDF. Any air emission control equipment supply availability constraints resulting from these rules should be short term, if at all. Furthermore, TSDF owners and operators required to install air emission control equipment to comply with the subpart CC standards are allowed up to an additional 30 months after the rule's effective date to complete the equipment design and installation if they can document that the air emission controls cannot be installed and operating by the effective date, for reasons such as the unavailability of control equipment.

Also, the EPA expects that many TSDF owners and operators will choose to treat their hazardous waste earlier in the management sequence that they now do to reduce the organic content of the waste in accordance with one of the treatment requirements allowed for in the final subpart CC standards, and thus avoid the cost of installing and operating the control equipment on the downstream tanks, surface impoundments, and containers. The EPA also encourages the use of pollution prevention techniques as a means of reducing the quantity of waste generated, the organic concentration of the waste, or the toxicity of constituents in the waste.

F. Waste Stabilization in Tanks

Just prior to the long-scheduled and publicly-known promulgation date, representatives from the hazardous waste treatment industry notified the EPA of their opinion that the draft requirements for waste stabilization operations performed in tanks are economically and technically infeasible. These draft requirements are included in a May 19, 1994 interim review draft of the final rule, made publicly available in June 1994. (See RCRA docket entry number F-94-CESPS 00509.) Moreover, the industry indicated that volatilization of organic constituents during stabilization operations are negligible. No data were submitted to the EPA in support of these assertions. Industry representatives nevertheless feel strongly that for the majority of waste streams treated by stabilization, the organic constituents in the waste are not volatilized during the stabilization process. Additionally, they allege that for these same stabilization operations: (1) It is technically infeasible to comply with the air emission control requirements for tanks in the subpart CC standards; and (2) It is not feasible to treat organic waste prior to stabilization such that the volatile organic concentration of the waste entering the stabilization process would be below 100 ppmw, and the downstream units managing the waste (including the stabilization tanks) would thereby be exempt from subpart CC tank control requirements. (See RCRA docket number F-94-CESF-FFFFF.)

These statements contradict the conclusions drawn by the EPA based on site visits to observe hazardous waste stabilization processes, and experiments and studies conducted by the EPA to characterize waste stabilization processes and estimate associated organic emissions. The most recent EPA studies were mentioned in the Notice of Data Availability (see 57 FR 43171, September 18, 1992) and were made available for public review and comment in the docket for this rulemaking (see RCRA docket number F-92-CESA-FFFFF). No comments were received concerning the validity of these stabilization study conclusions.

At the same time, however, and despite the inappropriate timing of industry's comments on this issue (compounded by the industry's failure to comment on the information presented by the Notice of Data Availability), the EPA has determined that it may be worthwhile to review pertinent data for current waste stabilization activities at hazardous waste TSDF. Industry has pledged to provide detailed data from an emissions test conducted to measure organic emissions from a full-scale stabilization operation treating hazardous waste streams. The test will be conducted using the EPA approved sampling and analytical methods, and the volatile organic concentration of the waste streams will be measured using Method 25D, with gas chromatography and with mass spectrometry (see RCRA docket number F-94-CESF-FFFFF). The EPA will accept until September 6, 1995 all pertinent information and comments on the following limited issues: (1) Volatilization of organics during waste stabilization activities, (2) feasibility of treating organic wastes to destroy or remove organics prior to stabilization to immobilize toxic metals, and (3) alternative organic emission controls applicable to stabilization tanks. Persons interested in submitting comments or data pertaining to these issues should notify the EPA of their intent by contacting Ms. Michele Aston at the address listed in the FOR FURTHER INFORMATION CONTACT section at the beginning of this preamble. Written information and comments regarding the above issues should be mailed to the RCRA Docket Office (5305), U.S. Environmental Protection Agency, room 2616, 401 M Street SW., Washington, DC 20460. Please send an original and two copies of all information, and refer to RCRA docket number F-94-CESA-FFFFF. The EPA will assess all submitted information, and will make a rapid determination whether to amend the requirements under the subpart CC standards being promulgated today for tanks in which waste stabilization operations are performed. The EPA emphasizes that the current record does not support any amendment to these standards. However, if the EPA were to amend the requirements for stabilization tanks, the amendment could include any of the provisions described below, a modification of today's promulgated requirements, or

possibly other options.
The EPA may choose to amend the final subpart CC tank standards such that stabilization tanks could comply with alternative air emission controls to those included in today's promulgation. The EPA will determine the appropriateness of such an amendment based on the evaluation of:
(1) Information that is submitted relating to industry's comments that it is not feasible to comply with the technical requirements of today's final rule or to pretreat waste prior to stabilization; (2) Information related to alternative emission controls that could be applied to stabilization tanks for effective organic emission reduction;
(3) Data related to the specific characteristics of hazardous waste that is stabilized at TSDF;
(4) Detailed information regarding the stabilization processes performed in TSDF tanks; and
(5) Other related information.
For a given stabilization tank to qualify for certain compliance options, the EPA could require the facility owner or operator to demonstrate (through specified testing, monitoring, sampling, or other means) that organic constituents are not volatilized during the hazardous waste stabilization operations performed in that tank. A similar requirement for biological treatment performed in tanks and surface impoundments is included in the final subpart CC standards (for example see 40 CFR 264.1085(a)(2)) as well as other air standards developed by the EPA under the Clean Air Act (e.g., the Hazardous Organic NESHAP (59 FR 19402, April 22, 1994) and the proposed Off-Site Waste and Recovery Operations NESHAP (59 FR 51919, October 13, 1994)). For biological treatment processes, which are generally acknowledged by the EPA as appropriate treatment for organic constituents in waste with respect to controlling organic emissions, the EPA considers such a demonstration to be a reasonable requirement for certain compliance options. Therefore, the EPA also could consider it reasonable to require that stabilization operations, which the EPA does not consider appropriate treatment for organic constituents in waste with respect to controlling organic emissions, perform at least an equivalent demonstration for certain compliance options. If the EPA were to amend today's promulgated subpart CC tank standards to include such a demonstration, the required procedure could include any of the following, or possibly other procedures: whole waste analyses, fullscale analyses, specified emissions monitoring, material balance calculations, temperature monitoring, and water content information. In light of this supplemental comment opportunity, the EPA considers it appropriate to extend the effective date of the final rules for tanks that could be affected if the EPA chooses to modify the standards. Therefore, a separate compliance schedule is applicable to tanks in which waste stabilization activities are performed as of December 6, 1994. It is important to note that all applicable requirements with respect to other units at a facility subject to the subpart CC standards will be effective June 5, 1995. For these stabilization tanks, the effective date of the final rules will be December 6, 1995. As of the extended effective date for stabilization tanks, each TSDF owner or operator and each hazardous waste generator subject to the final rules must either install and operate the specified air emission control requirements on all affected tanks used for stabilization, or begin performing the specified waste determinations and recordkeeping to indicate that a stabilization tank is exempted from these requirements. Under circumstances where required air emission control equipment cannot be operational by December 6, 1995, an implementation schedule for installation of the required air emission controls must be developed and placed in the facility operating records no later than December 6, 1995. In such cases, the facility must have all air emission controls required by the final rules in operation no later than June 8, 1998.

VII. Requirements of Final Rule

A. TSDF Tank, Surface Impoundment, and Container Requirements

Today's action by the EPA promulgates air emission standards for TSDF tanks, surface impoundments, and containers as a new subpart CC in both 40 CFR parts 264 and 265. Subpart CC under 40 CFR part 265 establishes standards for owners and operators of interim-status TSDF. As discussed in section VIII.A of this preamble, owners and operators of permitted TSDF that have been issued final permits prior to June 5, 1995, are required to comply with subpart CC under 40 CFR part 265 until the facility's permit is reviewed or reissued by the EPA. The air emission control requirements of the final subpart CC standards in 40 CFR part 264 and 40 CFR part 265 are identical with the exception of the reporting requirements. There are no reporting requirements in subpart CC under 40 CFR part 265.

1. Applicability
   a. General applicability. In general, the subpart CC standards apply to RCRA-permitted tanks, surface impoundments, and containers subject to 40 CFR part 264, subparts J, K, or I, respectively, as well as to interim-status TSDF tanks, surface impoundments, and containers subject to 40 CFR part 265, subparts J, K, or I, respectively. However, certain specific types of TSDF tanks, surface impoundments, and containers are not subject to the subpart CC standards under applicability provisions in other RCRA regulations as well as provisions included specifically in the subpart CC standards. The subpart CC standards do not apply to those TSDF tanks, surface impoundments, or containers excluded from regulation under 40 CFR 264.1. For example, TSDF owners and operators are not required to obtain a RCRA permit for tanks or tank systems that manage hazardous wastewaters or wastewater treatment sludges and are subject to regulation under either section 402 or 307(b) of the Clean Water Act [refer to 40 CFR 264.1(g)(6) and 40 CFR 265.1(c)(10)]. Because these tanks are exempted from RCRA permitting requirements, they are not subject to the requirements of 40 CFR parts 264 and 265. Thus, the subpart CC standards do not apply to a TSDF tank that is considered to be a part of a ``wastewater treatment unit'' as defined in 40 CFR 260.10. Similarly, the subpart CC standards do not apply to TSDF tanks, surface impoundments, or containers when these units are used for emergency or spill management activities in accordance with 40 CFR 264.1(g)(8)(i) or 40 CFR 265.1(c)(11)(i). b. Exemptions. The subpart CC standards are only applicable to containers with a design capacity greater than or equal to 0.1 m\3\ (approximately 26 gallons). This means that any container that has a design capacity less than 0.1 m\3\ is not subject to the subpart CC standards regardless of the volatile organic concentration of the hazardous waste placed in the container. The subpart CC standards apply only to TSDF tanks, surface impoundments, and containers in which an owner or operator places hazardous waste on or after June 5, 1995. With respect to surface impoundments, the EPA has already explained that RCRA regulations do not apply to impoundments at which there is no active management of hazardous waste after the rule's effective date (see 55 FR 39410, September 27, 1990). This would include impoundments that cease operation before the rule's effective date, and impoundments that convert to non-hazardous waste impoundments before the effective date. This latter class of impoundments includes those impoundments that contain hazardous wastes deposited before the rule's effective date for which the impoundment is the final disposal site for hazardous waste already in the unit (i.e., the impoundment is a disposal unit) and hazardous wastes are not actively managed in the impoundment. Id. The principle in today's rule is consistent with this existing interpretation.
   The rationale for not applying the subpart CC standards to tanks and containers that do not receive hazardous waste after the effective date is somewhat different. Under the subpart CC standards, the need to apply air emission controls to a particular tank or container is

determined by the organic content of the hazardous waste at a point prior to being placed in the tank or container (this is discussed in the following section under ``General Standards''). In many situations where existing tanks and containers at a TSDF already hold hazardous waste but no longer receive new wastes, a TSDF owner or operator will be unable to perform a waste determination as specified in the rule because waste samples cannot be collected at the required locations and the owner or operator has insufficient knowledge about the waste. Furthermore, even if a waste determination can be performed for these tanks or containers but the units presently are uncovered or have other openings, most if not all of the volatile organics in the waste have most likely already been emitted to the atmosphere. Thus, the EPA decided that air emission control requirements should only apply to those tanks and containers in which hazardous waste is placed on or after the effective date of the rule.

The EPA decided not to apply the subpart CC standards to a tank once an owner or operator stops adding hazardous waste to the unit and begins closure pursuant to an approved closure plan because in many cases, use of the required air emission controls would hinder or prevent closure activities from being performed. c. Remediation wastes. The EPA has further decided to temporarily defer application of the subpart CC standards to tanks, containers, and surface impoundments which are being used on-site to treat or store hazardous wastes containing organics generated from remedial activities required under RCRA corrective action or CERCLA response authorities, or similar State remediation authorities, provided that the wastes are managed in units that do not also manage other hazardous wastes. This deferral applies only to on-site management of such wastes. For remediation waste transported off-site, the point of waste origination will be the point at which the wastes are physically moved outside the facility boundary (or for CERCLA response actions, outside the site boundary).

As the D.C. Circuit recently explained, a temporary deferral such as today's is permissible if the Agency legitimately needs further time to ascertain the best means of integrating concurrent statutory and regulatory schemes to avoid potential interference with the objectives of both schemes, and where Congress has not expressly forbidden a temporary deferral. Edison Electric Inst. v. EPA, 2 F. 3d 438, 451-53 (D.C. Cir. 1993). See also RCRA section 1006, requiring the EPA to integrate all provisions of RCRA for purposes of administration and enforcement, and to avoid duplication to the maximum extent practicable in doing so.

This situation is presented here. Control of air emissions from units at remediation sites implicates the overlapping and potentially competing concerns of RCRA section 3004(n) and the complex statutory provisions under RCRA, CERCLA, and State laws relating to remediation. The EPA's primary goal in this rulemaking has been to develop air emission standards for tanks, containers, and surface impoundments holding as-generated hazardous wastes containing organics. At proposal, the EPA thus did not fully consider the issue of whether different standards should appropriately apply to wastes that are generated and managed as the result of remedial activities, or how the proposed rule for air emissions could best be integrated with the remediation authorities of RCRA and other Federal or State laws. 56 FR at 33497-98 (July 22, 1991).

Commenters on the proposed subpart CC regulations pointed out that these were important issues deserving careful attention. The EPA agrees. It is possible that certain provisions of the air emission requirements promulgated today may be inappropriate or unnecessarily restrictive if applied to remediation activities (see 58 FR 8660, February 16, 1993).

The EPA notes that some measure of control of air emissions from remediation tanks, containers, and impoundments will be assured during

the deferral period. Remediation authorities of RCRA and CERCLA and similar State authorities allow overseeing officials to impose, on a site-specific basis, appropriate air emission controls on these types of units, as well as on other waste management units and handling operations. In addition, hazardous wastes containing organics that are managed off-site (i.e., outside a RCRA facility's boundary, or outside a CERCLA site) would be subject to the subpart CC management standards. Finally, the EPA emphasizes that the deferral is indeed temporary. The issue of appropriate air emission controls for remediation units is likely to be addressed in the context of the Hazardous Waste Identification Rules which are currently being developed by the EPA. The issue is also potentially part of the third phase of the RCRA section 3004(n) implementation. In addition, waste remediation sites are on the initial list of source categories under CAA section 112, and the EPA currently is scheduled to issue technology-based standards to control emissions of hazardous air pollutants from this source (see 57 FR 31576, July 16, 1992). Consequently, the EPA will be addressing this issue in the reasonably near future.

d. Radioactive mixed wastes. As explained in section IV.F of this preamble, the management of radioactive mixed waste at TSDF is subject to regulation under subtitle C of RCRA. The EPA reviewed the special nature of radioactive mixed wastes with respect to the air emission control requirements under the final subpart CC standards. In certain cases, the air emission controls used as the basis for the subpart CC standards are not compatible with the NRC requirements for safe handling of radioactive mixed wastes. For example, drums used to store radioactive mixed waste cannot be sealed with vapor leak-tight covers because of unacceptable pressure buildup of hydrogen gas to levels that can potentially cause rupture of the drum or create a potentially serious explosion hazard. This generation of hydrogen gas results from the radiolytic decomposition of organic materials (e.g., plastics) or aqueous solutions stored in the drums. Consequently, a drum used for storage of radioactive mixed wastes must be continuously vented through special filters in accordance with technical guidance issued by the NRC to prevent the hydrogen concentration in the drum from reaching dangerous levels. The EPA is planning to further investigate methods for effective control of organic emissions from waste management units handling radioactive mixed waste that are consistent with the NRC waste management practices.

2. General Standards

The final subpart CC standards require that TSDF owners and operators install and operate air emission controls on each tank, surface impoundment, and container subject to the rules except when all of the hazardous waste placed in the unit is determined to meet certain conditions. These conditions are based on properties of the hazardous waste determined at either one of two locations: (1) The point where a hazardous waste is generated or the point where the waste is received by an off-site facility; or (2) The point following treatment of a hazardous waste to remove or destroy the organics in the waste.

a. Point of waste origination. Under the final subpart CC standards, a TSDF owner or operator is exempted from managing a hazardous waste in a tank, surface impoundment, or container in accordance with the air emission control requirements of the rule when the owner or operator determines that all hazardous waste placed in the unit has an average volatile organic concentration at the point of waste origination less than 100 ppmw. The point of waste origination is defined in the rule with respect to the point where the TSDF owner or operator first has possession of a hazardous waste. When the TSDF owner or operator is the generator of the hazardous waste, the point of waste origination means the point where a solid waste produced by a system, process, or waste management unit is determined to be a hazardous waste as defined in 40 CFR part 261. As previously stated, the term ``point of waste

origination'' applied to this situation is being used in a similar manner to the use of the term ``point of generation'' in waste operations air standards established under authority of the Clean Air Act in 40 CFR parts 60, 61, and 63 of this chapter. When neither the TSDF owner nor operator is the generator of the hazardous waste, point of waste origination means the point where the owner or operator accepts delivery or takes possession of the hazardous waste. b. Treated Hazardous Waste. If a hazardous waste has an average volatile organic concentration equal to or greater than 100 ppmw based on the hazardous waste composition at the point of waste origination, then this waste is required under the subpart CC standards to be managed in accordance with the air emission control requirements of the rule. Under these requirements, specific air emission controls must be installed and operated on every tank, surface impoundment, and container subject to the rule used in the waste management sequence from the point of waste origination through the point where the organics in the waste are removed or destroyed by a process that meets or exceeds a minimum level of performance specified in the rule. In other words, once a hazardous waste is treated to remove or destroy the organics in the waste in accordance with the rule requirements, the subsequent downstream tanks, surface impoundments, and containers used to manage this particular hazardous waste are not required to meet the air emission control requirements of the subpart CC standards. The final subpart CC standards provide TSDF owners and operators with several alternative provisions for determining when a treated hazardous waste is no longer required to be managed in tanks, surface impoundments, and containers meeting the air emission control requirements of the rule. Treated hazardous waste provisions are specified in the subpart CC standards for the following processes: (1) An organic destruction, biological degradation, or organic removal process that reduces the organic content of the hazardous waste and is designed and operated in accordance with certain conditions specified in the rule;
(2) A hazardous waste incinerator that is designed and operated in accordance with the requirements of 40 CFR 264 subpart O or 40 CFR 265 subpart O; or
(3) A boiler or industrial furnace that is subject to the requirements of 40 CFR part 266 subpart H. A process that simply mixes, blends, combines, or aggregates a hazardous waste stream with other materials does not destroy the organics in the waste stream or remove the organics from the waste stream. While diluting a hazardous waste stream having a volatile organic concentration greater than 100 ppmw with sufficient quantities of other hazardous waste streams having a volatile organic concentration less than 100 ppmw (or water or other low organic content materials) would reduce the volatile organic concentration of the resulting hazardous waste mixture to a level below 100 ppmw, the total mass quantity of organics in the waste does not change since no organics were removed or destroyed from the waste. The potential for organic emissions from handling the waste mixture is essentially the same as for the individual hazardous waste streams prior to being mixed. Therefore, the EPA does not allow dilution of a hazardous waste as a means for complying with the requirements specified in the subpart CC standards for placing treated hazardous waste in affected tanks, surface impoundments, or containers not using the required air emission controls. Consequently, when a hazardous waste is treated by an organic destruction or removal process and the hazardous waste has been mixed or aggregated together with other hazardous wastes or materials with a volatile organic concentration less than 100 ppmw prior to the point of waste treatment, the subpart CC standards require that TSDF owners and operators meet special requirements to ensure that organics in the hazardous waste have actually been removed or destroyed. An owner or operator can choose from several alternative provisions to comply with these requirements.

One provision requires that mixed hazardous wastes be treated by an organic destruction or removal process that reduces the volatile organic concentration of the hazardous waste to meet a site-specific treatment process exit concentration limit. This limit is determined by the TSDF owner or operator on a case-by-case basis using an equation specified in the rule that accounts for the portion of the reduction in the volatile organic concentration in the resulting treated hazardous waste stream due to dilution. To use this equation, the owner or operator must first determine the volatile organic concentration at the point of waste origination for each individual hazardous waste stream that is mixed together prior to entering the treatment process. As an alternative to calculating the exit concentration limit for a treatment process, the subpart CC standards allow the owner or operator to treat the mixed hazardous wastes to a volatile organic concentration level that is less than or equal to the lowest waste volatile organic concentration at the point of waste origination for all of the individual hazardous waste streams mixed together prior to entering the treatment process.

Another alternative in the subpart CC standards available to owners and operators allows mixed hazardous wastes to be treated using a single process that achieves an organic reduction efficiency of 95 percent or greater on a mass basis, and reduces the average volatile organic concentration of the resulting hazardous waste stream exiting the process to a level less than 50 ppmw. This alternative does not require the owner or operator to perform any volatile organic concentration waste determinations for the hazardous wastes prior to mixing, yet still accommodates the mixing of wastes that have different volatile organic concentrations. For a waste stream having a volatile organic concentration greater than 2,000 ppmw, requiring only a minimum 95 percent reduction of the organic content in the waste stream would not lower the volatile organic concentration of the treated waste stream to the 100 ppmw level of the rule. However, if such a waste stream had been mixed together prior to treatment with other waste streams having lower volatile organic concentrations, then the volatile organic concentration of the treated waste exiting the process could be less than 100 ppmw. The EPA does not consider such situations to be unlikely, and has therefore chosen for this alternative to require an exit concentration for the treated waste lower than 100 ppmw. The EPA considers an exit concentration of 50 ppmw, combined with a 95 percent treatment efficiency, to be an appropriate demonstration that the reduction in volatile organic concentration for a mixture of hazardous waste streams has been achieved through destruction or removal of organic constituents in the waste, rather than by dilution. The final subpart CC standards also provide another alternative that does not require the owner or operator to perform any volatile organic concentration waste determinations for the hazardous wastes prior to mixing when the waste is treated by a biological process that destroys or degrades the organics contained in the hazardous waste to meet certain performance requirements specified in the rule. These conditions are either of the following: (1) Achieve an organic reduction efficiency for the biological treatment process equal to or greater than 95 percent, and achieve an organic biodegradation efficiency for the process equal to or greater than 95 percent; or

(2) Achieve a total actual organic mass biodegradation rate for all hazardous waste treated by the process equal to or greater than the required organic mass removal rate for the process. Compliance with these parameters is determined using the procedures specified in rule. The EPA may at any time measure or request that the owner or operator measure using Method 25D the volatile organic concentration of a hazardous waste that is placed in a tank, surface impoundment, or container not using air emission controls in accordance with the requirements of the subpart CC standards. Measurement results showing

that the volatile organic concentration of the hazardous waste is equal to or greater than 100 ppmw constitutes noncompliance with the subpart CC standards. However, in a case where the owner or operator has used an averaging period greater than 1 hour for determining the volatile organic concentration of a hazardous waste, the Regional Administrator may consider information that was used by the owner or operator to determine the average volatile organic concentration of the hazardous waste (e.g., test results, measurements, calculations, and other documentation) together with the results of the waste determination in determining whether the owner or operator is in compliance with the subpart CC standards.

3. Waste Determination Procedures

A determination of the volatile organic concentration of a hazardous waste is required by the subpart CC standards only when a hazardous waste is to be placed in a tank, surface impoundment, or container subject to the rule that does not use air emission controls in accordance with the requirements of the rule. A TSDF owner or operator is not required to determine the volatile organic concentration of the waste if it is placed in a tank, surface impoundment, or container using the required air emission controls. When the hazardous waste is generated as part of a continuous process, the owner or operator is required to perform an initial waste determination of the average volatile organic concentration of the waste stream before the first time any portion of the material in the waste stream is placed in a waste management unit subject to the rule, and thereafter update the information used for the waste determination at least once every 12 months following the date of the initial waste determination. When the hazardous waste is generated as part of a batch process that is performed repeatedly but not necessarily continuously, the owner or operator is required to perform an initial waste determination of the average volatile organic concentration for one or more representative waste batches generated by the process before the first time any portion of the material in the these waste batches is placed in a waste management unit subject to the rule, and thereafter update the information used for the waste determination at least once every 12 months following the date of the initial waste determination. For either case, the owner or operator is required to perform a new waste determination whenever changes to the process generating the hazardous waste are reasonably likely to cause the average volatile organic concentration to increase to a level at or above 100 ppmw. If an average volatile organic concentration is used, an initial waste determination must be performed for each averaging period. Waste determinations should be performed for any waste that is generated as a part of an unplanned event or is generated as a part of an event that is not included in the normal operating conditions for the source or process generating the hazardous waste. Examples of an unplanned event include malfunctions that affect the operation of the process or that alter the composition of the waste or product. Examples of events that are not normal operating conditions include maintenance activities and equipment cleaning. Normal operating conditions for the source or process generating the waste include cyclic process operations such as start-up and shutdown. For processes that have variations in normal operating conditions such that the waste volatile organic concentration may exceed 100 ppmw, but for which the average waste volatile organic concentration for the averaging period is below 100 ppmw, documentation must be retained in the facility operating record that specifies the following information: (1) The maximum and minimum waste volatile organic concentration values that will occur for that averaging period; (2) the circumstances under which a waste volatile organic concentration above 100 ppmw would occur, and; (3) the calculations and waste determination procedures used as the basis for the determination of the average volatile organic concentration. For a given averaging period, if there are no deviations from the

operating circumstances or from the maximum or minimum waste volatile organic concentrations specified in the operating plan, then no additional waste determinations would be required after the initial waste determination for that averaging period. The subpart CC standards include provisions that allow a TSDF owner or operator to use either direct measurement or knowledge of the waste to determine the volatile organic concentration of a hazardous waste. The following paragraphs describe these two options available to the owner or operator for performing a waste determination. a. Direct measurement. When the hazardous waste is generated on a continuous basis, the averaging period to be used for determining the volatile organic concentration on a mass-weighted average basis must be designated and recorded. This averaging period can represent any time interval that the hazardous waste flows until such time that a new waste determination must be performed pursuant to the requirements of the rule. However, this averaging period cannot exceed 1 year. A sufficient number of samples, but no less than four, must be collected to represent the complete range of organic compositions and organic quantities that occur in the hazardous waste stream during the entire averaging period due to normal variations in the operating conditions for the source or process generating the hazardous waste. When the hazardous waste is generated as part of a batch process that is performed repeatedly but not necessarily continuously, samples are collected from one or more representative waste batches generated by the process. The volatile organic concentration for the waste is calculated as a mass-weighted average based on the analysis results for all of the waste samples collected for these waste batches. A sufficient number of samples, but no less than four, must be collected to represent the organic composition for each representative batch. Each sample of the hazardous waste is to be collected in accordance with the requirements specified in ``Test Methods for Evaluating Solid Waste, Physical/Chemical Methods,'' EPA Publication No. SW-846, third edition, November 1986, as amended by Update I, November 15, 1992. Sufficient information must be recorded to document the waste quantity and the operating conditions for the source, process, or waste management unit generating the hazardous waste represented by each sample collected.

Each of the collected waste samples is to be prepared and analyzed in accordance with the requirements of Method 25D in 40 CFR part 60, appendix A. The volatile organic concentration for a hazardous waste on a mass-weighted average basis is then calculated by entering the analysis results for all of the collected waste samples into an equation specified in the rule.

b. Knowledge of the waste. The final subpart CC standards allow TSDF owners or operators to use their knowledge of the waste for waste determinations (see Hazardous Waste Treatment Council v. EPA, 886 F.2d 355, 370-71 (D.C. Cir. 1989) upholding the use of generator knowledge to determine if treatment standards are met). Information may be used that is prepared by either the facility owner or operator or by the generator of the hazardous waste. Examples of information that could constitute acceptable knowledge include: (1) Organic material balances for the source, process, or waste management unit generating the waste;

(2) Documentation that lists the raw materials or intermediate products fed to a process showing that no organics are used in the process generating the waste;

(3) Information that shows the waste is generated by a process that is substantially similar to a process at the same or another facility that generates a waste that has previously been determined by direct measurement to have a volatile organic content less than the action level;

(4) Test data that provide speciation analysis results for the waste that are still applicable to the current waste management practices

and from which the total concentration of organics in the waste can be computed; or
(5) Other knowledge based on manifests, shipping papers, or waste certification notices.
When test data are used as the basis for knowledge of the waste, the owner or operator must provide documentation describing the testing protocol and the means by which sampling variability and analytical variability are accounted for in the determination of the volatile organic concentration of the hazardous waste. For example, an owner or operator may use individual organic constituent concentration test data that are validated in accordance with Method 301 in appendix A to 40 CFR part 63 as the basis for knowledge of the waste.

4. Tank Standards

The tank standards establish the requirements for tanks using air emission controls to comply with the general standards of the rule. No air emission controls are required under the subpart CC standards for a tank in which all hazardous waste placed in the unit has been treated to remove or destroy organics in accordance with the requirements specified in the general standards.
Also, the tank standards do not apply to a tank in which biological degradation of the organics in the hazardous waste treated in the unit is demonstrated to achieve specific performance levels. Either of the following sets of conditions must be demonstrated to qualify for this exemption: (1) The organic reduction efficiency for the process is equal to or greater than 95 percent, and the organic biodegradation efficiency for the process is equal to or greater than 95 percent; or (2) the total actual organic mass biodegradation rate for all hazardous waste treated by the process is equal to or greater than the required organic mass removal rate. The organic biodegradation efficiency or the organic mass biodegradation rate for a biological treatment unit is determined by procedures specified in the rule. The tank standards specify that the owner or operator install and operate on each affected tank one of the following air emission control systems: (1) A cover that is connected through a closed-vent system to a control device; (2) a fixed-roof type cover with an internal floating roof that is designed and operated in accordance with the requirements equivalent to the new source performance standard (NSPS) for volatile organic liquid (VOL) storage; (3) an external floating roof that is designed and operated in accordance with the requirements equivalent to the VOL storage NSPS; or (4) a pressure tank that is designed to operate as a closed system. Under the subpart CC standards, an owner or operator is allowed to use a fixed-roof type cover (without any additional controls) for affected tanks under certain conditions. Four conditions must be met for a particular tank before use of a fixed-roof type cover (without any additional controls) is allowed under the subpart CC standards. First, the hazardous waste cannot be mixed, stirred, agitated, or circulated within the tank by a process that results in splashing, frothing, or visible turbulent flow on the waste surface except during limited circumstances. Second, the hazardous waste in the tank cannot be heated by the owner or operator except when necessary to prevent the waste from freezing or to maintain adequate waste flow conditions for continuous normal process operations. Third, the hazardous waste cannot be treated using a waste stabilization process or a process that produces an exothermic reaction. Finally, the maximum organic vapor pressure of the hazardous waste in the tank must be less than the limit established in the rule by tank design capacity. For a tank having a design capacity equal to or greater than 151 m\3\ (approximately 40,000 gallons), then the maximum organic vapor pressure of the hazardous waste in the tank must be less than 5.2 kPA. For a tank having a design capacity equal to or greater than 75 m\3\ (approximately 20,000 gallons) but less than 151 m\3\, then the maximum organic vapor pressure of the waste in the tank must be less

than 27.6 kPa. For a smaller tank (design capacity less than 75 m\3\), the maximum organic vapor pressure must be less than 76.6 kPa.
The subpart CC standards require each cover opening not vented to a control device to be maintained in a closed, sealed position except at those times when a specific opening must be used to add, remove, inspect, or sample the waste in the tank or when it is necessary to use the opening to inspect, maintain, or repair equipment located inside the tank. Also, safety devices that vent directly to the atmosphere may be used on the tank, cover, closed-vent system, or control device provided that the safety device is not used for planned or routine venting of organic vapors. These safety devices are to remain in a closed position except when an unplanned event requires that the device be open for the purpose of preventing physical damage or permanent deformation of the tank, cover, closed-vent system, or control device in accordance with good engineering and safety practices for handling flammable, combustible, explosive, or other hazardous materials. An example of an unplanned event is a sudden power outage.

5. Surface Impoundment Standards
The surface impoundment standards establish the requirements for surface impoundments using air emission controls to comply with the general standards of the rule. No air emission controls are required under the subpart CC standards for a surface impoundment in which all hazardous waste placed in the unit has been treated to remove or destroy organics in accordance with the requirements specified in the general standards. Also, air emission controls are not required for a surface impoundment in which biological treatment of a hazardous waste is performed under the same conditions specified in the rule for tanks. The surface impoundment standards specify that the owner or operator install and operate on each affected surface impoundment a cover (e.g., air-supported structure) that is connected through a closed-vent system to a control device. Under the subpart CC standards, an owner or operator is allowed to use a floating membrane cover (without any additional controls) for affected surface impoundments under certain conditions specified in the rule. The requirements under the subpart CC standards for surface impoundment air emission control equipment are consistent with the requirements for tanks.

6. Container Standards
The container standards establish the requirements for affected containers (containers with a design capacity greater than or equal to 0.1 m\3\) using air emission controls to comply with the general standards of the rule. No air emission controls are required by the subpart CC standards for any container with a design capacity less than 0.1 m\3\ regardless of the volatile organic concentration of the hazardous waste placed in the container. For affected containers used for storage, treatment, or handling of hazardous waste, the owner or operator is required to use either: (1) A container that is equipped with a vapor leak-tight cover; (2) a container having a design capacity less than or equal to 0.46 m\3\ (approximately 119 gallons) that is equipped with a cover and complies with all applicable U.S. Department of Transportation (DOT) regulations on packaging hazardous waste for transport under 49 CFR part 178; or (3) a container that is attached to or forms a part of any truck, trailer, or railcar and that has been demonstrated within the preceding 12 months to be organic vapor tight in accordance with the procedure specified in Method 27. For a container in which treatment of hazardous waste is performed, the owner or operator is required to place the container inside an enclosure that is connected through a closed-vent system to a control device at all times that the container is completely or partially uncovered during the treatment operation. Transfer of hazardous waste by pumping into a container having a design capacity greater than 0.46 m\3\ is required to be performed using submerged fill loading.

The requirement for use of leak-tight covers on containers is established by testing the cover for no detectable organic emissions as determined using Method 21 in 40 CFR part 60, appendix A. The test is performed when all openings in the cover (e.g., lids, bungs, hatches, and sampling ports) are secured in a closed, sealed position. Under certain circumstances, the EPA has determined that a cover other than a rigid, gasketed cover can be used on a container that will meet the requirement for no detectable organic emissions. For example, the EPA has concluded that use of a tarpaulin with a vapor-suppressing foam is an acceptable cover for roll-off boxes used for short-term storage (e.g., less than 30 days) of bulk solid materials (refer to RCRA docket entry number F-94-CESP-S00507 for specific conditions under which this type of cover is acceptable).

As an alternative to using covers tested for no detectable organic emissions on drums and other containers with a design capacity less than or equal to 0.46 m\3\, the subpart CC standards allow an owner or operator to place the hazardous waste in drums meeting the DOT specifications and testing requirements under 49 CFR part 178. When a container meeting these DOT regulations is used, no leak detection monitoring nor recordkeeping for the container is required by the subpart CC standards. It is important to note that none of the exceptions to the 49 CFR part 178 regulations other than the exception for lab packs used for combination packagings as specified in 49 CFR 173.12(b) apply to a container for the purpose of complying with the subpart CC standards.

The subpart CC container standards allow use of a tank truck or tank railcar that has been tested for organic vapor tightness within the preceding 12 months in accordance with the requirements of Method

7. This method is a pressure test procedure originally developed by the EPA for determining the vapor-leak tightness of a tank truck into which gasoline is placed. The EPA considers Method 27 also appropriate for determining vapor-leak tightness of tank trucks and railcars into which hazardous wastes containing volatile organics are placed. No Method 21 leak monitoring or recordkeeping is required for tank trucks or tank railcars complying with this provision of the rule. When it is necessary for a container to be open during certain treatment processes, the subpart CC standards require the container to be located in an enclosure connected to a closed-vent system with control device. The enclosure must be designed to operate with sufficient airflow into the structure to capture all organic vapors vented from the container and route the vapors through the closed-vent system to the control device. The enclosure may have permanent or temporary openings to allow worker access, passage of containers through the enclosure by conveyor or other mechanical means, entry of permanent mechanical or electrical equipment, or to direct airflow into the enclosure. Whenever an open container is placed inside the enclosure, the pressure drop across each opening in the enclosure is to be maintained at a pressure below atmospheric pressure such that no organic vapors released from the container can exit the enclosure through the opening.

   Finally, the container standards include the same unit and control equipment safety venting provisions allowed under the subpart CC standards for tanks and surface impoundments.

8. Closed-Vent System and Control Device Requirements The design and operating requirements under the final subpart CC standards for a closed-vent system with control device are the same as those already applicable to TSDF owners and operators under subpart AA in 40 CFR parts 264 and 265 with one exception. The subpart CC standards require that each control device achieve at least a 95 percent reduction in the total organic content of the vapor stream vented to the device or, in the case of an enclosed combustion device, a reduction of the total organic content of the vapor stream to a level less than or equal to 20 ppmw on a dry basis corrected to 3 percent oxygen.

The standards do not require the use of any specific type of equipment or add-on control device. The standards allow the owner or operator the flexibility of choosing the control device best suited for a control application based on the characteristics of the particular organic vapor stream. Furthermore, the subpart CC standards do not require that each tank, surface impoundment, and container be vented to a separate control device dedicated to that particular unit. Vent streams from several units can be combined and discharged to a single control device that achieves the required level of performance.

9. Inspection and Monitoring

The subpart CC standards provide exemptions from inspection and monitoring for specific circumstances defined in the rule. In the case of an underground tank, only those portions of the tank cover and those connections to the tank cover or tank body (e.g., fill ports, access hatches, gauge wells, etc.) that extend to or above the ground surface and can be opened to the atmosphere must be inspected and monitored. Leak monitoring using Method 21 in 40 CFR part 60, appendix A, is not required for the following: (1) Drums that meet applicable DOT regulations specified in the rule; (2) tank trucks and tank railcars that are annually demonstrated to be vapor-tight by Method 27 in 40 CFR part 60, appendix A; and (3) closed-vent systems and control devices operated in vacuum service (i.e., equipment that is operated at an internal pressure that is at least 5 kPa below ambient pressure) or closed-vent system connections that are permanently or semi-permanently sealed (e.g., a welded joint between two sections of metal pipe or a bolted and gasketed pipe flange). Also, semiannual leak monitoring is not required for a cover opening that has continuously remained in the closed, sealed position for the entire period since the cover opening was last monitored.

To ensure that emission control equipment is properly operated and maintained, the subpart CC standards require the TSDF owner or operator to visually inspect certain emission control equipment items semiannually. For example, emission control equipment covers on tanks are to be checked semiannually by facility employees to ensure that equipment is being used properly (e.g., covers are closed and latched except when an opening must be used to add, remove, inspect, or sample the waste in the tank or to inspect, maintain, replace, or repair equipment located inside the tank or to vent gases or vapors from the tank) and the equipment is being maintained in good condition (e.g., no visible holes, gaps, tears, or splits have developed in covers).

Continuous monitoring of control device operation is required under the subpart CC standards. This involves the use of automated instrumentation to measure critical operating parameters that indicate whether the control device is operating correctly or is malfunctioning. Semiannual leak detection monitoring using Method 21 under 40 CFR part 60, appendix A, is required for certain cover components to ensure gaskets and seals are in good condition and for closed-vent systems to ensure all fittings remain leak-tight. In addition, with the previously noted exception of permanently or semi-permanently sealed connections, each closed-vent system must be monitored for leaks using Method 21 at least once per year.

Special inspection and monitoring provisions are included in the final subpart CC standards for cover fittings that are unsafe or difficult for facility personnel to inspect and monitor. A TSDF owner or operator may designate a cover fitting as ``unsafe to inspect and monitor'' if a worker would be exposed to dangerous, hazardous, or other unsafe conditions when performing the inspection or monitoring. A cover fitting that is designated as unsafe must be inspected and monitored as frequently as practicable during those times when it is safe to inspect and monitor the fitting. Similarly, a cover may be designated as ``difficult to inspect and monitor'' if in so doing a worker would be elevated to a height more than 2 meters above a support surface and the cover was installed before June 5, 1995. A

cover fitting that is designated as difficult must be monitored and inspected at least once per calendar year.
The subpart CC standards require that the TSDF owner or operator repair a cover fitting found to be leaking within 15 days of detection. Repair of control equipment on a tank or surface impoundment may be delayed beyond 15 calendar days under certain circumstances. To delay repair, the owner or operator must document that the repair cannot be completed without emptying the contents of the unit and also that removing the unit from service would result in the unscheduled cessation of production from the process unit or operation of the waste management unit that is generating the hazardous waste. Repair of this control equipment must be completed the next time the process unit or waste management unit that is generating the hazardous waste managed in the tank or surface impoundment is shut down.

10. Recordkeeping Requirements

The final subpart CC standards require the TSDF owner or operator to record certain information in the on-site facility operating logs or files. This information is to be readily available for review by authorized representatives of the EPA. Consistent with 40 CFR 264.73 and 40 CFR 265.73, the rule requires that air emission control equipment design records and certain other records be maintained in the facility operating record until facility closure. Records and results of waste determinations, inspections, and monitoring are required to be kept for at least 3 years from the date of entry. The information to be collected and recorded includes: the results of all waste determinations such as of volatile organic concentration at the point of waste origination and organic vapor pressure; design specifications for closed-vent systems and control devices and certain control equipment; emission control equipment inspection and monitoring results; Methods 27 test results; control device exceedances and actions taken to remedy them; leak repairs; management of carbon removed from carbon adsorption systems; identification of incinerators, boilers, or industrial furnaces used to treat hazardous waste in accordance with the general requirements of the rule; documentation for biological wastewater treatment units using air emission controls in accordance with the rule requirements; and identification of equipment fittings designated as unsafe or difficult to monitor or inspect. At a facility where air emission control equipment required by the final rule cannot be in operation by June 5, 1995, the owner or operator is required to prepare an implementation schedule for the air emission control equipment specifying dates by which progress will be completed by the facility owner or operator to ensure the required air emission controls are in operation no later than December 8, 1997. Alternatively, the owner or operator may come into compliance by modifying facility processes to eliminate waste streams with average volatile organic concentration greater than or equal to 100 ppmw at the point of waste origination. At a minimum, specific calendar dates shall be established for award of contracts or issuance of purchase orders for the air emission control equipment; initiation of on-site installation of the equipment; completion of the equipment installation; and performance of any testing to demonstrate that the installed air emission control equipment meets the standards. The EPA recognizes that, in some cases, owners or operators may be unable to meet the implementation date for reasons beyond their control. For example, several commenters pointed out that permit modifications may be required to implement necessary changes, and that modification processes can be lengthy. The EPA developed this rule to be self-implementing and to eliminate the need for permit modifications to the extent possible; furthermore, in the final rule the implementation period has been extended from 2 to 3 years. Therefore, the EPA expects that most if not all facilities will be able to comply. However, the EPA acknowledges that in some cases State

permits may have to be modified (e.g., when surface impoundments are replaced with tanks). If the permit process is lengthy, or undergoes extensive appeal, the facility's ability to comply with the implementation date may be jeopardized. To address this and similar situations, the EPA has included a provision that will allow the Regional Administrator to extend the implementation date in situations beyond the owner or operator's control, where he or she made all reasonable and prudent efforts to meet the date. The EPA emphasizes that this extension would be available only where meeting the date was truly beyond the facility's control, and the EPA expects its application would be limited to situations such as delays in State permit processing. The extension would not be available where the facility's planning was at fault, a permit application was submitted unreasonably late, or permit processing was delayed because the permit application was inadequate. In some cases, the owner or operator of a facility in interim status at the time this rule becomes effective may not be able to implement the requirements of the rule before EPA (or an authorized state) issues the facility its RCRA permit. In this case, the EPA will generally incorporate the facility's implementation schedule into the permit, in accordance with the requirements of 40 CFR 270.33, which allows schedules of compliance in RCRA permits. Consistent with this approach, 40 CFR 270.27(a)(7) requires permit applicants to submit their schedules of implementation with their permit applications, if the owner or operator cannot implement the requirements of this rule before permit issuance.

As the EPA develops new hazardous waste listings or characteristics in the future, new containers, tanks, and surface impoundments will become subject to subpart CC standards. For these units, the effective date of the standards will be the effective date of the new listing or characteristic. Owners or operators of these units must institute controls by that date. In cases when owners or operators cannot comply with the applicable requirements of the subpart CC standards by this date, they must install and operate required air emission control equipment no later than 30 months after the effective date provided that they prepare a implementation schedule (as described above) for this control equipment by the effective date.

11. Reporting Requirements

The final subpart CC standards in 40 CFR part 264 require a TSDF owner or operator to submit reports to the EPA only when circumstances occur at the facility resulting in noncompliance with certain provisions of the rule. There are no reporting requirements under 40 CFR 265 subpart CC for owners and operators of interim-status TSDF. Each report required under the final subpart CC standards in 40 CFR part 264 is to be submitted to the EPA Regional office having jurisdiction for a particular TSDF location. The report is required to be signed and dated by an authorized representative of the facility owner or operator.

A TSDF owner or operator subject to the requirements of 40 CFR 264 subpart CC must report to the EPA all circumstances resulting in placement of a hazardous waste in a tank, surface impoundment, or container subject to the rule and not using air emission controls required by the rule when either of the following conditions occur: (1) The hazardous waste has a volatile organic concentration equal to or greater than 100 ppmw as determined on a mass-weighted average basis at the point of waste origination, or (2) the process used to treat the hazardous waste fails to meet the applicable conditions specified in the rule. The owner or operator must submit a written report within 15 calendar days of the time that the owner or operator becomes aware of the circumstances.

A TSDF owner or operator subject to the requirements of 40 CFR part 264, subpart CC and using a control device in accordance with the requirements of the rule is required to submit a semiannual written report to the EPA. This report is to describe each occurrence during

the previous 6-month period when a control device is operated continuously for 24 hours or longer in noncompliance with the applicable operating values defined in 40 CFR 264.1035(c)(4) or when a flare is operated with visible emissions as defined in 40 CFR 264.1033(d). A TSDF owner or operator is not required to submit this report for a 6-month period during which all control devices at a facility subject to the subpart CC standards are operated by the owner or operator so that during no period of 24 hours or longer did a control device operate continuously in noncompliance with the applicable operating values defined in the rule.

B. TSDF Miscellaneous Unit Requirements

The EPA permits miscellaneous units at TSDF on a case-by-case basis with terms and provisions as needed to protect public health and the environment through generic performance standards specified in 40 CFR 264.601. Today's rule amends Sec. 264.601 to include the air emission controls required by the standards under 40 CFR part 264, subparts AA, BB, and CC among the ``appropriate'' controls a permit writer may require for a miscellaneous unit.

Application of the air standards under 40 CFR part 264, subparts AA, BB, and CC to subpart X miscellaneous units will require determining which one of the waste management unit categories (e.g., tank, surface impoundment, container), if any, is most similar to the miscellaneous unit. As an example, hazardous waste is sometimes stored or treated in a miscellaneous unit consisting of a flexible, synthetic liner supported by an above ground metal frame (instead of a depression formed of earthen materials as is the case for a surface impoundment). Placing hazardous waste containing organics in this type of miscellaneous unit could result in significant organic emissions from the exposed waste surface comparable to those resulting from placing the waste in a similar size surface impoundment. Using the types of air emission controls applicable to surface impoundments (e.g., floating membrane cover) would reduce organic emissions from this type of miscellaneous unit. Therefore, in the case where the miscellaneous unit is determined to resemble a surface impoundment, a subpart X permit may be issued that includes air emission control requirements for surface impoundments under the subpart CC standards. The same application of the rule would be true for a miscellaneous unit used to manage organiccontaining hazardous waste and determined to be similar to a tank or a container.

C. 90-Day Tanks and Containers Requirements

Today's final rulemaking amends subparts I and J of 40 CFR part 265 to add a requirement that 90-day tanks and containers covered by these subparts also have to comply with air emission control requirements in subparts AA, BB, and CC. The rule adds these provisions as conditions with which generators must comply to not be required to obtain a permit for on-site tanks and containers used to accumulate hazardous waste.

D. Amendments to Subparts AA and BB Standards

Today's action adds new requirements for TSDF owners and operators using activated carbon adsorption systems to comply with the control device requirements of subparts AA and BB under 40 CFR parts 264 and 265. These requirements specify the procedures for managing the spent carbon removed from the control devices, and are consistent with the requirements promulgated today in subpart CC under 40 CFR parts 264 and 265.

VIII. Implementation of Final Rule

A. Existing Sources

Today's action by the EPA modifies the ``permit-as-a-shield'' practice for implementation of RCRA rules by owners and operators of existing TSDF for which final RCRA permits have been issued by the EPA. The EPA is amending 40 CFR 270.4 to require that owners and operators of TSDF that have been issued final permits prior to June 5, 1995, comply with the air standards under 40 CFR part 265, subparts AA, BB, and CC until the facility's permit is reviewed or reissued by the EPA. This amendment eliminates application of the ``permit-as-a-shield'' practice for these air standards but does not require that the EPA or the TSDF owner or operator initiate a permit modification to add the requirements of 40 CFR part 264, subparts AA, BB, or CC. The EPA believes that this will minimize the administrative burden on the TSDF owner or operator as well as limit the additional burden on the permitting resources of the EPA. However, when a permit is reopened or subject to renewal, or when a TSDF owner or operator submits a Class 3 modification request pertaining to an existing unit or addition of a new unit subject to these standards (e.g., a modification regarding a tank, surface impoundment, or container), then the applicable requirements of 40 CFR part 264, subparts AA, BB, and CC shall be incorporated into the permit conditions. The subpart CC standards promulgated today are implemented on the following schedule by owners and operators of existing TSDF (except for tanks in which waste stabilization activities are performed as of December 6, 1994, as explained in section VI.F of this preamble): (1) All owners and operators of existing TSDF become subject to the requirements of 40 CFR part 265, subparts AA, BB, and CC effective June 5, 1995.
(2) Beginning June 5, 1995, each TSDF owner or operator is required to be in compliance with 40 CFR part 265, subparts AA, BB, and CC. Implementation of the leak detection and repair program required by the subpart BB standards is required by this date. At a facility where the air emission controls required by the subpart AA, BB, and CC standards are not in place, the owner or operator must have one of the following in the facility's operating record: An implementation schedule for the air emission controls in accordance with the recordkeeping requirements of the rule or the facility's waste determination that indicates that air emission controls are not required. (3) No later than December 8, 1997, the air emission controls required by 40 CFR part 265, subparts AA, BB, and CC must be installed and in operation.
All final permits, or Class 3 permit modifications, issued by the EPA after June 5, 1995, must incorporate the requirements of 40 CFR part 264, subparts AA, BB, and CC. The owner and operator of an interim status TSDF who have submitted Part B applications to the EPA but have not received a draft permit as of June 5, 1995, are required to modify the Part B application to incorporate the requirements of 40 CFR part 264, subparts AA, BB, and CC prior to a draft permit being issued by the EPA. However, if the owner and operator have received a draft permit as of June 5, 1995, then the requirements of 40 CFR part 264, subparts AA, BB, and CC must be incorporated into the permit conditions prior to final permit determination. The Regional Administrator may establish, on a case-by-case basis, a reasonable date for submittal of the revised Part B application.
An existing solid waste management unit (or facility) may become a hazardous waste management unit (or facility) requiring a RCRA permit when a waste becomes newly listed or identified as hazardous. Owners and operators of TSDF not previously requiring a RCRA permit who have existing units handling newly listed or identified hazardous waste can submit a Part A application and gain interim status. The air standards being promulgated today are implemented at these facilities on the following schedule:
(1) 180 days following the date the waste is listed or identified as hazardous waste, the standards become effective; all facilities become subject to the standards.
(2) Beginning June 5, 1995, each TSDF owner or operator is required to be in compliance with the subpart AA, BB, and CC standards. At a facility where the air emission controls required by the subpart AA, BB, and CC standards are not in place, the owner or operator must have one of the following in the facility's operating record: an implementation schedule

for the air emission controls in accordance with the recordkeeping requirements of the rule, or the facility's waste determination that indicates that air emission controls are not required.
(3) No later than December 8, 1997, the controls required by the standards must be installed at all facilities.

B. New Sources

All air emission controls required by 40 CFR part 264, subparts AA, BB, and CC must be in place and operating upon startup of a new TSDF. Under 40 CFR 270.10, owners and operators of new TSDF are required to submit Part A and Part B permit applications and to receive a final permit from the EPA prior to construction of the facility. The Part B application for a new facility must incorporate the requirements of 40 CFR part 264. Owners and operators who have submitted a Part B application for a new TSDF but have not been issued a final permit as of June 5, 1995, are required to modify their Part B applications to incorporate the requirements of 40 CFR part 264, subpart CC.

C. State Authority

1. Applicability of Rule in Authorized States Under RCRA section 3006, the EPA may authorize a qualified State to administer and enforce the RCRA program within the State (refer to 40 CFR part 271 for the standards and requirements for authorization). Although an authorized State has primary responsibility for enforcement of RCRA, the EPA retains enforcement authority under RCRA sections 3008, 7003, and 3013, as well as inspection authority under RCRA section 3007.
   Prior to the enactment of the HSWA, a State with final authority administered its hazardous waste program entirely in lieu of the EPA administering the Federal program in that State. The Federal requirements no longer applied in the authorized State, and the EPA could not issue permits for facilities in that State. When new, more stringent Federal requirements were promulgated or enacted, the State was obligated to enact equivalent requirements within specified time frames. The new Federal requirements did not take effect as Federal law in an authorized State until the State adopted the requirements as State law and was granted authority by the EPA to administer the requirements.
   In contrast, new Federal requirements promulgated under authority of the HSWA, become effective in authorized States at the same time they are effective in nonauthorized States. Under RCRA section 3006(g)(1), the EPA is directed to administer the new Federal requirements in authorized States, including the issuance of permits, until the State is granted authority to do so. While authorized States must still adopt all new RCRA provisions as State law to retain final authorization, requirements promulgated under RCRA provisions added by the HSWA are administered by the EPA as Federal law in authorized States in the interim.
   Today's rules are promulgated under authority of RCRA section 3004(n), a provision added to RCRA by the HSWA. Therefore, the EPA is adding the requirements of the rules to Table 1 in 40 CFR 271.1(j). This table identifies the Federal program requirements that are promulgated pursuant to the HSWA and that take effect in all States, regardless of their authorization status.
2. Effect on State Authorizations
   The EPA will implement the air standards promulgated today in an authorized State until such a time when the State either: (1) Modifies its RCRA program to adopt the rule and receives final authorization from the EPA for the modification; or (2) receives interim authorization from the EPA as described below. Because these air standards are promulgated under authority of the HSWA, a State submitting a program modification may apply to receive either interim

or final authorization under RCRA section 3006(g)(2) or 3006(b), respectively, on the basis of requirements that are substantially equivalent or equivalent to the EPA's. The procedures and schedule for State program modifications for either interim or final authorization are described in 40 CFR 271.21. The availability of HSWA interim authorization was recently extended by the EPA until January 1, 2003 (see 57 60129, December 18, 1992).

In accordance with the requirements of 40 CFR 271.21(e)(2), States with final authorization must modify their programs to reflect Federal program changes and subsequently must submit the modifications to the EPA for approval. The deadline by which a State must modify its RCRA program to adopt today's rulemaking is determined by the date of promulgation of the final rule, in accordance with 40 CFR 271.21(e)(2). This deadline can be extended in certain cases [40 CFR 271.21(e)(3)]. Once the EPA approves the modification, the State requirements become subtitle C RCRA requirements.

A State that submits its Base program application less than 12 months after the effective date of these standards is not required to include standards equivalent to these standards in its application. However, the State must modify its program by the deadlines set forth in 40 CFR 271.21(e). States that submit official applications for final authorization 12 months after the effective date of these standards must include standards equivalent to these standards in their applications. The 40 CFR 271.3 sets forth the requirements a State must meet when submitting its final authorization application. States with authorized RCRA programs may already have requirements similar to those in today's rule. Such State regulations have not been assessed against the Federal regulations being finalized today to determine whether they meet the tests for authorization. Thus, a State is not authorized to implement these requirements as RCRA requirements until the State program modification is assessed against Federal requirements and approved. Of course, States with existing standards may continue to administer and enforce their standards as a matter of State law. In implementing the Federal program, the EPA will work with States under cooperative agreements to minimize duplication of efforts. In many cases, the EPA will be able to defer to the States in their efforts to implement their programs, rather than take separate actions under Federal authority.

IX. Test Methods

A. Method 25D

Method 25D in 40 CFR part 60, appendix A is the applicable test method for the determination of the volatile organic concentration of wastes. Method 25D was originally proposed as a part of this rulemaking but was subsequently promulgated in a separate rulemaking (see 56 FR 19402, April 22, 1994). Responses to comments received on the proposed Method 25D as part of this rulemaking are presented in the BID for today's final rule. Additional comments and responses relevant to the proposed Method 25D that were received as part of other EPA rulemakings are available in Air Docket Number A-90-23 located at the EPA's Air and Radiation Docket Information Center, Waterside Mall, room 1500, 1st Floor, 401 M Street, SW., Washington, DC 20460. The sampling requirements in Method 25D have been changed since proposal. The promulgated version of Method 25D requires that samples of waste be collected from a source following specific procedures for sampling a single-phase or well-mixed waste, a multiple-phase waste, and solid materials. Each sample is suspended in an organic/aqueous matrix, then heated and purged with nitrogen for 30 minutes to separate certain organic compounds. A portion of the sample is analyzed for carbon concentration, as methane, with a flame ionization detector. The other portion of the sample is analyzed for chlorine concentration, as chloride, with an electrolytic conductivity detector. The volatile organic

concentration of the waste is then computed as the sum of the measured carbon and chlorine contents.

B. Method 25E

Method 25E is the applicable test method for determining the organic vapor pressure of waste managed in tanks. The version of Method 25E promulgated today in 40 CFR part 60, appendix A, is the same as the proposed version with one addition to the sampling requirements to provide for sampling waste in a tank. Method 25E requires collection of a waste sample in a headspace sample vial and transfer of the vial to a balanced pressure headspace sampler. The headspace vapor of the sample is analyzed for carbon content by a headspace analyzer, which uses a flame ionization detector.

X. Administrative Requirements

A. Paperwork Reduction Act

The information collection requirements in these rules have been approved by the Office of Management and Budget (OMB) under the Paperwork Reduction Act, 44 U.S.C. 3501 et seq., and have been assigned control number 1593.02. To aid the EPA with enforcement of the rule being promulgated today, TSDF owners and operators and hazardous waste generators subject to today's action are required to record certain information in the onsite facility operating logs or files. The recordkeeping requirements for each respondent (i.e., person subject to the rule) will vary depending on a variety of site-specific factors. These factors include: the number of tanks, surface impoundments, and containers subject to the rule in operation at the respondent's facility; the number of hazardous waste streams managed at the facility; the type of waste determination methods selected by the respondent; and the type of air emission control equipment selected by the respondent to comply with the requirements of the rule.
This collection of information has an estimated reporting burden averaging 1.4 hours per response and an estimated annual recordkeeping burden averaging 62.5 hours per respondent. These estimates include time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information.
In general, a respondent is not required to submit any reports to the EPA unless certain events occur at the respondent's facility in which a hazardous waste is improperly managed in a unit not using the required air emission controls or a control device malfunction cannot be corrected by the respondent within 24 hours of being detected. Thus, the EPA expects that many respondents complying with this rule will have no reporting burden. On a nationwide average basis, the public reporting burden resulting from today's action is estimated by the EPA to be approximately 2 hours per year per respondent. Send comments regarding the burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden to Chief, Information Policy Branch; EPA; 401 M St., S.W. (Mail Code 2136); Washington, DC 20460; and to the Office of Information and Regulatory Affairs, Office of Management and Budget, Washington, DC 20503, marked ``Attention Desk Officer for EPA.''

B. Executive Order 12866 Review

Under Executive Order 12866, (58 FR 51735, October 4, 1993) the Agency must determine whether the regulatory action is ``significant'' and therefore subject to OMB review and the requirements of the Executive Order. The Order defines ``significant regulatory action'' as one that is likely to result in a rule that may: (1) Have an annual effect on the economy of $100 million or more or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities;

(2) Create a serious inconsistency or otherwise interfere with an action taken or planned by another agency; (3) Materially alter the budgetary impact of entitlements, grants, user fees, or loan programs or the rights and obligations of recipients thereof; or
(4) Raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in the Executive Order.''
Pursuant to the terms of Executive Order 12866, it has been determined that this rule is a ``significant regulatory action'' based on the estimated annual cost of the rulemaking to the economy (i.e., the EPA's estimate of nationwide annual costs for the subpart CC standards exceeds $100 million). As such, the EPA has submitted this action to OMB for review. Changes made in response to OMB suggestions or recommendations will be documented in the public record.

C. Regulatory Flexibility Act

Under the Regulatory Flexibility Act (5 U.S.C. 601 et seq.), whenever a Federal agency publishes any proposed or final rule in the Federal Register, it must prepare a Regulatory Flexibility Analysis (RFA) that describes the impact of the rule on small entities (i.e., small businesses, organizations, and governmental jurisdictions). This analysis is not necessary, however, if the agency certifies that the rule will not have a significant economic impact on a substantial number of small entities.
The EPA has established guidelines for determining whether an RFA is required for the EPA rulemaking. These guidelines state that, if a preliminary analysis indicates that a proposed regulation would affect 20 percent or more of ``small entities'', then an RFA is to be prepared. In addition, these guidelines are used to evaluate if a regulation will have a ``significant impact'' on small entities. A regulation is considered by the EPA to have a ``significant impact'' if any one of the following four criteria is met: (1) Annual compliance costs increase the relevant production costs for small entities by more than 5 percent; (2) The ratio of compliance costs to sales will be 10 percent higher for small entities than for large entities; (3) Capital costs of compliance will represent a significant portion of the capital available to small entities, taking into account internal cash flow plus external financing capabilities; (4) Costs of the regulation will likely result in closures of small entities.
The EPA used the economic impact model developed for the RIA to estimate the effects of today's rulemaking on small entities (refer to Chapter VI of the RIA for additional details). The results of this analysis indicate that the effects of the air standards on small entities are minimal. The number of affected small entities is insubstantial, and the impacts are insignificant. Pursuant to the provisions of 5 U.S.C. 605(b), I hereby certify that these final rules promulgated today will not have a significant impact on a substantial number of small entities. Therefore, an RFA is not required for this rulemaking.

D. Docket

Three RCRA dockets contain information pertaining to today's rulemaking:
(1) RCRA docket number F-91-CESP-FFFFF, which contains copies of all BID references and other information related to the development of the rule up through proposal;
(2) RCRA docket number F-92-CESA-FFFFF, which contains copies of the supplemental data made available for public comment prior to promulgation; and
(3) RCRA docket number F-94-CESF-FFFFF, which contains copies of all BID references and other information related to development of the final rule following proposal.

The public may review all materials in these dockets at the EPA RCRA Docket Office.

The EPA RCRA Docket Office is located in room 2427 of the U.S. Environmental Protection Agency, 401 M Street SW., Washington, DC 20460. The Docket Office is open from 9 a.m. to 4 p.m., Monday through Friday, except for Federal holidays. The public must have an appointment to review docket materials. Appointments can be scheduled by calling the Docket Office at (202) 260-9327. An individual may copy a maximum of 100 pages of material from any one regulatory docket free of charge. Additional pages of material from the docket may be copied at a charge of $0.15 per page.

XI. Legal Authority

These regulations are promulgated under the authority of sections 2002, 3001-3007, 3010, and 7004 of the Solid Waste Disposal Act of 1970, as amended by RCRA, as amended (42 U.S.C. 6921-6927, 6930, and 6974).

List of Subjects

40 CFR Part 9

Environmental protection, Reporting and recordkeeping requirements.

40 CFR Part 60

Air pollution control, Test method, Vapor-phase organic concentration, Volatile organic concentration, Waste, Waste testing.

40 CFR Part 260

Air pollution control, Incorporation by reference.

40 CFR Part 262

Accumulation time, Air pollution control, Container, Tank.

40 CFR Parts 264 and 265

Air pollution control, Container, Control device, Hazardous waste, Incorporation by reference, Inspection, Miscellaneous unit, Monitoring, Reporting and recordkeeping requirements, Standards, Surface impoundment, Tank, Waste determination.

40 CFR Part 270

Administrative practice and procedure, Air pollution control, Confidential business information, Hazardous waste, Permit, Permit modification, Reporting and recordkeeping requirements.

40 CFR Part 271

Administrative practice and procedure, Air pollution control, Confidential business information, Hazardous waste, Reporting and recordkeeping requirements.

Dated: November 15, 1994.
Carol M. Browner,
The Administrator.
For the reasons set out in the preamble, title 40, chapter I, parts 9, 60, 260, 262, 264, 265, 270, and 271 of the Code of Federal Regulations are amended as follows:

PART 9--OMB APPROVALS UNDER THE PAPERWORK REDUCTION ACT

1. The authority citation for part 9 continues to read as follows:

Authority: 7 U.S.C. 135 et seq., 136-136y; 15 U.S.C. 2001, 2003, 2005, 2006, 2601-2671; 21 U.S.C. 331j, 346a, 348; 31 U.S.C. 9701; 33 U.S.C. 1251 et seq., 1311, 1313d, 1314, 1321, 1326, 1330, 1344, 1345 (d) and (e), 1361; E.O. 11735, 38 FR 21243, 3 CFR, 1971-1975 Comp. p. 973; 42 U.S.C. 241, 242b, 243, 246, 300f, 300g, 300g-1, 300g-2, 300g-3, 300g-4, 300g-5, 300g-6, 300j-1, 300j-2, 300j-3, 300j-4, 300j-9, 1857 et seq., 6901-6992k, 7401-7671q, 7542, 9601-9657, 11023, 11048.

2. Section 9.1 is amended by adding new entities in numerical order to the table under the indicated headings to read as follows:

Sec. 9.1 OMB approvals under the Paperwork Reduction Act.

PART 60--STANDARDS OF PERFORMANCE FOR NEW STATIONARY SOURCES

3. The authority citation for part 60 continues to read as follows:

Authority: Sections 111, 301(a) of the Clean Air Act as amended (42 U.S.C. 7411, 7601(a)) unless otherwise noted.

4. Appendix A is amended by adding Method 25E:

Appendix A--Test Methods

* * * * *

Method 25E--Determination of Vapor Phase Organic

Concentration in Waste Samples

Introduction

Performance of this method should not be attempted by persons unfamiliar with the operation of a flame ionization detector (FID) nor by those who are unfamiliar with source sampling because knowledge beyond the scope of this presentation is required.

1. Applicability and Principle

1.1 Applicability. This method is applicable for determining the vapor pressure of waste samples which represent waste which is or will be managed in tanks.
1.2 Principle. The headspace vapor of the sample is analyzed for carbon content by a headspace analyzer, which uses an FID.

2. Interferences

2.1 The analyst shall select the operating parameters best suited to the requirements for a particular analysis. The analyst shall produce confirming data through an adequate supplemental analytical technique and have the data available for review by the Administrator.

3. Apparatus

3.1 Sampling. The following equipment is required: 3.1.1 Sample Containers. Vials, glass, with butyl rubber septa, Perkin-Elmer Corporation Numbers 0105-0129 (glass vials), B001-0728 (gray butyl rubber septum, plug style), 0105-0131 (butyl rubber septa), or equivalent. The seal must be made from butyl rubber. Silicone rubber seals are not acceptable. 3.1.2 Vial Sealer. Perkin-Elmer Number 105-0106, or equivalent. 3.1.3 Gas-Tight Syringe. Perkin-Elmer Number 00230117, or equivalent.
3.1.4 The following equipment is required for sampling. 3.1.4.1 Tap.
3.1.4.2 Tubing. Telfon, 0.25-in. ID. Note: Mention of trade names or specific products does not constitute endorsement by the Environmental Protection Agency.
3.1.4.3 Cooling Coil. Stainless steel (304), 0.25 in.-ID, equipped with a thermocouple at the coil outlet. 3.2 Analysis. The following equipment is required: 3.2.1 Balanced Pressure Headspace Sampler. Perkin-Elmer HS-6, HS-100, or equivalent, equipped with a glass bead column instead of a chromatographic column.
3.2.2 FID. An FID meeting the following specifications is required:
3.2.2.1 Linearity. A linear response (<plus-minus>5 percent) over the operating range as demonstrated by the procedures established in Section 6.1.2.
3.2.2.2 Range. A full scale range of 1 to 10,000 ppm CH<INF>4. Signal attenuators shall be available to produce a minimum signal response of 10 percent of full scale.
3.2.3 Data Recording System. Analog strip chart recorder or digital integration system compatible with the FID for permanently recording the output of the detector.
3.2.4 Thermometer. Capable of reading temperatures in the range of 30 deg. to 60 deg.C with an accuracy of <plus-minus>0.1 deg.C.

4. Reagents

4.1 Analysis. The following items are required for analysis: 4.1.1 Hydrogen (H<INF>2). Zero grade. 4.1.2 Carrier Gas. Zero grade nitrogen, containing less than 1 ppm carbon (C) and less than 1 ppm carbon dioxide. 4.1.3

Combustion Gas. Zero grade air or oxygen as required by the FID.
4.2 Calibration and Linearity Check. 4.2.1 Stock Cylinder Gas Standard. 100 percent propane. The manufacturer shall:
(a) Certify the gas composition to be accurate to <plus-minus>3 percent or better (see Section 4.2.1.1); (b) Recommend a maximum shelf life over which the gas concentration does not change by greater than <plus-minus>5 percent from the certified value; and
(c) Affix the date of gas cylinder preparation, certified propane concentration, and recommended maximum shelf life to the cylinder before shipment to the buyer.
4.2.1.1 Cylinder Standards Certification. The manufacturer shall certify the concentration of the calibration gas in the cylinder by (a) directly analyzing the cylinder and (b) calibrating his analytical procedure on the day of cylinder analysis. To calibrate his analytical procedure, the manufacturer shall use, as a minimum, a three-point calibration curve.
4.2.1.2 Verification of Manufacturer's Calibration Standards. Before using, the manufacturer shall verify each calibration standard by (a) comparing it to gas mixtures prepared in accordance with the procedure described in Section 7.1 of Method 106 of part 61, appendix B, or by (b) calibrating it against Standard Reference Materials (SRM's) prepared by the National Bureau of Standards, if such SRM's are available. The agreement between the initially determined concentration value and the verification concentration value shall be within <plus-minus>5 percent. The manufacturer must reverify all calibration standards on a time interval consistent with the shelf life of the cylinder standards sold.

5. Procedure

5.1 Sampling.
5.1.1 Install a sampling tap to obtain the sample at a point which is most representative of the unexposed waste (where the waste has had minimum opportunity to volatilize to the atmosphere). Assemble the sampling apparatus as shown in Figure 25E-1. BILLING CODE 6560-50-P

<GRAPHIC><TIFF>TR06DE94.000

BILLING CODE 6560-50-C
5.1.2 Begin sampling by purging the sample lines and cooling coil with at least four volumes of waste. Collect the purged material in a separate container and dispose of it properly. 5.1.3 After purging, stop the sample flow and transfer the Teflon sampling tube to a sample container. Sample at a flow rate such that the temperature of the waste is <10 deg.C (<50 deg.F). Fill the sample container halfway (<plus-minus>5 percent) and cap it within 5 seconds. Store immediately in a cooler and cover with ice.
5.1.4 Alternative sampling techniques may be used upon the approval of the Administrator.
5.2 Analysis.
5.2.1 Allow one hour for the headspace vials to equilibrate at the temperature specified in the regulation. Allow the FID to warm up until a stable baseline is achieved on the detector. 5.2.2 Check the calibration of the FID daily using the procedures in Section 6.1.2.
5.2.3 Follow the manufacturer's recommended procedures for the normal operation of the headspace sampler and FID. 5.2.4 Use the procedures in Sections 7.4 and 7.5 to calculate the vapor phase organic vapor pressure in the samples. 5.2.5 Monitor the output of the detector to make certain that the results are being properly recorded.

6. Operational Checks and Calibration

Maintain a record of performance of each item. 6.1 Use the procedures in Section 6.1.1 to calibrate the headspace analyzer and FID and check for linearity before the system is first placed in operation, after any shutdown longer than 6 months, and after any modification of the system.

6.1.1 Calibration and Linearity. Use the procedures in Section 6.2.1 of Method 18 of Part 60, Appendix A, to prepare the standards and calibrate the flowmeters, using propane as the standard gas. Fill the calibration standard vials halfway (<plus-minus>5 percent) with deionized water. Purge and fill the airspace with calibration standard. Prepare a minimum of three calibration standards in triplicate at concentrations that will bracket the applicable cutoff. For a cutoff of 5.2 kPa, prepare nominal concentrations of 30,000, 50,000, and 70,000 ppm as propane. For a cutoff of 27.6 kPa, prepare nominal concentrations of 200,000, 300,000, and 400,000 ppm as propane.
6.1.1.1 Use the procedures in Section 5.2.3 to measure the FID response of each standard. Use a linear regression analysis to calculate the values for the slope (k) and the y-intercept (b). Use the procedures in Sections 7.2 and 7.3 to test the calibration and the linearity.
6.1.2 Daily FID Calibration Check. Check the calibration at the beginning and at the end of the daily runs by using the following procedures. Prepare two calibration standards at the nominal cutoff concentration using the procedures in Section 6.1.1. Place one at the beginning and one at the end of the daily run. Measure the FID response of the daily calibration standard and use the values for k and b from the most recent calibration to calculate the concentration of the daily standard. Use an equation similar to 25E- 2 to calculate the percent difference between the daily standard and C<INF>s. If the difference is within 5 percent, then the previous values for k and b may be used. Otherwise, use the procedures in Section 6.1.1 to recalibrate the FID.

7. Calculations

7.1 Nomenclature.

A = Measurement of the area under the response curve, counts. b = y-intercept of the linear regression line. C<INF>a = Measured vapor phase organic concentration of sample, ppm as propane.
C<INF>ma = Average measured vapor phase organic concentration of standard, ppm as propane.
C<INF>m = Measured vapor phase organic concentration of standard, ppm as propane.
C<INF>s = Calculated standard concentration, ppm as propane. k = Slope of the linear regression line. P<INF>bar = Atmospheric pressure at analysis conditions, mm Hg (in. Hg).
P* = Organic vapor pressure in the sample, kPa (psi). <greek-b> = 1.333 X 10<SUP>-7 kPa/[(mm Hg)(ppm)], (4.91 X 10<SUP>-7 psi/[(in. Hg)(ppm)])

7.2 Linearity. Use the following equation to calculate the measured standard concentration for each standard vial.

C<INF>m = k A + b Eq. 25E-1

7.2.1 Calculate the average measured standard concentration (C<INF>ma) for each set of triplicate standards and use the following equation to calculate the percent difference (PD) between C<INF>ma and C<INF>s.

<GRAPHIC><TIF1>TR06DE94.001

The instrument linearity is acceptable if the percent difference is within five for each standard.
7.3 Relative Standard Deviation (RSD). Use the following equation to calculate the RSD for each triplicate set of standards.

<GRAPHIC><TIF2>TR06DE94.002

The calibration is acceptable if the RSD is within five for each standard concentration.

7.4 Concentration of organics in the headspace. Use the following equation to calculate the concentration of vapor phase organics in each sample.

C<INF>a = k A + b Eq. 25E-4

7.5 Vapor Pressure of Organics in the Headspace Sample. Use the following equation to calculate the vapor pressure of organics in the sample.

P* = <greek-b> P<INF>bar C<INF>a Eq. 25E-5

API Publication 2517, Third Edition, February 1989, ``Evaporative Loss from External Floating-Roof Tanks,'' available from the American Petroleum Institute, 1220 L Street, Northwest, Washington, D.C. 20005. ``ASTM Standard Test Method for Vapor Pressure--Temperature Relationship and Initial Decomposition Temperature of Liquids by Isoteniscope,'' ASTM Standard D 2879-92, available from American Society for Testing and Materials (ASTM), 1916 Race Street, Philadelphia, Pennsylvania 19103;

* * * * *

(b) The references listed in paragraph (a) of this section are also available for inspection at the Office of the Federal Register, 800 North Capitol Street, NW., suite 700, Washington, DC. * * *

PART 262--STANDARDS APPLICABLE TO GENERATORS OF HAZARDOUS WASTE

8. The authority citation for part 262 continues to read as follows:

Authority: 42 U.S.C. 6906, 6912(a), 6922, 6923, 6924, 6925, 6937 and 6938, unless otherwise noted.

8a. Section 262.34 is amended by revising paragraphs (a)(1)(i), (a)(1)(ii) and (d)(2) as follows:

Sec. 262.34 Accumulation time.

(a) * * *
(1) * * *
(i) In containers and the generator complies with subparts I AA, BB and CC of 40 CFR part 265; and/or
(ii) In tanks and the generator complies with subparts J, AA, BB and CC of 40 CFR part 265, except Secs. 265.197(c) and 265.200; and/or

* * * * *

(d) * * *
(2) The generator complies with the requirements of subpart I of part 265 of this chapter, except for Secs. 265.176 and 265.178;

* * * * *

PART 264--STANDARDS FOR OWNERS AND OPERATORS OF HAZARDOUS WASTE TREATMENT, STORAGE, AND DISPOSAL FACILITIES

9. The authority citation for part 264 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6924 and 6925.

Subpart B--General Facility Standards

Sec. 264.13 [Amended]

10. In Sec. 264.13, paragraph (b)(6) is amended by adding ``264.1083,'' after the phrase ``as specified in Secs. 264.17, 264.314, 264.341, 264.1034(d), 264.1063(d),''.
11. In Sec. 264.13, paragraph (b)(8) is added to read as follows:

Sec. 264.13 General waste analysis.

* * * * *

(b) * * *

(8) For owners and operators seeking an exemption to the air emission standards of subpart CC in accordance with Sec. 264.1082-- (i) The procedures and schedules for waste sampling and analysis, and the analysis of test data to verify the exemption. (ii) Each generator's notice and certification of the volatile organic concentration in the waste if the waste is received from off site.

* * * * *

Sec. 264.15 [Amended]

12. In Sec. 264.15, paragraph (b)(4) is amended by removing the word ``and'' after the phrase ``frequencies called for in Secs. 264.174, 264.193, 264.195, 264.226, 264.254, 264.278, 264.303, 264.347, 264.602, 264.1033, 264.1052, 264.1053,'' and adding ``264.1088, and 264.1091(b),'' after ``264.1058,''.

Subpart E--Manifest System, Recordkeeping, and Reporting

13. Section 264.73 is amended by revising paragraphs (b)(3) and (b)(6) to read as follows:

Sec. 264.73 Operating record.

* * * * *

(b) * * *

(3) Records and results of waste analyses and waste determinations performed as specified in Secs. 264.13, 264.17, 264.314, 264.341, 264.1034, 264.1063, 264.1083, 268.4(a), and 268.7 of this chapter.

* * * * *

(6) Monitoring, testing or analytical data, and corrective action where required by subpart F of this part and Secs. 264.19, 264.191, 264.193, 264.195, 264.222, 264.223, 264.226, 264.252 through 264.254, 264.276, 264.278, 264.280, 264.302 through 264.304, 264.309, 264.347, 264.602, 264.1034(c) through 264.304(f), 264.1035, 264.1063(d) through 264.1063(i), 264.1064, 264.1088, 264.1089, and 264.1091.

* * * * *

* Section 264.77 is amended by revising paragraph (c) to read as follows:

Sec. 264.77 Additional reports.

* * * * *

(c) As otherwise required by subparts F, K through N, AA, BB, and CC of this part.

Subpart I--Use and Management of Containers

15. Section 264.179 is added to read as follows:

Sec. 264.179 Air Emission Standards.

The owner or operator shall manage all hazardous waste placed in a container in accordance with the requirements of subpart CC of this part.

Subpart J--Tank Systems

16. Section 264.200 is added to read as follows:

Sec. 264.200 Air emission standards.

The owner or operator shall manage all hazardous waste placed in a tank in accordance with the requirements of subpart CC of this part.

Subpart K--Surface Impoundments

17. Section 264.232 is added to read as follows:

Sec. 264.232 Air emission standards.

The owner or operator shall manage all hazardous waste placed in a surface impoundment in accordance with the requirements of subpart CC of this part.

Subpart X--Miscellaneous Unit

Sec. 264.601 [Amended]

18. The introductory text of Sec. 264.601 is amended by adding the words ``and subparts AA through CC'' after ``subparts I through O''.

Subpart AA--Air Emission Standards for Process Vents

19. Section 264.1033 is amended by revising paragraph (k)(2) and adding paragraph (m) to read as follows:

Sec. 264.1033 Standards: Closed-vent systems and control devices.

* * * * *

(k) * * *

(2) Closed-vent systems shall be monitored to determine compliance with this section during the initial leak detection monitoring, which shall be conducted by the date that the facility becomes subject to the provisions of this section, annually, and at other times as requested by the Regional Administrator. For the annual leak detection monitoring after the initial leak detection monitoring, the owner or operator is not required to monitor those closed-vent system components which operate in vacuum service or those closed-vent system joints, seams, or other connections that are permanently or semi-permanently sealed (e.g., a welded joint between two sections of metal pipe or a bolted and gasketed pipe flange).

* * * * *

(m) The owner or operator using a carbon adsorption system shall document that all carbon removed from a carbon adsorption system to comply with Sec. 264.1033(g) and Sec. 264.1033(h) is managed in one of the following manners:

(1) Regenerated or reactivated in a thermal treatment unit that is

permitted under subpart X of this part; (2) Incinerated by a process that is permitted under subpart O of this part; or
(3) Burned in a boiler or industrial furnace that is permitted under subpart H of part 266 of this chapter.

* In part 264, subpart CC is added to read as follows: Subpart CC--Air Emission Standards for Tanks, Surface Impoundments, and Containers

Sec.

Subpart CC--Air Emission Standards for Tanks, Surface Impoundments, and Containers

Sec. 264.1080 Applicability.

(a) The requirements of this subpart apply to owners and operators of all facilities that treat, store, or dispose of hazardous waste in tanks, surface impoundments, or containers subject to either subparts I, J, or K of this part except as Sec. 264.1 and paragraph (b) of this section provide otherwise.
(b) The requirements of this subpart do not apply to the following waste management units at the facility: (1) A waste management unit that holds hazardous waste placed in the unit before June 5, 1995, and in which no hazardous waste is added to the unit on or after June 5, 1995.
(2) A container that has a design capacity less than or equal to 0.1 m<SUP>3.
(3) A tank in which an owner or operator has stopped adding hazardous waste and the owner or operator has begun implementing or completed closure pursuant to an approved closure plan. (4) A surface impoundment in which an owner or operator has stopped adding hazardous waste (except to implement an approved closure plan) and the owner or operator has begun implementing or completed closure pursuant to an approved closure plan.
(5) A waste management unit that is used solely for on-site treatment or storage of hazardous waste that is generated as the result of implementing remedial activities required under the corrective action authorities of RCRA sections 3004(u), 3004(v) or 3008(h), CERCLA authorities, or similar Federal or State authorities. (6) A waste management unit that is used solely for the management of radioactive mixed waste in accordance with all applicable regulations under the authority of the Atomic Energy Act and the Nuclear Waste Policy Act.
(c) For the owner and operator of a facility subject to this subpart and who received a final permit under RCRA section 3005 prior to June 5, 1995, the requirements of this subpart shall be incorporated into the permit when the permit is reissued in accordance with the requirements of 40 CFR 124.15 or reviewed in accordance with the requirements of 40 CFR 270.50(d). Until such date when the owner and operator receives a final permit incorporating the requirements of this subpart, the owner and operator is subject to the requirements of 40 CFR part 265, subpart CC.

Sec. 264.1081 Definitions.

As used in this subpart, all terms shall have the meaning given to them in 40 CFR 265.1081, the Act, and parts 260 through 266 of this chapter.

Sec. 264.1082 Standards: General.

(a) This section applies to the management of hazardous waste in tanks, surface impoundments, and containers subject to this subpart. (b) The owner or operator shall control air emissions from each waste management unit in accordance with standards specified in Secs. 264.1084 through 264.1087 of this subpart, as applicable to the waste management unit, except as provided for in paragraph (c) of this section.
(c) A waste management unit is exempted from standards specified in Secs. 264.1084 through 264.1087 of this subpart provided that all hazardous waste placed in the waste management unit is determined by the owner or operator to meet either of the following conditions: (1) The average VO concentration of the hazardous waste at the point of waste origination is less than 100 parts per million by weight (ppmw). The average VO concentration shall be determined by the procedures specified in Sec. 264.1083(a) of this subpart. (2) The organic content of the hazardous waste has been reduced by an organic destruction or removal process that achieves any one of the following conditions:
(i) A process that removes or destroys the organics contained in the hazardous waste to a level such that the average VO concentration of the hazardous waste at the point of waste treatment is less than the exit concentration limit (C<INF>t) established for the process. The average VO concentration of the hazardous waste at the point of waste treatment and the exit concentration limit for the process shall be determined using the procedures specified in Sec. 264.1083(b) of this subpart.
(ii) A process that removes or destroys the organics contained in the hazardous waste to a level such that the organic reduction efficiency (R) for the process is equal to or greater than 95 percent, and the average VO concentration of the hazardous waste at the point of waste treatment is less than 50 ppmw. The organic reduction efficiency for the process and the average VO concentration of the hazardous waste at the point of waste treatment shall be determined using the procedures specified in Sec. 264.1083(b) of this subpart. (iii) A process that removes or destroys the organics contained in the hazardous waste to a level such that the actual organic mass removal rate (MR) for the process is greater than the required organic mass removal rate (RMR) established for the process. The required organic mass removal rate and the actual organic mass removal rate for the process shall be determined using the procedures specified in Sec. 264.1083(b) of this subpart.
(iv) A biological process that destroys or degrades the organics contained in the hazardous waste, such that either of the following conditions is met:
(A) The organic reduction efficiency (R) for the process is equal to or greater than 95 percent, and the organic biodegradation efficiency (R<INF>bio) for the process is equal to or greater than 95 percent. The organic reduction efficiency and the organic biodegradation efficiency for the process shall be determined in accordance with the procedures specified in Sec. 264.1083(b) of this subpart.
(B) The total actual organic mass biodegradation rate (MR<INF>bio) for all hazardous waste treated by the process is equal to or greater than the required organic mass removal rate (RMR). The required organic mass removal rate and the actual organic mass biodegradation rate for the process shall be determined using the procedures specified in Sec. 264.1083(b) of this subpart.
(v) A process that removes or destroys the organics contained in the hazardous waste and meets all of the following conditions: (A) All of the materials entering the process are hazardous wastes. (B) From the point of waste origination through the point where the hazardous waste enters the process, the hazardous waste is continuously managed in waste management units which use air emission controls in accordance with the standards specified in Secs. 264.1084 through 264.1087 of this subpart, as applicable to the waste management unit. (C) The average VO concentration of the hazardous waste at the point of waste treatment is less than the lowest

average VO concentration at the point of waste origination determined for each of the individual hazardous waste streams entering the process or 100 ppmw, whichever value is lower. The average VO concentration of each individual hazardous waste stream at the point of waste origination shall be determined using the procedure specified in Sec. 264.1083(a) of this subpart. The average VO concentration of the hazardous waste at the point of waste treatment shall be determined using the procedure specified in Sec. 264.1083(b) of this subpart. (vi) A hazardous waste incinerator for which the owner or operator has either:
(A) Been issued a final permit under 40 CFR part 270, and designs and operates the unit in accordance with the requirements of subpart O of this part; or
(B) Has certified compliance with the interim status requirements of 40 CFR part 265, subpart O.
(vii) A boiler or industrial furnace for which the owner or operator has either:
(A) Been issued a final permit under 40 CFR part 270, and designs and operates the unit in accordance with the requirements of 40 CFR part 266, subpart H, or
(B) Has certified compliance with the interim status requirements of 40 CFR part 266, subpart H.
(d) When a process is used for the purpose of treating a hazardous waste to meet one of the sets of conditions specified in paragraphs (c)(2)(i) through (c)(2)(v) of this section, each material removed from or exiting the process that is not a hazardous waste but has an average VO concentration equal to or greater than 100 ppmw shall be managed in a waste management unit in accordance with the requirements of paragraph (b) of this section.
(e) The Regional Administrator may at any time perform or request that the owner or operator perform a waste determination for a hazardous waste managed in a tank, surface impoundment, or container exempted from using air emission controls under the provisions of this section as follows:
(1) The waste determination for average VO concentration of a hazardous waste at the point of waste origination shall be performed using direct measurement in accordance with the applicable requirements of Sec. 264.1083(a) of this subpart. The waste determination for a hazardous waste at the point of waste treatment shall be performed in accordance with the applicable requirements of Sec. 264.1083(b) of this subpart.
(2) In a case when the owner or operator is requested to perform the waste determination, the Regional Administrator may elect to have an authorized representative observe the collection of the hazardous waste samples used for the analysis.
(3) In a case when the results of the waste determination performed or requested by the Regional Administrator do not agree with the results of a waste determination performed by the owner or operator using knowledge of the waste, then the results of the waste determination performed in accordance with the requirements of paragraph (e)(1) of this section shall be used to establish compliance with the requirements of this subpart.
(4) In a case when the owner or operator has used an averaging period greater than 1 hour for determining the average VO concentration of a hazardous waste at the point of waste origination, the Regional Administrator may elect to establish compliance with this subpart by performing or requesting that the owner or operator perform a waste determination using direct measurement based on waste samples collected within a 1-hour period as follows:
(i) The average VO concentration of the hazardous waste at the point of waste origination shall be determined by direct measurement in accordance with the requirements of Sec. 264.1083(a) of this subpart. (ii) Results of the waste determination performed or requested by the Regional Administrator showing that the average VO concentration of the hazardous waste at the point of waste origination is equal to or greater than 100 ppmw shall constitute noncompliance with this subpart except in a case as provided for in paragraph (e)(4)(iii) of this section.

(iii) For the case when the average VO concentration of the hazardous waste at the point of waste origination previously has been determined by the owner or operator using an averaging period greater than 1 hour to be less than 100 ppmw but because of normal operating process variations the VO concentration of the hazardous waste determined by direct measurement for any given 1-hour period may be equal to or greater than 100 ppmw, information that was used by the owner or operator to determine the average VO concentration of the hazardous waste (e.g., test results, measurements, calculations, and other documentation) and recorded in the facility records in accordance with the requirements of Sec. 264.1083(a) and Sec. 264.1089 of this subpart shall be considered by the Regional Administrator together with the results of the waste determination performed or requested by the Regional Administrator in establishing compliance with this subpart.

Sec. 264.1083 Waste determination procedures.

(a) Waste determination procedure for average volatile organic (VO) concentration of a hazardous waste at the point of waste origination. (1) An owner or operator shall determine the average VO concentration at the point of waste origination for each hazardous waste placed in waste management units exempted under the provisions of Sec. 264.1082(c)(1) of this subpart from using air emission controls in accordance with standards specified in Sec. 264.1084 through Sec. 264.1087 of this subpart, as applicable to the waste management unit.
(2) The VO concentration at the point of waste origination for a hazardous waste shall be determined in accordance with the procedures specified in 40 CFR 265.1084(a)(2) through (a)(6) of this chapter. (b) Waste determination procedures for treated hazardous waste. (1) An owner or operator shall perform the applicable waste determinations for each treated hazardous waste placed in waste management units exempted under the provisions of Sec. 264.1082(c)(2) of this subpart from using air emission controls in accordance with standards specified in Sec. 264.1084 through Sec. 264.1087 of this subpart, as applicable to the waste management unit. (2) The waste determination for a treated hazardous waste shall be performed in accordance with the procedures specified in 40 CFR 265.1084(b)(2) through (b)(10), as applicable to the treated hazardous waste.
(c) Procedure to determine the maximum organic vapor pressure of a hazardous waste in a tank.
(1) An owner or operator shall determine the maximum organic vapor pressure for each hazardous waste placed in tanks using air emission controls in accordance with standards specified in Sec. 264.1084(c) of this subpart.
(2) The maximum organic vapor pressure of the hazardous waste shall be determined in accordance with the procedures specified in 40 CFR 265.1084(c)(2) through (c)(4).

Sec. 264.1084 Standards: Tanks.

(a) This section applies to owners and operators of tanks subject to this subpart into which any hazardous waste is placed except for the following tanks:
(1) A tank in which all hazardous waste entering the tank meets the conditions specified in Sec. 264.1082(c) of this subpart; or (2) A tank used for biological treatment of hazardous waste in accordance with the requirements of Sec. 264.1082(c)(2)(iv) of this subpart.
(b) The owner or operator shall place the hazardous waste into one of the following tanks:
(1) A tank equipped with a cover (e.g., a fixed roof) that is vented through a closed-vent system to a control device in accordance with the requirements specified in paragraph (d) of this section; (2) A tank equipped with a fixed roof and internal floating roof in accordance with the requirements of Sec. 264.1091 of this subpart; (3) A tank equipped with an external floating roof in accordance with the requirements of Sec. 264.1091 of this subpart; or (4) A pressure tank that is designed to

operate as a closed system such that the tank operates with no detectable organic emissions at all times that hazardous waste is in the tank except as provided for in paragraph (g) of this section.
(c) As an alternative to complying with paragraph (b) of this section, an owner or operator may place hazardous waste in a tank equipped with a cover (e.g., a fixed roof) meeting the requirements specified in paragraph (d)(1) of this section when the hazardous waste is determined to meet all of the following conditions: (1) The hazardous waste is neither mixed, stirred, agitated, nor circulated within the tank by the owner or operator using a process that results in splashing, frothing, or visible turbulent flow on the waste surface during normal process operations; (2) The hazardous waste in the tank is not heated by the owner or operator except during conditions requiring that the waste be heated to prevent the waste from freezing or to maintain adequate waste flow conditions for continuing normal process operations; (3) The hazardous waste in the tank is not treated by the owner or operator using a waste stabilization process or a process that produces an exothermic reaction; and
(4) The maximum organic vapor pressure of the hazardous waste in the tank as determined using the procedure specified in Sec. 264.1083(c) of this subpart is less than the following applicable value:
(i) If the tank design capacity is equal to or greater than 151 m<SUP>3, then the maximum organic vapor pressure shall be less than 5.2 kPa;
(ii) If the tank design capacity is equal to or greater than 75 m<SUP>3 but less than 151 m<SUP>3, then the maximum organic vapor pressure shall be less than 27.6 kPa; or (iii) If the tank design capacity is less than 75 m<SUP>3, then the maximum organic vapor pressure shall be less than 76.6 kPa. (d) To comply with paragraph (b)(1) of this section, the owner or operator shall design, install, operate, and maintain a cover that vents the organic vapors emitted from hazardous waste in the tank through a closed-vent system connected to a control device. (1) The cover shall be designed and operated to meet the following requirements:
(i) The cover and all cover openings (e.g., access hatches, sampling ports, and gauge wells) shall be designed to operate with no detectable organic emissions when all cover openings are secured in a closed, sealed position.
(ii) Each cover opening shall be secured in a closed, sealed position (e.g., covered by a gasketed lid or cap) at all times that hazardous waste is in the tank except as provided for in paragraph (f) of this section.
(2) The closed-vent system and control device shall be designed and operated in accordance with the requirements of Sec. 264.1087 of this subpart.
(e) The owner and operator shall install, operate, and maintain enclosed pipes or other closed-systems, EPA considers a drain system that meets the requirements of 40 CFR 61.346(a)(1) or 40 CFR 61.346(b)(1) through (b)(3) to be a ``closed systems'', to: (1) Transfer all hazardous waste to the tank from another tank, surface impoundment, or container subject to this subpart except for those hazardous wastes that meet the conditions specified in Sec. 264.1082(c) of this subpart; and
(2) Transfer all hazardous waste from the tank to another tank, surface impoundment, or container subject to this subpart except for those hazardous wastes that meet the conditions specified in Sec. 264.1082(c) of this subpart.
(f) Each cover opening shall be secured in a closed, sealed position (e.g., covered by a gasketed lid) at all times that hazardous waste is in the tank except when it is necessary to use the cover opening to:
(1) Add, remove, inspect, or sample the material in the tank; (2) Inspect, maintain, repair, or replace equipment located inside the tank; or
(3) Vent gases or vapors from the tank to a closed-vent system connected to a control device that is designed and operated in accordance with the requirements of Sec. 264.1087 of this subpart. (g) One or more safety devices which vent directly to the atmosphere may be used on the tank, cover, closed-vent system, or control device provided each safety device meets all of the following conditions:
(1) The safety device is not used for planned or routine venting of organic

vapors from the tank or closed-vent system connected to a control device; and
(2) The safety device remains in a closed, sealed position at all times except when an unplanned event requires that the device open for the purpose of preventing physical damage or permanent deformation of the tank, cover, closed-vent system, or control device in accordance with good engineering and safety practices for handling flammable, combustible, explosive, or other hazardous materials. An example of an unplanned event is a sudden power outage.

Sec. 264.1085 Standards: Surface impoundments.

(a) This section applies to owners and operators of surface impoundments subject to this subpart into which any hazardous waste is placed except for the following surface impoundments: (1) A surface impoundment in which all hazardous waste entering the surface impoundment meets the conditions specified in Sec. 264.1082(c) of this subpart; or
(2) A surface impoundment used for biological treatment of hazardous waste in accordance with the requirements of Sec. 264.1082(c)(2)(iv) of this subpart. (b) The owner or operator shall place the hazardous waste into a surface impoundment equipped with a cover (e.g., an air-supported structure or a rigid cover) that is vented through a closed-vent system to a control device meeting the requirements specified in paragraph (d) of this section.
(c) As an alternative to complying with paragraph (b) of this section, an owner or operator may place hazardous waste in a surface impoundment equipped with a floating membrane cover meeting the requirements specified in paragraph (e) of this section when the hazardous waste is determined to meet all of the following conditions: (1) The hazardous waste is neither mixed, stirred, agitated, nor circulated within the surface impoundment by the owner or operator using a process that results in splashing, frothing, or visible turbulent flow on the waste surface during normal process operations; (2) The hazardous waste in the surface impoundment is not heated by the owner or operator; and
(3) The hazardous waste is not treated by the owner or operator using a waste stabilization process or a process that produces an exothermic reaction.
(d) To comply with paragraph (b)(1) of this section, the owner or operator shall design, install, operate, and maintain a cover that vents the organic vapors emitted from hazardous waste in the surface impoundment through a closed- vent system connected to a control device.
(1) The cover shall be designed and operated to meet the following requirements:
(i) The cover and all cover openings (e.g., access hatches, sampling ports, and gauge wells) shall be designed to operate with no detectable organic emissions when all cover openings are secured in a closed, sealed position.
(ii) Each cover opening shall be secured in the closed, sealed position (e.g., covered by a gasketed lid or cap) at all times that hazardous waste is in the surface impoundment except as provided for in paragraph (g) of this section.
(iii) The closed-vent system and control device shall be designed and operated in accordance with Sec. 264.1087 of this subpart. (e) To comply with paragraph (c) of this section, the owner or operator shall design, install, operate, and maintain a floating membrane cover that meets all of the requirements specified in 40 CFR 265.1086(e)(1) through (e)(4).
(f) The owner or operator shall install, operate, and maintain enclosed pipes or other closed-systems, EPA considers a drain system that meets the requirements of 40 CFR 61.346(a)(1) or 40 CFR 61.346(b)(1) through (b)(3) to be a ``closed system'', to: (1) Transfer all hazardous waste to the surface impoundment from another tank, surface impoundment, or container subject to this subpart except for those hazardous wastes that meet the conditions specified in Sec. 264.1082(c) of this subpart; and
(2) Transfer all hazardous waste from the surface impoundment to another tank, surface impoundment, or container subject to this subpart except for

those hazardous wastes that meet the conditions specified in Sec. 264.1082(c) of this subpart.
(g) Each cover opening shall be secured in the closed, sealed position (e.g., a cover by a gasketed lid or cap) at all times that hazardous waste is in the surface impoundment except when it is necessary to use the cover opening to:
(1) Add, remove, inspect, or sample the material in the surface impoundment;
(2) Inspect, maintain, repair, or replace equipment located underneath the cover;
(3) Remove treatment residues from the surface impoundment in accordance with the requirements of 40 CFR 268.4; or (4) Vent gases or vapors from the surface impoundment to a closedvent system connected to a control device that is designed and operated in accordance with the requirements of Sec. 264.1087 of this subpart. (h) One or more safety devices that vent directly to the atmosphere may be installed on the cover, closed-vent system, or control device provided each device meets all of the following conditions:
(1) The safety device is not used for planned or routine venting of organic vapors from the surface impoundment or the closed-vent system connected to a control device; and
(2) The safety device remains in a closed, sealed position at all times except when an unplanned event requires that the device open for the purpose of preventing physical damage or permanent deformation of the cover, closed-vent system, or control device in accordance with good engineering and safety practices for handling flammable, combustible, explosive, or other hazardous materials. An example of an unplanned event is a sudden power outage.

Sec. 264.1086 Standards: Containers.

(a) This section applies to the owners and operators of containers having design capacities greater than 0.1 m<SUP>3 subject to this subpart into which any hazardous waste is placed except for a container in which all hazardous waste entering the container meets the conditions specified in Sec. 264.1082(c) of this subpart. (b) An owner or operator shall manage hazardous waste in containers using the following procedures:
(1) The owner or operator shall place the hazardous waste into one of the following containers except when a container is used for hazardous waste treatment as required by paragraph (b)(2) of this section:
(i) A container that is equipped with a cover which operates with no detectable organic emissions when all container openings (e.g., lids, bungs, hatches, and sampling ports) are secured in a closed, sealed position. The owner or operator shall determine that a container operates with no detectable emissions by testing each opening on the container for leaks in accordance with Method 21 in 40 CFR part 60, appendix A the first time any portion of the hazardous waste is placed into the container. If a leak is detected and cannot be repaired immediately, the hazardous waste shall be removed from the container and the container not used to meet the requirements of this paragraph until the leak is repaired and the container is retested. (ii) A container having a design capacity less than or equal to 0.46 m<SUP>3 that is equipped with a cover and complies with all applicable Department of Transportation regulations on packaging hazardous waste for transport under 49 CFR part 178. (A) A container that is managed in accordance with the requirements of 49 CFR part 178 for the purpose of complying with this subpart is not subject to any exceptions to the 49 CFR part 178 regulations, except as noted in paragraph (b)(1)(ii)(B) of this section. (B) A lab pack that is managed in accordance with the requirements of 49 CFR part 178 for the purpose of complying with this subpart may comply with the exceptions for combination packagings specified in 49 CFR 173.12(b).
(iii) A container that is attached to or forms a part of any truck, trailer, or railcar; and that has been demonstrated within the preceding 12 months to be organic vapor tight when all container openings are in a

closed, sealed position (e.g., the container hatches or lids are gasketed and latched). For the purpose of meeting the requirements of this paragraph, a container is organic vapor tight if the container sustains a pressure change of not more than 750 pascals within 5 minutes after it is pressurized to a minimum of 4,500 pascals. This condition is to be demonstrated using the pressure test specified in Method 27 of 40 CFR part 60, appendix A, and a pressure measurement device which has a precision of <plus-minus>2.5 mm water and which is capable of measuring above the pressure at which the container is to be tested for vapor tightness.
(2) An owner or operator treating hazardous waste in a container by either a waste stabilization process, any process that requires the addition of heat to the waste, or any process that produces an exothermic reaction shall meet the following requirements: (i) Whenever it is necessary for the container to be open during the treatment process, the container shall be located inside an enclosure that is vented through a closed-vent system to a control device.
(ii) The enclosure shall be a structure that is designed and operated in accordance with the following requirements: (A) The enclosure shall be a structure that is designed and operated with sufficient airflow into the structure to capture the organic vapors emitted from the hazardous waste in the container and vent the vapors through the closed-vent system to the control device. (B) The enclosure may have permanent or temporary openings to allow worker access; passage of containers through the enclosure by conveyor or other mechanical means; entry of permanent mechanical or electrical equipment; or to direct airflow into the enclosure. The pressure drop across each opening in the enclosure shall be maintained at a pressure below atmospheric pressure such that whenever an open container is placed inside the enclosure no organic vapors released from the container exit the enclosure through the opening. The owner or operator shall determine that an enclosure achieves this condition by measuring the pressure drop across each opening in the enclosure. If the pressure within the enclosure is equal to or greater than atmospheric pressure then the enclosure does not meet the requirements of this section. (iii) The closed-vent system and control device shall be designed and operated in accordance with the requirements of Sec. 264.1087 of this subpart.
(3) An owner or operator transferring hazardous waste into a container having a design capacity greater than 0.46 m\3\ shall meet the following requirements:
(i) Hazardous waste transfer by pumping shall be performed using a conveyance system that uses a tube (e.g., pipe, hose) to add the waste into the container. During transfer of the waste into the container, the cover shall remain in place and all container openings shall be maintained in a closed, sealed position except for those openings through which the tube enters the container and as provided for in paragraph (c) of this section. The tube shall be positioned in a manner such that either the:
(A) Tube outlet continuously remains submerged below the waste surface at all times waste is flowing through the tube; (B) Lower bottom edge of the tube outlet is located at a distance no greater than two inside diameters of the tube or 15.25 cm, whichever distance is greater, from the bottom of the container at all times waste is flowing through the tube; or
(C) Tube is connected to a permanent port mounted on the bottom of the container so that the lower edge of the port opening inside the container is located at a distance equal to or less than 15.25 cm from the container bottom.
(ii) Hazardous waste transferred by a means other than pumping shall be performed such that during transfer of the waste into the container, the cover remains in place and all container openings are maintained in a closed, sealed position except for those openings through which the hazardous waste is added and as provided for in paragraph (d) of this section.
(c) Each container opening shall be maintained in a closed, sealed position (e.g., covered by a gasketed lid) at all times that hazardous waste is in the container except when it is necessary to use the opening to:

(1) Add, remove, inspect, or sample the material in the container; (2) Inspect, maintain, repair, or replace equipment located inside the container; or
(3) Vent gases or vapors from a cover located over or enclosing an open container to a closed-vent system connected to a control device that is designed and operated in accordance with the requirements of Sec. 264.1087 of this subpart.
(d) One or more safety devices that vent directly to the atmosphere may be used on the container, cover, enclosure, closed-vent system, or control device provided each device meets all of the following conditions:
(1) The safety device is not used for planned or routine venting of organic vapors from the container, cover, enclosure, or closed-vent system connected to a control device; and (2) The safety device remains in a closed, sealed position at all times except when an unplanned event requires that the device open for the purpose of preventing physical damage or permanent deformation of the container, cover, enclosure, closed-vent system, or control device in accordance with good engineering and safety practices for handling flammable, combustible, explosive, or other hazardous materials. An example of an unplanned event is a sudden power outage.

Sec. 264.1087 Standards: Closed-vent systems and control devices.

(a) This section applies to each closed-vent system and control device installed and operated by the owner or operator to control air emissions in accordance with standards of this subpart. (b) The closed-vent system shall meet the following requirements: (1) The closed-vent system shall route the gases, vapors, and fumes emitted from the hazardous waste in the waste management unit to a control device that meets the requirements specified in paragraph (c) of this section.
(2) The closed-vent system shall be designed and operated in accordance with the requirements specified in Sec. 264.1033(k) of this part.
(3) If the closed-vent system contains one or more bypass devices that could be used to divert all or a portion of the gases, vapors, or fumes from entering the control device, the owner or operator shall meet the following requirements:
(i) For each bypass device except as provided for in paragraph (b)(3)(ii) of this section, the owner or operator shall either: (A) Install, calibrate, maintain, and operate a flow indicator at the inlet to the bypass device that indicates at least once every 15 minutes whether gas, vapor, or fume flow is present in the bypass device; or
(B) Secure a valve installed at the inlet to the bypass device in the closed position using a car-seal or a lock-and-key type configuration. The owner or operator shall visually inspect the seal or closure mechanism at least once every month to verify that the valve is maintained in the closed position.
(ii) Low leg drains, high point bleeds, analyzer vents, open-ended valves or lines, and safety devices are not subject to the requirements of paragraph (b)(3)(i) of this section. (c) The control device shall meet the following requirements: (1) The control device shall be one of the following devices: (i) A control device designed and operated to reduce the total organic content of the inlet vapor stream vented to the control device by at least 95 percent by weight;
(ii) An enclosed combustion device designed and operated in accordance with the requirements of Sec. 264.1033(c) of this part; or (iii) A flare designed and operated in accordance with the requirements of Sec. 264.1033(d) of this part. (2) The control device shall be operating at all times when gases, vapors, or fumes are vented from the waste management unit through the closed-vent system to the control device. (3) The owner or operator using a carbon adsorption system to comply with paragraph (c)(1) of this section shall operate and maintain the control device in accordance with the following requirements: (i) Following the initial startup of the control device, all activated carbon in the control device shall be

replaced with fresh carbon on a regular basis in accordance with the requirements of Sec. 264.1033(g) or Sec. 264.1033(h) of this part. (ii) All carbon removed from the control device shall be managed in accordance with the requirements of Sec. 264.1033(m) of this part. (4) An owner or operator using a control device other than a thermal vapor incinerator, flare, boiler, process heater, condenser, or carbon adsorption system to comply with paragraph (c)(1) of this section shall operate and maintain the control device in accordance with the requirements of Sec. 264.1033(j) of this part. (5) The owner or operator shall demonstrate that a control device achieves the performance requirements of paragraph (c)(1) of this section as follows:
(i) An owner or operator shall demonstrate using either a performance test as specified in paragraph (c)(5)(iii) of this section or a design analysis as specified in paragraph (c)(5)(iv) of this section the performance of each control device except for the following:
(A) A flare;
(B) A boiler or process heater with a design heat input capacity of 44 megawatts or greater;
(C) A boiler or process heater into which the vent stream is introduced with the primary fuel;
(D) A boiler or process heater burning hazardous waste for which the owner or operator has been issued a final permit under 40 CFR part 270 and designs and operates the unit in accordance with the requirements of 40 CFR part 266, subpart H; or (E) A boiler or process heater burning hazardous waste for which the owner or operator has certified compliance with the interim status requirements of 40 CFR part 266, subpart H. (ii) An owner or operator shall demonstrate the performance of each flare in accordance with the requirements specified in Sec. 264.1033(e).
(iii) For a performance test conducted to meet the requirements of paragraph (c)(5)(i) of this section, the owner or operator shall use the test methods and procedures specified in Sec. 264.1034(c)(1) through (c)(4).
(iv) For a design analysis conducted to meet the requirements of paragraph (c)(5)(i) of this section, the design analysis shall meet the requirements specified in Sec. 264.1035(b)(4)(iii). (v) The owner or operator shall demonstrate that a carbon adsorption system achieves the performance requirements of paragraph (c)(1) of this section based on the total quantity of organics vented to the atmosphere from all carbon adsorption system equipment that is used for organic adsorption, organic desorption or carbon regeneration, organic recovery, and carbon disposal.
(6) If the owner or operator and the Regional Administrator do not agree on a demonstration of control device performance using a design analysis then the disagreement shall be resolved using the results of a performance test performed by the owner or operator in accordance with the requirements of paragraph (c)(5)(iii) of this section. The Regional Administrator may choose to have an authorized representative observe the performance test.

Sec. 264.1088 Inspection and monitoring requirements.

(a) This section applies to an owner or operator using air emission controls in accordance with the requirements of Sec. 264.1084 through Sec. 264.1087 of this subpart.
(b) Each cover used in accordance with requirements of Sec. 264.1084 through Sec. 264.1086 of this subpart shall be visually inspected and monitored for detectable organic emissions by the owner or operator using the procedure specified in 40 CFR 265.1089(f)(1) through (f)(7) except as follows:
(1) An owner or operator is exempted from performing the cover inspection and monitoring requirements specified in 40 CFR 265.1089(f)(1) through (f)(7) for the following tank covers: (i) A tank internal floating roof that is inspected and monitored in accordance with the requirements of Sec. 264.1091 of this subpart; or
(ii) A tank external floating roof that is inspected and monitored in

accordance with the requirements of Sec. 264.1091 of this subpart. (2) If a tank is buried partially or entirely underground, an owner or operator is required to perform the cover inspection and monitoring requirements specified in 40 CFR 265.1089(f)(1) through (f)(7) only for those portions of the tank cover and those connections to the tank cover or tank body (e.g. fill ports, access hatches, gauge wells, etc.) that extend to or above the ground surface and can be opened to the atmosphere.
(3) An owner or operator is exempted from performing the cover inspection and monitoring requirements specified in 40 CFR 265.1089(f)(1) through (f)(7) for a container that meets all requirements specified in either Sec. 264.1086(b)(1)(ii) or Sec. 264.1086(b)(1)(iii) of this subpart. (4) An owner or operator is exempted from performing the cover inspection and monitoring requirements specified in 40 CFR 265.1089(f)(1) through (f)(7) for an enclosure used to control air emissions from containers in accordance with the requirements of Sec. 264.1086(b)(2) of this subpart.
(c) Each closed-vent system used in accordance with the requirements of Sec. 264.1087 shall be inspected and monitored by the owner or operator in accordance with the procedure specified in Sec. 264.1033(k).
(d) Each control device used in accordance with the requirements of Sec. 264.1087 of this subpart shall be inspected and monitored by the owner or operator in accordance with the procedures specified in Sec. 264.1033(f) and Sec. 264.1033(i).
(e) The owner or operator shall develop and implement a written plan and schedule to perform all inspection and monitoring requirements of this section. The owner or operator shall incorporate this plan and schedule into the facility inspection plan required under Sec. 264.15.

Sec. 264.1089 Recordkeeping requirements.

(a) Each owner or operator of a facility subject to requirements in this subpart shall record and maintain the following information as applicable:
(1) Documentation for each cover installed on a tank in accordance with the requirements of Sec. 264.1084(b)(2) or Sec. 264.1084(b)(3) of this subpart that includes information prepared by the owner or operator or provided by the cover manufacturer or vendor describing the cover design, and certification by the owner or operator that the cover meets the applicable design specifications as listed in 40 CFR 265.1091(c).
(2) Documentation for each floating membrane cover installed on a surface impoundment in accordance with the requirements of Sec. 264.1085(c) of this subpart that includes information prepared by the owner or operator or provided by the cover manufacturer or vendor describing the cover design, and certification by the owner or operator that the cover meets the specifications listed in 40 CFR 265.1086(e). (3) Documentation for each enclosure used to control air emissions from containers in accordance with the requirements of Sec. 264.1086(b)(2)(i) of this subpart that includes information prepared by the owner or operator or provided by the manufacturer or vendor describing the enclosure design, and certification by the owner or operator that the enclosure meets the specifications listed in Sec. 264.1086(b)(2)(ii) of this subpart. (4) Documentation for each closed-vent system and control device installed in accordance with the requirements of Sec. 264.1087 of this subpart that includes:
(i) Certification that is signed and dated by the owner or operator stating that the control device is designed to operate at the performance level documented by a design analysis as specified in paragraph (a)(4)(ii) of this section or by performance tests as specified in paragraph (a)(4)(iii) of this section when the tank, surface impoundment, or container is or would be operating at capacity or the highest level reasonably expected to occur. (ii) If a design analysis is used, then design documentation as specified in Sec. 264.1035(b)(4). The documentation shall include information prepared by the owner or operator or provided by the control device manufacturer or vendor that describes the control device design in accordance with Sec. 264.1035(b)(4)(iii) and certification by the owner or operator that the control equipment meets the applicable specifications.

(iii) If performance tests are used, then a performance test plan as specified in Sec. 264.1035(b)(3) and all test results. (iv) Information as required by Sec. 264.1035(c)(1) and (c)(2). (5) Records for all Method 27 tests performed by the owner or operator for each container used to meet the requirements of Sec. 264.1086(b)(1)(iii) of this subpart. (6) Records for all visual inspections conducted in accordance with the requirements of Sec. 264.1088 of this subpart. (7) Records for all monitoring for detectable organic emissions conducted in accordance with the requirements of Sec. 264.1088 of this subpart.
(8) Records of the date of each attempt to repair a leak, repair methods applied, and the date of successful repair. (9) Records for all continuous monitoring conducted in accordance with the requirements of Sec. 264.1088 of this subpart. (10) Records of the management of carbon removed from a carbon adsorption system conducted in accordance with Sec. 264.1087(c)(3)(ii) of this subpart.
(11) Records for all inspections of each cover installed on a tank in accordance with the requirements of Sec. 264.1084(b)(2) or Sec. 264.1084(b)(3) of this subpart that includes information as listed in 40 CFR 265.1091(c).
(b) An owner or operator electing to use air emission controls for a tank in accordance with the conditions specified in Sec. 264.1084(c) of this subpart shall record the following information: (1) Date and time each waste sample is collected for direct measurement of maximum organic vapor pressure in accordance with Sec. 264.1083(c) of this subpart.
(2) Results of each determination of the maximum organic vapor pressure of the waste in a tank performed in accordance with Sec. 264.1083(c) of this subpart.
(3) Records specifying the tank dimensions and design capacity. (c) An owner or operator electing to use air emission controls for a tank in accordance with the requirements of Sec. 264.1091 of this subpart shall record the information required by Sec. 264.1091(c) of this subpart.
(d) An owner or operator electing not to use air emission controls for a particular tank, surface impoundment, or container subject to this subpart in accordance with the conditions specified in Sec. 264.1082(c) of this subpart shall record the information used by the owner or operator for each waste determination (e.g., test results, measurements, calculations, and other documentation) in the facility operating log. If analysis results for waste samples are used for the waste determination, then the owner or operator shall record the date, time, and location that each waste sample is collected in accordance with applicable requirements of Sec. 264.1083 of this subpart. (e) An owner or operator electing to comply with requirements in accordance with Sec. 264.1082(c)(2)(v) or Sec. 264.1082(c)(2)(vi) of this subpart shall record the identification number for the incinerator, boiler, or industrial furnace in which the hazardous waste is treated.
(f) An owner or operator designating a cover as unsafe to inspect and monitor pursuant to 40 CFR 265.1089(f)(5) or difficult to inspect and monitor pursuant to 40 CFR 265.1089(f)(6) shall record in a log that is kept in the facility operating record the following information:
(1) A list of identification numbers for tanks with covers that are designated as unsafe to inspect and monitor in accordance with the requirements of 40 CFR 265.1089(f)(5), an explanation for each cover stating why the cover is unsafe to inspect and monitor, and the plan and schedule for inspecting and monitoring each cover. (2) A list of identification numbers for tanks with covers that are designated as difficult to inspect and monitor in accordance with the requirements of 40 CFR 265.1089(f)(6), an explanation for each cover stating why the cover is difficult to inspect and monitor, and the plan and schedule for inspecting and monitoring each cover. (g) All records required by paragraphs (a) through (f) of this section except as required in paragraphs (a)(1) through (a)(4) of this section shall be maintained in the operating record for a minimum of 3 years. All records required by paragraphs (a)(1) through (a)(4) of this section shall be maintained in the operating record until the air emission control equipment is replaced or otherwise no longer in

service.
(h) The owner or operator of a facility that is subject to this subpart and to the control device standards in 40 CFR part 60, subpart VV or 40 CFR part 61, subpart V may elect to demonstrate compliance with the applicable sections of this subpart by documentation either pursuant to this subpart, or pursuant to the provisions of 40 CFR part 60, subpart VV or 40 CFR part 61, subpart V, to the extent that the documentation required by 40 CFR parts 60 or 61 duplicates the documentation required by this section.

Sec. 264.1090 Reporting requirements.

(a) Each owner or operator managing hazardous waste in a tank, surface impoundment, or container exempted from using air emission controls under the provisions of Sec. 264.1082(c) shall report to the Regional Administrator each occurrence when hazardous waste is placed in the waste management unit in noncompliance with the conditions specified in Sec. 264.1082(c)(1) or (c)(2) of this subpart, as applicable. Examples of such occurrences include placing in the waste management unit a hazardous waste having an average VO concentration equal to or greater than 100 ppmw at the point of waste origination; or placing in the waste management unit a treated hazardous waste which fails to meet the applicable conditions specified in Sec. 264.1082(c)(2)(i) through (c)(2)(v) of this subpart. The owner or operator shall submit a written report within 15 calendar days of the time that the owner or operator becomes aware of the occurrence. The written report shall contain the EPA identification number, facility name and address, a description of the noncompliance event and the cause, the dates of the noncompliance, and the actions taken to correct the noncompliance and prevent reoccurrence of the noncompliance. The report shall be signed and dated by an authorized representative of the owner or operator.
(b) Each owner or operator using air emission controls on a tank in accordance with the requirements Sec. 264.1084(c) of this subpart shall report to the Regional Administrator each occurrence when hazardous waste is managed in the tank in noncompliance with the conditions specified in Sec. 264.1084(c)(1) through (c)(4) of this subpart. The owner or operator shall submit a written report within 15 calendar days of the time that the owner or operator becomes aware of the occurrence. The written report shall contain the EPA identification number, facility name and address, a description of the noncompliance event and the cause, the dates of the noncompliance, and the actions taken to correct the noncompliance and prevent reoccurrence of the noncompliance. The report shall be signed and dated by an authorized representative of the owner or operator. (c) Each owner or operator using a control device in accordance with the requirements of Sec. 264.1087 of this subpart shall submit a semiannual written report to the Regional Administrator excepted as provided for in paragraph (d) of this section. The report shall describe each occurrence during the previous 6-month period when a control device is operated continuously for 24 hours or longer in noncompliance with the applicable operating values defined in Sec. 264.1035(c)(4) or when a flare is operated with visible emissions as defined in Sec. 264.1033(d). The written report shall include the EPA identification number, facility name and address, and an explanation why the control device could not be returned to compliance within 24 hours, and actions taken to correct the noncompliance. The report shall be signed and dated by an authorized representative of the owner or operator.
(d) A report to the Regional Administrator in accordance with the requirements of paragraph (c) of this section is not required for a 6-month period during which all control devices subject to this subpart are operated by the owner or operator such that during no period of 24 hours or longer did a control device operate continuously in noncompliance with the applicable operating values defined in Sec. 264.1035(c)(4) or a flare operate with visible emissions as defined in Sec. 264.1033(d).

Sec. 264.1091 Alternative control requirements for tanks.

(a) This section applies to owners and operators of tanks electing to comply with Sec. 264.1084(b)(2) or Sec. 264.1084(b)(3) of this subpart. (1) The owner or operator electing to comply with Sec. 264.1084(b)(2) of this subpart shall design, install, operate, and maintain a fixed roof and internal floating roof that meet the requirements specified in 40 CFR 265.1091(a)(1)(i) through (a)(1)(ix). (2) The owner or operator electing to comply with Sec. 264.1084(b)(3) of this subpart shall design, install, operate, and maintain an external floating roof that meets the requirements specified in 40 CFR 265.1091(a)(2)(i) through (a)(2)(iii). (b) The owner or operator shall inspect and monitor the control equipment in accordance with the following requirements: (1) For a tank equipped with a fixed roof and internal floating roof in accordance with the requirements of paragraph (a)(1) of this section, the owner or operator shall perform the inspection and monitoring requirements specified in 40 CFR 265.1091(b)(1). (2) For a tank equipped with an external floating roof in accordance with the requirements of paragraph (a)(2) of this section, the owner or operator shall perform the inspection and monitoring requirements specified in 40 CFR 265.1091(b)(2). (c) The owner or operator shall record the following information in the operating record in accordance with the requirements of Sec. 264.1089(a)(1) and (a)(11) of this subpart: (1) For a tank equipped with a fixed roof and internal floating roof in accordance with the requirements of paragraph (a)(1) of this section, the owner or operator shall record the information listed in 40 CFR 265.1091(c)(1).
(2) For a tank equipped with an external floating roof in accordance with the requirements of paragraph (a)(1) of this section, the owner or operator shall record the information listed in 40 CFR 265.1091(c)(2).

PART 265--INTERIM STATUS STANDARDS FOR OWNERS AND OPERATORS OF HAZARDOUS WASTE TREATMENT, STORAGE, AND DISPOSAL FACILITIES

21. The authority citation for part 265 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6924, 6925, and 6935.

Subpart A--General

22. Section 265.1(b) is amended by revising the first sentence to read as follows:

Sec. 265.1 Purpose, scope, and applicability.

* * * * *

(b) Except as provided in Sec. 265.1080(b), the standards of this part, and of 40 CFR 264.552 and 40 CFR 264.553, apply to owners and operators of facilities that treat, store or dispose of hazardous waste who have fully complied with the requirements for interim status under section 3005(e) of RCRA and Sec. 270.10 of this chapter until either a permit is issued under section 3005 of RCRA or until applicable part 265 closure and post-closure responsibilities are fulfilled, and to those owners and operators of facilities in existence on November 19, 1980 who have failed to provide timely notification as required by section 3010(a) of RCRA and/or failed to file Part A of the permit application as required by 40 CFR 270.10 (e) and (g). * * *

* * * * *

Subpart B--General Facility Standards

Sec. 265.13 [Amended]

23. In Sec. 265.13, paragraph (b)(6) is amended by adding ``265.1084,''

after the phrase ``as specified in Secs. 265.200, 265.225, 265.252, 265.273, 265.314, 265.341, 265.375, 265.402, 265.1034(d), 265.1063(d),''.
24. In Sec. 265.13, paragraph (b)(8) is added to read as follows:

Sec. 265.13 General waste analysis.

* * * * *
(b) * * *
(8) For owners and operators seeking an exemption to the air emission standards of Subpart CC of this part in accordance with Sec. 265.1083--
(i) The procedures and schedules for waste sampling and analysis, and the analysis of test data to verify the exemption. (ii) Each generator's notice and certification of the volatile organic concentration in the waste if the waste is received from offsite.
* * * * *

Sec. 265.15 [Amended]

25. In Sec. 265.15, paragraph (b)(4) is amended by removing the word ``and'' after the phrase ``frequencies called for in Secs. 265.174, 265.193, 265.195, 265.226, 265.260, 265.278, 265.304, 265.347, 265.377, 265.403, 265.1033, 265.1052, 265.1053,'' and adding ``265.1089, and 265.1091(b),'' after ``265.1058,''.

Subpart E--Manifest System, Recordkeeping, and Reporting

26. Section 265.73 is amended by revising paragraphs (b)(3) and (b)(6) to read as follows:

Sec. 265.73 Operating record.

* * * * *
(b) * * *
(3) Records and results of waste analysis, waste determinations, and trial tests performed as specified in Secs. 265.13, 265.200, 265.225, 265.252, 265.273, 265.314, 265.341, 265.375, 265.402, 265.1034, 265.1063, 265.1084, 268.4(a), and 268.7 of this chapter.
* * * * *
(6) Monitoring, testing or analytical data when required by Secs. 265.19, 265.90, 265.94, 265.191, 265.193, 265.195, 265.222, 265.223, 265.226, 265.255, 265.259, 265.260, 265.276, 265.278, 265.280(d)(1), 265.302 through 265.304, 265.347, 265.377, 265.1034(c) through 265.1034(f), 265.1035, 265.1063(d) through 265.1063(i), 265.1064, 265.1089, 265.1090, and 265.1091.
* * * * *
* Section 265.77 is amended by revising paragraph (d) to read as follows:

Sec. 265.77 Additional reports.

* * * * *
(d) As otherwise required by Subparts AA, BB, and CC of this part.

Subpart I--Use and Management of Containers

28. Section 265.178 is added to read as follows:

Sec. 265.178 Air emission standards.

The owner or operator shall manage all hazardous waste placed in a container in accordance with the requirements of subpart CC of this part.

Subpart J--Tank Systems

29. Section 265.202 is added to read as follows:

Sec. 265.202 Air emission standards.

The owner or operator shall manage all hazardous waste placed in a tank in accordance with the requirements of subparts AA, BB, and CC of this part.

Subpart K--Surface Impoundments

30. Section 265.231 is added to read as follows:

Sec. 265.231 Air emission standards.

The owner or operator shall manage all hazardous waste placed in a surface impoundment in accordance with the requirements of subpart CC of this part.

Subpart AA--Air Emission Standards for Process Vents

31. Section 265.1033 is amended by revising paragraph (j)(2) and adding paragraph (l) to read as follows:

Sec. 265.1033 Standards: Closed-vent systems and control devices.

* * * * *

(j) * * *

(2) Closed-vent systems shall be monitored to determine compliance with this section during the initial leak detection monitoring, which shall be conducted by the date that the facility becomes subject to the provisions of this section, annually, and at other times as requested by the Regional Administrator. For the annual leak detection monitoring after the initial leak detection monitoring, the owner or operator is not required to monitor those closed-vent system components which continuously operate in vacuum service or those closed-vent system joints, seams, or other connections that are permanently or semipermanently sealed (e.g., a welded joint between two sections of metal pipe or a bolted and gasketed pipe flange).

* * * * *

(l) The owner or operator using a carbon adsorption system shall document that all carbon removed from the control device is managed in one of the following manners:

(1) Regenerated or reactivated in a thermal treatment unit that is permitted under subpart X of 40 CFR part 264 or subpart P of this part; (2) Incinerated by a process that is permitted under subpart O of 40 CFR part 264 or subpart O of this part; or (3) Burned in a boiler or industrial furnace that is permitted under subpart H of part 266 of this chapter.

* In 40 CFR part 265, subpart CC is added to read as follows: Subpart CC--Air Emission Standards for Tanks, Surface Impoundments, and Containers

Sec.

Subpart CC--Air Emission Standards for Tanks, Surface Impoundments, and Containers

Sec. 265.1080 Applicability.

(a) The requirements of this subpart apply to owners and operators of all facilities that treat, store, or dispose of hazardous waste in tanks, surface impoundments, or containers subject to either subparts I, J, or K of this part except as Sec. 265.1 and paragraph (b) of this section provide otherwise.
(b) The requirements of this subpart do not apply to the following waste management units at the facility: (1) A waste management unit that holds hazardous waste placed in the unit before June 5, 1995, and in which no hazardous waste is added to the unit on or after June 5, 1995.
(2) A container that has a design capacity less than or equal to 0.1 m\3\.
(3) A tank in which an owner or operator has stopped adding hazardous waste and the owner or operator has begun implementing or completed closure pursuant to an approved closure plan. (4) A surface impoundment in which an owner or operator has stopped adding hazardous waste (except to implement an approved closure plan) and the owner or operator has begun implementing or completed closure pursuant to an approved closure plan.
(5) A waste management unit that is used solely for on-site treatment or storage of hazardous waste that is generated as the result of implementing remedial activities required under the RCRA corrective action authorities of 3004(u), 3004(v) or 3008(h), CERCLA authorities, or similar Federal or State authorities. (6) A waste management unit that is used solely for the management of radioactive mixed waste in accordance with all applicable regulations under the authority of the Atomic Energy Act and the Nuclear Waste Policy Act.
(c) For the owner and operator of a facility subject to this subpart who has received a final permit under RCRA section 3005 prior to June 5, 1995, the following requirements apply: (1) The requirements of 40 CFR part 264, subpart CC shall be incorporated into the permit when the permit is reissued in accordance with the requirements of 40 CFR 124.15 or reviewed in accordance with the requirements of 40 CFR 270.50(d).
(2) Until the date when the permit is reissued in accordance with the requirements of 40 CFR 124.15 or reviewed in accordance with the requirements of 40 CFR 270.50(d), the owner and operator is subject to the requirements of this subpart.

Sec. 265.1081 Definitions.

As used in this subpart, all terms not defined herein shall have the meaning given to them in the Act and parts 260 through 266 of this chapter.
Average volatile organic concentration or average VO concentration means the mass-weighted average volatile organic concentration of a hazardous waste as determined in accordance with the requirements of Sec. 265.1084 of this subpart.
Cover means a device or system which is placed on or over a hazardous waste such that the entire hazardous waste surface area is enclosed and sealed to reduce air emissions to the atmosphere. A cover may have openings such as access hatches, sampling ports, and gauge wells that are necessary for operation, inspection, maintenance, or repair of the unit on which the cover is installed provided that each opening is closed and sealed when not in use. Examples of covers include a fixed roof installed on a tank, a floating membrane cover installed on a surface impoundment, a lid installed on a drum, and an enclosure in which an open container is placed during waste treatment. External floating roof means a pontoon or double-deck type floating roof that rests on the surface of a hazardous waste being managed in a tank that has no fixed roof.
Fixed roof means a rigid cover that is installed in a stationary position so that it does not move with fluctuations in the level of the hazardous

waste placed in a tank.
Floating membrane cover means a cover consisting of a synthetic flexible membrane material that rests upon and is supported by the hazardous waste being managed in a surface impoundment. Floating roof means a pontoon-type or double-deck type cover that rests upon and is supported by the hazardous waste being managed in a tank, and is equipped with a closure seal or seals to close the space between the cover edge and the tank wall. Internal floating roof means a floating roof that rests or floats on the surface (but not necessarily in complete contact with it) of a hazardous waste being managed in a tank that has a fixed roof. Liquid-mounted seal means a foam or liquid-filled primary seal mounted in contact with the hazardous waste between the tank wall and the floating roof continuously around the circumference of the tank. Maximum organic vapor pressure means the equilibrium partial pressure exerted by the hazardous waste contained in a tank determined at the temperature equal to either: (1) the local maximum monthly average temperature as reported by the National Weather Service when the hazardous waste is stored or treated at ambient temperature; or (2) the highest calendar-month average temperature of the hazardous waste when the hazardous waste is stored at temperatures above the ambient temperature or when the hazardous waste is stored or treated at temperatures below the ambient temperature. No detectable organic emissions means no escape of organics from a device or system to the atmosphere as determined by an instrument reading less than 500 parts per million by volume (ppmv) above the background level at each joint, fitting, and seal when measured in accordance with the requirements of Method 21 in 40 CFR part 60, appendix A, and by no visible openings or defects in the device or system such as rips, tears, or gaps.
Point of waste origination means as follows: (1) When the facility owner or operator is the generator of the hazardous waste, the point of waste origination means the point where a solid waste produced by a system, process, or waste management unit is determined to be a hazardous waste as defined in 40 CFR part 261.

[Note: In this case, this term is being used in a manner similar to the use of the term ``point of generation'' in air standards established for waste management operations under authority of the Clean Air Act in 40 CFR parts 60, 61, and 63].

(2) When the facility owner and operator are not the generator of the hazardous waste, point of waste origination means the point where the owner or operator accepts delivery or takes possession of the hazardous waste.
Point of waste treatment means the point where a hazardous waste exits a waste management unit used to destroy, degrade, or remove organics in the hazardous waste.
Vapor-mounted seal means a foam-filled primary seal mounted continuously around the circumference of the tank so that there is an annular vapor space underneath the seal. The annular vapor space is bounded by the bottom of the primary seal, the tank wall, the hazardous waste surface, and the floating roof.
Volatile organic concentration or VO concentration means the fraction by weight of organic compounds in a hazardous waste expressed in terms of parts per million (ppmw) as determined by direct measurement using Method 25D or by knowledge of the waste in accordance with the requirements of Sec. 265.1084 of this subpart. Waste determination means performing all applicable procedures in accordance with the requirements of Sec. 265.1084 of this subpart to determine whether a hazardous waste meets standards specified in this subpart. Examples of a waste determination include performing the procedures in accordance with the requirements of Sec. 265.1084 of this subpart to determine the average VO concentration of a hazardous waste at the point of waste origination; the average VO concentration of a hazardous waste at the point of waste treatment and comparing the results to the exit concentration limit specified for the process used to treat the hazardous waste; determining the organic

reduction efficiency and the organic biodegradation efficiency for a biological process used to treat a hazardous waste and comparing the results to the applicable standards; or the maximum volatile organic vapor pressure for a hazardous waste in a tank and comparing the results to the applicable standards.
Waste stabilization process means any physical or chemical process used to either reduce the mobility of hazardous constituents in a hazardous waste or eliminate free liquids as determined by Test Method 9095 (Paint Filter Liquids Test) in ``Test Methods for Evaluating Solid Waste, Physical/Chemical Methods,'' EPA Publication No. SW-846, Third Edition, September 1986, as amended by Update I, November 15, 1992 (incorporated by reference--refer to Sec. 260.11 of this chapter). A waste stabilization process includes mixing the hazardous waste with binders or other materials, and curing the resulting hazardous waste and binder mixture. Other synonymous terms used to refer to this process are ``waste fixation'' or ``waste solidification.''

Sec. 265.1082 Schedule for implementation of air emission standards.

(a) Owners or operators of facilities existing on June 5, 1995, and subject to subparts I, J, and K of this part shall meet the following requirements:
(1) Install and begin operation of all control equipment required by this subpart by June 5, 1995, except as provided for in paragraph (a)(2) of this section.
(2) When control equipment required by this subpart cannot be installed and in operation by June 5, 1995, the owner or operator shall:
(i) Install and begin operation of the control equipment as soon as possible but no later than December 8, 1997. (ii) Prepare an implementation schedule that includes the following information: specific calendar dates for award of contracts or issuance of purchase orders for the control equipment, initiation of on-site installation of the control equipment, completion of the control equipment installation, and performance of any testing to demonstrate that the installed equipment meets the applicable standards of this subpart.
(iii) For facilities subject to the recordkeeping requirements of Sec. 265.73 of this part, the owner or operator shall enter the implementation schedule specified in paragraph (a)(2)(ii) of this section in the operating record no later than June 5, 1995. (iv) For facilities not subject to Sec. 265.73 of this part, the owner or operator shall enter the implementation schedule specified in paragraph (a)(2)(ii) of this section in a permanent, readily available file located at the facility no later than June 5, 1995.
(b) Owners or operators of facilities in existence on the effective date of statutory or regulatory amendments under the Act that render the facility subject to subparts I, J, or K of this part shall meet the following requirements:
(1) Install and begin operation of all control equipment required by this subpart by the effective date of the amendment except as provided for in paragraph (b)(2) of this section. (2) When control equipment required by this subpart cannot be installed and begin operation by the effective date of the amendment, the owner or operator shall:
(i) Install and operate the control equipment as soon as possible but no later than 30 months after the effective date of the amendment. (ii) For facilities subject to the recordkeeping requirements of Sec. 265.73, enter and maintain the implementation schedule specified in paragraph (a)(2)(ii) of this section in the operating record no later than the effective date of the amendment, or (iii) For facilities not subject to Sec. 265.73, the owner or operator shall enter and maintain the implementation schedule specified in paragraph (a)(2)(ii) of this section in a permanent, readily available file located at the facility site no later than the effective date of the amendment.
(c) The Regional Administrator may elect to extend the implementation date for control equipment at a facility, on a case by case basis, to a date later than December 8, 1997, when special circumstances that are beyond the

facility owner's or operator's control delay installation or operation of control equipment and the owner or operator has made all reasonable and prudent attempts to comply with the requirements of this subpart.

Sec. 265.1083 Standards: General.

(a) This section applies to the management of hazardous waste in tanks, surface impoundments, and containers subject to this subpart. (b) The owner or operator shall control air emissions from each waste management unit in accordance with standards specified in Sec. 265.1085 through Sec. 265.1088 of this subpart, as applicable to the waste management unit, except as provided for in paragraph (c) of this section.
(c) A waste management unit is exempted from standards specified in Sec. 265.1085 through Sec. 265.1088 of this subpart provided that all hazardous waste placed in the waste management unit is determined by the owner or operator to meet either of the following conditions: (1) The average VO concentration of the hazardous waste at the point of waste origination is less than 100 parts per million by weight (ppmw). The average VO concentration shall be determined by the procedures specified in Sec. 265.1084(a) of this subpart. (2) The organic content of the hazardous waste has been reduced by an organic destruction or removal process that achieves any one of the following conditions:
(i) A process that removes or destroys the organics contained in the hazardous waste to a level such that the average VO concentration of the hazardous waste at the point of waste treatment is less than the exit concentration limit (C<INF>t) established for the process. The average VO concentration of the hazardous waste at the point of waste treatment and the exit concentration limit for the process shall be determined using the procedures specified in Sec. 265.1084(b) of this subpart.
(ii) A process that removes or destroys the organics contained in the hazardous waste to a level such that the organic reduction efficiency (R) for the process is equal to or greater than 95 percent, and the average VO concentration of the hazardous waste at the point of waste treatment is less than 50 ppmw. The organic reduction efficiency for the process and the average VO concentration of the hazardous waste at the point of waste treatment shall be determined using the procedures specified in Sec. 265.1084(b) of this subpart. (iii) A process that removes or destroys the organics contained in the hazardous waste to a level such that the actual organic mass removal rate (MR) for the process is greater than the required organic mass removal rate (RMR) established for the process. The required organic mass removal rate and the actual organic mass removal rate for the process shall be determined using the procedures specified in Sec. 265.1084(b) of this subpart.
(iv) A biological process that destroys or degrades the organics contained in the hazardous waste, such that either of the following conditions is met:
(A) The organic reduction efficiency (R) for the process is equal to or greater than 95 percent, and the organic biodegradation efficiency (R<INF>bio) for the process is equal to or greater than 95 percent. The organic reduction efficiency and the organic biodegradation efficiency for the process shall be determined in accordance with the procedures specified in Sec. 265.1084(b) of this subpart.
(B) The total actual organic mass biodegradation rate (MR<INF>bio) for all hazardous waste treated by the process is equal to or greater than the required organic mass removal rate (RMR). The required organic mass removal rate and the actual organic mass biodegradation rate for the process shall be determined using the procedures specified in Sec. 265.1084(b) of this subpart.
(v) A process that removes or destroys the organics contained in the hazardous waste and meets all of the following conditions: (A) All of the materials entering the process are hazardous wastes. (B) From the point of waste origination through the point where the hazardous waste enters the process, the hazardous waste is continuously managed in waste management

units which use air emission controls in accordance with the standards specified in Sec. 265.1085 through Sec. 265.1088 of this subpart, as applicable to the waste management unit.
(C) The average VO concentration of the hazardous waste at the point of waste treatment is less than the lowest average VO concentration at the point of waste origination determined for each of the individual hazardous waste streams entering the process or 100 ppmw, whichever value is lower. The average VO concentration of each individual hazardous waste stream at the point of waste origination shall be determined using the procedure specified in Sec. 265.1084(a) of this subpart. The average VO concentration of the hazardous waste at the point of waste treatment shall be determined using the procedure specified in Sec. 265.1084(b) of this subpart. (vi) A hazardous waste incinerator for which the owner or operator has either:
(A) Been issued a final permit under 40 CFR part 270, and designs and operates the unit in accordance with the requirements of 40 CFR part 264, subpart O; or
(B) Has certified compliance with the interim status requirements of subpart O of this part.
(vii) A boiler or industrial furnace for which the owner or operator has either:
(A) Been issued a final permit under 40 CFR part 270, and designs and operates the unit in accordance with the requirements of 40 CFR part 266, subpart H, or
(B) Has certified compliance with the interim status requirements of 40 CFR part 266, subpart H.
(d) When a process is used for the purpose of treating a hazardous waste to meet one of the sets of conditions specified in paragraphs (c)(2)(i) through (c)(2)(v) of this section, each material removed from or exiting the process that is not a hazardous waste but has an average VO concentration equal to or greater than 100 ppmw shall be managed in a waste management unit in accordance with the requirements of paragraph (b) of this section.
(e) The Regional Administrator may at any time perform or request that the owner or operator perform a waste determination for a hazardous waste managed in a tank, surface impoundment, or container exempted from using air emission controls under the provisions of this section as follows:
(1) The waste determination for average VO concentration of a hazardous waste at the point of waste origination shall be performed using direct measurement in accordance with the applicable requirements of Sec. 265.1084(a) of this subpart. The waste determination for a hazardous waste at the point of waste treatment shall be performed in accordance with the applicable requirements of Sec. 265.1084(b) of this subpart.
(2) In a case when the owner or operator is requested to perform the waste determination, the Regional Administrator may elect to have an authorized representative observe the collection of the hazardous waste samples used for the analysis.
(3) In a case when the results of the waste determination performed or requested by the Regional Administrator do not agree with the results of a waste determination performed by the owner or operator using knowledge of the waste, then the results of the waste determination performed in accordance with the requirements of paragraph (e)(1) of this section shall be used to establish compliance with the requirements of this subpart.
(4) In a case when the owner or operator has used an averaging period greater than 1 hour for determining the average VO concentration of a hazardous waste at the point of waste origination, the Regional Administrator may elect to establish compliance with this subpart by performing or requesting that the owner or operator perform a waste determination using direct measurement based on waste samples collected within a 1-hour period as follows:
(i) The average VO concentration of the hazardous waste at the point of waste origination shall be determined by direct measurement in accordance with the requirements of Sec. 265.1084(a) of this subpart. (ii) Results of the waste determination performed or requested by the Regional

Administrator showing that the average VO concentration of the hazardous waste at the point of waste origination is equal to or greater than 100 ppmw shall constitute noncompliance with this subpart except in a case as provided for in paragraph (e)(4)(iii) of this section.
(iii) For the case when the average VO concentration of the hazardous waste at the point of waste origination previously has been determined by the owner or operator using an averaging period greater than 1 hour to be less than 100 ppmw but because of normal operating process variations the VO concentration of the hazardous waste determined by direct measurement for any given 1-hour period may be equal to or greater than 100 ppmw, information that was used by the owner or operator to determine the average VO concentration of the hazardous waste (e.g., test results, measurements, calculations, and other documentation) and recorded in the facility records in accordance with the requirements of Sec. 265.1084(a) and Sec. 265.1090 of this subpart shall be considered by the Regional Administrator together with the results of the waste determination performed or requested by the Regional Administrator in establishing compliance with this subpart.

Sec. 265.1084 Waste determination procedures.

(a) Waste determination procedure for volatile organic (VO) concentration of a hazardous waste at the point of waste origination. (1) An owner or operator shall determine the average VO concentration at the point of waste origination for each hazardous waste placed in a waste management unit exempted under the provisions of Sec. 265.1083(c)(1) of this subpart from using air emission controls in accordance with standards specified in Sec. 265.1085 through Sec. 265.1088 of this subpart, as applicable to the waste management unit.
(2) When the facility owner or operator is the generator of the hazardous waste, the owner or operator shall determine the average VO concentration of the hazardous waste using either direct measurement as specified in paragraph (a)(5) of this section or knowledge of the waste as specified in paragraph (a)(6) of this section for each hazardous waste generated as follows:
(i) When the hazardous waste is generated as part of a continuous process, the owner or operator shall:
(A) Perform an initial waste determination of the average VO concentration of the waste stream before the first time any portion of the material in the waste stream is placed in a waste management unit subject to this subpart, and thereafter update the information used for the waste determination at least once every 12 months following the date of the initial waste determination; and (B) Perform a new waste determination whenever changes to the source generating the waste stream are reasonably likely to cause the average VO concentration of the hazardous waste to increase to a level that is equal to or greater than the applicable VO concentration limits specified in Sec. 265.1083 of this subpart. (ii) When the hazardous waste is generated as part of a batch process that is performed repeatedly but not necessarily continuously, the owner or operator shall:
(A) Perform an initial waste determination of the average VO concentration for one or more representative waste batches generated by the process before the first time any portion of the material in the batches is placed in a waste management unit subject to this subpart, and thereafter update the information used for the waste determination at least once every 12 months following the date of the initial waste determination; and
(B) Perform a new waste determination whenever changes to the process generating the waste batches are reasonably likely to cause the average VO concentration of the hazardous waste to increase to a level that is equal to or greater than the applicable VO concentration limits specified in Sec. 265.1083 of this subpart. (3) When the facility owner and operator is not the generator of the hazardous waste, the owner or operator shall determine the average VO concentration of the hazardous waste using either direct measurement as specified in paragraph (a)(5) of this section or knowledge

of the waste as specified in paragraph (a)(6) of this section for each hazardous waste entering the facility as follows: (i) When the hazardous waste enters the facility as a continuous flow of material through a pipeline or other means (e.g., wastewater stream), the owner or operator shall:
(A) Perform an initial waste determination of the waste stream before the first time any portion of the material in the waste stream is placed in a waste management unit subject to this subpart, and thereafter update the information used for the waste determination at least once every 12 months following the date of the initial waste determination; and
(B) Perform a new waste determination whenever changes to the source generating the waste stream are reasonably likely to cause the average VO concentration of the hazardous waste to increase to a level that is equal to or greater than the applicable VO concentration limits specified in Sec. 265.1083 of this subpart. (ii) When the hazardous waste enters the facility in a container, the owner or operator shall perform a waste determination for the material held in each container.
(4) For the case when the average VO concentration of the hazardous waste is determined by the owner or operator to be less than 100 ppmw, but because of normal operating variations in the source or process generating the hazardous waste the VO concentration of the hazardous waste may be equal to or greater than 100 ppmw at any given time during the averaging period, the owner or operator shall prepare and enter in the facility operating record information that specifies the following: (i) The maximum and minimum VO concentration values for the hazardous waste that occur during that averaging period used for the waste determination;
(ii) The operating conditions or circumstances under which the VO concentration of the hazardous waste will be equal to or greater than 100 ppmw, and;
(iii) The information and calculations used by the owner or operator to determine the average VO concentration of the hazardous waste.
(5) Procedure for using direct measurement to determine average VO concentration of a hazardous waste at the point of waste origination. (i) The owner or operator shall identify and record the point of waste origination for the hazardous waste. All waste samples used to determine the average VO concentration of the hazardous waste shall be collected at this point.
(ii) The owner or operator shall designate and record the averaging period to be used for determining the average VO concentration for the hazardous waste. The averaging period shall not exceed 1 year. An initial waste determination shall be performed for each averaging period.
(iii) The owner or operator shall identify each discrete quantity of the material composing the hazardous waste represented by the averaging period designated in paragraph (a)(5)(ii) of this section. An example of a discrete quantity of material composing a hazardous waste generated as part of a continuous process is the quantity of material generated during a process operating mode defined by a specific set of operating conditions which are normal for the process. An example of a discrete quantity of material composing a hazardous waste generated as part of a batch process that is performed repeatedly but not necessarily continuously is the total quantity of material composing a single batch generated by the process. An example of a discrete quantity of material composing a hazardous waste delivered to a facility in a container is the total quantity of material held in the container.
(iv) The following procedure shall be used measure the VO concentration for each discrete quantity of material identified in paragraph (a)(5)(iii) of this section:
(A) A sufficient number of samples, but no less than four samples, shall be collected to represent the organic composition for the entire discrete quantity of hazardous waste being tested. All of the samples shall be collected within a 1-hour period. Sufficient information shall be prepared and recorded to document the waste quantity represented by the samples and, as applicable, the operating conditions for the source or process

generating the hazardous waste represented by the samples. (B) Each sample shall be collected in accordance with the requirements specified in ``Test Methods for Evaluating Solid Waste, Physical/Chemical Methods,'' EPA Publication No. SW-846, Third Edition, September 1986, as amended by Update I, November 15, 1992 (incorporated by reference--refer to Sec. 260.11 of this chapter). (C) Each collected sample shall be prepared and analyzed in accordance with the requirements of Method 25D in 40 CFR part 60, appendix A.
(D) The measured VO concentration for the discrete quantity of hazardous waste shall be determined by using the results for all samples analyzed in accordance with paragraph (a)(5)(iv)(C) of this section and the following equation:

<GRAPHIC><TIF3>TR06DE94.003

where:

C=Measured VO concentration of the discrete quantity of hazardous waste, ppmw.
i=Individual sample ``i'' of the hazardous waste collected in accordance with the requirements of SW-846. n=Total number of samples of hazardous waste collected (at least 4) within a 1-hour period.
C<INF>i=VO concentration measured by Method 25D for sample ``i'', ppmw.

(v) The average VO concentration of the hazardous waste shall be determined using the following procedure: (A) When the facility owner or operator is the generator of the hazardous waste, a sufficient number of VO concentration measurements for the hazardous waste shall be performed in accordance with the requirements of paragraph (a)(5)(iv) of this section to represent the complete range of hazardous waste organic compositions and quantities that occur during the entire averaging period due to normal variations in the operating conditions for each process operating mode identified for the source or process generating the hazardous waste. (B) When the facility owner or operator is not the generator of the hazardous waste, a sufficient number of VO concentration measurements for the hazardous waste shall be performed in accordance with the requirements of paragraph (a)(5)(iv) of this section to represent the complete range of hazardous waste organic compositions and quantities that occur in the hazardous waste as received at the facility during the entire averaging period.
(C) The average VO concentration of the hazardous waste at the point of waste origination shall be calculated by using the results for all VO measurements performed in accordance with paragraph (a)(5)(iv) of this section and the following equation:

<GRAPHIC><TIF4>TR06DE94.004

where:
C<INF>ave=Average VO concentration of the hazardous waste at the point of waste origination, ppmw.
j=Individual discrete quantity ``j'' of the hazardous waste for which a VO concentration measurement is determined in accordance with the requirements of paragraph (a)(5)(iv) of this section. m=Total number of VO concentration measurements determined in accordance with the requirements of paragraph (a)(5)(iv) of this section for the averaging period.
Q<INF>j=Mass of the discrete quantity of the hazardous waste represented by C<INF>j, kg.
Q<INF>T=Total mass of the hazardous waste for the averaging period, kg.
C<INF>j=Measured VO concentration of discrete quantity ``j'' for the hazardous waste determined in accordance with the requirements of paragraph (a)(5)(iv) of this section, ppmw.

(6) Procedure for using knowledge of the waste to determine the average VO

concentration of a hazardous waste at the point of waste origination.
(i) The owner or operator shall identify and record the point of waste origination for the hazardous waste. All information used to determine the average VO concentration of the hazardous waste shall be based on the hazardous waste composition at this point. (ii) The owner or operator shall designate and record the averaging period to be used for determining the average VO concentration for the hazardous waste. The averaging period shall not exceed 1 year. An initial waste determination shall be performed for each averaging period.
(iii) The owner or operator shall prepare and record sufficient information that documents the average VO concentration for the hazardous waste. Information may be used that is prepared by either the facility owner or operator or by the generator of the hazardous waste. Examples of information that may be used as the basis for knowledge of the waste include: organic material balances for the source or process generating the waste; VO concentration measurements for the same type of waste performed in accordance with the procedure specified in paragraph (a)(5)(iv) of this section; previous individual organic constituent test data for the waste that are still applicable to the current waste management practices; documentation that the waste is generated by a process for which no organics-containing materials are used; previous test data for other locations managing the same type of waste; or other knowledge based on manifests, shipping papers, or waste certification notices.
(iv) If test data other than VO concentration measurements performed in accordance with the procedure specified in paragraph (a)(5)(iv) of this section are used as the basis for knowledge of the waste, then the owner or operator shall document the test method, sampling protocol, and the means by which sampling variability and analytical variability are accounted for in the determination of the average VO concentration. For example, an owner or operator may use individual organic constituent concentration test data that are validated in accordance with Method 301 in appendix A of 40 CFR part 63 as the basis for knowledge of the waste. (b) Waste determination procedures for treated hazardous waste. (1) An owner or operator shall perform the applicable waste determination for each treated hazardous waste placed in a waste management unit exempted under the provisions of Sec. 265.1083(c)(2) of this subpart from using air emission controls in accordance with standards specified in Sec. 265.1085 through Sec. 265.1088 of this subpart, as applicable to the waste management unit. (2) The owner or operator shall perform a waste determination for each discrete quantity of treated hazardous waste as follows: (i) When the hazardous waste is treated by a continuous process, the owner or operator shall:
(A) Perform an initial waste determination for the treated waste stream before the first time any portion of the material in the waste stream is placed in a waste management unit subject to this subpart, and thereafter update the information used for the waste determination at least once every 12 months following the date of the initial waste determination; and
(B) Perform a new waste determination whenever changes to the hazardous waste streams fed to the process are reasonably likely to cause the characteristics of the hazardous waste at the point of waste treatment to change to levels that fail to achieve the applicable conditions specified in Sec. 265.1083(c)(2) of this subpart. (ii) When the hazardous waste is treated by a batch process that is performed repeatedly but not necessarily continuously, the owner or operator shall:
(A) Perform an initial waste determination for the treated hazardous waste in one or more representative batches treated by the process, and thereafter update the information used for the waste determination at least once every 12 months following the date of the initial waste determination; and
(B) Perform a new waste determination whenever changes to the hazardous waste treated by the process are reasonably likely to cause the characteristics of the hazardous waste at the point of waste treatment to change to levels that fail to achieve the applicable conditions specified in Sec. 265.1083(c)(2) of this subpart. (3) The owner or operator shall

designate and record the specific provision in Sec. 265.1083(c)(2) of this subpart for which the waste determination is being performed. The waste determination for the treated hazardous waste shall be performed using the applicable procedures specified in paragraphs (b)(4) through (b)(10) of this section.
(4) Procedure to determine the average VO concentration of a hazardous waste at the point of waste treatment. (i) The owner or operator shall identify and record the point of waste treatment for the hazardous waste. All waste samples used to determine the average VO concentration of the hazardous waste shall be collected at this point.
(ii) The owner or operator shall designate and record the averaging period to be used for determining the average VO concentration for the hazardous waste. The averaging period shall not exceed 1 year. An initial waste determination shall be performed for each averaging period.
(iii) The owner or operator shall identify each discrete quantity of the material composing the hazardous waste represented by the averaging period designated in paragraph (b)(4)(ii) of this section. (iv) The following procedure shall be used measure the VO concentration for each discrete quantity of material identified in paragraph (b)(4)(iii) of this section:
(A) A sufficient number of samples, but no less than four samples, shall be collected to represent the organic composition for the entire discrete quantity of hazardous waste being tested. All of the samples shall be collected within a 1-hour period. Sufficient information shall be prepared and recorded to document the waste quantity represented by the samples and, as applicable, the operating conditions for the process treating the hazardous waste represented by the samples. (B) Each sample shall be collected in accordance with the requirements specified in ``Test Methods for Evaluating Solid Waste, Physical/Chemical Methods,'' EPA Publication No. SW-846, Third Edition, September 1986, as amended by Update I, November 15, 1992 (incorporated by reference--refer to Sec. 260.11 of this chapter).
(C) Each collected sample shall be prepared and analyzed in accordance with the requirements of Method 25D in 40 CFR part 60, appendix A.
(D) The measured VO concentration for the discrete quantity of hazardous waste shall be determined by using the results for all samples analyzed in accordance with paragraph (b)(4)(iv)(C) of this section and the following equation:

<GRAPHIC><TIF5>TR06DE94.005

where:

C = Measured VO concentration of the discrete quantity of hazardous waste, ppmw.
i = Individual sample ``i'' of the hazardous waste collected in accordance with the requirements of SW-846. n = Total number of samples of hazardous waste collected (at least 4) within a 1-hour period.
C<INF>i = VO concentration measured by Method 25D for sample ``i'', ppmw.

(v) The average VO concentration of the hazardous waste at the point of waste treatment shall be determined using the following procedure:
(A) When the facility owner or operator is the generator of the hazardous waste, a sufficient number of VO concentration measurements for the hazardous waste shall be performed in accordance with the requirements of paragraph (b)(4)(iv) of this section to represent the complete range of hazardous waste organic compositions and quantities treated by the process during the entire averaging period. (B) The average VO concentration of the hazardous waste at the point of waste treatment shall be calculated by using the results for all VO measurements performed in accordance with paragraph (b)(4)(iv) of this section and the following equation:

<GRAPHIC><TIF6>TR06DE94.006

where:

C<INF>ave = Average VO concentration of the hazardous waste at the point of waste treatment, ppmw.
j = Individual discrete quantity ``j'' of the hazardous waste for which a VO concentration measurement is determined in accordance with the requirements of paragraph (b)(4)(iv) of this section. m = Total number of VO concentration measurements determined in accordance with the requirements of paragraph (b)(4)(iv) of this section for the averaging period.
Q<INF>j = Mass of the discrete quantity of the hazardous waste represented by C<INF>j, kg.
Q<INF>T = Total mass of the hazardous waste for the averaging period, kg.
C<INF>j = Measured VO concentration of discrete quantity ``j'' for the hazardous waste determined in accordance with the requirements of paragraph (b)(4)(iv) of this section, ppmw.

(5) Procedure to determine the exit concentration limit (C<INF>t) for a treated hazardous waste.
(i) The point of waste origination for each hazardous waste treated by the process at the same time shall be identified. (ii) If a single hazardous waste stream is identified in paragraph (b)(5)(i) of this section, then the exit concentration limit (C<INF>t) shall be 100 ppmw.
(iii) If more than one hazardous waste stream is identified in paragraph (b)(5)(i) of this section, then the VO concentration of each hazardous waste stream at the point of waste origination shall be determined in accordance with the requirements of paragraph (a) of this section. The exit concentration limit (C<INF>t<SUP>) shall be calculated by using the results determined for each individual hazardous waste stream and the following equation:

<GRAPHIC><TIF7>TR06DE94.007

where:

C<INF>t = Exit concentration limit for treated hazardous waste, ppmw. x = Individual hazardous waste stream ``x'' that has a VO concentration less than 100 ppmw at the point of waste origination as determined in accordance with the requirements of Sec. 265.1084(a). y = Individual hazardous waste stream ``y'' that has a VO concentration equal to or greater than 100 ppmw at the point of waste origination as determined in accordance with the requirements of Sec. 265.1084(a). m = Total number of ``x'' hazardous waste streams treated by process. n = Total number of ``y'' hazardous waste streams treated by process. Q<INF>x = Annual mass quantity of hazardous waste stream ``x'', kg/yr. Q<INF>y = Annual mass quantity of hazardous waste stream ``y'', kg/yr. C<INF>x = Average VO concentration of hazardous waste stream ``x'' at the point of waste origination as determined in accordance with the requirements of Sec. 265.1084(a), ppmw.

(6) Procedure to determine the organic reduction efficiency (R) for a treated hazardous waste.
(i) The organic reduction efficiency for a treatment process shall be determined based on results for a minimum of three consecutive runs. The sampling time for each run shall be 1 hour. (ii) The point of each hazardous waste stream entering the process and each hazardous waste stream exiting the process that is to be included in the calculation of the organic reduction efficiency for the process shall be identified.
(iii) For each run, the following information shall be determined for each hazardous waste stream identified in paragraph (b)(6)(ii) of this section using the following procedures: (A) The mass quantity of each hazardous waste stream entering the process (Q<INF>b) and the mass quantity of each hazardous waste stream exiting the process (Q<INF>a) shall be determined.
(B) The VO concentration of each hazardous waste stream entering the process (C<INF>b) during the run shall be measured in accordance with the

requirements of paragraphs (a)(5)(iv)(A) through (a)(5)(iv)(D) of this section. The VO concentration of each hazardous waste stream exiting the process (C<INF>a) during the run shall be determined in accordance with the requirements of paragraph (b)(4)(iv) of this section. Samples shall be collected as follows: (1) For a continuous process, the samples of the hazardous waste entering and samples of the hazardous waste exiting the process shall be collected concurrently.
(2) For a batch process, the samples of the hazardous waste entering the process shall be collected at the time that the hazardous waste is placed in the process. The samples of the hazardous waste exiting the process shall be collected as soon as practicable after the time when the process stops operation or the final treatment cycle ends.
(iv) The waste volatile organic mass flow entering the process (E<INF>b) and the waste volatile organic mass flow exiting the process (E<INF>a) shall be calculated by using the results determined in accordance with paragraph (b)(6)(iii) of this section and the following equations:

<GRAPHIC><TIF8>TR06DE94.008

where:

E<INF>a = Waste volatile organic mass flow exiting process, kg/hr. E<INF>b = Waste volatile organic mass flow entering process, kg/hr. m = Total number of runs (at least 3)
j = Individual run ``j''
Q<INF>bj = Mass quantity of hazardous waste entering process during run ``j'', kg/hr.
Q<INF>aj = Average mass quantity of waste exiting process during run ``j'', kg/hr.
C<INF>aj = Measured VO concentration of hazardous waste exiting process during run ``j'' as determined in accordance with the requirements of Sec. 265.1084(b)(4)(iv), ppmw.
C<INF>bj = Measured VO concentration of hazardous waste entering process during run ``j'' as determined in accordance with the requirements of Sec. 265.1084 (a)(5)(iv)(A) through (a)(5)(iv)(D), ppmw.

(v) The organic reduction efficiency of the process shall be calculated by using the results determined in accordance with paragraph (b)(6)(iv) of this section and the following equation:

<GRAPHIC><TIF9>TR06DE94.009

where:

R = Organic reduction efficiency, percent. E<INF>b = Waste volatile organic mass flow entering process as determined in accordance with the requirements of paragraph (b)(6)(iv) of this section, kg/hr.
E<INF>a = Waste volatile organic mass flow exiting process as determined in accordance with the requirements of paragraph (b)(6)(iv) of this section, kg/hr.

(7) Procedure to determine the organic biodegradation efficiency (R<INF>bio) for a treated hazardous waste. (i) The fraction of organics biodegraded (F<INF>bio) shall be determined using the procedure specified in 40 CFR part 63, appendix C of this chapter.
(ii) The organic biodegradation efficiency shall be calculated by using the following equation:

R<INF>bio = F<INF>bio x 100 where:

R<INF>bio = Organic biodegradation efficiency, percent. F<INF>bio = Fraction of organic biodegraded as determined in accordance with the requirements of paragraph (b)(7)(i) of this section.

(8) Procedure to determine the required organic mass removal rate (RMR) for a treated hazardous waste.
(i) The point of waste origination for each hazardous waste treated by the process at the same time shall be identified. (ii) For each hazardous waste stream identified in paragraph (b)(8)(i) of this section, the VO concentration of the hazardous waste stream at the point of waste origination shall be determined in accordance with the requirements of paragraph (a) of this section. (iii) For each individual hazardous waste stream that has a volatile organic concentration equal to or greater than 100 ppmw at the point of waste origination as determined in accordance with the requirements of paragraph (b)(8)(ii) of this section, the average volumetric flow rate of hazardous waste at the point of waste origination and the density of the hazardous waste stream shall be determined.
(iv) The required organic mass removal rate for the hazardous waste shall be calculated by using the results determined for each individual hazardous waste stream in accordance with the requirements of paragraphs (b)(8)(ii) and (b)(8)(iii) of this section and the following equation:

<GRAPHIC><TIF10>TR06DE94.010

where:

RMR = Required organic mass removal rate, kg/hr. y = Individual hazardous waste stream ``y'' that has a volatile organic concentration equal to or greater than 100 ppmw at the point of waste origination as determined in accordance with the requirements of Sec. 265.1084(a).
n = Total number of ``y'' hazardous waste streams treated by process.
V<INF>y = Average volumetric flow rate of hazardous waste stream ``y'' at the point of waste origination, m<SUP>3/hr. k<INF>y = Density of hazardous waste stream ``y'', kg/m<SUP>3 C<INF>y = Average VO concentration of hazardous waste stream ``y'' at the point of waste origination as determined in accordance with the requirements of Sec. 265.1084(a), ppmw.

(9) Procedure to determine the actual organic mass removal rate (MR) for a treated hazardous waste.
(i) The actual organic mass removal rate shall be determined based on results for a minimum of three consecutive runs. The sampling time for each run shall be 1 hour.
(ii) The waste volatile organic mass flow entering the process (E<INF>b) and the waste volatile organic mass flow exiting the process (E<INF>a) shall be determined in accordance with the requirements of paragraph (b)(6)(iv) of this section.
(iii) The actual organic mass removal rate shall be calculated by using the results determined in accordance with the requirements of paragraph (b)(9)(ii) of this section and the following equation: MR = E<INF>b - E<INF>a
where:

MR = Actual organic mass removal rate, kg/hr. E<INF>b = Waste volatile organic mass flow entering process as determined in accordance with the requirements of paragraph (b)(6)(iv) of this section, kg/hr.
E<INF>a = Waste volatile organic mass flow exiting process as determined in accordance with the requirements of paragraph (b)(6)(iv) of this section, kg/hr.
(10) Procedure to determine the actual organic mass biodegradation rate (MR<INF>bio) for a treated hazardous waste. (i) The actual organic mass biodegradation rate shall be determined based on results for a minimum of three consecutive runs. The sampling time for each run shall be 1 hour.
(ii) The waste organic mass flow entering the process (E<INF>b) shall be determined in accordance with the requirements of paragraph (b)(6)(iv) of this section.
(iii) The fraction of organic biodegraded (F<INF>bio) shall be determined

using the procedure specified in 40 CFR part 63, appendix C. (iv) The actual organic mass biodegradation rate shall be calculated by using the mass flow rates and fraction of organic biodegraded determined in accordance with the requirements of paragraphs (b)(10)(ii) and (b)(10)(iii) of this section and the following equation:
MR<INF>bio = E<INF>b x F<INF>bio where:

MR<INF>bio = Actual organic mass biodegradation rate, kg/hr. E<INF>b = Waste organic mass flow entering process as determined in accordance with the requirements of paragraph (b)(6)(iv) of this section, kg/hr. F<INF>bio = Fraction of organic biodegraded as determined in accordance with the requirements of paragraph (b)(10)(iii) of this section.

(c) Procedure to determine the maximum organic vapor pressure of a hazardous waste in a tank.
(1) An owner or operator shall determine the maximum organic vapor pressure for each hazardous waste placed in a tank using air emission controls in accordance with standards specified in Sec. 265.1085(c) of this subpart.
(2) An owner or operator shall use either direct measurement as specified in paragraph (c)(3) of this section or knowledge of the waste as specified by paragraph (c)(4) of this section to determine the maximum organic vapor pressure which is representative of the hazardous waste composition stored or treated in the tank. (3) To determine the maximum organic vapor pressure of the hazardous waste by direct measurement, the following procedure shall be used:
(i) Representative samples of the waste contained in the tank shall be collected. Sampling shall be conducted in accordance with the requirements specified in ``Test Methods for Evaluating Solid Waste, Physical/Chemical Methods,'' EPA Publication No. SW-846, Third Edition, September 1986, as amended by Update I, November 15, 1992 (incorporated by reference--refer to Sec. 260.11 of this chapter). (ii) Any appropriate one of the following methods may be used to analyze the samples and compute the maximum organic vapor pressure: (A) Method 25E in 40 CFR part 60, appendix A; (B) Methods described in American Petroleum Institute Publication 2517, Third Edition, February 1989, ``Evaporative Loss from External Floating-Roof Tanks,'' (incorporated by reference--refer to Sec. 260.11 of this chapter); (C) Methods obtained from standard reference texts; (D) ASTM Method 2879-92 (incorporated by reference--refer to Sec. 260.11 of this chapter); or (E) Any other method approved by the Regional Administrator. (4) To determine the maximum organic vapor pressure of the hazardous waste by knowledge, sufficient information shall be prepared and recorded that documents the maximum organic vapor pressure of the hazardous waste in the tank. Examples of information that may be used include: documentation that the waste is generated by a process for which no organics-containing materials are used; or that the waste is generated by a process for which at other locations it previously has been determined by direct measurement that the waste maximum organic vapor pressure is less than the maximum vapor pressure limit for the appropriate design capacity category specified for the tank.

Sec. 265.1085 Standards: Tanks.

(a) This section applies to owners and operators of tanks subject to this subpart into which any hazardous waste is placed except for the following tanks:
(1) A tank in which all hazardous waste entering the tank meets the conditions specified in Sec. 265.1083(c) of this subpart; or (2) A tank used for biological treatment of hazardous waste in accordance with the requirements of Sec. 265.1083(c)(2)(iv) of this subpart.
(b) The owner or operator shall place the hazardous waste into one of the following tanks:
(1) A tank equipped with a cover (e.g., a fixed roof) that is vented through a closed-vent system to a control device in accordance with the

requirements specified in paragraph (d) of this section; (2) A tank equipped with a fixed roof and internal floating roof in accordance with the requirements of Sec. 265.1091 of this subpart; (3) A tank equipped with an external floating roof in accordance with the requirements of Sec. 265.1091 of this subpart; or (4) A pressure tank that is designed to operate as a closed system such that the tank operates with no detectable organic emissions at all times that hazardous waste is in the tank except as provided for in paragraph (g) of this section.
(c) As an alternative to complying with paragraph (b) of this section, an owner or operator may place hazardous waste in a tank equipped with a cover (e.g., a fixed roof) meeting the requirements specified in paragraph (d)(1) of this section when the hazardous waste is determined to meet all of the following conditions: (1) The hazardous waste is neither mixed, stirred, agitated, nor circulated within the tank by the owner or operator using a process that results in splashing, frothing, or visible turbulent flow on the waste surface during normal process operations; (2) The hazardous waste in the tank is not heated by the owner or operator except during conditions requiring that the waste be heated to prevent the waste from freezing or to maintain adequate waste flow conditions for continuing normal process operations; (3) The hazardous waste in the tank is not treated by the owner or operator using a waste stabilization process or a process that produces an exothermic reaction; and
(4) The maximum organic vapor pressure of the hazardous waste in the tank as determined using the procedure specified in Sec. 265.1084(c) of this subpart is less than the following applicable value:
(i) If the tank design capacity is equal to or greater than 151 m<SUP>3, then the maximum organic vapor pressure shall be less than 5.2 kPa;
(ii) If the tank design capacity is equal to or greater than 75 m<SUP>3 but less than 151 m<SUP>3, then the maximum organic vapor pressure shall be less than 27.6 kPa; or (iii) If the tank design capacity is less than 75 m<SUP>3, then the maximum organic vapor pressure shall be less than 76.6 kPa. (d) To comply with paragraph (b)(1) of this section, the owner or operator shall design, install, operate, and maintain a cover that vents the organic vapors emitted from hazardous waste in the tank through a closed-vent system connected to a control device. (1) The cover shall be designed and operated to meet the following requirements:
(i) The cover and all cover openings (e.g., access hatches, sampling ports, and gauge wells) shall be designed to operate with no detectable organic emissions when all cover openings are secured in a closed, sealed position.
(ii) Each cover opening shall be secured in a closed, sealed position (e.g., covered by a gasketed lid or cap) at all times that hazardous waste is in the tank except as provided for in paragraph (f) of this section.
(2) The closed-vent system and control device shall be designed and operated in accordance with the requirements of Sec. 265.1088 of this subpart.
(e) The owner and operator shall install, operate, and maintain enclosed pipes or other closed systems for the transfer of hazardous waste as described in paragraph (e)(1) or (e)(2) of this section. The EPA considers a drain system that meets the requirements of 40 CFR 61.346(a)(1) or 40 CFR 61.346(b)(1) through (b)(3) to be a closed system.
(1) Transfer all hazardous waste to the tank from another tank, surface impoundment, or container subject to this subpart except for those hazardous wastes that meet the conditions specified in Sec. 265.1083(c) of this subpart; and
(2) Transfer all hazardous waste from the tank to another tank, surface impoundment, or container subject to this subpart except for those hazardous wastes that meet the conditions specified in Sec. 265.1083(c) of this subpart.
(f) Each cover opening shall be secured in a closed, sealed position (e.g., covered by a gasketed lid) at all times that hazardous waste is in the tank except when it is necessary to use the cover opening to:
(1) Add, remove, inspect, or sample the material in the tank; (2) Inspect, maintain, repair, or replace equipment located inside the tank; or

(3) Vent gases or vapors from the tank to a closed-vent system connected to a control device that is designed and operated in accordance with the requirements of Sec. 265.1088 of this subpart. (g) One or more safety devices which vent directly to the atmosphere may be used on the tank, cover, closed-vent system, or control device provided each safety device meets all of the following conditions:
(1) The safety device is not used for planned or routine venting of organic vapors from the tank or the closed-vent system connected to a control device; and
(2) The safety device remains in a closed, sealed position at all times except when an unplanned event requires that the device open for the purpose of preventing physical damage or permanent deformation of the tank, cover, closed-vent system, or control device in accordance with good engineering and safety practices for handling flammable, combustible, explosive, or other hazardous materials. An example of an unplanned event is a sudden power outage.

Sec. 265.1086 Standards: surface impoundments.

(a) This section applies to owners and operators of surface impoundments subject to this subpart into which any hazardous waste is placed except for the following surface impoundments: (1) A surface impoundment in which all hazardous waste entering the surface impoundment meets the conditions specified in Sec. 265.1083(c) of this subpart; or
(2) A surface impoundment used for biological treatment of hazardous waste in accordance with the requirements of Sec. 265.1083(c)(2)(iv) of this subpart. (b) The owner or operator shall place the hazardous waste into a surface impoundment equipped with a cover (e.g., an air-supported structure or a rigid cover) that is vented through a closed-vent system to a control device meeting the requirements specified in paragraph (d) of this section.
(c) As an alternative to complying with paragraph (b) of this section, an owner or operator may place hazardous waste in a surface impoundment equipped with a floating membrane cover meeting the requirements specified in paragraph (e) of this section when the hazardous waste is determined to meet all of the following conditions: (1) The hazardous waste is neither mixed, stirred, agitated, nor circulated within the surface impoundment by the owner or operator using a process that results in splashing, frothing, or visible turbulent flow on the waste surface during normal process operations; (2) The hazardous waste in the surface impoundment is not heated by the owner or operator; and
(3) The hazardous waste in the surface impoundment is not treated by the owner or operator using a waste stabilization process or a process that produces an exothermic reaction. (d) To comply with paragraph (b)(1) of this section, the owner or operator shall design, install, operate, and maintain a cover that vents the organic vapors emitted from hazardous waste in the surface impoundment through a closed- vent system connected to a control device.
(1) The cover shall be designed, installed, operated, and maintained to meet the following requirements: (i) The cover and all cover openings (e.g., access hatches, sampling ports, and gauge wells) shall be designed to operate with no detectable organic emissions when all cover openings are secured in a closed, sealed position.
(ii) Each cover opening shall be secured in the closed, sealed position (e.g., covered by a gasketed lid or cap) at all times that hazardous waste is in the surface impoundment except as provided for in paragraph (g) of this section.
(iii) The closed-vent system and control device shall be designed and operated in accordance with Sec. 265.1088 of this subpart. (e) To comply with paragraph (c) of this section, the owner or operator shall design, install, operate, and maintain a floating membrane cover that meets all of the following requirements: (1) The floating membrane cover shall be designed, installed, and operated such that at all times when hazardous waste is in the surface impoundment, the entire surface area of the

hazardous waste is enclosed by the cover, and any air spaces underneath the cover are not vented to the atmosphere except during conditions specified in paragraph (h) of this section.
(2) The floating membrane cover and all cover openings (e.g., access hatches, sampling ports, and gauge wells) shall be designed to operate with no detectable organic emissions when all cover openings are secured in a closed, sealed position. (3) Each cover opening shall be secured in a closed, sealed position (e.g., covered by a gasketed lid or cap) at all times that hazardous waste is in the surface impoundment except as provided for in paragraphs (g)(1) through (g)(3) of this section; and (4) The synthetic membrane material used for the floating membrane cover shall be either:
(i) High density polyethylene with a thickness no less than 2.5 mm; or
(ii) A material or a composite of different materials determined to have the following properties:
(A) Organic permeability properties that are equivalent to those of the material specified in paragraph (e)(4)(i) of this section; and (B) Chemical and physical properties that maintain the material integrity for as long as the cover is in use. Factors that shall be considered in selecting the material include: the effects of contact with the waste managed in the impoundment, weather exposure, and cover installation and operation practices.
(f) The owner or operator shall install, operate, and maintain enclosed pipes or other closed systems for the transfer of hazardous waste as described in paragraph (f)(1) or (f)(2) of this section. The EPA considers a drain system that meets the requirements of 40 CFR 61.346(a)(1) or 40 CFR 61.346(b)(1) through (b)(3) to be a closed system.
(1) Transfer all hazardous waste to the surface impoundment from another tank, surface impoundment, or container subject to this subpart except for those hazardous wastes that meet the conditions specified in Sec. 265.1083(c) of this subpart; and
(2) Transfer all hazardous waste from the surface impoundment to another tank, surface impoundment, or container subject to this subpart except for those hazardous wastes that meet the conditions specified in Sec. 265.1083(c) of this subpart.
(g) Each cover opening shall be secured in the closed, sealed position (e.g., covered by a gasketed lid or cap) at all times that hazardous waste is in the surface impoundment except when it is necessary to use the cover opening to:
(1) Add, remove, inspect, or sample the material in the surface impoundment;
(2) Inspect, maintain, repair, or replace equipment located underneath the cover;
(3) Remove treatment residues from the surface impoundment in accordance with the requirements of 40 CFR 268.4; or (4) Vent gases or vapors from the surface impoundment to a closedvent system connected to a control device that is designed and operated in accordance with the requirements of Sec. 265.1088 of this subpart. (h) One or more safety devices that vent directly to the atmosphere may be installed on the cover, closed-vent system, or control device provided each device meets all of the following conditions:
(1) The safety device is not used for planned or routine venting of organic vapors from the surface impoundment or the closed-vent system connected to a control device; and
(2) The safety device remains in a closed, sealed position at all times except when an unplanned event requires that the device open for the purpose of preventing physical damage or permanent deformation of the cover, closed-vent system, or control device in accordance with good engineering and safety practices for handling flammable, combustible, explosive, or other hazardous materials. An example of an unplanned event is a sudden power outage.

Sec. 265.1087 Standards: Containers.

(a) This section applies to the owners and operators of containers having design capacities greater than 0.1 m<SUP>3 subject to this subpart into which any hazardous waste is placed except for a container in which all hazardous waste entering the container meets the conditions specified in Sec. 265.1083(c) of this subpart. (b) An owner or operator shall manage hazardous waste in containers using the following procedures:
(1) The owner or operator shall place the hazardous waste into one of the following containers except when a container is used for hazardous waste treatment as required by paragraph (b)(2) of this section:
(i) A container that is equipped with a cover which operates with no detectable organic emissions when all container openings (e.g., lids, bungs, hatches, and sampling ports) are secured in a closed, sealed position. The owner or operator shall determine that a container operates with no detectable emissions by testing each opening on the container for leaks in accordance with Method 21 in 40 CFR part 60, appendix A the first time any portion of the hazardous waste is placed into the container. If a leak is detected and cannot be repaired immediately, the hazardous waste shall be removed from the container and the container not used to meet the requirements of this paragraph until the leak is repaired and the container is retested. (ii) A container having a design capacity less than or equal to 0.46 m<SUP>3 that is equipped with a cover and complies with all applicable Department of Transportation regulations on packaging hazardous waste for transport under 49 CFR part 178. (A) A container that is managed in accordance with the requirements of 49 CFR part 178 for the purpose of complying with this subpart is not subject to any exceptions to the 49 CFR part 178 regulations, except as noted in paragraph (b)(1)(ii)(B) of this section. (B) A lab pack that is managed in accordance with the requirements of 49 CFR part 178 for the purpose of complying with this subpart may comply with the exceptions for combination packagings specified in 49 CFR 173.12(b).
(iii) A container that is attached to or forms a part of any truck, trailer, or railcar; and that has been demonstrated within the preceding 12 months to be organic vapor tight when all container openings are in a closed, sealed position (e.g., the container hatches or lids are gasketed and latched). For the purpose of meeting the requirements of this paragraph, a container is organic vapor tight if the container sustains a pressure change of not more than 750 pascals within 5 minutes after it is pressurized to a minimum of 4,500 pascals. This condition is to be demonstrated using the pressure test specified in Method 27 of 40 CFR part 60, appendix A, and a pressure measurement device which has a precision of <plus-minus> 2.5 mm water and which is capable of measuring above the pressure at which the container is to be tested for vapor tightness.
(2) An owner or operator treating hazardous waste in a container by either a waste stabilization process, any process that requires the addition of heat to the waste, or any process that produces an exothermic reaction shall meet the following requirements: (i) Whenever it is necessary for the container to be open during the treatment process, the container shall be located inside an enclosure that is vented through a closed-vent system to a control device.
(ii) The enclosure shall be a structure that is designed and operated in accordance with the following requirements: (A) The enclosure shall be a structure that is designed and operated with sufficient airflow into the structure to capture the organic vapors emitted from the hazardous waste in the container and vent the vapors through the closed-vent system to the control device. (B) The enclosure may have permanent or temporary openings to allow worker access; passage of containers through the enclosure by conveyor or other mechanical means; entry of permanent mechanical or electrical equipment; or to direct airflow into the enclosure. The pressure drop across each opening in the enclosure shall be maintained at a pressure below atmospheric pressure such that whenever an open container is placed inside the enclosure no organic vapors released from the container exit the enclosure through the opening. The owner or operator shall determine that an enclosure achieves this condition by measuring the pressure drop across

each opening in the enclosure. If the pressure within the enclosure is equal to or greater than atmospheric pressure then the enclosure does not meet the requirements of this section. (iii) The closed-vent system and control device shall be designed and operated in accordance with the requirements of Sec. 265.1088 of this subpart.
(3) An owner or operator transferring hazardous waste into a container having a design capacity greater than 0.46 m\3\ shall meet the following requirements:
(i) Hazardous waste transfer by pumping shall be performed using a conveyance system that uses a tube (e.g., pipe, hose) to add the waste into the container. During transfer of the waste into the container, the cover shall remain in place and all container openings shall be maintained in a closed, sealed position except for those openings through which the tube enters the container and as provided for in paragraph (c) of this section. The tube shall be positioned in a manner such that either the:
(A) Tube outlet continuously remains submerged below the waste surface at all times waste is flowing through the tube; (B) Lower bottom edge of the tube outlet is located at a distance no greater than two inside diameters of the tube or 15.25 cm, whichever distance is greater, from the bottom of the container at all times waste is flowing through the tube; or
(C) Tube is connected to a permanent port mounted on the bottom of the container so that the lower edge of the port opening inside the container is located at a distance equal to or less than 15.25 cm from the container bottom.
(ii) Hazardous waste transferred by a means other than pumping shall be performed such that during transfer of the waste into the container, the cover remains in place and all container openings are maintained in a closed, sealed position except for those openings through which the hazardous waste is added and as provided for in paragraph (d) of this section.
(c) Each container opening shall be maintained in a closed, sealed position (e.g., covered by a gasketed lid) at all times that hazardous waste is in the container except when it is necessary to use the opening to:
(1) Add, remove, inspect, or sample the material in the container; (2) Inspect, maintain, repair, or replace equipment located inside the container; or
(3) Vent gases or vapors from a cover located over or enclosing an open container to a closed-vent system connected to a control device that is designed and operated in accordance with the requirements of Sec. 265.1088 of this subpart.
(d) One or more safety devices that vent directly to the atmosphere may be used on the container, cover, enclosure, closed-vent system, or control device provided each device meets all of the following conditions:
(1) The safety device is not used for planned or routine venting of organic vapors from the container, cover, enclosure, or closed-vent system connected to a control device; and (2) The safety device remains in a closed, sealed position at all times except when an unplanned event requires that the device open for the purpose of preventing physical damage or permanent deformation of the container, cover, enclosure, closed-vent system, or control device in accordance with good engineering and safety practices for handling flammable, combustible, explosive, or other hazardous materials. An example of an unplanned event is a sudden power outage.

Sec. 265.1088 Standards: Closed-vent systems and control devices.

(a) This section applies to each closed-vent system and control device installed and operated by the owner or operator to control air emissions in accordance with standards of this subpart. (b) The closed-vent system shall meet the following requirements: (1) The closed-vent system shall route the gases, vapors, and fumes emitted from the hazardous waste in the waste management unit to a control device that meets the requirements specified in paragraph (c) of this section.

(2) The closed-vent system shall be designed and operated in accordance with the requirements specified in Sec. 265.1033(j) of this part.
(3) If the closed-vent system contains one or more bypass devices that could be used to divert all or a portion of the gases, vapors, or fumes from entering the control device, the owner or operator shall meet the following requirements:
(i) For each bypass device except as provided for in paragraph (b)(3)(ii) of this section, the owner or operator shall either: (A) Install, calibrate, maintain, and operate a flow indicator at the inlet to the bypass device that indicates at least once every 15 minutes whether gas, vapor, or fume flow is present in the bypass device; or
(B) Secure the valve installed at the inlet to the bypass device in the closed position using a car-seal or a lock-and-key type configuration. The owner or operator shall visually inspect the seal or closure mechanism at least once every month to verify that the valve is maintained in the closed position.
(ii) Low leg drains, high point bleeds, analyzer vents, open-ended valves or lines, and safety devices are not subject to the requirements of paragraph (b)(3)(i) of this section. (c) The control device shall meet the following requirements: (1) The control device shall be one of the following devices: (i) A control device designed and operated to reduce the total organic content of the inlet vapor stream vented to the control device by at least 95 percent by weight;
(ii) An enclosed combustion device designed and operated in accordance with the requirements of Sec. 265.1033(c); or (iii) A flare designed and operated in accordance with the requirements of Sec. 265.1033(d).
(2) The control device shall be operating at all times when gases, vapors, or fumes are vented from the waste management unit through the closed-vent system to the control device. (3) The owner or operator using a carbon adsorption system to comply with paragraph (c)(1) of this section shall operate and maintain the control device in accordance with the following requirements: (i) Following the initial startup of the control device, all activated carbon in the control device shall be replaced with fresh carbon on a regular basis in accordance with the requirements of Sec. 265.1033(g) or Sec. 265.1033(h).
(ii) All carbon removed from the control device shall be managed in accordance with the requirements of Sec. 265.1033(l). (4) An owner or operator using a control device other than a thermal vapor incinerator, flare, boiler, process heater, condenser, or carbon adsorption system to comply with paragraph (c)(1) of this section shall operate and maintain the control device in accordance with the requirements of Sec. 265.1033(i). (5) The owner or operator shall demonstrate that a control device achieves the performance requirements of paragraph (c)(1) of this section as follows:
(i) An owner or operator shall demonstrate using either a performance test as specified in paragraph (c)(5)(iii) of this section or a design analysis as specified in paragraph (c)(5)(iv) of this section the performance of each control device except for the following:
(A) A flare;
(B) A boiler or process heater with a design heat input capacity of 44 megawatts or greater;
(C) A boiler or process heater into which the vent stream is introduced with the primary fuel;
(D) A boiler or process heater burning hazardous waste for which the owner or operator has been issued a final permit under 40 CFR part 270 and designs and operates the unit in accordance with the requirements of 40 CFR part 266, subpart H; or (E) A boiler or process heater burning hazardous waste for which the owner or operator has certified compliance with the interim status requirements of 40 CFR part 266, subpart H. (ii) An owner or operator shall demonstrate the performance of each flare in accordance with the requirements specified in Sec. 265.1033(e).
(iii) For a performance test conducted to meet the requirements of paragraph (c)(5)(i) of this section, the owner or operator shall use the test methods and procedures specified in Sec. 265.1034(c)(1) through

(c)(4).
(iv) For a design analysis conducted to meet the requirements of paragraph (c)(5)(i) of this section, the design analysis shall meet the requirements specified in Sec. 265.1035(b)(4)(iii). (v) The owner or operator shall demonstrate that a carbon adsorption system achieves the performance requirements of paragraph (c)(1) of this section based on the total quantity of organics vented to the atmosphere from all carbon adsorption system equipment that is used for organic adsorption, organic desorption or carbon regeneration, organic recovery, and carbon disposal.
(6) If the owner or operator and the Regional Administrator do not agree on a demonstration of control device performance using a design analysis then the disagreement shall be resolved using the results of a performance test performed by the owner or operator in accordance with the requirements of paragraph (c)(5)(iii) of this section. The Regional Administrator may choose to have an authorized representative observe the performance test.

Sec. 265.1089 Inspection and monitoring requirements.

(a) This section applies to an owner or operator using air emission controls in accordance with the requirements of Sec. 265.1085 through Sec. 265.1088 of this subpart.
(b) Each cover used in accordance with requirements of Sec. 265.1085 through Sec. 265.1087 of this subpart shall be visually inspected and monitored for detectable organic emissions by the owner or operator using the procedure specified in paragraph (f) of this section except as follows:
(1) An owner or operator is exempted from performing the cover inspection and monitoring requirements specified in paragraph (f) of this section for the following tank covers: (i) A tank internal floating roof that is inspected and monitored in accordance with the requirements of Sec. 265.1091 of this subpart; or
(ii) A tank external floating roof that is inspected and monitored in accordance with the requirements of Sec. 265.1091 of this subpart. (2) If a tank is buried partially or entirely underground, an owner or operator is required to perform the cover inspection and monitoring requirements specified in paragraph (f) of this section only for those portions of the tank cover and those connections to the tank cover or tank body (e.g. fill ports, access hatches, gauge wells, etc.) that extend to or above the ground surface and can be opened to the atmosphere.
(3) An owner or operator is exempted from performing the cover inspection and monitoring requirements specified in paragraph (f) of this section for a container that meets all requirements specified in either Sec. 265.1087(b)(1)(ii) or Sec. 265.1087(b)(1)(iii) of this subpart.
(4) An owner or operator is exempted from performing the cover inspection and monitoring requirements specified in paragraph (f) of this section for an enclosure used to control air emissions from containers in accordance with the requirements of Sec. 265.1087(b)(2) of this subpart.
(c) Each closed-vent system used in accordance with the requirements of Sec. 265.1088 of this subpart shall be inspected and monitored by the owner or operator in accordance with the procedure specified in Sec. 265.1033(j).
(d) Each control device used in accordance with the requirements of Sec. 265.1088 of this subpart shall be inspected and monitored by the owner or operator in accordance with the procedure specified in Sec. 265.1033(f).
(e) The owner or operator shall develop and implement a written plan and schedule to perform all inspection and monitoring requirements of this section. The owner or operator shall incorporate this plan and schedule into the facility inspection plan required under 40 CFR 265.15.
(f) Inspection and monitoring of a cover in accordance with the requirements of paragraph (b) of this section shall performed as follows:
(1) The cover and all cover openings shall be initially visually inspected and monitored for detectable organic emissions on or before the date that the tank, surface impoundment, or container using the cover becomes subject to the provisions of this subpart and at other times as requested by the Regional Administrator. (2) At least once every 6 months following the

initial visual inspection and monitoring for detectable organic emissions required under paragraph (f)(1) of this section, the owner and operator shall visually inspect and monitor the cover and each cover opening except for following cover openings:
(i) A cover opening that has continuously remained in a closed, sealed position for the entire period since the last time the cover opening was visually inspected and monitored for detectable emissions; (ii) A cover opening that is designated as unsafe to inspect and monitor in accordance with paragraph (f)(5) of this section; (iii) A cover opening on a cover installed and placed in operation before December 6, 1994, that is designated as difficult to inspect and monitor in accordance with paragraph (f)(6) of this section. (3) To visually inspect a cover, the owner or operator shall view the entire cover surface and each cover opening in a closed, sealed position for evidence of any defect that may affect the ability of the cover or cover opening to continue to operate with no detectable organic emissions. A visible hole, gap, tear, or split in the cover surface or a cover opening is defined as a leak which shall be repaired in accordance with paragraph (f)(7) of this section. (4) To monitor a cover for detectable organic emissions, the owner or operator shall use the following procedure: (i) Method 21 in 40 CFR part 60, appendix A to test each cover seal and cover connection for detectable organic emissions. Seals on floating membrane covers shall be monitored around the entire perimeter of the cover at locations spaced no greater than 3 meters apart. (ii) For all cover connections and seals except for the seals around a rotating shaft that passes through a cover opening, if the monitoring instrument indicates detectable organic emissions (i.e., an instrument concentration reading greater than 500 ppmv plus the background level), then a leak is detected. Each detected leak shall be repaired in accordance with paragraph (f)(7) of this section. (iii) For the seals around a rotating shaft that passes through a cover opening, if the monitoring instrument indicates a concentration reading greater than 10,000 ppmv, then a leak is detected. Each detected leak shall be repaired in accordance with paragraph (f)(7) of this section.
(5) An owner or operator may designate a cover as an unsafe to inspect and monitor cover if all of the following conditions are met: (i) The owner or operator determines that inspection or monitoring of the cover would expose a worker to dangerous, hazardous, or other unsafe conditions.
(ii) The owner or operator develops and implements a written plan and schedule to inspect the cover using the procedure specified in paragraph (f)(3) of this section and monitor the cover using the procedure specified in paragraph (f)(4) of this section as frequently as practicable during those times when a worker can safely access the cover.
(6) An owner or operator may designate a cover installed and placed in operation before December 6, 1994, as a difficult to inspect and monitor cover if all of the following conditions are met: (i) The owner or operator determines that inspection or monitoring the cover requires elevating a worker to a height greater than 2 meters above a support surface; and
(ii) The owner and operator develops and implements a written plan and schedule to inspect the cover using the procedure specified in paragraph (f)(3) of this section, and to monitor the cover using the procedure specified in paragraph (f)(4) of this section at least once per calendar year.
(7) When a leak is detected by either of the methods specified in paragraph (f)(3) or (f)(4) of this section, the owner or operator shall repair the leak in the following manner: (i) The owner or operator shall make a first attempt at repairing the leak no later than 5 calendar days after the leak is detected. Repair of the leak shall be completed as soon as practicable, but no later than 15 calendar days after the leak is detected. If repair of the leak cannot be completed within the 15-day period, except as provided in paragraph (f)(7)(ii) of this section, then the owner or operator shall not add hazardous waste to the tank, surface impoundment, or container on which the cover is installed until the repair of the leak is completed.
(ii) Repair of a leak detected on a cover installed on a tank or surface

impoundment may be delayed beyond 15 calendar days if the owner or operator determines that both of the following conditions occur: (A) Repair of the leak requires first emptying the contents of the tank or surface impoundment; and
(B) Temporary removal of the tank or surface impoundment from service will result in the unscheduled cessation of production from the process unit or operation of the waste management unit that is generating the hazardous waste managed in the tank or surface impoundment.
(iii) Repair of a leak determined by the owner or operator to meet the conditions specified in paragraph (f)(7)(ii) of this section shall be performed at the next time the process, system, or waste management unit that is generating the hazardous waste managed in the tank or surface impoundment stops operation for any reason.

Sec. 265.1090 Recordkeeping requirements.

(a) Each owner or operator of a facility subject to requirements in this subpart shall record and maintain the following information as applicable:
(1) Documentation for each cover installed on a tank in accordance with the requirements of Sec. 265.1085(b)(2) or Sec. 265.1085(b)(3) of this subpart that includes information prepared by the owner or operator or provided by the cover manufacturer or vendor describing the cover design, and certification by the owner or operator that the cover meets the applicable design specifications as listed in Sec. 265.1091(c) of this subpart.
(2) Documentation for each floating membrane cover installed on a surface impoundment in accordance with the requirements of Sec. 265.1086(c) of this subpart that includes information prepared by the owner or operator or provided by the cover manufacturer or vendor describing the cover design, and certification by the owner or operator that the cover meets the specifications listed in Sec. 265.1086(e) of this subpart.
(3) Documentation for each enclosure used to control air emissions from containers in accordance with the requirements of Sec. 265.1087(b)(2)(i) of this subpart that includes information prepared by the owner or operator or provided by the manufacturer or vendor describing the enclosure design, and certification by the owner or operator that the enclosure meets the specifications listed in Sec. 265.1087(b)(2)(ii) of this subpart. (4) Documentation for each closed-vent system and control device installed in accordance with the requirements of Sec. 265.1088 of this subpart that includes:
(i) Certification that is signed and dated by the owner or operator stating that the control device is designed to operate at the performance level documented by a design analysis as specified in paragraph (a)(4)(ii) of this section or by performance tests as specified in paragraph (a)(4)(iii) of this section when the tank, surface impoundment, or container is or would be operating at capacity or the highest level reasonably expected to occur. (ii) If a design analysis is used, then design documentation as specified in Sec. 265.1035(b)(4). The documentation shall include information prepared by the owner or operator or provided by the control device manufacturer or vendor that describes the control device design in accordance with Sec. 265.1035(b)(4)(iii) and certification by the owner or operator that the control equipment meets the applicable specifications.
(iii) If performance tests are used, then a performance test plan as specified in Sec. 265.1035(b)(3) and all test results. (iv) Information as required by Sec. 265.1035(c)(1) and Sec. 265.1035(c)(2).
(5) Records for all Method 27 tests performed by the owner or operator for each container used to meet the requirements of Sec. 265.1087(b)(1)(iii) of this subpart. (6) Records for all visual inspections conducted in accordance with the requirements of Sec. 265.1089 of this subpart. (7) Records for all monitoring for detectable organic emissions conducted in accordance with the requirements of Sec. 265.1089 of this subpart.
(8) Records of the date of each attempt to repair a leak, repair methods applied, and the date of successful repair. (9) Records for all continuous monitoring conducted in accordance with the requirements of Sec. 265.1089

of this subpart. (10) Records of the management of carbon removed from a carbon adsorption system conducted in accordance with Sec. 265.1088(c)(3)(ii) of this subpart.
(11) Records for all inspections of each cover installed on a tank in accordance with the requirements of Sec. 265.1085(b)(2) or Sec. 265.1085(b)(3) of this subpart that includes information as listed in Sec. 265.1091(c) of this subpart.
(b) An owner or operator electing to use air emission controls for a tank in accordance with the conditions specified in Sec. 265.1085(c) of this subpart shall record the following information: (1) Date and time each waste sample is collected for direct measurement of maximum organic vapor pressure in accordance with Sec. 265.1084(c) of this subpart.
(2) Results of each determination for the maximum organic vapor pressure of the waste in the tank performed in accordance with Sec. 265.1084(c) of this subpart.
(3) Records specifying the tank dimensions and design capacity. (c) An owner or operator electing to use air emission controls for a tank in accordance with the requirements of Sec. 265.1091 of this subpart shall record the information required by Sec. 265.1091(c) of this subpart.
(d) An owner or operator electing not to use air emission controls for a particular tank, surface impoundment, or container subject to this subpart in accordance with the conditions specified in Sec. 265.1083(c) of this subpart shall record the information used by the owner or operator for each waste determination (e.g., test results, measurements, calculations, and other documentation) in the facility operating log. If analysis results for waste samples are used for the waste determination, then the owner or operator shall record the date, time, and location that each waste sample is collected in accordance with applicable requirements of Sec. 265.1084 of this subpart. (e) An owner or operator electing to comply with requirements in accordance with Sec. 265.1083(c)(2)(vi) or Sec. 265.1083(c)(2)(v) of this subpart shall record the identification number for the incinerator, boiler, or industrial furnace in which the hazardous waste is treated.
(f) An owner or operator designating a cover as unsafe to inspect and monitor pursuant to Sec. 265.1089(f)(5) of this subpart or difficult to inspect and monitor pursuant to Sec. 265.1089(f)(6) of this subpart shall record in a log that is kept in the facility operating record the following information: (1) A list of identification numbers for tanks with covers that are designated as unsafe to inspect and monitor in accordance with the requirements of Sec. 265.1089(f)(5) of this subpart, an explanation for each cover stating why the cover is unsafe to inspect and monitor, and the plan and schedule for inspecting and monitoring each cover. (2) A list of identification numbers for tanks with covers that are designated as difficult to inspect and monitor in accordance with the requirements of Sec. 265.1089(f)(6) of this subpart, an explanation for each cover stating why the cover is difficult to inspect and monitor, and the plan and schedule for inspecting and monitoring each cover. (g) All records required by paragraphs (a) through (f) of this section except as required in paragraphs (a)(1) through (a)(4) of this section shall be maintained in the operating record for a minimum of 3 years. All records required by paragraphs (a)(1) through (a)(4) of this section shall be maintained in the operating record until the air emission control equipment is replaced or otherwise no longer in service.
(h) The owner or operator of a facility that is subject to this subpart and to the control device standards in 40 CFR part 60, subpart VV, or 40 CFR part 61, subpart V, may elect to demonstrate compliance with the applicable sections of this subpart by documentation either pursuant to this subpart, or pursuant to the provisions of 40 CFR part 60, subpart VV or 40 CFR part 61, subpart V, to the extent that the documentation required by 40 CFR parts 60 or 61 duplicates the documentation required by this section.

Sec. 265.1091 Alternative tank emissions control requirements.

(a) This section applies to owners and operators of tanks electing to

comply with Sec. 265.1085(b)(2) or (b)(3) of this subpart. (1) The owner or operator electing to comply with Sec. 265.1085(b)(2) of this subpart shall design, install, operate, and maintain a fixed roof and internal floating roof that meet the following requirements.
(i) The fixed roof shall comply with the requirements of Sec. 265.1085(d)(1) of this subpart. The internal floating roof shall rest or float on the waste surface (but not necessarily in complete contact with it) inside a tank that has a fixed roof. The internal floating roof shall be floating on the waste surface at all times, except during initial fill and during those intervals when the tank is completely emptied or subsequently emptied and refilled. When the roof is resting on the leg supports, the process of filling, emptying, or refilling shall be continuous and shall be accomplished as rapidly as possible.
(ii) Each internal floating roof shall be equipped with one of the following closure devices between the wall of the tank and the edge of the internal floating roof:
(A) A foam- or liquid-filled seal mounted in contact with the waste (liquid-mounted seal). A liquid-mounted seal means a foam- or liquidfilled seal mounted in contact with the waste between the wall of the tank and the floating roof continuously around the circumference of the tank.
(B) Two seals mounted one above the other so that each forms a continuous closure that completely covers the space between the wall of the tank and the edge of the internal floating roof. The lower seal may be vapor-mounted, but both shall be continuous. (C) A mechanical shoe seal. A mechanical shoe seal is a metal sheet held vertically against the wall of the tank by springs or weighted levers and is connected by braces to the floating roof. A flexible coated fabric (envelope) spans the annular space between the metal sheet and the floating roof.
(iii) Each opening in a noncontact internal floating roof except for automatic bleeder vents (vacuum breaker vents) and the rim space vents is to provide a projection below the waste surface. (iv) Each opening in the internal floating roof except for leg sleeves, automatic bleeder vents, rim space vents, column wells, ladder wells, sample wells, and stub drains is to be equipped with a cover or lid which is to be maintained in a closed position at all times (i.e., no visible gap) except when the device is in actual use. The cover or lid shall be equipped with a gasket. Covers on each access hatch and automatic gauge float well shall be bolted except when they are in use. (v) Automatic bleeder vents shall be equipped with a gasket and are to be closed at all times when the roof is floating except when the roof is being floated off or is being landed on the roof leg supports. (vi) Rim space vents shall be equipped with a gasket and are to be set to open only when the internal floating roof is not floating or at the manufacturer's recommended setting. (vii) Each penetration of the internal floating roof for the purpose of sampling shall be a sample well. The sample well shall have a slit fabric cover that covers at least 90 percent of the opening. (viii) Each penetration of the internal floating roof that allows for passage of a column supporting the fixed roof shall have a flexible fabric sleeve seal or a gasketed sliding cover. (ix) Each penetration of the internal floating roof that allows for passage of a ladder shall have a gasketed sliding cover. (2) The owner or operator electing to comply with Sec. 265.1085(b)(3) of this subpart shall design, install, operate, and maintain an external floating roof that meets the following requirements:
(i) Each external floating roof shall be equipped with a closure device between the wall of the tank and the roof edge. The closure device is to consist of two seals, one above the other. The lower seal is referred to as the primary seal, and the upper seal is referred to as the secondary seal.
(A) The primary seal shall be either a mechanical shoe seal or a liquid-mounted seal. Except as provided in paragraph (b)(2)(iv) of this section, the seal shall completely cover the annular space between the edge of the floating roof and tank wall. (B) The secondary seal shall completely cover the annular space between the external floating roof and the wall of the tank in a continuous fashion except as allowed in paragraph (b)(2)(iv)

of this section.
(ii) Except for automatic bleeder vents and rim space vents, each opening in a noncontact external floating roof shall provide a projection below the waste surface. Except for automatic bleeder vents, rim space vents, roof drains, and leg sleeves, each opening in the roof is to be equipped with a gasketed cover, seal, or lid that is to be maintained in a closed position at all times (i.e., no visible gap) except when the device is in actual use. Automatic bleeder vents are to be closed at all times when the roof is floating except when the roof is being floated off or is being landed on the roof leg supports. Rim vents are to be set to open when the roof is being floated off the roof leg supports or at the manufacturer's recommended setting. Automatic bleeder vents and rim space vents are to be gasketed. Each emergency roof drain is to be provided with a slotted membrane fabric cover that covers at least 90 percent of the area of the opening. (iii) The roof shall be floating on the waste at all times (i.e., off the roof leg supports) except during initial fill until the roof is lifted off leg supports and when the tank is completely emptied and subsequently refilled. The process of filling, emptying, or refilling when the roof is resting on the leg supports shall be continuous and shall be accomplished as rapidly as possible. (3) The owner or operator may elect to comply with Sec. 265.1085(b)(2) or (b)(3) of this subpart using an alternative means of emission limitation for which a Federal Register notice has been published in accordance with the requirements of 40 CFR 60.114b permitting its use as an alternative means for the purpose of compliance with 40 CFR 60.112b.
(b) Monitoring and inspection of the control equipment described in paragraph (a) of this section shall be conducted as follows: (1) After installation, owners and operators of internal floating roofs shall:
(i) Visually inspect the internal floating roof, the primary seal, and the secondary seal (if one is in service), prior to filling the tank with waste. If there are holes, tears, or other openings in the primary seal, the secondary seal, or the seal fabric, or defects in the internal floating roof, or both, the owner or operator shall repair the items before filling the tank.
(ii) For tanks equipped with a liquid-mounted or mechanical shoe primary seal, visually inspect the internal floating roof and the primary seal or the secondary seal (if one is in service) through manholes and roof hatches on the fixed roof at least once every 12 months after initial fill. If the internal floating roof is not resting on the surface of the waste inside the tank, or there is liquid accumulated on the roof, or the seal is detached, or there are holes or tears in the seal fabric, the owner or operator shall repair the items or empty and remove the tank from service within 45 days. If a failure that is detected during inspections required in this paragraph cannot be repaired within 45 days and if the tank cannot be emptied within 45 days, a 30-day extension may be requested from the Regional Administrator. Such a request for an extension shall document that alternate capacity is unavailable and specify a schedule of actions the owner or operator will take that will assure that the control equipment will be repaired or the tank will be emptied as soon as possible. (iii) For tanks equipped with a double-seal system as specified in paragraph (a)(1)(i)(B) of this section: (A) Visually inspect the tank as specified in paragraph (b)(1)(iv) of this section at least every 5 years; or (B) Visually inspect the tank as specified in paragraph (b)(1)(ii) of this section.
(iv) Visually inspect the internal floating roof, the primary seal, the secondary seal (if one is in service), gaskets, slotted membranes, and sleeve seals (if any) each time the tank is emptied and degassed. If the internal floating roof has defects; the primary seal has holes, tears, or other openings in the seal or the seal fabric; or the secondary seal has holes, tears, or other openings in the seal or the seal fabric; or the gaskets no longer close off the waste surfaces from the atmosphere; or the slotted membrane has more than 10 percent open area, the owner or operator shall repair the items as necessary so that none of the conditions

specified in this paragraph exist before refilling the tank with waste. In no event shall inspections conducted in accordance with this provision occur at intervals greater than 10 years in the case of tanks conducting the annual visual inspection as specified in paragraph (b)(1)(ii) of this section, and at intervals no greater than 5 years in the case of tanks specified in paragraph (b)(1)(iii) of this section.
(v) Notify the Regional Administrator in writing at least 30 days prior to the filling or refilling of each tank for which an inspection is required by paragraphs (b)(1)(i) and (b)(1)(iv) of this section to afford the Regional Administrator the opportunity to have an observer present. If the inspection required by paragraph (b)(1)(iv) of this section is not planned and the owner or operator could not have known about the inspection 30 days in advance of refilling the tank, the owner or operator shall notify the Regional Administrator at least 7 days prior to the refilling of the tank. Notification shall be made by telephone immediately followed by written documentation demonstrating why the inspection was unplanned.
Alternatively, this notification, including the written documentation, may be made in writing and sent by express mail so that it is received by the Regional Administrator at least 7 days prior to the refilling.
(2) After installation, the owner or operator of an external floating roof shall:
(i) Determine the gap areas and maximum gap widths between the primary seal and the wall of the tank and between the secondary seal and the wall of the tank according to the following frequency: (A) Measurements of gaps between the tank wall and the primary seal (seal gaps) shall be performed during the hydrostatic testing of the tank or within 60 days of the initial fill with waste and at least once every 5 years thereafter.
(B) Measurements of gaps between the tank wall and the secondary seal shall be performed within 60 days of the initial fill with waste and at least once per year thereafter.
(C) If any tank ceases to hold waste for a period of 1 year or more, subsequent introduction of waste into the tank shall be considered an initial fill for the purposes of paragraphs (b)(2)(i)(A) and (b)(2)(i)(B) of this section.
(ii) Determine the gap widths and areas in the primary and secondary seals individually by the following procedures: (A) Measure seal gaps, if any, at one or more floating roof levels when the roof is floating off the roof leg supports. (B) Measure seal gaps around the entire circumference of the tank in each place where a 0.32-cm diameter uniform probe passes freely (without forcing or binding against the seal) between the seal and the wall of the tank and measure the circumferential distance of each such location.
(C) Determine the total surface area of each gap described in paragraph (b)(2)(ii)(B) of this section by using probes of various widths to measure accurately the actual distance from the tank wall to the seal and multiplying each such width by its respective circumferential distance.
(iii) Add the gap surface area of each gap location for the primary seal and the secondary seal individually and divide the sum for each seal by the nominal diameter of the tank and compare each ratio to the respective standards in paragraph (b)(2)(iv) of this section. (iv) Make necessary repairs or empty the tank within 45 days of identification in any inspection for seals not meeting the following requirements:
(A) The accumulated area of gaps between the tank wall and the mechanical shoe or liquid-mounted primary seal shall not exceed 212 cm<SUP>2 per meter of tank diameter, and the width of any portion of any gap shall not exceed 3.81 cm.
(1) One end of the mechanical shoe is to extend into the waste contained in the tank, and the other end is to extend a minimum vertical distance of 61 cm above the waste surface. (2) There are to be no holes, tears, or other openings in the shoe, seal fabric, or seal envelope.
(B) The secondary seal is to meet the following requirements: (1) The secondary seal is to be installed above the primary seal so that it completely covers the space between the roof edge and the tank wall except as provided in paragraph (b)(2)(ii)(C) of this section. (2) The accumulated

area of gaps between the tank wall and the secondary seal shall not exceed 21.2 cm<SUP>2 per meter of tank diameter, and the width of any portion of any gap shall not exceed 1.27 cm.
(3) There are to be no holes, tears, or other openings in the seal or seal fabric.
(v) If a failure that is detected during inspections required in paragraph (b)(2)(i) of this section cannot be repaired within 45 days and if the tank cannot be emptied within 45 days, a 30-day extension may be requested from the Regional Administrator. Such extension request shall include a demonstration of the unavailability of alternate capacity and a specification of a schedule that will assure that the control equipment will be repaired or the tank will be emptied as soon as possible.
(vi) Notify the Regional Administrator 30 days in advance of any gap measurements required by paragraph (b)(2)(i) of this section to afford the Regional Administrator the opportunity to have an observer present.
(vii) Visually inspect the external floating roof, the primary seal, secondary seal, and fittings each time the vessel is emptied and degassed.
(A) If the external floating roof has defects, the primary seal has holes, tears, or other openings in the seal or the seal fabric, or the secondary seal has holes, tears, or other openings in the seal or the seal fabric, the owner or operator shall repair the items as necessary so that none of the conditions specified in this paragraph exist before filling or refilling the tank with waste. (B) For all the inspections required by paragraph (b)(2)(vii) of this section, the owner or operator shall notify the Regional Administrator in writing at least 30 days prior to the filling or refilling of each tank to afford the Regional Administrator the opportunity to inspect the tank prior to refilling. If the inspection required by paragraph (b)(2)(vii) of this section is not planned and the owner or operator could not have known about the inspection 30 days in advance of refilling the tank, the owner or operator shall notify the Regional Administrator at least 7 days prior to the refilling of the tank. Notification shall be made by telephone immediately followed by written documentation demonstrating why the inspection was unplanned. Alternatively, this notification, including the written documentation, may be made in writing and sent by express mail so that it is received by the Regional Administrator at least 7 days prior to the refilling.
(c) Owners and operators who elect to install and operate the control equipment in paragraph (a) of this section shall include the following information in the operating record in accordance with the requirements of Sec. 265.1090(a)(1) and (a)(11) of this subpart: (1) Internal floating roof.
(i) Documentation that describes the control equipment design and certifies that the control equipment meets the specifications of paragraphs (a)(1) and (b)(1) of this section. (ii) Records of each inspection performed as required by paragraphs (b)(1)(i) through (b)(1)(iv) of this section. Each record shall identify the tank on which the inspection was performed and shall contain the date the tank was inspected and the observed condition of each component of the control equipment (seals, internal floating roof, and fittings).
(iii) If any of the conditions described in paragraph (b)(1)(ii) of this section are detected during the annual visual inspection required by paragraph (b)(1)(ii) of this section, the records shall identify the tank, the nature of the defects, and the date the tank was emptied or the nature of and date the repair was made. (iv) After each inspection required by paragraph (b)(1)(iii) of this section that finds holes or tears in the seal or seal fabric, or defects in the internal floating roof, or other control equipment defects listed in paragraph (b)(1)(ii) of this section, the records shall identify the tank and the reason it did not meet the specifications of paragraph (a)(1) or (b)(1)(iii) of this section and describe each repair made.
(2) External floating roof.
(i) Documentation that describes the control equipment design and certifies that the control equipment meets the specifications of paragraphs (a)(2)

and (b)(2)(ii) through (b)(2)(iv) of this section. (ii) Records of each gap measurement performed as required by paragraph (b)(2) of this section. Each record shall identify the tank in which the measurement was performed, the date of measurement, the raw data obtained in the measurement, and the calculations described in paragraphs (b)(2)(ii) and (b)(2)(iii) of this section. (iii) Records for each seal gap measurement that detects gaps exceeding the limitations specified by paragraph (b)(2)(iv) of this section that identifies the tank, the date the tank was emptied or the repairs made, and the nature of the repair.

PART 270--EPA ADMINISTERED PERMIT PROGRAMS: THE HAZARDOUS WASTE MANAGEMENT PROGRAM

33. The authority citation for part 270 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912, 6925, 6927, 6939, and 6974.

Subpart A--General Information

34. Section 270.4 is amended by revising paragraphs (a)(2), and (a)(3) and by adding paragraph (a)(4) to read as follows:

Sec. 270.4 Effect of a permit.

(a) * * *
(2) Are promulgated under part 268 of this chapter restricting the placement of hazardous wastes in or on the land; (3) Are promulgated under part 264 of this chapter regarding leak detection systems for new and replacement surface impoundment, waste pile, and landfill units, and lateral expansions of surface impoundment, waste pile, and landfill units. The leak detection system requirements include double liners, CQA programs, monitoring, action leakage rates, and response action plans, and will be implemented through the procedures of Sec. 270.42 Class 1 permit modifications; or (4) Are promulgated under subparts AA, BB, or CC of part 265 of this chapter limiting air emissions.

* * * * *

Subpart B--Permit Application

35. Section 270.14 is amended by revising paragraph (b)(5) to read as follows:

Sec. 270.14 Contents of Part B: General requirements.

* * * * *
(b) * * *
(5) A copy of the general inspection schedule required by Sec. 264.15(b). Include where applicable, as part of the inspection schedule, specific requirements in Secs. 264.174, 245.193(i), 264.195, 264.226, 264.254, 264.273, 264.303, 264.602, 264.1033, 264.1052, 264.1053, 264.1058, 264.1088, and 264.1091.
* * * * *
* Section 270.15 is amended by adding paragraph (e) to read as follows:

Sec. 270.15 Specific Part B information requirements for containers.

* * * * *
(e) Information on air emission control equipment as required in Sec. 270.27.
* Section 270.16 is amended by adding paragraph (k) to read as follows:

Sec. 270.16 Specific Part B information requirements for tank systems.

* * * * *

(k) Information on air emission control equipment as required in Sec. 270.27.

* Section 270.17 is amended by adding paragraph (j) to read as follows:

Sec. 270.17 Specific Part B information requirements for surface impoundments.

* * * * *

(j) Information on air emission control equipment as required in Sec. 270.27.

* Part 270 subpart B is amended by adding Sec. 270.27 to read as follows:

Sec. 270.27 Specific Part B information requirements for air emission controls for tanks, surface impoundments, and containers.

(a) Except as otherwise provided in Sec. 264.1 of this chapter, owners and operators of tanks, surface impoundments, or containers that use air emission controls in accordance with the requirements of 40 CFR part 264, subpart CC shall provide the following additional information:
(1) Documentation for each cover installed on a tank subject to Sec. 264.1084(b)(2) or Sec. 264.1084(b)(3) of this chapter that includes information prepared by the owner or operator or provided by the cover manufacturer or vendor describing the cover design, and certification by the owner or operator that the cover meets the applicable design specifications as listed in Sec. 265.1091(c) of this chapter.
(2) Identification of each container area subject to the requirements of 40 CFR part 264, subpart CC and certification by the owner or operator that the requirements of this subpart are met. (3) Documentation for each enclosure used to control air emissions from containers in accordance with the requirements of Sec. 264.1086(b)(2)(i) of this chapter that includes information prepared by the owner or operator or provided by the manufacturer or vendor describing the enclosure design, and certification by the owner or operator that the enclosure meets the specifications listed in Sec. 265.1087(b)(2)(ii) of this chapter. (4) Documentation for each floating membrane cover installed on a surface impoundment in accordance with the requirements of Sec. 264.1085(c) of this chapter that includes information prepared by the owner or operator or provided by the cover manufacturer or vendor describing the cover design, and certification by the owner or operator that the cover meets the specifications listed in Sec. 265.1086(e) of this chapter.
(5) Documentation for each closed-vent system and control device installed in accordance with the requirements of Sec. 264.1087 of this chapter that includes design and performance information as specified in Sec. 270.24 (c) and (d).
(6) An emission monitoring plan for both Method 21 and control device monitoring methods. This plan shall include the following information: monitoring point(s), monitoring methods for control devices, monitoring frequency, procedures for documenting exceedances, and procedures for mitigating noncompliances. (7) When an owner or operator of a facility subject to 40 CFR part 265, subpart CC cannot comply with 40 CFR part 264, subpart CC by the date of permit issuance, the schedule of implementation required under Sec. 265.1082 of this chapter.

PART 271--REQUIREMENTS FOR AUTHORIZATION OF STATE HAZARDOUS WASTE PROGRAMS

40. The authority citation for part 271 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), and 6926.

Subpart A--Requirements for Final Authorization

41. Section 271.1(j) is amended by adding the following entry to Table 1 in chronological order by date of publication:

Sec. 271.1 Purpose and scope.

[FRL–5206–9]

RIN 2060–AB94

Hazardous Waste Treatment, Storage, and Disposal Facilities and Hazardous Waste Generators; Organic Air Emission Standards for Tanks, Surface Impoundments, and Containers

AGENCY: Environmental Protection Agency (EPA).

ACTION: Notice of postponed effective date.

SUMMARY: This document postpones the effective date of the final rule on Hazardous Waste Treatment, Storage, and Disposal Facilities and Hazardous Waste Generators; Organic Air Emission Standards for Tanks, Surface Impoundments, and Containers until December 6, 1995.

EFFECTIVE DATE: The final rule will be effective as of December 6, 1995. The EPA specified in the final rule a schedule that established the compliance dates by which different requirements of the rule must be met. These compliance dates and requirements are explained further in the final rule (59 FR 62896, December 6, 1994) under **SUPPLEMENTARY INFORMATION**. This document only changes the June 5, 1995 effective date to December 6, 1995; all other compliance dates for the final rule remain as published in the final rule (59 FR 62896, December 6, 1994.)

ADDRESSES: Docket. The supporting information used for the final rule is available for public inspection and copying in the RCRA docket. The RCRA docket numbers pertaining to the final rule are F–91–CESP–FFFFF, F–92–CESA–FFFFF, F–94–CESF–FFFFF, and F–94–CE2A–FFFFF. The docket is available for inspection at the EPA RCRA Docket Office (5305), Room 2616, U.S. Environmental Protection Agency, 401 M Street, SW., Washington, DC 20460.

FOR FURTHER INFORMATION CONTACT: For information about this postponement contact the RCRA Hotline at (800) 424–9346 toll-free, or (703) 920–9810.

SUPPLEMENTARY INFORMATION: This document announces the postponement of the effective date for the final Air Emission Standards published under the Resource Conservation and Recovery Act. These final standards were published on December 6, 1994 (59 FR 62896) and were originally scheduled to become effective as of June 5, 1995. Since promulgation, the EPA has become aware that certain provisions of the final standards may require clarification, and plans to publish a subsequent **Federal Register** document to clarify such provisions. This process may result in compliance options that facilities do not now realize are available. To ensure that all options are clear to affected facilities, and to ensure that all affected facilities have time to make any such alterations in their compliance plan prior to the effective date of the standards, EPA is postponing the effective date of the final rule for six months. The EPA considers a postponement of six months to be adequate time to allow for affected facilities to make any such necessary adjustments. The EPA also believes that it would be inequitable not to postpone the effective date in light of the possibility of increased compliance flexibility, so that a modest postponement is justified. See 5 U.S.C. 705 (''when an agency finds that justice so requires, it may postpone the effective date of action taken by it, pending judicial review''). Therefore, the effective date of the final rule will be postponed until December 6, 1995. The final rule text affected by this change is amended as follows.

List of Subjects

40 CFR Part 264

Environmental protection, Air pollution control, Hazardous waste, Insurance, Packaging and containers, Reporting and recordkeeping requirements, Security measures, Surety bonds.

40 CFR Part 265

Air pollution control, Hazardous waste, Insurance, Packaging and containers, Reporting and recordkeeping requirements, Security measures, Surety bonds, Water supply.

40 CFR Part 271

Administrative practice and procedure, Confidential business information, Hazardous materials transportation, Hazardous waste, Indians-lands, Intergovernmental relations, Penalties, Reporting and recordkeeping requirements, Water pollution control, Water supply.

Dated: May 8, 1995.

Mary D. Nichols,

Assistant Administrator Office of Air and Radiation.

For the reasons set out in the preamble, title 40, chapter I, parts 264, 265, and 271 of the Code of Federal Regulations are amended as follows:

PART 264—STANDARDS FOR OWNERS AND OPERATORS OF HAZARDOUS WASTE TREATMENT, STORAGE, AND DISPOSAL FACILITIES

1. The authority citation for part 264 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6924 and 6925.

Subpart CC—Air Emission Standards for Tanks, Surface Impoundments, and Containers

2. Section 264.1080 is amended by revising paragraphs (b)(1) and (c) to read as follows:

§ 264.1080 Applicability.

* * * * *

(b) * * *

(1) A waste management unit that holds hazardous waste placed in the unit before December 6, 1995, and in which no hazardous waste is added to the unit on or after this date.

* * * * *

(c) For the owner and operator of a facility subject to this subpart and who received a final permit under RCRA section 3005 prior to December 6, 1995, the requirements of this subpart shall be incorporated into the permit when the permit is reissued in accordance with the requirements of § 124.15 of this chapter or reviewed in accordance with the requirements of § 270.50(d) of this chapter. Until such date when the owner and operator receives a final permit incorporating the requirements of this subpart, the owner and operator is subject to the requirements of 40 CFR part 265 subpart CC.

PART 265—INTERIM STATUS STANDARDS FOR OWNERS AND OPERATORS OF HAZARDOUS WASTE TREATMENT, STORAGE, AND DISPOSAL FACILITIES

3. The authority citation for part 265 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6924, 6925, and 6935.

Subpart CC—Air Emission Standards for Tanks, Surface Impoundments, and Containers

4. Section 265.1080 is amended by revising paragraph (b)(1) and paragraph (c) introductory text to read as follows:

§ 265.1080 Applicability.

* * * * *

(b) * * *

(1) A waste management unit that holds hazardous waste placed in the unit before December 6, 1995, and in which no hazardous waste is added to the unit on or after this date.

* * * * *

(c) For the owner and operator of a facility subject to this subpart who has received a final permit under RCRA section 3005 prior to December 6, 1995, the following requirements apply:

* * * * *

5. Section 265.1082 is amended by revising paragraphs (a) introductory text, paragraph (a)(1), (a)(2), introductory text, (a)(2)(iii), and (a)(2)(iv) to read as follows:

§ 265.1082 Schedule for implementation of air emission standards.

(a) Owners or operators of facilities existing on December 6, 1995, and subject to subparts I, J, and K of this part shall meet the following requirements:

(1) Install and begin operation of all control equipment required by this subpart by December 6, 1995, except as provided for in paragraph (a)(2) of this section.

(2) When control equipment required by this subpart cannot be installed and in operation by December 6, 1995, the owner or operator shall:

(i) * * *

(ii) * * *

(iii) For facilities subject to the recordkeeping requirements of § 265.73 of this part, the owner or operator shall enter the implementation schedule specified in paragraph (a)(2)(ii) of this section in the operating record no later than December 6, 1995.

(iv) For facilities not subject to § 265.73 of this part, the owner or operator shall enter the implementation schedule specified in paragraph (a)(2)(ii) of this section in a permanent, readily available file located at the facility no later than December 6, 1995.

* * * * *

PART 271—REQUIREMENTS FOR AUTHORIZATION OF STATE HAZARDOUS WASTE PROGRAMS

6. The authority citation for part 271 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), and 6926.

Subpart A—Requirements for Final Authorization

7. Section 271.1(j) is amended by adding the promulgation date, **Federal Register** reference, and effective date to the following entry in Table 1 to read as follows:

§ 271.1 Purpose and scope.

* * * * *

(j) * * *

TABLE 1.—REGULATIONS IMPLEMENTING THE HAZARDOUS AND SOLID WASTE AMENDMENTS OF 1984

Hazardous Waste Treatment, Storage, and Disposal Facilities and Hazardous Waste Generators; Organic Air Emission Standards for Tanks, Surface Impoundments, and Containers

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule; stay.

SUMMARY: The EPA is issuing a stay subject to conditions for air standards applicable to hazardous waste treatment, storage, and disposal facilities (TSDF). This stay is applicable to tanks and containers used for the management of certain hazardous wastes generated by organic peroxide manufacturing processes. Certain organic peroxide manufacturing wastes are inherently unstable and can not safely be confined in closed units or systems. Therefore, the EPA is staying the applicability of the subpart CC technical requirements for units managing these specific organic peroxide compounds.

EFFECTIVE DATE: December 6, 1995.

ADDRESSES: Docket. Docket entries cited in this notice may be found in RCRA docket number F–94–CE2A–FFFFF. Other RCRA docket numbers that pertain to the final rule are F–91–CESP–FFFFF, F–92–CESA–FFFFF, and F–94–CESF–FFFFF. The docket is available for inspection at the EPA RCRA Docket Office (5305), Room 2616, U.S. Environmental Protection Agency, 401 M Street, S.W., Washington, D.C. 20460.

FOR FURTHER INFORMATION CONTACT: For further information about this stay contact the RCRA Hotline at (703) 412–9877 or toll-free at 1–800–424–9346.

SUPPLEMENTARY INFORMATION:

I. Background

On December 6, 1994, the EPA published in the Federal Register (59 FR 62896) under authority of the Resource Conservation and Recovery Act (RCRA), as amended, standards requiring the use of air emission controls on certain tanks, surface impoundments, and containers at hazardous waste treatment, storage, and disposal facilities (TSDF). These standards are codified in 40 CFR parts 264 and 265 under subpart CC (referred to as the ''subpart CC standards'').

A major manufacturer of organic peroxide products has expressed its concern to the EPA regarding the availability of air emission controls which could safely be used on tanks and containers that manage certain types of organic peroxides. Certain organic peroxides are temperature sensitive compounds that are subject to spontaneous, rapid decomposition under certain conditions. The company maintains that use of the air emission controls required under the subpart CC standards on certain tanks and containers at their organic peroxides manufacturing facilities would have the potential to significantly increase the risk of explosion and fire. An inherent risk is created because these units manage a variety of organic peroxide wastes, including intermittent batches or streams containing organic peroxides that potentially undergo spontaneous, rapid thermal decomposition and hydrolysis at or below ambient temperatures.

A variety of organic peroxide products are manufactured in the United States for use by the plastics and allied industries. Typically, these organic peroxide compounds serve as initiators (catalysts) and resin hardeners in the manufacture of widely used polymer plastics (e.g., polystyrene, polyvinyl chloride, polyethylene, acrylic resins). At some organic peroxide manufacturing facilities, the production processes may generate hazardous wastes containing organic peroxides that are placed in waste management units subject to the subpart CC standards.

The manufacture, transport, and use of organic peroxide products may require implementing special safety precautions to avoid the spontaneous, rapid decomposition of certain organic peroxides. The rate at which these organic peroxides decompose is a function of temperature. Individual organic peroxide compounds and mixtures of these compounds have different sensitivities to temperature. Some organic peroxide compounds are relatively stable (i.e., do not decompose) at ambient temperatures (e.g., 30 °C). In general, it is not necessary to handle these types of organic peroxides any differently than other organic compounds during normal process operations. Other organic peroxide compounds can undergo spontaneous, rapid thermal decomposition and hydrolysis at temperatures at, or below, ambient temperatures. Once initiated, the self-accelerating thermal decomposition and hydrolysis reactions very rapidly generate large quantities of gaseous organic compounds and oxygen. Confinement of this gaseous mixture in an enclosed vessel (such as a covered tank or ventilation ducts) creates conditions that could result in explosion, detonation, and/or fire. Consequently, handling these types of organic peroxide compounds requires use of precautionary measures to address the possibility of uncontrolled organic peroxide decomposition.

The organic peroxide manufacturer who has raised this issue with the EPA produces a variety of organic peroxide products which are potentially unstable at or below ambient temperatures. The organic peroxide characteristics of the hazardous waste placed in tanks and containers at the company's facilities are highly variable because of the number of different types of organic peroxide products manufactured, the types of manufacturing processes used, and the nature of the operations used to safely handle organic peroxides at this company's facilities. Consequently, at any given time, the organic peroxide composition and concentration in the hazardous waste placed in these tanks and containers could potentially attain proportions initiating the spontaneous organic peroxide decomposition reactions. Unless provisions are made

for the very rapid evacuation of the decomposition gases, an explosion or fire could result in the waste management unit.

Prior to publication of the final subpart CC standards, the EPA received a letter from the company requesting the EPA to identify control technologies that could be safely used to control organic emissions from tanks managing hazardous waste waters that contains organic peroxides (RCRA docket entry F–94–CE2A–0001). The Agency was in the process of revising the draft final subpart CC standards to include a provision for safety venting of tanks and containers. Based on an initial review of the information provided, the Agency considered these safety vent provisions to be adequate to address the concerns raised by the company.

In November 1994, the EPA received a second letter restating the company's safety concerns with respect to implementing the subpart CC standards on tanks and containers at their organic peroxide manufacturing facilities (RCRA docket entry F–94–CE2A–0002). In response to this letter, the EPA met with company representatives on January 11, 1995 (RCRA docket entry F–94–CE2A–S0001). During this meeting, the company representatives stated that certain tanks and containers at its organic peroxide manufacturing facilities may require air emission controls under the subpart CC standards. Several different control equipment approaches for these tanks and containers have been considered by the company for complying with the subpart CC standards. For all cases, the company has concluded that use of the control equipment on the tanks and containers in accordance with the requirements specified in the subpart CC standards would have the potential to significantly increase the risk of explosion and fire at the company's facilities.

II. Issuance of Stay

The EPA expects that TSDF owners and operators will follow the proper safety procedures appropriate for their particular situations when designing and operating all air emission controls required by the subpart CC standards. In response to comments received at proposal, the EPA added several provisions to the final rule that specifically address special situations when venting of covers and other air emission control equipment is necessary for safety reasons. For example under 40 CFR 264.1084(g) and 40 CFR 265.1085(g), owners and operators are allowed to use pressure relief valves or other types of safety devices on a tank cover required under the subpart CC standards to address those special situations in which emergency venting of the covered tank is necessary, consistent with good engineering and safety practices, to prevent physical damage or permanent deformation of the tank or cover.

Following the January 11, 1995 meeting with the company, the EPA reviewed the air emission control equipment safety device provisions included in the final subpart CC standards with respect to the special nature of managing hazardous waste that contains organic peroxides with the potential to undergo spontaneous, self-accelerating decomposition reactions at or below ambient temperatures. The EPA recognizes that special precautions must be followed when handling hazardous wastes containing these types of organic peroxides. Tanks and containers used for management of this type of hazardous waste exist at one company's facilities and may exist at other TSDF locations of which the EPA is not yet aware. Some of these tanks and containers potentially could be subject to the subpart CC standards and require the use of air emission controls. The EPA recognizes that certain site-specific circumstances may exist where the provisions in the subpart CC standards allowing the use of safety devices on the air emission controls (as provided by, e.g., 40 CFR 264.1084(g)) may not be adequate to provide a level of safety consistent with good engineering and safety practices for handling organic peroxides, based on the composition of the organic peroxide wastes and the management operations for those wastes. Therefore, the EPA considers it appropriate to issue an administrative stay of the subpart CC standards' applicability, subject to conditions, for those special situations where hazardous waste that contains organic peroxides with the potential to undergo spontaneous, self-accelerating decomposition reactions at or below ambient temperatures are managed at a TSDF in tanks or containers, and for which the facility owner or operator determines that the use of any appropriate air emission controls, as required by the subpart CC standards, on these tanks and containers would create an undue safety hazard.

Based on the information provided to the EPA, the special circumstances requiring the need to issue this stay for these tanks and containers do not occur for TSDF surface impoundments. In particular, the only impoundment receiving these wastes is scheduled to be replaced by tanks before December 8, 1997, the compliance date by which facilities must install controls on units that were initially in compliance with the subpart CC standards through an implementation plan.

By today's issuance of the stay, the requirements of the subpart CC standards, with the exception of certain recordkeeping requirements, do not apply to TSDF tanks and containers used for management of hazardous waste generated by organic peroxide manufacturing and its associated laboratory operations when the facility owner or operator meets all of the conditions of the stay. This means that, for these specific tanks and containers at a TSDF site, the facility owner and operator is neither required to install and operate the air emission controls specified in the subpart CC standards on the waste management units, nor required to perform waste determinations for the hazardous waste placed in the units provided that the owner or operator satisfies all three conditions of the stay.

The first condition of the stay is that the tank or container must be used to manage hazardous waste from organic peroxide manufacturing processes that produce more than one functional family of organic peroxides, and these organic peroxides are the predominant products manufactured by the process. Further, these organic peroxides can potentially undergo self-accelerating thermal decomposition at or below ambient temperatures and these organic peroxides are the predominate products manufactured by the process. For the purpose of meeting this condition of this stay, ''organic peroxide'' means an organic compound that contains the bivalent -O-O- structure and which may be considered to be a structural derivative of hydrogen peroxide where one or both of the hydrogen atoms has been replaced by an organic radical.

The second condition of the stay is that the TSDF owner or operator must prepare documentation that explains why installation and operation of air emission controls on the tank or container, as required by the subpart CC standards, would create an undue safety hazard. The specific information that the EPA considers to be necessary to satisfy this condition is listed in § 264.1089(i) and § 265.1090(i) added to the subpart CC standards by today's action (the requirements in § 264.1089(i) applicable to permitted TSDF and in § 265.1090(i) applicable to interim-status TSDF are identical). The stay requires no administrative action by the EPA to take effect at a facility for which the owner or operator claims to satisfy the conditions of the stay. However, EPA officials (or officials from an

authorized State) could question the completeness and adequacy of the information prepared by the TSDF owner or operator to support the stay claim with respect to the requirements of § 264.1089(i) or § 265.1090(i), as applicable to the facility.

The third condition for the stay is that the TSDF owner or operator claiming the benefit of the stay submit a one-time notification of that fact to the appropriate EPA Region or authorized State office. This notice is to state that the TSDF manages hazardous wastes otherwise subject to the subpart CC standards in tanks and containers, but is not subject to those rules by virtue of this administrative stay. The notice must include the name and address of the facility, and must be signed and dated by an authorized representative of the facility owner or operator. This notification is necessary to alert EPA and State officials of the existence of the facility and, thus, provides a means of verifying if the stay conditions have been satisfied. As explained above, the stay is self-implementing; therefore, no administrative action by the EPA is necessary for the stay to apply to a particular TSDF. Thus, the notification does not present facts warranting grant of a stay; rather, it notifies the EPA and State authorities that the stay is being claimed by a TSDF owner or operator.

III. Administrative Requirements

A. Docket

Docket entries cited in this notice may be found in RCRA docket number F–94–CE2A-FFFFF. Other RCRA docket numbers that pertain to the final rule are F–91–CESP-FFFFF, F–92–CESA-FFFFF, and F–94–CESF-FFFFF. The docket is available for inspection at the EPA RCRA Docket Office (5305), Room 2616, U.S. Environmental Protection Agency, 401 M Street, S.W., Washington, D.C. 20460.

IV. Legal Authority

The EPA is issuing this administrative stay pursuant to 5 U.S.C. 705, authorizing administrative agencies to stay administrative action pending judicial review when ''justice so requires.'' See also Rule 18 of the Federal Rules of Appellate Procedure authorizing issuance of administrative stays pending review. (A petition for review has been filed regarding applicability of the subpart CC standards to persons managing hazardous waste containing organic peroxides in tanks and containers.) The EPA believes that issuance of a stay for this type of hazardous waste is needed because the promulgated regulation could (in the limited circumstances discussed in this notice) make it more dangerous to manage the waste. The stay is needed to prevent such an adverse result. The EPA also believes that the minimal conditions attached to the stay—documentation of the reason why the stay applies plus a one-time notification—are necessary to limit the stay only to the situations warranting relief.

To the extent good cause (pursuant to 5 U.S.C. 553 (b)) is needed to justify the Agency's immediately effective conditioned stay, the EPA believes that it is provided by the need to avoid the risks of explosion that could occur without the stay. In addition, the EPA notes that the general issue of providing a type of safety-override in the rule was addressed during the comment period and in the final rule, so that today's action arises from the notice and comment already provided during the rulemaking.

V. State Authority

As discussed in the final subpart CC standards (59 FR 62921, December 6, 1994), rules promulgated under RCRA section 3004(n) implement a provision of the 1984 Hazardous and Solid Waste Amendments (HSWA) and consequently take effect immediately in authorized States. The EPA will implement these standards in an authorized State until such a time when the State either: (1) modifies its RCRA program to adopt the rules and receives final authorization from the EPA for the modification: or (2) receives interim authorization from the EPA. *Id.* The EPA views today's conditioned stay as part of the rule, so that a State seeking authorization for the subpart CC standards should include this provision.

List of Subjects 40 CFR Parts 264 and 265

Air pollution control, Container, Control Device, Hazardous waste, Incorporation by reference, Inspection, Miscellaneous unit, Monitoring, Reporting and recordkeeping requirements, Standards, Surface impoundment, Tank, Waste determination.

Dated: September 14, 1995.

Mary D. Nichols,

Assistant Administrator for Air and Radiation.

For the reasons set out in the preamble, title 40, chapter I, parts 264 and 265 of the Code of Federal Regulations are amended as follows:

PART 264—STANDARDS FOR OWNERS AND OPERATORS OF HAZARDOUS WASTE TREATMENT, STORAGE, AND DISPOSAL FACILITIES

1. The authority citation for part 264 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6924 and 6925.

Subpart CC—Air Emission Standards for Tanks, Surface Impoundments, and Containers

2. In § 264.1080, paragraph (d) is added to read as follows:

§ 264.1080 Applicability.

* * * * *

(d) The requirements of this subpart, except for the recordkeeping requirements specified in § 264.1089(i) of this subpart, are administratively stayed for a tank or a container used for the management of hazardous waste generated by organic peroxide manufacturing and its associated laboratory operations when the owner or operator of the unit meets all of the following conditions:

(1) The owner or operator identifies that the tank or container receives hazardous waste generated by an organic peroxide manufacturing process producing more than one functional family of organic peroxides or multiple organic peroxides within one functional family, that one or more of these organic peroxides could potentially undergo self-accelerating thermal decomposition at or below ambient temperatures, and that organic peroxides are the predominant products manufactured by the process. For the purpose of meeting the conditions of this paragraph, ''organic peroxide'' means an organic compound that contains the bivalent —O—O— structure and which may be considered to be a structural derivative of hydrogen peroxide where one or both of the hydrogen atoms has been replaced by an organic radical.

(2) The owner or operator prepares documentation, in accordance with the requirements of § 264.1089(i) of this subpart, explaining why an undue safety hazard would be created if air emission controls specified in §§ 264.1084 through 264.1087 of this subpart are installed and operated on the tanks and containers used at the facility to manage the hazardous waste generated by the organic peroxide manufacturing process or processes meeting the conditions of paragraph (d)(1) of this section.

(3) The owner or operator notifies the Regional Administrator in writing that hazardous waste generated by an

organic peroxide manufacturing process or processes meeting the conditions of paragraph (d)(1) of this section are managed at the facility in tanks or containers meeting the conditions of paragraph (d)(2) of this section. The notification shall state the name and address of the facility, and be signed and dated by an authorized representative of the facility owner or operator.

3. In § 264.1089, paragraph (i) is added to read as follows:

§ 264.1089 Recordkeeping requirements.

* * * * *

(i) For each tank or container not using air emission controls specified in §§ 264.1084 through 264.1087 of this subpart in accordance with the conditions specified in § 264.1080(d) of this subpart, the owner or operator shall record and maintain the following information:

(1) A list of the individual organic peroxide compounds manufactured at the facility that meet the conditions specified in § 264.1080(d)(1).

(2) A description of how the hazardous waste containing the organic peroxide compounds identified in paragraph (i)(1) of this section are managed at the facility in tanks and containers. This description shall include:

(i) For the tanks used at the facility to manage this hazardous waste, sufficient information shall be provided to describe for each tank: a facility identification number for the tank; the purpose and placement of this tank in the management train of this hazardous waste; and the procedures used to ultimately dispose of the hazardous waste managed in the tanks.

(ii) For containers used at the facility to manage these hazardous wastes, sufficient information shall be provided to describe: a facility identification number for the container or group of containers; the purpose and placement of this container, or group of containers, in the management train of this hazardous waste; and the procedures used to ultimately dispose of the hazardous waste handled in the containers.

(3) An explanation of why managing the hazardous waste containing the organic peroxide compounds identified in paragraph (i)(1) of this section in the tanks and containers as described in paragraph (i)(2) of this section would create an undue safety hazard if the air emission controls, as required under §§ 264.1084 through 264.1087 of this subpart, are installed and operated on these waste management units. This explanation shall include the following information:

(i) For tanks used at the facility to manage these hazardous wastes, sufficient information shall be provided to explain: how use of the required air emission controls on the tanks would affect the tank design features and facility operating procedures currently used to prevent an undue safety hazard during the management of this hazardous waste in the tanks; and why installation of safety devices on the required air emission controls, as allowed under § 264.1084(g) of this subpart, will not address those situations in which evacuation of tanks equipped with these air emission controls is necessary and consistent with good engineering and safety practices for handling organic peroxides.

(ii) For containers used at the facility to manage these hazardous wastes, sufficient information shall be provided to explain: how use of the required air emission controls on the containers would affect the container design features and handling procedures currently used to prevent an undue safety hazard during the management of this hazardous waste in the containers; and why installation of safety devices on the required air emission controls, as allowed under § 264.1086(d) of this subpart, will not address those situations in which evacuation of containers equipped with these air emission controls is necessary and consistent with good engineering and safety practices for handling organic peroxides.

PART 265—INTERIM STATUS STANDARDS FOR OWNERS AND OPERATORS OF HAZARDOUS WASTE TREATMENT, STORAGE, AND DISPOSAL FACILITIES

4. The authority citation for part 265 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6924, 6925, and 6935.

Subpart CC—Air Emission Standards for Tanks, Surface Impoundments, and Containers

5. In § 265.1080, paragraph (d) is added to read as follows:

§ 265.1080 Applicability.

* * * * *

(d) The requirements of this subpart, except for the recordkeeping requirements specified in § 265.1090(i) of this subpart, are administratively stayed for a tank or a container used for the management of hazardous waste generated by organic peroxide manufacturing and its associated laboratory operations when the owner or operator of the unit meets all of the following conditions:

(1) The owner or operator identifies that the tank or container receives hazardous waste generated by an organic peroxide manufacturing process producing more than one functional family of organic peroxides or multiple organic peroxides within one functional family, that one or more of these organic peroxides could potentially undergo self-accelerating thermal decomposition at or below ambient temperatures, and that organic peroxides are the predominant products manufactured by the process. For the purpose of meeting the conditions of this paragraph, ''organic peroxide'' means an organic compound that contains the bivalent -O-O- structure and which may be considered to be a structural derivative of hydrogen peroxide where one or both of the hydrogen atoms has been replaced by an organic radical.

(2) The owner or operator prepares documentation, in accordance with the requirements of § 265.1090(i) of this subpart, explaining why an undue safety hazard would be created if air emission controls specified in §§ 265.1085 through 265.1088 of this subpart are installed and operated on the tanks and containers used at the facility to manage the hazardous waste generated by the organic peroxide manufacturing process or processes meeting the conditions of paragraph (d)(1) of this section.

(3) The owner or operator notifies the Regional Administrator in writing that hazardous waste generated by an organic peroxide manufacturing process or processes meeting the conditions of paragraph (d)(1) of this section are managed at the facility in tanks or containers meeting the conditions of paragraph (d)(2) of this section. The notification shall state the name and address of the facility, and be signed and dated by an authorized representative of the facility owner or operator.

6. In § 265.1090, paragraph (i) is added to read as follows:

§ 265.1090 Recordkeeping requirements.

* * * * *

(i) For each tank or container not using air emission controls specified in §§ 265.1085 through 265.1088 of this subpart in accordance with the conditions specified in § 265.1080(d) of this subpart, the owner or operator shall record and maintain the following information:

(1) A list of the individual organic peroxide compounds manufactured at

the facility that meet the conditions specified in § 265.1080(d)(1).

(2) A description of how the hazardous waste containing the organic peroxide compounds identified in paragraph (i)(1) of this section are managed at the facility in tanks and containers. This description shall include the following information:

(i) For the tanks used at the facility to manage this hazardous waste, sufficient information shall be provided to describe for each tank: a facility identification number for the tank; the purpose and placement of this tank in the management train of this hazardous waste; and the procedures used to ultimately dispose of the hazardous waste managed in the tanks.

(ii) For containers used at the facility to manage these hazardous wastes, sufficient information shall be provided to describe: a facility identification number for the container or group of containers; the purpose and placement of this container, or group of containers, in the management train of this hazardous waste; and the procedures used to ultimately dispose of the hazardous waste handled in the containers.

(3) An explanation of why managing the hazardous waste containing the organic peroxide compounds identified in paragraph (i)(1) of this section in the tanks and containers as described in paragraph (i)(2) of this section would create an undue safety hazard if the air emission controls, as required under §§ 265.1085 through 265.1088 of this subpart, are installed and operated on these waste management units. This explanation shall include the following information:

(i) For tanks used at the facility to manage these hazardous wastes, sufficient information shall be provided to explain: how use of the required air emission controls on the tanks would affect the tank design features and facility operating procedures currently used to prevent an undue safety hazard during the management of this hazardous waste in the tanks; and why installation of safety devices on the required air emission controls, as allowed under § 265.1085(g) of this subpart, will not address those situations in which evacuation of tanks equipped with these air emission controls is necessary and consistent with good engineering and safety practices for handling organic peroxides.

(ii) For containers used at the facility to manage these hazardous wastes, sufficient information shall be provided to explain: how use of the required air emission controls on the containers would affect the container design features and handling procedures currently used to prevent an undue safety hazard during the management of this hazardous waste in the containers; and why installation of safety devices on the required air emission controls, as allowed under § 265.1087(d) of this subpart, will not address those situations in which evacuation of containers equipped with these air emission controls is necessary and consistent with good engineering and safety practices for handling organic peroxides.

BILLING CODE 6560–50–P

40 CFR Part 300

[FRL–5306–3]

National Oil and Hazardous Substances Contingency Plan; National Priorities List Update

AGENCY: Environmental Protection Agency.

ACTION: Notice of deletion of the Witco Chemical Corporation Superfund Site from the National Priorities List (NPL).

SUMMARY: The Environmental Protection Agency (EPA) Region II announces the deletion of the Witco Chemical Corporation Superfund site in Oakland, New Jersey from the National Priorities List (NPL). The NPL is Appendix B of 40 CFR Part 300, the National Oil and Hazardous Substances Contingency Plan (NCP), which EPA promulgated pursuant to Section 105 of the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA), as amended. EPA and the State of New Jersey have determined that all appropriate Fund-financed responses under CERCLA have been implemented and that no further cleanup by responsible parties is appropriate. Moreover, EPA and the State of New Jersey have determined that remedial actions conducted at the site to date remain protective of public health, welfare, and the environment.

EFFECTIVE DATE: September 29, 1995.

FOR FURTHER INFORMATION CONTACT: Mr. John Osolin, Remedial Project Manager, U.S. Environmental Protection Agency, Region II, 290 Broadway, 19th Floor, New York, New York 10007, (212) 637–4412.

ADDRESSES: Comprehensive information on this site is available at the following addresses:

Oakland Public Library, Municipal Plaza, Oakland, New Jersey 07436, (201) 337–3742, Hrs. M–TH 10:00 AM–9:00 PM, F & SA 10:00 AM–5:00 PM.

Superfund Records Center, U.S. Environmental Protection Agency, Region II, 290 Broadway, 18th Floor, New York, New York 10007, (212) 637–4308, Hrs. M–F 9:00 AM–5:00 PM, (Call for an appointment, reasonable fees may be charged for copying.).

SUPPLEMENTARY INFORMATION: The site to be deleted from the NPL is: Witco Chemical Corporation Site, Oakland, New Jersey.

A Notice of Intent to Delete for this site was published November 18, 1993 (58 FR 60825). The closing date for comments on the Notice of Intent to Delete was December 17, 1993. EPA received no comments and therefore has not prepared a Responsiveness Summary.

The EPA identifies sites which appear to present a significant risk to public health, welfare, or the environment and it maintains the NPL as the list of those sites. Sites on the NPL may be the subject of Hazardous Substance Response Trust Fund (Fund-) financed remedial actions. Section 300.425(e)(3) of the NCP states that Fund-financed actions may be taken at sites deleted from the NPL in the unlikely event that conditions at the site warrant such action. Deletion of a site from the NPL does not affect responsible party liability or impede agency efforts to recover costs associated with response efforts.

List of Subjects in 40 CFR Part 300

Environmental protection, Air pollution control, Chemicals, Hazardous substances, Hazardous waste, Intergovernmental relations, Penalties, Reporting and recordkeeping requirements, Superfund, Water pollution control, Water supply.

Dated: September 15, 1995.

William J. Muszynski,

Acting Regional Administrator.

40 CFR part 300 is amended as follows:

PART 300—[AMENDED]

1. The authority citation for part 300 continues to read as follows:

Authority: 33 U.S.C. 1321(c)(2); 42 U.S.C. 9601–9657; E.O. 12777, 56 FR 54757, 3 CFR, 1991 Comp.; p. 351; E.O. 12580, 52 FR 2923, 3 CFR, 1987 Comp.; p. 193.

Appendix B—[Amended]

2. Table 1 of appendix B to part 300 is amended by removing Witco

certification), as well as provisions of general industry (29 CFR part 1910) standards appropriate to hazards found in these employments. Federal jurisdiction also remains in effect with respect to Federal government employers and employees.

(c) The Assistant Secretary retains his authority under section 11(c) of the Act with regard to complaints alleging discrimination against employees because of the exercise of any right afforded to the employee by the Act. The Assistant Secretary also retains his authority under section 6 of the Act to promulgate, modify or revoke occupational safety and health standards which address the working conditions of all employees. Any Federal standards, including any standards promulgated or modified during the period of the Virgin Islands final approval under section 18(e), are now enforceable by Federal OSHA.

(d) The Assistant Secretary also retains authority to continue to conduct investigations and inspections for the purpose of the evaluation of the Virgin Islands State plan under section 18 (e) and (f) of the Act. The Regional Administrator will closely monitor State performance and corrective action and make prompt recommendation to the Assistant Secretary for either reinstatement of the Virgin Islands final approval status or initiation of plan withdrawal action. Federal enforcement authority will continue to be exercised to the extent necessary to assure occupational safety and health protection to employees in the Virgin Islands until further notice.

Hazardous Waste Treatment, Storage, and Disposal Facilities and Hazardous Waste Generators; Organic Air Emission Standards for Tanks, Surface Impoundments, and Containers

AGENCY: Environmental Protection Agency (EPA).

ACTION: Notice of postponed effective date.

SUMMARY: This document postpones the effective date of the final rule on Hazardous Waste Treatment, Storage, and Disposal Facilities and Hazardous Waste Generators; Organic Air Emission Standards for Tanks, Surface Impoundments, and Containers until June 6, 1996.

EFFECTIVE DATE: The final rule will be effective as of June 6, 1996. The EPA specified in the final rule a schedule that established the compliance dates by which different requirements of the final rule must be met. These compliance dates and requirements are explained further in the final rule (59 FR 62896, December 6, 1994) under **SUPPLEMENTARY INFORMATION.** This document changes only the effective date of the standards. The effective date will be June 6, 1996 for all provisions of the standards, including the applicability of 40 CFR part 265 subparts AA, BB, and CC to 90-day accumulation units at hazardous waste generators, the applicability of 40 CFR part 265 subparts AA, BB, and CC to Resource Conservation and Recovery ACT (RCRA) permitted units, and the applicability of the final standards to tanks in which waste stabilization activities are performed. All other compliance dates for the final rule remain as published in the final rule (59 FR 62896.)

ADDRESSES: Docket. The supporting information used for the final rule is available for public inspection and copying in the RCRA docket. The RCRA docket numbers pertaining to the final rule are F–91–CESP–FFFFF, F–92–CESA–FFFFF, F–94–CESF–FFFFF, F–94–CE2A–FFFFF, and F–95–CE3A–FFFFF. The docket is available for inspection at the EPA RCRA Docket Office (5305), Room 2616, U.S. Environmental Protection Agency, 401 M Street, S.W., Washington, D.C. 20460, telephone (202) 260–9327.

FOR FURTHER INFORMATION CONTACT: For information about this postponement contact the RCRA Hotline at (800) 424–9346 toll-free, or (703) 920–9810.

SUPPLEMENTARY INFORMATION:

1. Postponement of December 6, 1995 Effective Date

This notice announces the postponement of the effective date for the final Air Emission Standards published under the RCRA. These final standards were published on December 6, 1994 (59 FR 62896) and were originally scheduled to become effective as of June 5, 1995. On May 19, 1995 (60 FR 26828) the EPA postponed the effective date until December 6, 1995 to allow time for the EPA to identify provisions of the final standards that require clarification, and to publish a Federal Register notice to clarify such provisions. The EPA expects to publish that notice in the near future.

Subsequently, on August 14, 1995 the EPA published a Federal Register document entitled, ''Proposed rule; data availability'' (60 FR 41870) and opened RCRA docket F–95–CE3A–FFFFF to accept comments on revisions that the EPA is considering for the final standards. The provisions of the final rule that these revisions would affect are the waste determination procedures, the standards for containers, and the applicability of the final standards to units that operate air emission controls in accordance with certain Clean Air Act standards. In addition, these revisions would reduce the monitoring, record keeping, and reporting requirements for affected tanks, surface impoundments, and containers.

The EPA accepted public comments on the appropriateness of these revisions through October 13, 1995. The EPA is now reviewing the comments received by the docket and will determine whether to revise the final rule to incorporate the described revisions. The incorporation of these revisions would provide certain compliance options for waste determination procedures and for container standards that are not currently available in the published final rule. By January of 1996, the EPA expects to complete its review of the public comments, and publish a Federal Register notice explaining the EPA's decision if and how to amend the rule.

Given that the EPA intends to clarify provisions of the rule and is actively considering amending the rule in ways that would increase compliance flexibility and possibly reduce certain regulatory requirements, the EPA considers it appropriate to delay the December 6, 1995 effective date for six months. This delay will both allow the ongoing administrative review process to be completed successfully, and allow ample time for facilities to make any necessary alterations to their compliance plans before the effective date of the standards.

The EPA has received a request that it stay the rule, from a party that has brought a judicial challenge to the published rule. In taking this action to postpone the rule's effective date, the EPA is not concurring that the criteria for a stay (such as likelihood of irreparable harm or likelihood that these parties will ultimately prevail should the rule be litigated) are met. Rather, as a prudential matter, the EPA believes that a six month delay is appropriate for the reasons explained above.

2. Retention of Final Compliance Date of December 8, 1997

The December 6, 1994 published rule set a final compliance date of December 8, 1997, by which time all required air emission control equipment must be operating (59 FR 62897). The EPA does not believe that postponing the effective date of this rule necessitates any postponement of the December 8, 1997 compliance date. The final compliance date was chosen to allow time for facility modifications that may be involved in the compliance approach of certain facilities. The EPA believes that, for many air emission control applications, the required control devices can be installed and in operation within several months. However, the EPA agrees that under some circumstances, the owner's or operator's approach to complying with the air emission control requirements under the subpart CC standards may involve a major design and construction project which requires a longer time to complete. In recognition of these cases, the EPA decided that it is reasonable to allow up to December 8, 1997 for affected facilities to install and begin operation of air emission controls required by the supbart CC standards. (Hazardous Waste TSDF Background Information Document for Promulgated Organic Air Emission Standards, EPA–453/R–94–076b, page 9–7.)

The final rule requirements that may necessitate a major modification, as described above, for tanks are paragraphs (b) through (d) of 40 CFR parts 264.1084 and 265.1085. These paragraphs specify air emission control equipment that must be operated on tanks receiving affected hazardous waste. Similarly, the requirements that may necessitate such a major modification for surface impoundments are paragraphs (b) through (e) of 40 CFR parts 264.1085 and 265.1086. These paragraphs specify air emission control equipment that must be operated on surface impoundments receiving affected hazardous waste. To comply with these requirements for tanks and surface impoundments, facilities may choose to construct new hazardous waste management units to replace existing units, or may choose to modify existing hazardous waste management units. Examples of facility equipment modifications that could require an extended period of compliance would be replacing a large open surface impoundment with a series of covered tanks, or fitting an existing open tank with a fixed roof vented to a control device. The EPA recognizes that such major modifications or new construction can require several months or more, and therefore allows until December 8, 1997 for facilities to comply with the air emission control requirements of the final subpart CC standards.

In addition, certain States may require that a facility obtain a permit modification prior to performing a major modification such as those described above. The EPA recognizes that such permit modifications can be a lengthy process, and therefore felt it was appropriate to afford an extended compliance period to allow such modifications to be obtained (59 FR 62919). The EPA does not expect that such a lengthy period of implementation would be required in circumstances other than those described above, although such a period is available if necessary.

The final rule provisions that justified a compliance date of December 8, 1997 are not among those that are potentially affected by the revisions currently under the EPA's consideration. Specifically, the EPA is not considering changes to the requirements for covers and air emission controls on tanks and surface impoundments. All affected facilities have been on notice of the final rule air emission control requirements for these units since the final rule publication on December 6, 1994. Therefore, the EPA does not consider it appropriate to postpone the compliance date of December 8, 1997, by which all required air emission control equipment must be operating.

3. Conclusion

The EPA is postponing the effective date of the final rule until June 6, 1996. The final rule text affected by this postponement is amended as follows.

Dated: October 31, 1995.

Mary D. Nichols,

Assistant Administrator for Air and Radiation.

For the reasons set out in the preamble, title 40, chapter I, parts 264, 265, and 271 of the Code of Federal Regulations are amended as follows:

PART 264—STANDARDS FOR OWNERS AND OPERATORS OF HAZARDOUS WASTE TREATMENT, STORAGE, AND DISPOSAL FACILITIES

1. The authority citation for part 264 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6924 and 6925.

Subpart CC—Air Emission Standards for Tanks, Surface Impoundments, and Containers

2. Section 264.1080 is amended by revising paragraphs (b)(1) and (c) to read as follows:

§ 264.1080 Applicability.

* * * * *

(b) * * *

(1) A waste management unit that holds hazardous waste placed in the unit before June 6, 1996, and in which no hazardous waste is added to the unit on or after this date.

* * * * *

(c) For the owner and operator of a facility subject to this subpart and who received a final permit under RCRA section 3005 prior to June 6, 1996, the requirements of this subpart shall be incorporated into the permit when the permit is reissued in accordance with the requirements of 40 CFR 124.15 of this chapter or reviewed in accordance with the requirements of 40 CFR 270.50(d) of this chapter. Until such date when the owner and operator receives a final permit incorporating the requirements of this subpart, the owner and operator is subject to the requirements of 40 CFR part 265, subpart CC.

PART 265—INTERIM STATUS STANDARDS FOR OWNERS AND OPERATORS OF HAZARDOUS WASTE TREATMENT, STORAGE, AND DISPOSAL FACILITIES

3. The authority citation for part 265 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6924, 6925, and 6935.

Subpart CC—Air Emission Standards for Tanks, Surface Impoundments, and Containers

4. Section 265.1080 is amended by revising paragraph (b)(1) and paragraph (c) introductory text to read as follows:

§ 265.1080 Applicability.

* * * * *

(b) * * *

(1) A waste management unit that holds hazardous waste placed in the unit before June 6, 1996, and in which no hazardous waste is added to the unit on or after this date.

* * * * *

(c) For the owner and operator of a facility subject to this subpart who has received a final permit under RCRA section 3005 prior to June 6, 1996, the following requirements apply:

* * * * *

5. Section 265.1082 is amended by revising paragraphs (a) introductory text, paragraph (a)(1), (a)(2), (a)(2)(iii), and (a)(2)(iv) to read as follows:

§ 265.1082 Schedule for implementation of air emission standards.

(a) Owners or operators of facilities existing on June 6, 1996, and subject to subparts I, J, and K of this part shall meet the following requirements:

(1) Install and begin operation of all control equipment required by this subpart by June 6, 1995, except as provided for in paragraph (a)(2) of this section.

(2) When control equipment required by this subpart cannot be installed and in operation by June 6, 1996, the owner or operator shall:

* * * * *

(iii) For facilities subject to the recordkeeping requirements of § 265.73 of this part, the owner or operator shall enter the implementation schedule specified in paragraph (a)(2)(ii) of this section in the operating record no later than June 6, 1996.

(iv) For facilities not subject to § 265.73 of this part, the owner or operator shall enter the implementation schedule specified in paragraph (a)(2)(ii) of this section in a permanent, readily available file located at the facility no later than June 6, 1996.

* * * * *

PART 271—REQUIREMENTS FOR AUTHORIZATION OF STATE HAZARDOUS WASTE PROGRAMS

6. The authority citation for part 271 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), and 6926.

Subpart A—Requirements for Final Authorization

7. Section 271.1(j) is amended by revising the December 6, 1994 entry in Table 1 to read as follows:

§ 271.1 Purpose and scope.

* * * * *

(j) * * *

TABLE 1.—REGULATIONS IMPLEMENTING THE HAZARDOUS AND SOLID WASTE AMENDMENTS OF 1984

Technical Amendments to Test Rules and Consent Orders; Republication

Editorial Note: This document was originally published at 60 FR 50432, September 29, 1995, and is being reprinted in its entirety because of typesetting errors.

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: EPA has approved by letter certain modifications to test standards and schedules for chemical testing programs under section 4 of the Toxic Substances Control Act (TSCA). These modifications, requested by test sponsors, will be incorporated and codified in the respective test regulation or consent order. Because these modifications do not significantly alter the scope of a test or significantly change the schedule for its completion, EPA approved these requests without seeking notice and comment. EPA annually publishes a notice describing all of the modifications granted by letter for the previous year.

EFFECTIVE DATE: This rule is effective on September 29, 1995.

FOR FURTHER INFORMATION CONTACT: Susan B. Hazen, Director, Environmental Assistance Division (7408), Office of Pollution Prevention and Toxics, Rm. E–543B, 401 M St., SW., Washington, DC 20460, (202) 554–1404, TDD (202) 554–0551, Internet: TSCA-Hotline@epamail.epa.gov.

SUPPLEMENTARY INFORMATION: EPA issued a rule published in the Federal Register of September 1, 1989 (54 FR 36311), amending procedures for modifying test standards and schedules for test rules and testing consent orders under section 4 of TSCA. The amended procedures allow EPA to approve requested modifications which do not alter the scope of a test or significantly change the schedule for its completion. These modifications are approved by letter without public comment. The rule also requires immediate placement of these letters in EPA's public files and publication of these modifications in the Federal Register. This document includes modifications approved from January 1, 1994, through December 31, 1994. For a detailed description of the rationale for these modifications, refer

Protection Agency, Research Triangle Park, North Carolina 27711; telephone (919) 541–2452.

SUPPLEMENTARY INFORMATION: Section 112 of the Act requires EPA to promulgate national emission standards for sources of hazardous air pollutants (HAP). On September 1, 1995 (60 FR 45947), the Agency promulgated final standards for the aerospace manufacturing and rework industry. Among other provisions, the rule established a deadline for existing sources to submit an initial notification to the Administrator.

The submittal of an initial notification by owners or operators of existing sources affected by relevant standards is required under § 63.9(b)(2) of the General Provisions to 40 CFR part 63. Section 63.9(b)(2) requires that this initial notification be submitted to the Administrator within 120 days of the effective date of a promulgated NESHAP. In the case of the final Aerospace NESHAP, affected existing facilities would be required to submit an initial notification by December 30, 1995.

However, in paragraph V.H.(2)(a) of the preamble to the proposed aerospace manufacturing and rework NESHAP published in the Federal Register on June 6, 1994 (59 FR 29216), the Agency stated its intent to override the submittal date specified in the General Provisions and to require owners or operators of affected aerospace manufacturing and rework facilities to submit this initial notification ''* * * no later than 12 months before the final compliance date [i.e., by September 1, 1997] * * *.'' One comment was received concerning the submittal of the initial notification (see Docket Number A–92–20, Entry Number IV–D–31). This commenter requested that the initial notification be submitted within the 120 days specified in the General Provisions. While the Agency generally favors early interaction amongst the regulated community, permitting agencies, and the public, especially in instances where the final compliance date is less than three years from promulgation; the Agency was not compelled to alter its position from that found in the preamble to the proposed rule because of the three years allowed for existing sources to comply. Therefore, the final rule should have indicated requirements for the submittal of an initial notification within 2 years of the effective date of the final standard. However, language specifying the September 1, 1997 date for submittal of the initial notification was mistakenly omitted from the final rule published in the Federal Register. In today's document, the Agency has corrected this omission and has included the applicable language.

Dated: February 1, 1996.

Richard D. Wilson,

Acting Assistant Administrator for Air and Radiation.

The following corrections are being made in the regulatory text for: National Emission Standards for Hazardous Air Pollutants for Aerospace Manufacturing and Rework Facilities published in the Federal Register on September 1, 1995 (60 FR 45948):

§ 63.753 [Corrected]

1. Paragraph (a)(1) of § 65.753 on page 45979, column 1, should read as follows:

* * * * *

(a)(1) Except as provided in paragraphs (a)(2) and (a)(3) of this section, each owner or operator subject to this subpart shall fulfill the requirements contained in § 63.9 (a) through (e) and (h) through (j), Notification requirements, and § 63.10 (a), (b), (d) and (f), Recordkeeping and reporting requirements, of the General Provisions, 40 CFR part 63, subpart A, except that the initial notification requirements for new or reconstructed affected sources in § 63.9(b) (3) though (5) shall not apply. In addition to the requirements of § 63.9(h), the notification of compliance status shall include:

(i) Information detailing whether the source has operated within the specified ranges of its designated operating parameters.

(ii) For each coating line, where averaging will be used along with the types of quantities of coatings the facility expects to use in the first year of operation. Averaging scheme shall be approved by the Administrator or delegated State authority and shall be included as part of the facility's title V or part 70 permit.

(2) The initial notification for existing sources, required in § 63.9(b)(2) shall be submitted no later than September 1, 1997. For the purpose of this subpart, a title V or part 70 permit application may be used in lieu of the initial notification required under § 63.9(b)(2), provided the same information is contained in the permit application as required by § 63.9(b)(2), and the State to which the permit application has been submitted has an approved operating permit program under part 70 of this chapter and has received delegation of authority from the EPA. Permit applications shall be submitted by the same due dates as those specified for the initial notifications.

Hazardous Waste Treatment, Storage, and Disposal Facilities and Hazardous Waste Generators; Organic Air Emission Standards for Tanks, Surface Impoundments, and Containers

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule; technical amendment.

SUMMARY: Under the authority of the Resource Conservation and Recovery Act (RCRA), as amended, the EPA has published air standards to reduce organic emissions from hazardous waste management activities (59 FR 62896, December 6, 1994). The air standards apply to owners and operators of hazardous waste treatment, storage, and disposal facilities (TSDF) subject to RCRA subtitle C permitting requirements and to certain hazardous waste generators accumulating waste in on-site tanks and containers. This action makes clarifying amendments in the regulatory text of the final standards, corrects typographical and grammatical errors, and clarifies certain language in the preamble to the final rule.

EFFECTIVE DATE: The rule provisions clarified by this action are effective as of June 6, 1996, the effective date of the final rule.

ADDRESSES: This notice is available on the EPA's Clean-up Information Bulletin Board (CLU–IN). To access CLU–IN with a modem of up to 28,800 baud, dial (301) 589–8366. First time users will be asked to input some initial registration information. Next, select ''D'' (download) from the main menu. Input the file name ''RCRACLAR.ZIP'' to download this notice. Follow the on-line instructions to complete the download. More information about the download procedure is located in Bulletin 104; to read this type ''B 104'' from the main menu. For additional help with these instructions, telephone the CLU–IN help line at (301) 589–8368.

Docket. The supporting information used for this rulemaking is available for public inspection and copying in the RCRA docket. The RCRA docket numbers pertaining to this rulemaking are F–91–CESP–FFFFF, F–92–CESA–FFFFF, F–94–CESF–FFFFF, F–94–

CE2A–FFFFF, and F–95–CE3A–FFFFF. The RCRA docket is located at Crystal Gateway, 1235 Jefferson Davis Highway, First Floor, Arlington, Virginia. Hand delivery of items and review of docket materials are made at the Virginia address. The public must have an appointment to review docket materials. Appointments can be scheduled by calling the Docket Office at (703) 603–9230. The mailing address for the RCRA docket office is RCRA Information Center (5305W), U. S. Environmental Protection Agency, 401 M Street SW, Washington, DC 20460.

FOR FURTHER INFORMATION CONTACT: The RCRA Hotline, toll-free at (800) 424–9346. For further information on the specific provisions to which this clarification refers, contact Ms. Michele Aston, Emission Standards Division (Mail Drop 13), Office of Air Quality Planning and Standards, U.S. Environmental Protection Agency, Research Triangle Park, North Carolina 27711, telephone number (919) 541–2363.

SUPPLEMENTARY INFORMATION:

Background

The EPA is today making clarifying amendments to the final subpart CC standards. Since the publication of the final rule, the EPA has published two Federal Register documents to delay the effective date of the final rule. The first (60 FR 26828, May 19, 1995) revised the effective date of the standards to be December 6, 1995. The second (60 FR 56952, November 13, 1995) subsequently revised the effective date of the standards to be June 6, 1996. The EPA has also issued a stay of the standards specific to units managing wastes produced by certain organic peroxide manufacturing processes (60 FR 50426, September 29, 1995).

On August 14, 1995, the EPA published a Federal Register document entitled, ''Proposed rule; data availability'' (60 FR 41870) and opened RCRA docket F–95–CE3A–FFFFF to accept comments on revisions that the EPA is considering for the final subpart CC standards. The EPA accepted public comments on the appropriateness of these revisions through October 13, 1995 and is now in the process of reviewing and evaluating the comments that were received. The EPA expects to complete its review of these public comments, and publish a Federal Register notice explaining the EPA's decision if and how to amend the rule to reflect the proposed revisions, in early 1996.

Today's action clarifies provisions of the final rule to better convey the EPA's original intent. While today's clarifications may be applicable to certain comments submitted to docket F–95–CE3A–FFFFF, today's action is independent of those proposed revisions and the Federal Register document that EPA intends to publish in early 1996 addressing its evaluation of the proposed revisions. The information presented in this preamble is organized as follows:

1. Applicability.
2. Definitions.
3. Schedule for implementation of air emission standards.
4. Standards: General.
5. Waste determination procedures.
6. Standards: Tanks.
7. Standards: Surface impoundments.
8. Standards: Containers.
9. Closed-Vent Systems and Control Devices.
10. Inspection and Monitoring requirements.
11. Recordkeeping Requirements.
12. Reporting Requirements.
13. Alternative Control Requirements for Tanks.
14. Immediate Effective Date.

1. Applicability

The EPA deferred applicability of the final subpart CC standards to units used solely for on-site treatment or storage of hazardous waste generated in the course of certain remedial activities. Paragraph (b)(5) of § 264.1080 and § 265.1080 specified that this deferral applied to ''remedial activities required under the corrective action authorities of RCRA sections 3004(u), 3004(v) or 3008(h), CERCLA authorities, or similar Federal or State authorities.'' However, page 62897 of the preamble to the final subpart CC standards stated that this deferral applied to ''remedial activities required under RCRA corrective action or CERCLA response authorities (or similar State remediation authorities).'' Consistent with the regulatory language, the EPA intended that this deferral apply to remedial activities under the authority of RCRA corrective action, CERCLA response, similar Federal authorities, or similar State authorities. An example of a similar Federal authority would be the EPA Compliance Monitoring Program (CMP) pursuant to the Toxic Substances Control Act, and a waste management unit that is used solely for on-site storage of hazardous wastes generated from remedial activities required by the CMP thus would qualify for deferral from the applicability of the final subpart CC standards.

The EPA also deferred applicability of the subpart CC standards to hazardous waste management units that are used ''solely'' to treat or store radioactive mixed waste, in paragraph (b)(6) of § 264.1080 and § 265.1080. EPA is clarifying here that the use of the word ''solely'' does not preclude addition of other materials to a unit managing radioactive mixed waste if applicable regulations of the Atomic Energy Act or the Nuclear Waste Policy Act require that material other than radioactive mixed waste be added to the unit. Such additions would not contravene the purpose of EPA's limitation of the scope of the deferral: To prevent radioactive mixed wastes from being used to exempt other hazardous waste from the rule through mixing and to limit the volume of mixed waste that is managed, again by limiting options for exempt mixing. Thus, if any materials other than radioactive mixed waste are added after June 6, 1996 to units used to treat or store mixed waste, the regulatory deferral of the unit would not apply *unless* the addition is pursuant to a regulatory requirement imposed pursuant to the Atomic Energy Act and/or the Nuclear Waste Policy Act.

2. Definitions

The EPA is revising the definition of ''cover'' and adding a definition for the term ''enclosure'' to clarify the EPA's intended distinction between the two technologies, and to clarify the specific requirements for an enclosure. As used in the final subpart CC standards, the EPA considers a cover to be a device that is placed on or over a unit and forms a barrier between the entire waste surface and the space external to the unit. Examples of covers include a fitted lid on a drum and a roof on a tank. In contrast, the EPA considers an enclosure to be a structure that is external to a unit which surrounds the unit and some space external to the unit. An example of an enclosure would be a shed or a building within which a unit is either permanently or temporarily located. The definition for ''cover'' contained in the December 6, 1994 final standards listed an enclosure surrounding a container as an example of a cover, which has led to several inquiries from the public as to whether a tank located inside a building equipped with a ventilation system routed to a control device would meet the requirements for tank covers specified in § 264.1084(d) and § 265.1085(d). It is not the EPA's intent to allow an enclosure or building surrounding a tank to meet the control requirements for the final subpart CC standards; see Hazardous Waste TSDF Background Information for Promulgated Organic Air Emission Standards for Tanks, Surface Impoundments, and Containers, EPA–

453/R–94–076b (''BID''), page 6–61. To make explicit what is already implicit in the final rule, EPA is clarifying that an enclosure surrounding a tank is not equivalent to a cover on a tank. Thus, the EPA is removing the example of an enclosure from the definition of ''cover'' and is creating a separate definition for the term ''enclosure.''

The final subpart CC standards require enclosures surrounding open fixation containers to meet airflow and pressure drop requirements, as specified in paragraph (b)(2)(ii) of § 264.1086 and § 265.1087. The EPA has received a number of requests from the public to more clearly specify these requirements. In response, the EPA is specifically defining the term ''enclosure'' such that an enclosure be designed and operated in accordance with the requirements of ''Procedure T—Criteria for and Verification of a Permanent or Temporary Total Enclosure'' contained in § 52.741, appendix B. The requirements of this procedure will provide facilities with a more clear definition of the EPA's intent for the design and operation of enclosures.

The EPA is also amending the term ''waste stabilization'' to specifically exclude the process of adding non-reactive absorbent material to the surface of a waste. The EPA recognizes that to meet certain criteria under the Land Disposal Restrictions, or to prevent the introduction of liquids into certain combustion devices, owners or operators apply absorbent material to the surface of wastes just prior to disposal. In such procedures, the container is opened, absorbent material is placed on the surface of the waste to absorb a relatively small amount of liquid, and the container is closed. No mixing or agitation is involved in this process. The EPA's intended definition of waste stabilization for the final subpart CC air rules does not include processes that do not include mixing or agitation, and do not involve curing (BID, p. 6–57). The EPA is amending the definition of ''waste stabilization'' to clarify this intent.

3. Schedule for implementation of air emission standards

The December 6, 1994 published rule establishes additional air standards for TSDF owners and operators subject to 40 CFR part 264 or 40 CFR part 265. All requirements enacted under this final action are effective as of June 6, 1996. This includes the application of the requirements of 40 CFR part 265 subparts AA, BB, and CC to 90-day accumulation units at hazardous waste generators, and the application of 40 CFR part 265 subparts AA, BB, and CC to facilities with final RCRA permits.

The final rule provides that when the required air emission control equipment cannot be operational at an existing hazardous waste generator or TSDF by June 6, 1996, an implementation schedule for installation of the equipment must be developed and placed in the facility operating records no later than June 6, 1996. In such cases, § 265.1082(a)(2)(i) states that the facility owner or operator must have all air emission controls required by the final rule in operation no later than December 8, 1997.

The EPA also recognizes that certain affected facilities may require time beyond June 6, 1996 to implement other provisions of the final standards, such as developing a facility program to perform the specified leak detection tests on tank covers. Also, generator and TSDF facilities to which the requirements of subparts AA and BB are newly applicable on the June 6, 1996 effective date may need additional time to come into compliance with all provisions of those subparts. The EPA expects such instances to be rare, but in the event a facility cannot implement any technical requirement of subparts AA, BB, or CC, it is the EPA's intent that the owner or operator document the necessity for a delay in the facility operating record. To be in compliance with the rule, the necessary documentation must be in place by the June 6, 1996 effective date. To be in compliance with the subpart CC standards, affected facilities must have all required air emission controls installed and operating no later than December 8, 1997. However, facilities newly subject to subparts AA and BB must be in compliance with all the requirements of those subparts no later than 30 months after the effective date that the facility becomes subject to those subparts. Paragraph (a)(2) in § 264.1033 and § 265.1033 is amended to clarify this intent.

In addition, the EPA is clarifying that an affected unit which the owner or operator intends to replace or remove may also be in compliance through the use of an implementation plan. The EPA recognizes that certain facilities may choose to comply with the subpart CC air rules by replacing an existing hazardous waste management unit, or by modifying their facility process such that a given waste management unit is no longer necessary. The EPA also realizes that facilities could require time beyond June 6, 1996 to complete such modifications, during which time it may be necessary for the facility to continue adding hazardous waste to the affected unit. The EPA had therefore intended to allow the owner or operator to be in compliance with the subpart CC standards provided that sufficient documentation is entered into the facility operating record by the June 6, 1996 effective date. The facility operating record must contain sufficient information to document the necessity to continue adding hazardous waste to the unit after June 6, 1996, and document the owner or operator's schedule and plan to cease adding hazardous waste to the affected unit as soon as is feasible, but no later than December 8, 1997 (BID p. 9–6).

Paragraphs (b)(3) and (b)(4) in § 264.1080 and § 265.1080 specify that the subpart CC standards do not apply to tanks or surface impoundments for which the owner or operator has begun implementing or has completed closure pursuant to an approved closure plan, and into which the owner or operator has stopped adding hazardous waste. However, if a closure plan has not been approved for an affected unit, the final subpart CC standards are applicable to that unit. In such a case, the subpart CC standards require that on the June 6, 1996 effective date, if the affected unit is not equipped with the appropriate air emission controls, no hazardous waste may be added to that unit. In this situation, it is the EPA's intent that the owner or operator would be in compliance with the subpart CC standards provided that sufficient documentation is entered into the facility operating record by the June 6, 1996 effective date. This is consistent with the situation described in the previous paragraph where the removal of an affected unit cannot be accomplished before the June 6, 1996 effective date. As with the situation described above, the facility operating record must contain sufficient information to document the inability of the owner or operator to cease adding hazardous waste to the unit prior to June 6, 1996. The facility operating record must also include the owner or operator's schedule to obtain an approved closure plan, or to cease adding hazardous waste to that unit, no later than December 8, 1997.

The December 6, 1994 published rule allowed an extended effective date and compliance date for tanks in which stabilization operations are performed, to allow interested parties time to submit data to the EPA and to allow EPA time to review that data (59 FR at 62897). The effective date for such tanks was originally December 6, 1995. Since the publication of that final rule, the effective date of the final standards for all rule provisions has been extended

until June 6, 1996 (60 FR 56952). Therefore, the EPA no longer considers it necessary to provide a separate compliance schedule for tanks in which stabilization operations are performed, and the effective date for such tanks will be the June 6, 1996 effective date of the final rule.

4. Standards: General

The owner or operator must install and operate the specified air emission controls on every affected tank, surface impoundment, and container used in the waste management sequence from the point of waste origination through the point where the organics in the waste are removed or destroyed by a process in accordance with the requirements of the rule. The final rule provides seven options by which an owner or operator may demonstrate that the required treatment or destruction of organics has been accomplished, as specified in § 265.1083(c)(2) (i) through (vii). Depending on the nature of the affected hazardous waste, the process through which the waste has been managed, or the treatment applied to the waste, one or more of these seven demonstration options may not be appropriate for a given waste stream. In recognition of this, the EPA chose to allow seven different options to demonstrate that effective treatment has been accomplished; the EPA recognizes that not all of these seven options will be practical for demonstrations of all waste treatment scenarios. However, the EPA believes that the variety of waste treatment demonstrations allowed in the final subpart CC rules does offer at least one demonstration alternative for most, if not all, reasonable waste treatment scenarios.

Paragraph (c)(2)(iii) of §§ 264.1082 and 265.1083 is one of the seven options to demonstrate that waste has been treated to effectively reduce the organics in accordance with the requirements of the final subpart CC standards. In the December 6, 1994 published rule, this option required that the ''actual organic mass removal rate (MR) for the process is greater than the required organic mass removal rate (RMR) for the process.'' The EPA had intended this provision to specify that the MR for the process must be greater than or equal to the RMR. The EPA is amending this provision to clarify that intent.

The seven options in § 265.1083(c)(2) refer to a waste treatment process that accomplishes specified organic destruction or removal. As the term ''process'' is used in these requirements, the EPA refers to either a single waste treatment unit, or a series of waste treatment units. If a facility uses a series of waste treatment units, the applicable exemption from controls applies to units downstream of the point where the necessary removal or destruction occurs. Thus, points downstream of the unit which accomplishes the 95th percentile reduction would not be required to install and operate air emission controls.

Similarly, the requirement for covers on tanks and surface impoundments do not apply to tanks or surface impoundments in which biological degradation of the organics in the hazardous waste treated in the unit is demonstrated to achieve specific performance levels. Either of the following sets of conditions, as described in paragraph (c)(2)(iv) of § 264.1082 and § 265.1083, must be demonstrated to qualify for this exemption: (1) The organic reduction efficiency for the process is equal to or greater than 95 percent, and the organic biodegradation efficiency for the process is equal to or greater than 95 percent; or (2) the total actual organic mass biodegradation rate for all hazardous waste treated by the process is equal to or greater than the required organic mass removal rate (59 FR at 62915). A biological treatment unit that is operated within a series of units would not be required to be equipped with a cover provided that series of units met one of the treatment demonstration options in § 265.1083(c)(2), and the biological treatment unit occurred in the series at the point where the necessary treatment was achieved. In the case of a treatment series that achieved a 95 percent reduction in organics by weight as demonstrated by the requirements of § 265.1083(c)(2)(ii), the biological treatment unit could operate without a cover provided that it was the unit achieving the 95th percent control for the affected waste streams. However, if the placement of the biological treatment unit in the treatment series was prior to the achievement of the 95th percent organic reduction, the biological treatment unit must operate with a cover and air emission controls.

Paragraph (d) in §§ 264.1082 and 265.1083 of the final rule indicated that certain materials that are not hazardous wastes must be controlled in accordance with the subpart CC standards. These final standards are only applicable to RCRA hazardous waste. The EPA is amending §§ 264.1082(d) and 265.1083(d) to clarify that non-hazardous wastes are not subject to the subpart CC standards. (This means, incidentally, that wastes that become exempt from RCRA subtitle C by virtue of an exemption such as the Bevill amendments (codified at 261.4(b)(7)) or the domestic sewage exclusion (codified at 261.4(a)(1)) would not be subject to the subpart CC rules.) In making this clarification, the EPA also notes that it is not addressing here (or in any way reopening) the issue of the types of treatment standards under the Land Disposal Restriction program to which hazardous waste treatment residues could be subject before land disposal. Such treatment standards could apply to spent treatment residues that are not themselves identified or listed as a hazardous waste. See 58 FR at 29866–868 and 29871–72 (May 24, 1993) and *Chemical Waste Management* v. *EPA,* 976 F.2d 2, 16–18 (D.C. Cir. 1992), cert. denied 113 S. Ct. 1961 (1993). This same caveat applies with respect to the spent activated carbon residue discussed at section 9 below.

5. Waste Determination Procedures

Under the final subpart CC standards, a TSDF owner or operator is not required to determine the volatile organic concentration of the waste if it is placed in a tank, surface impoundment, or container using the required air emission controls. However, an owner or operator must perform a determination of the average volatile organic (VO) concentration for each hazardous waste placed in a waste management unit exempted from using air emission controls based on the VO concentration of the waste at its point of waste origination. The EPA is amending paragraphs (a)(1) and (b)(1) of § 264.1083 to clarify this requirement.

The determination of the volatile organic concentration of hazardous waste under the final subpart CC standards is based on the organic composition of the waste at the ''point of waste origination.'' The ''point of waste origination'' is defined in § 265.1081 of the final rule with respect to the point where the TSDF owner or operator first has possession of a hazardous waste. This definition specifies that when the TSDF owner or operator is the generator of the hazardous waste, the ''point of waste origination'' means the point where a solid waste produced by a system, process, or waste management unit is determined to be a hazardous waste as defined in 40 CFR part 261. In such a case, the owner or operator may sample the hazardous waste at its point of origination, or may sample the waste at a point downstream from the point of origination, provided the downstream sampling point provides an accurate representation of the waste volatile organic concentration as it was at the point of waste origination. Simply put, an owner or operator may sample

downstream of the point of origination provided the waste has not been altered, mixed with other materials, or allowed to release any volatile organic components prior to sampling. When neither the TSDF owner or operator is the generator of the hazardous waste, the ''point of waste origination'' means the point where the owner or operator accepts delivery or takes possession of the hazardous waste. The EPA considers this to be the point when and where the TSDF owner or operator accepts the waste manifest document for the hazardous waste.

The preamble to the final subpart CC rule incorrectly stated that to calculate the average of a waste stream using direct measurement, ''a sufficient number of samples, but no less than four, must be collected to represent the complete range of organic compositions and organic quantities that occur in the hazardous waste stream during the entire averaging period'' (59 FR at 62916). The intended rule requirement to take a minimum number of four waste samples is for the performance of one single waste determination. The requirement for four individual samples is intended to compensate for both variations in the methodology and variations within a waste stream that may be due to non-homogeneous waste mixtures. It is not acceptable to take four or more individual samples of a waste stream, mix the samples, then perform a method 25D analysis on the mixture. The requirements of § 265.1084(a)(5)(iv) specify the procedure by which the four or more samples be analyzed by method 25D individually, and the results mathematically averaged to produce one waste determination result. This process accounts for test method variability as well as variability in the waste stream and the waste samples.

The EPA recognizes that not all hazardous waste regulated by the subpart CC standards is liquid or aqueous. Therefore, § 4.1.4 of method 25D (40 CFR part 60, appendix A) includes a sampling technique for solid materials. For wastes that are solid or semi-solid, a representative sample is obtained by placing a 10 gram sample of the waste material into a vial containing the specified 30 mL of polyethylene glycol. Once the sample is obtained, the method 25D analysis is performed as it would be on any other waste sample.

To calculate an average volatile organic concentration for a waste stream that has variations in the organic concentration, the owner or operator must perform the number of waste determinations that are necessary to adequately demonstrate that the waste stream volatile organic concentration meets the applicable criteria. An owner or operator may choose to perform a waste determination at a point where they know the waste stream is at its maximum volatile organic concentration for the averaging period. If the resulting average of the four required Method 25D sample runs yields a volatile organic concentration below 100 parts per million by weight (ppmw), the owner or operator would not need to perform additional waste determinations for that averaging period. However, if the owner or operator was not able to perform a waste determination at the point of the waste stream's maximum volatile organic concentration, they could be required to perform additional waste determinations during the averaging period to sufficiently calculate a mass-weighted average volatile organic concentration. The final subpart CC standards specify that the facility owner or operator enter into the facility record a test plan that demonstrates how they will perform a representative volatile organic concentration determination.

The final subpart CC rules require that a waste determination be performed prior to the first time a hazardous waste is placed in an affected unit on or after June 6, 1996. Section 265.1084(a)(2) (i) and (ii) specify the process to determine the average VO concentration for waste streams generated as part of a continuous process or generated as part of a batch process that is performed repeatedly but not necessarily continuously. The EPA is amending § 265.1084(a)(2) to clarify that for waste generated as part of a batch process that is not performed repeatedly, the owner or operator shall perform a waste determination of the VO concentration of the waste in the batch. The EPA is amending § 265.1084(b)(2) to clarify the similar waste determination procedures for treated hazardous waste.

The procedures in paragraphs (a)(5), (a)(6) and (b)(4) of § 265.1084 for determining the average VO concentration of a hazardous waste require that the owner or operator have sufficient knowledge of any variations in the volatile organic concentration of their affected waste streams throughout the averaging period. An owner or operator who does not have sufficient knowledge of variations in the VO concentration of their waste stream prior to June 6, 1996, may not be eligible to determine compliance with the final rule using the average VO concentration for their affected waste streams. The option to use an average volatile organic waste concentration requires sufficient knowledge of the waste stream, and if that knowledge is not available, the option is not allowed. In such a case, the owner or operator would be required to install and operate air emission controls on each affected unit receiving hazardous waste on or after June 6, 1996 (as required by paragraph (b) of § 264.1082 and § 265.1083), or to determine that at no time waste with a VO concentration greater than or equal to 100 ppmw is placed in a unit not equipped with the required air emission controls (as required by paragraph (c) of § 264.1082 and § 265.1083). In essence, each and every portion of the hazardous waste entering the unit would be considered to be a discrete quantity that is not generated as part of a batch process; therefore, the average VO concentration of each of these discrete quantities of waste would be the same as its measured VO concentration (as described in § 265.1084(a)(2)(iii) and § 265.1084(b)(2)(iii), as amended by today's action).

In § 265.1084(a)(5)(v)(C) the equation to determine the average VO concentration of the hazardous waste at the point of waste origination was printed with an incorrect symbol representing the average VO concentration of the hazardous waste at the point of waste origination. The EPA is revising that equation to specify the correct symbol.

Section 265.1084(a)(6)(iii) of the final subpart CC standards allows an owner or operator to determine the volatile organic concentration of a hazardous waste using knowledge that is based on information supplied by the generator of the waste. The generator-prepared information can be included in manifests, shipping papers, or waste certification notices accompanying the waste shipment, as agreed upon between the waste generator and the TSDF owner or operator. The subpart CC final rules do not impose requirements for a generator to provide such documentation to a TSDF. Rather, where such information does exist, the TSDF owner or operator has the option to use that information to perform the volatile organic waste determination or the volatile organic vapor pressure determination upon accepting delivery or taking possession of the hazardous waste. The EPA is amending paragraph (b)(8) of § 264.13 and § 265.13 to clarify this intent. The validity of any information used to comply with these final standards is the responsibility of the owner or operator who has custody of the waste. Therefore, a TSDF owner or operator should rely on waste information only if it is provided by a source in whose accuracy they have confidence.

The December 6, 1994 published rule incorrectly referenced the requirements by which waste streams entering a process must be measured, at § 265.1084(b)(6)(iii)(B) and in the nomenclature for C_{Bj} at § 265.1084(b)(6)(iv). The EPA is amending these provisions to reference the requirements contained in paragraph (a)(5)(iv). The EPA is also amending the nomenclature for Q_{Aj} in § 265.1084(b)(6)(iv) to clarify that it represents the mass quantity of waste exiting the process.

To determine the maximum organic vapor pressure of a hazardous waste in a tank using Method 25E, an owner or operator shall collect a minimum of three waste samples. It was the intent of the EPA to defer to the Clean Air Act General Provisions contained in § 60.8(f) to specify the number of samples required for a Method 25E analysis. However, the subpart CC standards are not subject to § 60.8(f); therefore, this information was not referenced for the final subpart CC standards. The EPA is amending the requirements of paragraph 265.1084(c) to require that, unless otherwise specified in the method being used, a minimum of three samples shall be taken when using any of the methods listed in § 265.1084(c)(3)(ii). To perform a Method 25E analysis, each of these samples shall be analyzed separately, and the result of the analysis mathematically averaged. The requirements of Method 25E specify the procedure to analyze the samples and mathematically average the analytical results.

6. Standards: Tanks

In the final subpart CC tank standards, paragraph (b)(4) of § 264.1084 and § 265.1085 allows the use of a pressure tank to manage affected hazardous waste. The EPA did not intend to specify operating conditions or a minimum internal pressure that must be met to comply with the option. For the purpose of complying with this provision of the subpart CC standards, the EPA is clarifying that a pressure tank must be designed and operated such that the internal pressure is above atmospheric pressure and the tank operates as a closed system, with no detectable emissions occurring during routine operations including filling and emptying (BID p. 6–51). Therefore, the tank must be designed and operated to withstand the pressure of having the vapor space of the waste compressed until the tank is filled to design capacity. The EPA is amending the tank standards to clarify this requirement.

The EPA intended that the final subpart CC standards allow tanks to operate with a fixed-roof type cover without any additional air emission controls provided certain conditions were met (59 FR at 62917). As published in the December 6, 1994 final standards, paragraph (c) of § 264.1084 and § 265.1085 did not correctly convey the EPA's intent for this provision. The EPA is revising these paragraphs of the tank standards to clarify that for the purposes of compliance with the subpart CC standards, tanks meeting the specified waste management requirements can operate fixed-roof type covers without additional air emission controls.

One of the conditions that must be met for this provision is that no turbulent agitation may occur on the surface of the waste, as described in paragraph (c)(1) of § 264.1084 and § 265.1085. Such turbulence on the surface of a waste increases emission of organics from the waste to the air. This cover-only option was provided for tanks that are used for waste storage, and in which no waste treatment is occurring. The cover-only option of paragraph (c)(1) does not provide effective emission control for waste that is managed such that there is visible turbulent flow on the surface of the waste. The EPA considers that the requirements of paragraph (c)(1) are consistent with the provisions of the New Source Performance Standard for volatile organic liquid storage vessels under 40 CFR part 60, subpart Kb, after which the technical requirements for fixed-roof covers were modelled. The EPA does not intend to specify a test to measure turbulent flow, or to otherwise narrowly define the conditions that meet this paragraph. The EPA does wish to clarify that for a tank through which the waste surface is not viewable, an owner or operator may elect to use engineering calculations and modelling to determine if the surface of the hazardous waste managed in a tank has turbulent flow that would be visible.

The EPA recognizes that, for certain hazardous wastes managed in tanks, it may be necessary to continuously mix, stir or circulate the waste inside the tank during normal storage operations. For instance, the properties of the waste may be such that it is necessary to continuously stir the waste to prevent phase separation or to prevent the waste from solidifying. Paragraph (c)(1) of § 264.1084 and § 265.1085 prohibits such activities if they result in splashing, frothing, or visible turbulent flow on the surface of the waste. However, an owner or operator may perform continuous or frequent mixing operations in a cover-only tank, provided the operation does not cause visible turbulent flow on the surface of the waste. To be allowed under the requirements of paragraph (c)(1), such a mixing operation must be designed and performed to operate without causing visible turbulent flow on the waste surface. To design and operate a mixing system to ensure that visible turbulent flow does not occur, the owner or operator must consider all relevant factors, including mixing speed, position of the mixing apparatus, and waste level in the tank. If the mixing apparatus is positioned and designed such that visible turbulent flow occurs when the waste is below a certain level in the tank, the mixing operation must be ceased when the waste is not above that level in the tank. During such a period, visible turbulent flow on the surface of the waste would be allowed if it resulted from an intermittent required operation, such as loading waste into the tank.

The EPA recognizes that owners or operators may need to mix, stir or circulate the waste that is stored in tanks to occasionally perform certain necessary operations, and these actions may result in splashing, frothing, or visible turbulent flow. Examples of this include mixing waste contents at sample times to facilitate obtaining a representative waste sample, and causing visible turbulent flow on the waste surface during transfer of hazardous waste into or from the tank. In such a situation, there would be a mixing apparatus available to be used in the tank, but this apparatus would not be in use during normal waste storage operations. The EPA considers some degree of splashing, frothing, or visible turbulent flow to be allowable, provided that the activity causing this condition is waste sampling, waste transfer, or a similar necessary operation that is performed infrequently. The requirements of § 264.1084(c)(1) and § 265.1085(c)(1) specify that the disallowed waste management activities must not be part of the normal process operations for that tank. The EPA intends that provision to prohibit continual or usual performance of such procedures, but allow the procedure when necessary to perform intermittent operations, such as waste sampling or waste transfer (BID p. 6–54). Therefore, a tank for which the waste transfer operation is continuous or occurs frequently and causes visible turbulent flow, should be equipped with organic emission controls in accordance with paragraph (b) of § 264.1084 and § 265.1085. Similarly, the EPA intends that this clarification also apply to hazardous waste management in surface impoundments complying with the

floating membrane cover provisions of § 264.1085(c) and § 265.1086(c).

An additional condition that must be met for the fixed-roof cover control option requires that the waste managed in the unit have a volatile organic vapor pressure below certain limits based on the capacity of the tank, as described in paragraph (c)(4) of § 264.1084 and § 265.1085. The waste managed in the tank must meet the appropriate volatile organic vapor pressure limits at the highest vapor pressure that will occur under normal operating conditions. Unlike the waste volatile organic concentration determination which must represent individual waste streams prior to mixing or dilution, the waste organic vapor pressure determination must indicate the vapor pressure of the actual mixture of waste that is managed in the tank. The waste organic vapor pressure to be compared to the limits specified in § 264.1084(c)(4) and § 265.1085(c)(4) of the final rule is the highest pressure present among any temperatures at which the waste is present in the tank.

The EPA had intended the final subpart CC standards to allow fixed-roof covers on tanks to be equipped with one or more pressure relieving devices that vent directly to the atmosphere to allow for the relief of pressure or vacuum caused by normal operations (BID p. 6–47). For the purposes of this provision the EPA requires that the pressure relieving device be a normally closed device that opens only when a pressure or vacuum is created in the unit. The EPA does not intend to specify parameters for the operation or setting of such pressure relieving device, but rather has established a performance standard that the facility owner or operator design and operate the conservation vents so that emissions to the atmosphere are minimized, yet tank integrity is protected, in accordance with sound engineering design specifications and practices appropriate for the affected tank. This provision is clarified in the amendments to paragraph (c) of § 264.1084 and § 265.1085. This allowance for pressure relieving devices differs from the final rule allowance for safety devices described in paragraph (g) of § 264.1084 and § 265.1085, which are only allowed to vent to the atmosphere during unplanned events. Units not eligible to be equipped with pressure relieving devices that open during normal operations include pressure tanks, and tanks equipped with floating roofs.

7. Standards: Surface Impoundments

In the December 6, 1994 published rule, paragraph (d) of § 264.1085 and § 265.1086 incorrectly referenced paragraph (b)(1), which does not exist. The EPA is amending paragraph (d) of these sections to reference paragraph (b), as intended.

8. Standards: Containers

In § 264.1086 and § 265.1087, paragraph (b)(1) lists three options to demonstrate compliance for containers used to manage hazardous waste subject to subpart CC. The first option, in paragraph (b)(1)(i), specifies that the container operates with no detectable emissions as tested by Method 21 in 40 CFR part 60 appendix A. This option is appropriate for any container subject to subpart CC, including the types of containers specified in the second and third options. The second option, in paragraph (b)(1)(ii), is a container with a capacity of 0.46 cubic meters, which complies with all Department of Transportation regulations for packaging hazardous waste for transport under 40 CFR part 178. The third option, in paragraph (b)(2)(iii), is a tank truck or rail car that has been demonstrated within the previous 12 months to be organic vapor tight using the pressure test specified in Method 27 of 40 CFR part 60 appendix A. The EPA has received several questions regarding the applicability of Method 27 for use on vehicular containers that are not equipped with a vapor recovery system. This method is a pressure test procedure originally developed by the EPA for determining the vapor-leak tightness of a gasoline tank truck equipped with a vapor recovery system. The EPA also considers Method 27 appropriate on tank trucks and rail cars that are used to manage hazardous waste, regardless of whether the tank truck or rail car is equipped with a vapor recovery system. As described above, an owner or operator of a tank truck or rail car has the option to comply with paragraph (b)(1)(i), and demonstrate no detectable emissions by Method 21, as does the owner or operator of any container equal to or less than 0.46 m^3 in capacity.

Paragraph (b)(2)(ii) of § 264.1086 and 265.1087 of the December 6, 1994 final standards describes the criteria for an enclosure in which stabilization operations performed in open containers must be located. In describing the requirements for the enclosure, the EPA had intended to paraphrase the specifications of Procedure T in Appendix B to § 52.741, titled ''Criteria for and Verification of a Permanent or Temporary Total Enclosure.'' To better clarify the intended requirements for container enclosures, the EPA is revising the enclosure requirements of paragraph (b)(2)(ii) to specifically reference Procedure T in § 52.741, Appendix B.

The waste transfer requirements specified in paragraph (b)(3) of § 264.1086 and § 265.1087 of the final rule for containers are intended to reduce exposure of hazardous waste to the atmosphere. Paragraph (b)(3)(i) specifically describes submerged-fill techniques to be used; however, the EPA does not intend that submerged-fill be performed in situations where the process of submerged-fill increases waste exposure to the atmosphere, or worker exposure to hazardous wastes. Certain splash loading operations are performed through a fitted opening in the top of a container, and the transfer line is subsequently purged with nitrogen gas to clean the interior of the line before it is removed from the container opening. This transfer practice could result in less waste exposure than a submerged-fill practice performed for the same waste and container. Another container loading practice is vapor balancing, in which the vapors displaced by transferring waste into a container are routed to the unit from which the waste was transferred. Thus, the EPA is adding clarifying language to the container transfer requirements of paragraph (b)(3) in § 264.1086 and § 265.1087 to direct owners or operators to transfer waste using the procedure that will minimize exposure of waste to the atmosphere.

The submerged filling procedure described in the final subpart CC standards is one procedure that may be appropriate for waste transfer into containers, but the EPA is amending these provisions to direct owners or operators to employ the container filling practice most appropriate for their facility operation.

The EPA originally intended the subpart CC final rules to allow containers to vent emissions directly to the atmosphere during filling operations. The December 6, 1994 final rules only allowed for venting through the opening through which waste was transferred. The EPA intended to allow venting during waste transfer operations either through the opening through which the waste is transferred, or through a second opening that would serve as a vent. In addition to the amendment to paragraph (b)(3) described above, the EPA is amending paragraph (c) of § 264.1086 and § 265.1087 to clarify this venting allowance.

9. Closed-Vent Systems and Control Devices

The final subpart CC standards added requirements for the management of

spent carbon removed from a carbon adsorption system used to comply with the subpart AA, BB, and CC standards. The EPA is clarifying that the carbon management requirements are only applicable to carbon that is hazardous waste. Spent carbon is hazardous if it exhibits a characteristic of hazardous waste or if it is listed. Spent carbon deriving from the treatment of listed hazardous waste is considered to be a type of listed waste by virtue of the derived from rule found at § 261.3(c)(2). See also 56 FR at 7200 (February 21, 1991).

The EPA is amending the spent carbon management requirements of §§ 264.1033(m) and 265.1033(l), and paragraph (c)(3)(ii) of § 264.1087 and § 265.1088 to clarify the intent described today. The EPA is also revising §§ 264.1033(m) and 265.1033(l) to allow management of affected spent carbon to be conducted in certain interim status units in addition to the permitted units specified in the December 6, 1994 published rule.

10. Inspection and Monitoring Requirements

As published in the December 6, 1994 final rule, §§ 264.1033(k)(2) and 265.1033(j)(2) allowed that after the required initial leak detection monitoring, an owner or operator is not required to conduct annual monitoring on those closed-vent system components which continuously operate in vacuum service. The EPA had intended that this allowance apply to system components continuously operating under negative pressure, because such systems would not release constituents to the atmosphere even if there were a rupture or other loss of integrity to the component (BID p. 6–100). However, the EPA specified the term ''in vacuum service,'' which requires that a system operate at an internal pressure at least 5 kPa below ambient pressure, under the assumption that systems operating under negative pressure would meet this requirement. The use of the term ''in vacuum service'' has prompted several questions from the public asking EPA to clarify whether systems operated under negative pressure, but not necessarily in vacuum service, must be monitored annually after the initial leak detection monitoring. The EPA had intended to not require annual monitoring of closed-vent system components which operate under pressure such that all emissions are routed to a control device even if a leak or hole exists in the component. A component that continuously operates under negative pressure would satisfy this intent, even if the component does not necessarily operate in vacuum service. Therefore, the EPA is amending §§ 264.1033(k)(2) and 265.1033(j)(2) to specify that, after the initial leak detection monitoring, an owner or operator is not required to monitor system components which continuously operate under negative pressure.

As published in the December 6, 1994 standards, the reference in paragraph (d) of § 264.1088 and § 265.1089 incorrectly specified that certain control devices used to comply with the subpart CC standards must be inspected and monitored in accordance with the procedures specified in § 264.1033(f). The EPA had intended that this reference should be to § 264.1033(f)(2). The EPA is amending paragraph (d) in § 264.1088 and § 265.1089 to correct this reference and to clarify the frequency of monitoring and the requirement for corrective measures.

11. Recordkeeping Requirements

The EPA is amending § 264.1089(a)(1) and § 265.1090(a)(1) such that these paragraphs correctly reference paragraph 265.1091(a) of the alternative tank control requirements. The EPA is also amending § 264.1089(e) and § 265.1090(e) such that these paragraphs correctly specify recordkeeping requirements for a hazardous waste incinerator and boiler or industrial furnace used to comply with the treatment demonstration options in § 264.1082 and § 265.1083. These amendments clarify references that were incorrectly printed in the December 6, 1994 published standards (59 FR 62896).

12. Reporting Requirements

The EPA is amending § 264.1090 (c) and (d) to clarify what noncompliance occurrences for control device operations a facility owner or operator must report to their Regional Administrator.

13. Alternative Control Requirements for Tanks

Paragraph 265.1091(a)(1)(i) of the final subpart CC standards specifies filling requirements for a tank equipped with an internal floating roof. The requirement is that when the roof is resting on the leg supports, the process of filling, emptying, or refilling shall be continuous and shall be accomplished as rapidly as possible. The intent of this requirement is to minimize the time during which a vapor space exists between the floating roof and the stored waste. EPA recognizes that facility owners or operators may not have full control over the amount and handling of waste transferred into their tanks, and this may lead to periods when the filling of a tank may not be continuous. Therefore, the EPA is clarifying this requirement to state that the process of filling shall be as continuous as possible, based on the amount of waste and the nature of the waste handling operation.

14. Immediate Effective Date

The EPA has determined to make today's action effective immediately. The EPA believes that the corrections being made in this document are either interpretations of existing regulations which do not require prior notice and opportunity for comment, or are technical corrections of obvious errors in the published rule (for example corrections of regulatory language that is inconsistent with the preamble, BID, or with otherwise clearly indicated EPA intent) for which comment is unnecessary (within the meaning of 5 USC 553(b)(3)(B)). In addition, the EPA notes that many of these clarifications result from the public comment obtained at various public meetings regarding the subpart CC standards that were held during the summer of 1995. Thus, the EPA has provided for a measure of opportunity to comment.

Docket. Five RCRA dockets contain information pertaining to today's rulemaking: (1) RCRA docket number F–91–CESP–FFFFF, which contains copies of all BID references and other information related to the development of the rule up through proposal; (2) RCRA docket number F–92–CESA–FFFFF, which contains copies of the supplemental data made available for public comment prior to promulgation; (3) RCRA docket number F–94–CESF–FFFFF, which contains copies of all BID references and other information related to development of the final rule following proposal; (4) RCRA docket number F–94–CE2A–FFFFF, which contains information pertaining to waste stabilization operations performed in tanks; and (5) RCRA docket number F–95–CE3A–FFFFF, which contains information about potential final rule revisions made available for public comment. The public may review all materials in these dockets at the EPA RCRA Docket Office.

The EPA RCRA Docket Office is located at Crystal Gateway, 1235 Jefferson Davis Highway, First Floor, Arlington, Virginia. Hand delivery of items and review of docket materials are made at the Virginia address. The public must have an appointment to review docket materials. Appointments can be scheduled by calling the Docket Office at (703) 603–9230. The mailing address for the RCRA Docket Office is RCRA

Information Center (5305W), 401 M Street SW., Washington, DC 20460. The Docket Office is open from 9 a.m. to 4 p.m., Monday through Friday, except for Federal holidays.

Legal Authority

These regulations are amended under the authority of sections 2002, 3001–3007, 3010, and 7004 of the Solid Waste Disposal Act of 1970, as amended by RCRA, as amended (42 U.S.C. 6921–6927, 6930, and 6974).

List of Subjects

40 CFR Part 262

Environmental protection, Accumulation time, Air pollution control, Container, Tank.

40 CFR Parts 264 and 265

Air pollution control, Container, Control device, Hazardous waste, Incorporation by reference, Inspection, Miscellaneous unit, Monitoring, Reporting and recordkeeping requirements, Standards, Surface impoundment, Tank, TSDF, Waste determination.

40 CFR Part 270

Administrative practice and procedure, Air pollution control, Confidential business information, Hazardous waste, Permit, Permit modification, Reporting and recordkeeping requirements.

Dated: December 18, 1995.

Mary D. Nichols,

Assistant Administrator for Air and Radiation.

For the reasons set out in the preamble, title 40, chapter I, parts 262, 264, 265, 270, and 271 of the Code of Federal Regulations is amended as follows:

PART 262—STANDARDS APPLICABLE TO GENERATORS OF HAZARDOUS WASTE

1. The authority citation for part 262 continues to read as follows:

Authority: 42 U.S.C. 6906, 6912(a), 6922, 6923, 6924, 6925, 6937 and 6938, unless otherwise noted.

§ 262.34 [Amended]

2. Section 262.34(a)(1)(i) is amended by inserting a comma after ''subparts I'' to read ''subparts I, AA, BB and CC''.

PART 264—STANDARDS FOR OWNERS AND OPERATORS OF HAZARDOUS WASTE TREATMENT, STORAGE, AND DISPOSAL FACILITIES

3. The authority citation for part 264 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6924 and 6925.

Subpart B—General Facility Standards

4. Section 264.13 is amended by revising paragraphs (b)(8) (i) and (ii) to read as follows:

§ 264.13 General waste analysis.

* * * * *

(b) * * *

(8) * * *

(i) If direct measurement is used for the waste determination, the procedures and schedules for waste sampling and analysis, and the results of the analysis of test data to verify the exemption.

(ii) If knowledge of the waste is used for the waste determination, any information prepared by the facility owner or operator or by the generator of the hazardous waste, if the waste is received from off-site, that is used as the basis for knowledge of the waste.

Subpart AA—Air Emission Standards for Process Vents

5. In § 264.1033 the second sentence of paragraph (a)(2) is revised, paragraph (k)(2) is revised, and paragraph (m) is revised to read as follows:

§ 264.1033 Standards: Closed-vent systems and control devices.

(a) * * *

(2) * * * The controls must be installed as soon as possible, but the implementation schedule may allow up to 30 months after the effective date that the facility becomes subject to this subpart for installation and startup.

* * *

* * * * *

(k) * * *

(2) Closed-vent systems shall be monitored to determine compliance with this section during the initial leak detection monitoring, which shall be conducted by the date that the facility becomes subject to the provisions of this section, annually, and at other times as requested by the Regional Administrator. For the annual leak detection monitoring after the initial leak detection monitoring, the owner or operator is not required to monitor those closed-vent system components which continuously operate under negative pressure or those closed-vent system joints, seams, or other connections that are permanently or semi-permanently sealed (e.g., a welded joint between two sections of metal pipe or a bolted and gasketed pipe flange).

* * * * *

(m) The owner or operator using a carbon adsorption system shall document that all carbon removed that is a hazardous waste and that is removed from a carbon adsorption system used to comply with § 264.1033(g) and § 264.1033(h) is managed in one of the following manners, regardless of the volatile organic concentration of that carbon:

(1) Regenerated or reactivated in a thermal treatment unit for which the owner or operator has been issued a final permit under 40 CFR part 270, and designs and operates the unit in accordance with the requirements of subpart X of this part;

(2) Incinerated in a hazardous waste incinerator for which the owner or operator either:

(i) Has been issued a final permit under 40 CFR part 270, and designs and operates the unit in accordance with the requirements of subpart O of this part; or

(ii) Has certified compliance with the interim status requirements of 40 CFR part 265, subpart O; or

(3) Burned in a boiler or industrial furnace for which the owner or operator either:

(i) Has been issued a final permit under 40 CFR part 270, and designs and operates the unit in accordance with the requirements of 40 CFR part 266, subpart H; or

(ii) Has certified compliance with the interim status requirements of 40 CFR part 266, subpart H.

* * * * *

Subpart CC—Air Emission Standards for Tanks, Surface Impoundments, and Containers

§ 264.1082 [Amended]

6. In § 264.1082 paragraph (c)(2)(iii) is amended by revising ''removal rate (MR) for the process is greater'' to read ''removal rate (MR) for the process is equal to or greater''.

7. In § 264.1082 paragraph (d) is amended by revising ''that is not a hazardous waste but has an average VO concentration equal to or greater than 100 ppmw shall'' to read ''that is a hazardous waste shall''.

§ 264.1083 [Amended]

8. In § 264.1083 paragraph (a)(1) is amended by revising ''placed in waste management units'' to read ''placed in a waste management unit''.

9. In § 264.1083 paragraph (b)(1) is amended by revising ''placed in waste management units'' to read ''placed in a waste management unit''.

10. Section 264.1084 is amended by adding the following sentence to the end of paragraph (b)(4), and revising paragraph (c) to read as follows:

§ 264.1084 Standards: Tanks.

* * * * *

(b) * * *

(4) * * * To be considered a pressure tank for the purpose of compliance with this subpart, a unit must operate with no detectable emissions during filling to design capacity and the subsequent compression of the vapor headspace.

* * * * *

(c) As an alternative to complying with paragraph (b) of this section, an owner or operator may place hazardous waste in a tank equipped with a cover (e.g., a fixed roof) meeting the requirements specified in paragraph (c)(2) of this section when the hazardous waste is determined to meet the conditions specified in paragraph (c)(1) of this section.

(1) All of the following conditions shall be met at all times that hazardous waste is managed in the tank under normal process operations:

(i) The hazardous waste in the tank is neither mixed, stirred, agitated, nor circulated within the tank using a process that results in splashing, frothing, or visible turbulent flow on the waste surface during normal process operations;

(ii) The hazardous waste in the tank is not heated by the owner or operator except during conditions requiring that the waste be heated to prevent the waste from freezing or to maintain adequate waste flow conditions for continuing normal process operations;

(iii) The hazardous waste in the tank is not treated by the owner or operator using a waste stabilization process or a process that produces an exothermic reaction; and

(iv) The maximum organic vapor pressure of the hazardous waste in the tank as determined using the procedure specified in § 264.1083(c) of this subpart is less than the following applicable value:

(A) If the tank design capacity is equal to or greater than 151 m^3, then the maximum organic vapor pressure shall be less than 5.2 kPa;

(B) If the tank design capacity is equal to or greater than 75 m^3 but less than 151 m^3, then the maximum organic vapor pressure shall be less than 27.6 kPa; or

(C) If the tank design capacity is less than 75 m^3, then the maximum organic vapor pressure shall be less than 76.6 kPa.

(2) To comply with paragraph (c)(1) of this section, the owner or operator shall design, install, operate, and maintain a cover to meet the following requirements:

(i) The cover and all cover openings (e.g. access hatches, sampling ports, and gauge wells) shall be designed to operate with no detectable organic emissions when all cover openings are secured in a closed, sealed position.

(ii) Each cover opening shall be secured in a closed, sealed position (e.g. covered by a gasketed lid or cap) at all times that hazardous waste is in the tank except as provided for in paragraphs (c)(2)(iii), (f)(1), and (f)(2) of this section.

(iii) One or more pressure relief devices which vent directly to the atmosphere may be used on the cover provided that each device remains in a closed, sealed position at all times except when tank operating conditions require that the device open for the purpose of preventing physical damage or permanent deformation of the tank or cover in accordance with good engineering design practices and the equipment manufacturer's recommendations. The device must be operated to minimize organic air emissions to the atmosphere to the extent practical, in consideration of good design and safety practices for handling hazardous materials. Examples of such devices include pressure-vacuum relief valves and conservation vents. Examples of tank operating conditions that may require the pressure relief device to open are filling and emptying of the tank, and internal pressure changes caused by diurnal temperature changes.

* * * * *

§ 264.1084 [Amended]

11. Section 264.1084(e) introductory text, is amended by revising ''or other closed-systems, EPA considers a drain system that meets the requirements of 40 CFR 61.346(a)(1) or 40 CFR 61.346(b)(1) through (b)(3) to be a 'closed systems''' to read ''or other closed systems for the transfer of hazardous waste as described in paragraph (e)(1) or (e)(2) of this section. The EPA considers a drain system that meets the requirements of 40 CFR 61.346(a)(1) or 40 CFR 61.346(b)(1) through (b)(3) to be a closed system.''

§ 264.1085 [Amended]

12. In § 264.1085 paragraph (d) introductory text, is amended by revising ''paragraph (b)(1)'' to read ''paragraph (b)''.

13. In § 264.1085 paragraph (f) introductory text, is amended by revising ''or other closed-systems, EPA considers a drain system that meets the requirements of 40 CFR 61.346(a)(1) or 40 CFR 61.346(b)(1) through (b)(3) to be a 'closed system''' to read ''or other closed systems for the transfer of hazardous waste as described in paragraph (f)(1) or (f)(2) of this section. The EPA considers a drain system that meets the requirements of 40 CFR 61.346(a)(1) or 40 CFR 61.346(b)(1) through (b)(3) to be a closed system.''

§ 264.1086 [Amended]

14. Section 264.1086(b)(1) is amended by revising ''as required by paragraph (b)(2) to read ''in accordance with the requirements of paragraph (b)(2)''.

15. Section 264.1086 is amended by revising paragraph (b)(2)(ii)(B), adding paragraph (b)(2)(ii)(C), revising paragraph (b)(3) and revising paragraph (c) introductory text, to read as follows:

§ 264.1086 Standards: Containers.

(b) * * *

(2) * * *

(ii) * * *

(B) The enclosure may have permanent or temporary openings to allow worker access; passage of containers through the enclosure by conveyor or other mechanical means; entry of permanent mechanical or electrical equipment; or to direct airflow into the enclosure.

(C) The enclosure shall be designed and operated in accordance with the criteria for a permanent total enclosure as specified in ''Procedure T—Criteria for and Verification of a Permanent or Temporary Total Enclosure'' in Appendix B of § 52.741.

* * * * *

(3) Transfer of the waste into or from a container shall be conducted in such a manner as to minimize waste exposure to the atmosphere to the extent practical, considering good engineering and safety practices for handling hazardous materials. Examples of container loading procedures that the EPA considers to meet the requirements of this paragraph include using a submerged-fill method to load liquids into the container; using a vapor-balancing or a vapor-recovery system to collect and control the vapors displaced from the container during filling operations; and transferring waste through a conveyance tube that is fitted to a container opening above the liquid level to splash-fill the material, and subsequently purging the conveyance tube with gas prior to removing it from the container opening.

(c) Each container opening shall be maintained in a closed, sealed position (e.g. covered by a gasketed lid) at all times that hazardous waste is in the container except when it is necessary to have the opening open during procedures to:

* * * * *

16. In § 264.1087 paragraph (c)(3)(ii) is revised to read as follows:

§ 264.1087 Standards: Closed-vent systems and control devices.

* * * * *

(c) * * *

(3) * * *

(ii) All carbon that is a hazardous waste and that is removed from the control device shall be managed in accordance with the requirements of § 264.1033(m) of this part, regardless of the VO concentration of the carbon.

* * * * *

17. Section 264.1088 is amended by revising paragraph (d) to read as follows:

§ 264.1088 Inspection and monitoring requirements.

* * * * *

(d) Each control device used in accordance with the requirements of § 264.1087 of this subpart shall be inspected and monitored by the owner or operator in accordance with the procedures specified in § 264.1033(f)(2) and § 264.1033(i) of this part. The readings from each monitoring device required by § 264.1033(f)(2) shall be inspected at least once each operating day to check control device operation. Any necessary corrective measures should be immediately implemented to ensure the control device is operated in compliance with the requirements of § 264.1087 of this subpart.

* * * * *

§ 264.1089 [Amended]

18. Section 264.1089(a)(1) is amended by revising ''40 CFR 265.1091(c)'' to read ''40 CFR 265.1091(a)''.

19. Section 264.1089(e) is amended by revising ''§ 264.1082(c)(2)(v) or § 264.1082(c)(2)(vi)'' to read § 264.1082(c)(2)(vi) or § 264.1082(c)(2)(vii)''.

§ 264.1090 [Amended]

20. Section 264.1090(a) is amended by revising ''reoccurrence'' to read ''recurrence''.

21. Section 264.1090 is amended by revising the second sentence of paragraph (c) and by revising paragraph (d) to read as follows:

§ 264.1090 Reporting requirements.

(a) * * *

(c) * * * The report shall describe each occurrence during the previous 6-month period when either:

(1) A control device is operated continuously for 24 hours or longer in noncompliance with the applicable operating values defined in § 264.1035(c)(4); or

(2) A flare is operated with visible emissions for 5 minutes or longer in a two-hour period, as defined in § 264.1033(d). * * *

(d) A report to the Regional Administrator in accordance with the requirements of paragraph (c) of this section is not required for a 6-month period during which all control devices subject to this subpart are operated by the owner or operator such that:

(1) During no period of 24 hours or longer did a control device operate continuously in noncompliance with the applicable operating values defined in § 264.1035(c)(4); and

(2) No flare was operated with visible emissions for 5 minutes or longer in a two-hour period, as defined in § 264.1033(d).

22. Section 264.1091 is amended by adding paragraph (a)(3) to read as follows:

§ 264.1091 Alternative control requirements for tanks.

(a) * * *

(3) The owner or operator may elect to comply with § 264.1084 (b)(2) or (b)(3) of this subpart using an alternative means of emission limitation as specified in 40 CFR 265.1091(a)(3).

* * * * *

PART 265—INTERIM STATUS STANDARDS FOR OWNERS AND OPERATORS OF HAZARDOUS WASTE TREATMENT, STORAGE, AND DISPOSAL FACILITIES

23. The authority citation for part 265 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6924, 6925, and 6935.

Subpart B—General Facility Standards

24. Section 265.13 is amended by revising paragraph (b)(8)(i) and (ii) to read as follows:

§ 265.13 General waste analysis.

* * * * *

(b) * * *

(8) * * *

(i) If direct measurement is used for the waste determination, the procedures and schedules for waste sampling and analysis, and the results of the analysis of test data to verify the exemption.

(ii) If knowledge of the waste is used for the waste determination, any information prepared by the facility owner or operator or by the generator of the hazardous waste, if the waste is received from off-site, that is used as the basis for knowledge of the waste.

Subpart AA—Air Emission Standards for Process Vents

25. In § 265.1033 the second sentence of paragraph (a)(2) is amended, paragraph (j)(2) is revised, and paragraph (l) is revised to read as follows:

§ 265.1033 Standards: Closed-vent systems and control devices.

* * * * *

(a) * * *

(2) * * * The controls must be installed as soon as possible, but the implementation schedule may allow up to 30 months after the effective date that the facility becomes subject to this subpart for installation and startup.

* * *

* * * * *

(j) * * *

(2) Closed-vent systems shall be monitored to determine compliance with this section during the initial leak detection monitoring, which shall be conducted by the date that the facility becomes subject to the provisions of this section, annually, and at other times as requested by the Regional Administrator. For the annual leak detection monitoring after the initial leak detection monitoring, the closed-vent system components which continuously operate under negative pressure or those closed-vent system joints, seams, or other connections that are permanently or semi-permanently sealed (e.g., a welded joint between two sections of metal pipe or a bolted and gasketed pipe flange).

* * * * *

(l) The owner or operator using a carbon adsorption system shall document that all carbon that is a hazardous waste and that is removed from the control device is managed in one of the following manners, regardless of the volatile organic concentration of the carbon:

(1) Regenerated or reactivated in a thermal treatment unit for which the owner or operator has been issued a final permit under 40 CFR part 270, and designs and operates the unit in accordance with the requirements of 40 CFR part 264 subpart X;

(2) Incinerated in a hazardous waste incinerator for which the owner or operator either:

(i) Has been issued a final permit under 40 CFR part 270, and designs and operates the unit in accordance with the requirements of 40 CFR part 264 subpart O; or

(ii) Has certified compliance with the interim status requirements of subpart O of this part; or

(3) Burned in a boiler or industrial furnace for which the owner or operator either:

(i) Has been issued a final permit under 40 CFR part 270, and designs and operates the unit in accordance with the

requirements of 40 CFR part 266, subpart H; or

(ii) Has certified compliance with the interim status requirements of 40 CFR part 266, subpart H.

* * * * *

Subpart CC—Air Emission Standards for Tanks, Surface Impoundments, and Containers

26. Section 265.1081 is amended by revising the definition of *Cover*, and adding a definition for *Enclosure* to read as follows:

§ 265.1081 Definitions.

* * * * *

Cover means a device or system which is placed on or over a hazardous waste to create an air-tight barrier between the entire hazardous waste surface area and the space surrounding the unit, such that air emissions to the atmosphere are reduced. A cover may have openings such as access hatches, sampling ports, and gauge wells that are necessary for operation, inspection, maintenance, or repair of the unit on which the cover is installed provided that each opening is closed and sealed when not in use. Examples of covers include a fixed roof installed on a tank, a floating membrane cover installed on a surface impoundment, and a lid installed on a drum.

Enclosure means a structure that: (1) Surrounds a hazardous waste management unit, captures organic vapors emitted from that unit, and vents the vapors through a closed vent system to a control device; and (2) is designed and operated in accordance with the criteria for a permanent total enclosure as specified in ''Procedure T—Criteria for and Verification of a Permanent or Temporary Total Enclosure'' in Appendix B of § 52.741.

§ 265.1081 [Amended]

27. In § 265.1081, the definition of *Waste determination* is amended by revising ''determining the organic reduction efficiency'' to read ''the organic reduction efficiency'' and the definition of *Waste stabilization process* is amended by adding the sentence ''This does not include the adding of absorbent materials to the surface of a waste, without mixing, agitation, or subsequent curing, to absorb free liquid.'' to the end of the definition.

* * * * *

§ 265.1083 [Amended]

28. In § 265.1083 paragraph (c)(2)(iii) is amended by revising ''removal rate (MR) for the process is greater'' to read ''removal rate (MR) for the process is equal to or greater''.

§ 265.1083 [Amended]

29. In § 265.1083 paragraph (d) is amended by revising ''that is not a hazardous waste but has an average VO concentration equal to or greater than 100 ppmw shall'' to read ''that is a hazardous waste shall''.

30. Section 265.1084 is amended by adding paragraph (a)(2)(iii), revising paragraph (a)(5)(iv), introductory text, revising the equation and the first definition in paragraph (a)(5)(v)(C), adding paragraph (b)(2)(iii), revising paragraph (b)(4)(iv), introductory text, revising the first sentence of paragraph (b)(6)(iii)(B), revising the definitions of Q_{aj} and C_{bj} in paragraph (b)(6)(iv), and revising the first sentence of paragraph (c)(3)(i) to read as follows:

§ 265.1084 Waste determination procedures.

(a) * * *

(2) * * *

(iii) When the hazardous waste is generated as part of a batch process that is not performed repeatedly, the owner or operator shall perform a waste determination of the VO concentration of the waste in the batch. The result of this waste determination is the average VO concentration for that waste.

* * * * *

(5) * * *

(iv) The following procedure shall be used to measure the VO concentration for each discrete quantity of material identified in paragraph (a)(5)(iii) of this section:

* * * * *

(v) * * *

(C) * * *

$$\overline{C} = \frac{1}{Q_T} \times \sum_{j=1}^{m} \left(Q_j \times C_j \right)$$

where:

$\bar{C}$=Average VO concentration of the hazardous waste, at the point of waste origination, ppmw.

* * * * *

(b) * * *

(2) * * *

(iii) When the hazardous waste is treated by a batch process that is not performed repeatedly, the owner or operator shall perform a waste determination for the treated waste in the batch. The result of this waste determination is the average VO concentration for that waste.

* * * * *

(4) * * *

(iv) The following procedure shall be used to measure the VO concentration for each discrete quantity of material identified in paragraph (b)(4)(iii) of this section:

* * * * *

(6) * * *

(iii) * * *

(B) The VO concentration of each hazardous waste stream entering the process (C_b) during the run shall be measured in accordance with the requirements of paragraph (a)(5)(iv) of this section. * * *

(iv) * * *

Q_{aj} = Mass quantity of hazardous waste exiting process during run ''j'', kg/hr. * * *

C_{bj} = Measured VO concentration of hazardous waste entering process during run ''j'' as determined in accordance with the requirements of § 265.1084(a)(5)(iv), ppmw.

* * * * *

(c) * * *

(3) * * *

(i) Unless otherwise specified in the methods referenced in paragraphs (c)(3)(ii) (A) through (E) of this section, a sufficient number of samples, but no less than three samples, shall be collected to represent the waste contained in the tank. * * *

* * * * *

31. Section 265.1085 is amended by adding the following sentence to the end of paragraph (b)(4) and revising paragraph (c) to read as follows:

§ 265.1085 Standards: Tanks.

* * * * *

(b) * * *

(4) * * * To be considered a pressure tank for the purpose of compliance with this subpart, a unit must operate with no detectable emissions during filling to design capacity and the subsequent compression of the vapor headspace.

(c) As an alternative to complying with paragraph (b) of this section, an owner or operator may place hazardous waste in a tank equipped with a cover (e.g., a fixed roof) meeting the requirements specified in paragraph (c)(2) of this section when the hazardous waste is determined to meet the conditions specified in paragraph (c)(1) of this section.

(1) All of the following conditions shall be met at all times that hazardous waste is managed in the tank, during normal process operations:

(i) The hazardous waste in the tank is neither mixed, stirred, agitated, nor circulated within the tank using a process that results in splashing, frothing, or visible turbulent flow on the waste surface during normal process operations;

(ii) The hazardous waste in the tank is not heated by the owner or operator

except during conditions requiring that the waste be heated to prevent the waste from freezing or to maintain adequate waste flow conditions for continuing normal process operations;

(iii) The hazardous waste in the tank is not treated by the owner or operator using a waste stabilization process or a process that produces an exothermic reaction; and

(iv) The maximum organic vapor pressure of the hazardous waste in the tank as determined using the procedure specified in § 265.1084(c) of this subpart is less than the following applicable value:

(A) If the tank design capacity is equal to or greater than 151 m^3, then the maximum organic vapor pressure shall be less than 5.2 kPa;

(B) If the tank design capacity is equal to or greater than 75 m^3 but less than 151 m^3, then the maximum organic vapor pressure shall be less than 27.6 kPa; or

(C) If the tank design capacity is less than 75 m^3, then the maximum organic vapor pressure shall be less than 76.6 kPa.

(2) To comply with paragraph (c)(1) of this section, the owner or operator shall design, install, operate, and maintain a cover to meet the following requirements:

(i) The cover and all cover openings (e.g. access hatches, sampling ports, and gauge wells) shall be designed to operate with no detectable organic emissions when all cover openings are secured in a closed, sealed position.

(ii) Each cover opening shall be secured in a closed, sealed position (e.g., covered by a gasketed lid or cap) at all times that hazardous waste is in the tank except as provided for in paragraphs (c)(2)(iii), (f)(1), and (f)(2) of this section.

(iii) One or more pressure relief devices which vent directly to the atmosphere may be used on the cover provided that each device remains in a closed, sealed position at all times except when tank operating conditions require that the device open for the purpose of preventing physical damage or permanent deformation of the tank or cover in accordance with good engineering design practices and manufacturers recommendations. The device must be operated to minimize organic air emissions to the atmosphere to the extent practical, in consideration of good design and safety practices for handling hazardous materials. Examples of such devices include pressure-vacuum relief valves and conservation vents. Examples of tank operating conditions that may require the pressure relief device to open are filling and emptying of the tank, and internal pressure changes caused by diurnal temperature changes.

* * * * *

§ 265.1086 [Amended]

32. Section 265.1086(d) is amended by revising ''paragraph (b)(1)'' to read ''paragraph (b)''.

§ 265.1087 [Amended]

33. Section 265.1087(b)(1) is amended by revising ''as required by paragraph (b)(2)'' to read ''in accordance with the requirements of paragraph (b)(2)''.

34. Section 265.1087 is amended by revising paragraph (b)(2)(ii)(B), adding paragraph (b)(2)(ii)(C), revising paragraph (b)(3) and revising paragraph (c), introductory text, to read as follows:

§ 265.1087 Standards: Containers.

* * * * *

(b) * * *

(2) * * *

(ii) * * *

(B) The enclosure may have permanent or temporary openings to allow worker access; passage of containers through the enclosure by conveyor or other mechanical means; entry of permanent mechanical or electrical equipment; or to direct airflow into the enclosure.

(C) The enclosure shall be designed and operated in accordance with the criteria for a permanent total enclosure as specified in ''Procedure T—Criteria for and Verification of a Permanent of Temporary Total Enclosure'' in Appendix B of Section 52.741.

* * * * *

(3) Transfer of the waste into or from a container shall be conducted in such a manner as to minimize waste exposure to the atmosphere to the extent practical, considering good engineering and safety practices for handling hazardous materials. Examples of container loading procedures that the EPA considers to meet the requirements of this paragraph include using a submerged-fill method to load liquids into the container; using a vapor-balancing or a vapor-recover system to collect and control the vapors displaced from the container during filling operations; and transferring waste through a conveyance tube that is fitted to a container opening above the liquid level to splash-fill the material, and subsequently purging the conveyance tube with gas prior to removing it from the container opening.

(c) Each container opening shall be maintained in a closed, sealed position (e.g. covered by a gasketed lid) at all times that hazardous waste is in the container except when it is necessary to have the opening open during procedures to:

* * * * *

35. In § 265.1088 paragraph (c)(3)(ii) is revised to read as follows:

§ 265.1088 Standards: Closed-vent systems and control devices.

* * * * *

(c) * * *

(3) * * *

(ii) All carbon that is a hazardous waste and that is removed from the control device shall be managed in accordance with the requirements of § 264.1033(m) of this part, regardless of the VO concentration of the carbon.

* * * * *

36. In § 265.1089 paragraph (d) is revised to read as follows:

§ 265.1089 Inspection and monitoring requirements.

* * * * *

(d) Each control device used in accordance with the requirements of § 265.1088 of this subpart shall be inspected and monitored by the owner or operator in accordance with the procedures specified in § 265.1033(f)(2). The readings from each monitoring device required by § 265.1033(f)(2) shall be inspected at least once each operating day to check control device operation. Any necessary corrective measures should be immediately implemented to ensure the control device is operated in compliance with the requirements of § 265.1088 of this subpart.

* * * * *

§ 265.1090 [Amended]

37. Section 265.1090(a)(1) is amended by revising ''as listed in § 265.1091(c)'' to read ''as listed in § 265.1091(a)''.

§ 265.1090 [Amended]

38. Section 265.1090(e) is amended by revising ''in accordance with § 265.1083(c)(2)(vi) or § 265.1083(c)(2)(v)'' to read ''in accordance with § 265.1083(c)(2)(vi) or § 265.1083(c)(2)(vii)''.

39. In § 265.1091 paragraph (a)(1)(i) is revised to read as follows:

§ 265.1091 Alternative tank control requirements.

(a) * * *

(1) * * *

(i) The fixed roof shall comply with the requirements of § 265.1085(d)(1) of this subpart. The internal floating roof shall rest or float on the waste surface (but not necessarily in complete contact with it) inside a tank that has a fixed roof. The internal floating roof shall be floating on the waste surface at all

times, except during initial fill and during those intervals when the tank is completely emptied or subsequently emptied and refilled. When the roof is resting on the leg supports, the process of filling, emptying, or refilling shall be as continuous as possible, based on the amount of waste and the nature of the waste handling operation, and shall be accomplished as rapidly as possible.

* * * * *

PART 270—EPA ADMINISTERED PERMIT PROGRAMS: THE HAZARDOUS WASTE MANAGEMENT PROGRAM

40. The authority citation for Part 270 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912, 6925, 6927, 6939, and 6974.

Subpart B—Permit Application

§ 270.27 [Amended]

41. Section 270.27(a)(1) is amended by revising ''as listed in § 265.1091(c)'' to read ''as listed in § 265.1091(a)''.

§ 270.27 [Amended]

42. Section 270.27(a)(3) is amended by revising ''the specification listed in § 265.1087(b)(2)(ii)'' to read ''the specifications listed in § 264.1086(b)(2)(ii).''

BILLING CODE 6560–50–P

FEDERAL COMMUNICATIONS COMMISSION

47 CFR Parts 0 and 1

[ET Docket No. 93–266; FCC 95–493]

Review of the Pioneer's Preference Rules

AGENCY: Federal Communications Commission.

ACTION: Final rule.

SUMMARY: By this *Memorandum Opinion and Order* (*MO&O*), the Commission denies the petition for reconsideration filed by Qualcomm Incorporated (Qualcomm) to the *Second Report and Order* (*Second R&O*) in this proceeding, and grants the petition for reconsideration filed by Celsat America, Inc. (Celsat) to the *Third Report and Order* (*Third R&O*). The Commission finds that there is no need to reconsider its determination of what constitutes innovative technology, as requested by Qualcomm; and finds that it is desirable to reconsider its decision to apply certain new pioneer's preference regulations to pioneer's preference requests accepted for filing on or before September 1, 1994, as requested by Celsat. This action is intended to affirm the Commission's pioneer's preference policies, consistent with Congressional directives.

EFFECTIVE DATE: March 11, 1996.

FOR FURTHER INFORMATION CONTACT: Rodney Small, (202) 418–2452, Office of Engineering and Technology, Federal Communications Commission, Washington, DC 20554.

SUPPLEMENTARY INFORMATION: This is a summary of the Commission's *MO&O* adopted December 8, 1995, and released January 30, 1996. This action will not add to or decrease the public reporting burden. The full text of the Commission decision is available for inspection and copying during regular business hours in the FCC Reference Center (Room 239), 1919 M Street, NW, Washington, DC. The complete text of this decision also may be purchased from the Commission's duplication contractor, International Transcription Service, Inc., (202) 857–3800, 2100 M Street, NW, Suite 140, Washington, DC 20037.

Summary of MO&O

1. The pioneer's preference program provides preferential treatment in the Commission's licensing processes for parties that make significant contributions to the development of a new service or to the development of a new technology that substantially enhances an existing service. The program was established to foster new communications services and technologies and to encourage parties to submit innovative proposals in a timely manner. Under the pioneer's preference rules, a necessary condition for the award of a preference is that an applicant demonstrate that it has developed the capabilities or possibilities of a new technology or service, or has brought the technology or service to a more advanced or effective state. The applicant must also demonstrate that the new service or technology is technically feasible by submitting either the summarized results of an experiment or a technical showing. Finally, a preference is granted only if the service rules adopted are a reasonable outgrowth of the applicant's proposal and lend themselves to grant of a preference. A pioneer's preference recipient's license application is not subject to mutually exclusive applications.

2. The *Second R&O*, 60 FR 13636 (March 14, 1995), addressed proposals set forth in the *Notice of Proposed Rule Making*, 58 FR 57578 (October 26, 1993), in this proceeding and modified certain rules regarding the Commission's pioneer's preference program. Specifically, the *Second R&O* provided pioneers with a discount on license charges in services in which licenses are awarded by competitive bidding, and it also modified several administrative rules. In addition, the *Second R&O* also held that, where an ''innovative technology'' has developed or enhanced more than one service, the grant of a pioneer's preference in only one such service is sufficient incentive to encourage pioneering proposals to be submitted.

3. Qualcomm states that the Commission should reconsider its determination of what constitutes ''innovative technology.'' Qualcomm contends that four aspects of the *Second R&O* are not clearly defined. First, Qualcomm maintains that a technology should not be considered ineligible for a pioneer's preference merely because that technology could be used in an existing service; second, it requests that the Commission clarify that an innovative technology that can be applied to more than one new service should be eligible for a preference in all services that are not existing services; third, it requests that an innovator who develops a new technology that both significantly improves an existing service and that may also be used to provide a new service in a different band be eligible for a preference in the new service; and fourth, it requests that the Commission clarify what it means by a ''new service'' operating in a higher band. Qualcomm states that there may be some confusion on this point with respect to broadband Personal Communications Services (PCS). No party filed comments on Qualcomm's petition.

4. Legislation implementing domestically the General Agreement on Tariffs and Trade (GATT) was enacted on December 8, 1994, and contained an amendment to the Communications Act relating to the pioneer's preference program. Included in this amendment was Section 309(j)(13)(D), which specified new requirements regarding criteria, peer review, and unjust enrichment for pioneer's preference requests that were accepted for filing after September 1, 1994. In the *Third R&O*, 60 FR 32116 (June 20, 1995), the Commission implemented the new requirements specified in Section 309(j)(13)(D) and extended them to pioneer's preference requests filed on or before September 1, 1994 in proceedings that have not reached the tentative decision stage. The Commission stated that such action would further its

2. Section 17.5 is amended by revising the sixth sentence to read as follows:

§ 17.5 Bids.

* * * Bids must be accompanied by certified checks, post office money orders, bank drafts, or cashier's checks made payable to the United States of America for 2 percent of the amount of the fair market value or $2,500, whichever is greater, in the case of a freehold interest or for the amount of the first year's rent in the case of a leasehold interest. * * *

3. Section 17.6 is amended by adding two sentences to the end of the section, to read as follows:

§ 17.6 Action at close of bidding.

* * * In the case of a freehold interest, the high bidder must submit the balance of the bid within 45 days of the bid award in the form of a certified check, post office money order, bank draft, or cashier's check, made payable to the United States of America. Failure to submit the full balance within 45 days will result in the forfeiture of $1,000 of bid deposit, unless the bidder has been released from the bid or an extension has been granted by the authorized officer, and the property will be awarded to the next highest bidder upon fulfillment of the requirements of this section.

Date: May 19, 1996.

George T. Frampton, Jr.,

Assistant Secretary for Fish and Wildlife and Parks.

RIN 2060–AB94

Hazardous Waste Treatment, Storage, and Disposal Facilities and Hazardous Waste Generators; Organic Air Emission Standards for Tanks, Surface Impoundments, and Containers

AGENCY: Environmental Protection Agency (EPA).

ACTION: Amendment of final rule to postpone requirements.

SUMMARY: This document amends the EPA standards to postpone the effective date of the requirements in the December 6, 1994 final rule entitled, ''Hazardous Waste Treatment, Storage, and Disposal Facilities and Hazardous Waste Generators; Organic Air Emission Standards for Tanks, Surface Impoundments, and Containers'' until October 6, 1996.

DATES: These amendments are effective June 5, 1996.

ADDRESSES: Docket. The supporting information used for the final rule is available for public inspection and copying in the RCRA docket. The RCRA docket numbers pertaining to the final rule are F–91–CESP–FFFFF, F–92–CESA–FFFFF, F–94–CESF–FFFFF, F–94–CE2A–FFFFF, F–95–CE3A–FFFFF, and F–96–CE4A–FFFFF. The RCRA docket is located at Crystal Gateway, 1235 Jefferson Davis Highway, First Floor, Arlington, Virginia. Review of docket materials is conducted at the Virginia address; an appointment is required to review docket materials. Appointments can be scheduled by calling the Docket Office at (703) 603–9230. The mailing address for the RCRA Docket Office is RCRA Information Center (5305W), U.S. Environmental Protection Agency, 401 M Street, S.W., Washington, D.C. 20460.

FOR FURTHER INFORMATION CONTACT: For information about this postponement contact the RCRA Hotline at (800) 424–9346 toll-free, or (703) 920–9810.

SUPPLEMENTARY INFORMATION:

1. Postponement of Effective Date for Rule Requirements

The effective date of the requirements in the final rule, originally published December 6, 1994 (59 FR 62896) and postponed November 13, 1995 (60 FR 56952), are further postponed until October 6, 1996. The requirements of these final standards were originally scheduled to become effective as of June 5, 1995. The EPA specified in the final rule a schedule that established the compliance dates by which different requirements of the final rule must be met. These compliance dates and requirements are explained further in the final rule (59 FR 62896, December 6, 1994) under **SUPPLEMENTARY INFORMATION.** Today's amendment changes only the effective date of the requirements contained in the final standards. The effective date will be October 6, 1996 for all provisions of the standards, including the applicability of 40 CFR part 265 subparts AA, BB, and CC to 90-day accumulation units at hazardous waste generators, the applicability of 40 CFR part 265 subparts AA, BB, and CC to RCRA permitted units, and the applicability of the final standards to tanks in which waste stabilization activities are performed. All other compliance dates for the final rule remain as published in the final rule (59 FR 62896.)

The EPA initially extended the effective date of the requirements in the final rule for six months to allow time to clarify certain provisions of the final rule and develop other compliance options (see 60 FR 26828, May 19, 1995). On August 14, 1995 the EPA published a Federal Register notice, ''Proposed rule; data availability'' (60 FR 41870) and opened RCRA docket F–95–CE3A–FFFFF to accept comments on revisions that the EPA is considering for the final standards. The provisions of the final rule that these revisions would affect are the waste determination procedures, the standards for containers, and the applicability of the final standards to units that operate air emission controls in accordance with certain Clean Air Act standards. In addition, these revisions would reduce the monitoring, record keeping, and reporting requirements for affected tanks, surface impoundments, and containers.

The EPA accepted public comments on the appropriateness of these revisions through October 13, 1995, and is now in the process of finalizing amendments to the final rule to incorporate the described revisions, based on the information the EPA noticed and the comments EPA received. As anticipated, the amendments will provide certain compliance options for waste determination procedures and for container standards that are not currently available in the published final rule. On November 13, 1995 (60 FR 56952) the EPA again postponed the effective date of the rule requirements until June 6, 1996 to allow time for the EPA to publish amendments to the December 6, 1994 final standards. The EPA expects to publish these amendments in the near future. Given that the EPA is in the process of amending the rule in ways that would increase compliance flexibility and possibly reduce certain regulatory requirements, the EPA considers it appropriate to delay the June 6, 1996 effective date of the rule requirements for four months. (See 5 U.S.C. 705, ''when an agency finds that justice so requires, it may postpone the effective date of action taken by it, pending judicial review.'') In particular, the EPA is not sure that it will have adequate time to promulgate the amendments before June 6, 1996 to allow facilities to avoid compliance expenditures based on the December 6, 1994 final rule, expenditures which may prove unnecessary in light of the projected amendments. This postponement will thus allow time for the EPA to publish

the amendments. The EPA anticipates that by October 6, 1996 affected sources will have had ample time to make any necessary alterations to their compliance plans in response to the amendments. Affected sources have been on notice of the final regulations since they were published in December of 1994. The EPA expects that by early 1995, most facilities had begun preparing their implementation strategies and planning for any necessary equipment modifications, in anticipation of the originally scheduled implementation date of June 6, 1995. Thus, the EPA considers today's four month extension to be sufficient time for affected facilities to become familiar with the revised requirements contained in the amended standards, and to make any necessary revisions to their implementation strategies.

The EPA has received a request to stay the rule from parties that brought judicial challenges to the December 6, 1994 published rule. In taking this action to postpone the effective date of the rule requirements, the EPA is not concurring that the criteria for a stay (such as likelihood of irreparable harm or likelihood that these parties will ultimately prevail should the rule be litigated) are met. Rather, as a prudential matter, the EPA believes that a four month delay is appropriate for the reasons explained above.

2. Retention of Final Compliance Date of December 8, 1997

The December 6, 1994 published rule set a final compliance date of December 8, 1997, by which time all required air emission control equipment must be operating (59 FR 62897). The EPA does not believe that postponing the effective date of the rule requirements necessitates any postponement of the December 8, 1997 compliance date. The final compliance date was chosen to allow time for facility modifications that may be involved in the compliance approach of certain facilities. The EPA believes that, for many air emission control applications, the required control devices can be installed and in operation within several months. However, the EPA agrees that under some circumstances, the owner's or operator's approach to complying with the air emission control requirements under the subpart CC standards may involve a major design and construction project which requires a longer time to complete. In recognition of these cases, the EPA decided that it is reasonable to allow up to December 8, 1997 for affected facilities to install and begin operation of air emission controls required by the supbart CC standards. (Hazardous Waste TSDF Background Information Document for Promulgated Organic Air Emission Standards, EPA–453/R–94–076b, page 9–7.)

The final rule requirements that may necessitate a major modification, as described above, for tanks are paragraphs (b) through (d) of 40 CFR parts 264.1084 and 265.1085. These paragraphs specify air emission control equipment that must be operated on tanks receiving affected hazardous waste. Similarly, the requirements that may necessitate such a major modification for surface impoundments are paragraphs (b) through (e) of 40 CFR parts 264.1085 and 265.1086. These paragraphs specify air emission control equipment that must be operated on surface impoundments receiving affected hazardous waste. To comply with these requirements for tanks and surface impoundments, facilities may choose to construct new hazardous waste management units to replace existing units, or may choose to modify existing hazardous waste management units. Examples of facility equipment modifications that could require an extended period of compliance would be replacing a large open surface impoundment with a series of covered tanks, or fitting an existing open tank with a fixed roof vented to a control device. The EPA recognizes that such major modifications or new construction can require several months or more, and therefore allows until December 8, 1997 for facilities to comply with the air emission control requirements of the final subpart CC standards.

In addition, certain States may require that a facility obtain a permit modification prior to performing a major modification such as those described above. The EPA recognizes that such permit modifications can be a lengthy process, and therefore felt it was appropriate to afford an extended compliance period to allow such modifications to be obtained (59 FR 62919). The EPA does not expect that such a lengthy period of implementation would be required in circumstances other than those described above, although § 264.1082(c) allows that such a period is available if necessary.

The final rule provisions that justified a compliance date of December 8, 1997 are not among those that are potentially affected by the revisions currently under EPA's consideration. Specifically, the EPA is not considering changes to the requirements for covers and air emission controls on tanks and surface impoundments. All affected facilities have been on notice of the final rule air emission control requirements for these units since the final rule publication on December 6, 1994. Therefore, the EPA does not consider it appropriate to postpone the compliance date of December 8, 1997, by which all required air emission control equipment must be operating.

3. Conclusion

The EPA is amending the final rule such that the final rule requirements are not effective until October 6, 1996. The final rule text affected by this postponement is amended as follows.

List of Subjects

40 CFR Parts 264 and 265

Air pollution control, Container, Control device, Hazardous waste, Incorporation by reference, Inspection, Miscellaneous unit, Monitoring, Reporting and recordkeeping requirements, Standards, Surface impoundment, Tank, TSDF, Waste determination.

40 CFR Part 271

Administrative practice and procedure, Air pollution control, Confidential business information, Hazardous waste, Reporting and recordkeeping requirements.

Dated: May 16, 1996.

Mary D. Nichols,

Assistant Administrator for Air and Radiation.

For the reasons set out in the preamble, title 40, chapter I, parts 264, 265, and 271 of the Code of Federal Regulations are amended as follows:

PART 264—STANDARDS FOR OWNERS AND OPERATORS OF HAZARDOUS WASTE TREATMENT, STORAGE, AND DISPOSAL FACILITIES

1. The authority citation for part 264 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6924 and 6925.

Subpart CC—Air Emission Standards for Tanks, Surface Impoundments, and Containers

2. Section 264.1080 is amended by revising paragraphs (b)(1) and (c) to read as follows:

§ 264.1080 Applicability.

* * * * *

(b) * * *

(1) A waste management unit that holds hazardous waste placed in the unit before October 6, 1996, and in

which no hazardous waste is added to the unit on or after this date.

* * * * *

(c) For the owner and operator of a facility subject to this subpart and who received a final permit under RCRA section 3005 prior to October 6, 1996, the requirements of this subpart shall be incorporated into the permit when the permit is reissued in accordance with the requirements of 40 CFR 124.15 of this chapter or reviewed in accordance with the requirements of 40 CFR 270.50(d) of this chapter. Until such date when the owner and operator receives a final permit incorporating the requirements of this subpart, the owner and operator is subject to the requirements of 40 CFR Part 265 subpart CC.

PART 265—INTERIM STATUS STANDARDS FOR OWNERS AND OPERATORS OF HAZARDOUS WASTE TREATMENT, STORAGE, AND DISPOSAL FACILITIES

3. The authority citation for part 265 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6924, 6925, and 6935.

Subpart CC—Air Emission Standards for Tanks, Surface Impoundments, and Containers

4. Section 265.1080 is amended by revising paragraph (b)(1) and paragraph (c) introductory text to read as follows:

§ 265.1080 Applicability.

* * * * *

(b) * * *

(1) A waste management unit that holds hazardous waste placed in the unit before October 6, 1996, and in which no hazardous waste is added to the unit on or after this date.

* * * * *

(c) For the owner and operator of a facility subject to this subpart who has received a final permit under RCRA section 3005 prior to October 6, 1996, the following requirements apply:

* * * * *

5. Section 265.1082 is amended by revising paragraphs (a) introductory text, paragraph (a)(1), (a)(2) introductory text, (a)(2)(iii), and (a)(2)(iv) to read as follows:

§ 265.1082 Schedule for implementation of air emission standards.

(a) Owners or operators of facilities existing on October 6, 1996, and subject to subparts I, J, and K of this part shall meet the following requirements:

(1) Install and begin operation of all control equipment required by this subpart by October 6, 1995, except as provided for in paragraph (a)(2) of this section.

(2) When control equipment required by this subpart cannot be installed and in operation by October 6, 1996, the owner or operator shall:

* * * * *

(iii) For facilities subject to the recordkeeping requirements of § 265.73 of this part, the owner or operator shall enter the implementation schedule specified in paragraph (a)(2)(ii) of this section in the operating record no later than October 6, 1996.

(iv) For facilities not subject to § 265.73 of this part, the owner or operator shall enter the implementation schedule specified in paragraph (a)(2)(ii) of this section in a permanent, readily available file located at the facility no later than October 6, 1996.

* * * * *

PART 271—REQUIREMENTS FOR AUTHORIZATION OF STATE HAZARDOUS WASTE PROGRAMS

6. The authority citation for part 271 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), and 6926.

Subpart A—Requirements for Final Authorization

7. Section 271.1(j) is amended by revising the effective date of the following entry in Table 1 to read as follows:

§ 271.1 Purpose and Scope.

* * * * *

(j) * * *

TABLE 1.—REGULATIONS IMPLEMENTING THE HAZARDOUS AND SOLID WASTE AMENDMENTS OF 1984

Promulgation date	Title of regulation	**Federal Register** reference	Effective date

BILLING CODE 6560–50–P

40 CFR Part 300

[FRL–5511–9]

Substances Contingency Plan: National Priorities List Update

AGENCY: Environmental Protection Agency (EPA).

ACTION: Notice of deletion of the Waste Disposal Engineering Superfund Site from the National Priorities List (NPL).

SUMMARY: The Environmental Protection Agency (EPA) announces the deletion of the Waste Disposal Engineering Inc. Site in Minnesota from the National Priorities List (NPL). The NPL is Appendix B of 40 CFR part 300 which is National Oil and Hazardous Substances Contingency Plan (NCP), which EPA promulgated pursuant to Section 105 of the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA), as amended. This action is being taken by EPA and the State of Minnesota, because it has been determined that Responsible Parties have implemented all appropriate response actions required. Moreover, EPA and the State of Minnesota have determined that remedial actions conducted at the site to date remain protective of public health, welfare, and the environment.

EFFECTIVE DATE: June 5, 1996.

FOR FURTHER INFORMATION CONTACT:

Larry Schmitt at (312) 353–6565 (SR–6J), Remedial Project Manager or Gladys Beard at (312) 886–7253, Associate Remedial Project Manager, Superfund Division, U.S. EPA—Region V, 77 West Jackson Blvd., Chicago, IL 60604. Information on the site is available at the local information repository located at: The Anoka County Community Health and Environmental Service, Anoka County Government Center, RM. 360, 2100 3rd Ave., Anoka, MN 55303 and Andover City Hall, 1685 Crosstown Blvd., Andover, MN 55304. Requests for comprehensive copies of documents should be directed formally to the Regional Docket Office. The contact for the Regional Docket Office is Jan Pfundheller (H–7J), U.S. EPA, Region V, 77 W. Jackson Blvd., Chicago, IL 60604, (312) 353–5821.

SUPPLEMENTARY INFORMATION: The site to be deleted from the NPL is: Waste Disposal Engineering Inc. Site located in Andover, Minnesota. A Notice of Intent to Delete for this site was published March 26, 1996 (61 FR 13131). The closing date for comments on the Notice of intent to Delete was April 26, 1996. EPA received no comments and therefore no Responsiveness Summary was prepared.

The EPA identifies sites which appear to present a significant risk to public health, welfare, or the environment and it maintains the NPL as the list of those sites. Sites on the NPL may be the subject of Hazardous Substance Response Trust Fund (Fund-) financed remedial actions. Any site deleted from the NPL remains eligible for Fund-financed remedial actions in the unlikely event that conditions at the site warrant such action. Section 300.425(e)(3) of the NCP states that Fund-financed actions may be taken at sites deleted from the NPL in the unlikely event that conditions at the site warrant such action. Deletion of a site from the NPL does not affect responsible party liability or impede agency efforts to recover costs associated with response efforts.

List of Subjects in 40 CFR Part 300

Air pollution control, Chemicals, Hazardous substances, Hazardous Waste, Intergovernmental relations, Penalties, Reporting and recordkeeping requirements, Superfund, Water pollution control, Water supply.

Land Disposal Restrictions Phase III—Emergency Extension of the K088 Capacity Variance; Final Rule

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 268

[EPA # 530–Z–96–PH3F–FFFFF; FRL–5676–4]

Land Disposal Restrictions Phase III—Emergency Extension of the K088 Capacity Variance

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: Under the Land Disposal Restrictions (LDR) program of the Resource Conservation and Recovery Act (RCRA), EPA is extending the current national capacity variance for spent potliners from primary aluminum production (Hazardous Waste Number K088) for six (6) months. Thus, K088 wastes do not have to be treated to meet LDR treatment standards until July 8, 1997, six months from the current treatment standard effective date of January 8, 1997. EPA is extending the national capacity variance due to unanticipated performance problems by the treatment technology which provides most of the available treatment capacity for these wastes. As a result, the Agency does not believe that sufficient treatment capacity which minimizes short and long-term threats to human health and the environment posed by land disposal of the potliners is presently available. The length of the extension of the national capacity variance is based on EPA's best current estimate of the time it will take to modify, evaluate, and correct the current deficiencies in treatment performance.

EFFECTIVE DATE: January 8, 1997.

ADDRESSES: Supporting materials are available for viewing in the RCRA Information Center (RIC), located at Crystal Gateway One, 1235 Jefferson Davis Highway, First Floor, Arlington, VA. The Docket Identification Number is F–96–PH3F–FFFFF. The RCRA Docket is open from 9 a.m. to 4 p.m. Monday through Friday, except for Federal holidays. The public must make an appointment to review docket materials by calling (703) 603–9230. The public may copy a maximum of 100 pages from any regulatory document at mo cost. Additional copies cost $0.15 per page.

FOR FURTHER INFORMATION CONTACT: For general information, contact the RCRA Hotline at (800) 424–9346 (toll-free) or TDD (800) 553–7672 (hearing impaired). In the Washington, DC, metropolitan area, call (703) 412–9810 or TDD (703) 412–3323. For specific information, contact the Waste Treatment Branch (5302W), Office of Solid Waste (OSW), U.S. Environmental Protection Agency, 401 M Street S.W., Washington, D.C. 20460; phone (703) 308–8434. For information on the capacity analyses, call Pan Lee or Bill Kline at (703) 308–8440. For information on the regulatory impact analyses, contact Paul Borst at (703) 308–0481. For other questions, call John Austin at (703) 308–0436 or Mary Cunningham at (703) 308–8453.

SUPPLEMENTARY INFORMATION: Today's final rule as well as the K088 Fact Sheet and the Index to the Record of materials in the docket are available on the Internet. Follow these instructions to access the information electronically:

SUPPLEMENTARY INFORMATION

Table of Contents

I. Background

A. The Existing Treatment Standard and National Capacity

Variance for Spent Potliners

On April 8, 1996, EPA promulgated a prohibition on land disposing spent potliners from primary aluminum production (Hazardous Waste K088) unless the waste satisfied the treatment standards for K088 established by EPA as part of the same rulemaking. (61 FR 15566, April 8, 1996.) Spent potliners are a highly toxic hazardous waste, whose hazardous constituents include cyanide (present in concentrations between 0.1 and 1 percent, which are quite high for such a toxic constituent), toxic metals, and polycyclic aromatic hydrocarbons (PAHs). See the Final BDAT Background Document for Spent Potliners from Primary Aluminum Reduction—K088, February 29, 1995. These wastes also contain high concentrations of fluoride. See generally *id.* at 15584–585. Previous improper management of spent potliners has resulted in widespread groundwater contamination with cyanide and fluoride, and was an important factor in EPA's decision to list these materials as hazardous wastes. See 53 FR 35412, September 13, 1988. The treatment standards for K088 wastes require substantial reductions in the total concentration of organic hazardous constituents and cyanide, and substantial reductions in the leachability of toxic metals and fluoride. See 61 FR 15626, April 8, 1996. The reduction in leachability is measured by application of the Toxicity Characteristic Leaching Procedure (TCLP), SW–846 Method 1311. Id.

These treatment standards are based upon performance of combustion technology plus stabilization treatment of combustion residues. Id. at 15584. The treatment standard for fluoride is based upon the performance demonstrated by the treatment process developed by Reynolds Metals Company during studies conducted as part of their application for delisting [1] treated K088 from hazardous waste regulation. See 61 FR 15585, April 8, 1996. Although treatment standards were based upon these technologies, any treatment technology (other than impermissible dilution) may be used to achieve these established numerical standards. Data in the administrative record indicate that these treatment standards are achievable by a number of different technologies, including combustion followed by stabilization of the residue. See the Final BDAT Background Document for Spent Potliners from Primary Aluminum

[1] EPA granted a final exclusion from the lists of hazardous wastes contained in 40 CFR 261.32 —i.e., a delisting— for certain solid wastes derived from the treatment of K088 at Reynolds Metals Company, Gum Springs, Arkansas (56 FR 67197, December 30, 1991). The delisting is based on treating the same parameters covered by the LDR treatment standard, and compliance is also measured by TCLP analyses for toxic metals, PAHs, cyanide, and fluoride. The status of this delisting is discussed further in section V.A. of this Notice.

Reduction—K088, February 29, 1995, available in the docket.

Notwithstanding that a number of different treatment technologies can achieve the treatment standard, in fact, virtually all existing treatment capacity is provided by a single operation, the Reynolds treatment facility located in Gum Springs, Arkansas. See 61 FR 15589, April 8, 1996; Background Document for Capacity Analysis for Land Disposal Restrictions, Phase III (February 1996, Volume I, pages 4–4 to 4–11). The Reynolds process entails the crushing and sizing of spent potliner materials, the addition of roughly equal portions of limestone and a particular type of brown sand as flux, and the feeding of the combined mixture to a rotary kiln for thermal destruction of cyanide and PAHs. The process also is intended to reduce the mobility of soluble fluoride through the formation of insoluble calcium fluoride. Spent potliners (SPL) are generated in large volumes ranging from 100,000 to 125,000 tons annually.[2] Of the approximate 140,000 tons of treatment capacity EPA estimated was available, 120,000 tons are provided by Reynolds.[3] Because of this potential bottleneck, EPA was concerned enough about the possibility for administrative delays in obtaining access to Reynolds' process that the Agency delayed the prohibition effective date by granting a nine-month national capacity extension, pursuant to RCRA section 3004(h)(2), to assure that logistical difficulties were resolved before the prohibition on land disposal became effective. 61 FR 15589, April 8, 1996; Background Document for Capacity Analysis for Land Disposal Restrictions, Phase III (February 1996, Volume I, pages 4–4 to 4–11).[4] The prohibition (and applicable treatment standards) consequently is scheduled to take effect on January 8, 1997.

[2] Background Document for Capacity Analysis for Land Disposal Restrictions, Phase III (February 1996, Volume I, pages 4–5 to 4–8). Because SPL are not generated continuously, and because the rate of generation fluctuates according to the amount of aluminum produced, it is not possible to estimate this figure with more accuracy. Theoretically, an average of approximately 110,000 tons annually may be used for purpose of assessing available treatment capacity. There are generation data submitted after LDR Phase III was published and please see the docket files: 4/10/96 letter attached to July 9, 1996 petition from aluminum smelters and Reynolds' 11/25/96 submission in the Attachment of November 25, 1996 notes.

[3] Background Document for Capacity Analysis for Land Disposal Restrictions, Phase III (February 1996, Volume I, pages 4–9 to 4–10).

[4] Reynolds challenged EPA's decision in the D.C. Circuit and attempted to obtain expedited review of its petition, but the D.C. Circuit denied Reynolds' motion.

II. Subsequent Events

Reynolds presently uses its process to treat its own spent potliner K088 wastes and those from other sources, and disposes most of the residue in a dedicated landfill (i.e. a monofill receiving only these treatment residues) located at the treatment site. The company is also using these residues as fill material in unlined pits at a Hurricane Creek, Arkansas mining site, and as a test all-weather road surface at the mining site. (Trip Report, EPA, October 30, 1996). The treatment process appears to be destroying PAHs as predicted, and to be reducing total cyanide concentrations from initial concentrations ranging from 975 mg/kg to 6350 mg/kg to residual levels of 50 mg/kg to 150 mg/kg.[5] For over two years, however, notwithstanding that the wastes as tested by the TCLP would have complied with the land disposal restriction treatment standards for the non-wastewater forms of K088, *actual* sampling data shows potentially high concentrations of hazardous constituents in the leachate from the dedicated monofill. As measured in September 1996, total cyanide concentrations in the leachate are 46.5 mg/L (the treatment standards for K088 wastewaters specify a concentration of 1.2 mg/L); arsenic concentrations are at 6.55 mg/L (treatment standard 1.2 mg/L); and fluoride concentrations are at 2228 mg/L (treatment standard 35 mg/L). (Gum Springs Leachate Analytical Results, Reynolds Metals Company, September 26, 1996).[6] Analysis of surface water run-off from treated SPL used as test roadbeds at the Hurricane Creek Mine found total cyanide concentrations in the leachate of 2.0 mg/L (the treatment standards for K088 wastewaters specify a concentration of 1.2 mg/L); arsenic concentrations are at 1.24 mg/L (treatment standard 1.2 mg/L); and fluoride concentrations are at 229 mg/L (treatment standard 35 mg/L). (Arkansas Department of Pollution Control & Ecology, November 12, 1996). The Gum Springs monofill leachate also has a pH of 12.75 to 13.5, exceeding levels identifying a waste as hazardous due to the characteristic of corrosivity.[7]

[5] See Table 2, 56 FR 33004, July 18, 1991 and attachments to December 9, 1996 letter from Pat Grover to Mike Shapiro.

[6] EPA was not aware of these data until recently, and, in particular was not aware of these data during the rulemaking which established the K088 treatment standard. EPA notes further that the leachate from the landfill is being intercepted and collected by Reynolds, and so is not contaminating the environment at the treatment site. However, EPA also notes that there is no interception of leachate or runoff at the Hurricane Creek Mine Site.

[7] As it happens, this elevated pH could provide a clue to why the treatment process is operating less well than predicted, and could be rectifiable.

The Reynolds process thus appears to be performing significantly less well than anticipated. Indeed, it does not appear to be reducing mobility of hazardous constituents significantly more than occurs in disposal of *untreated* spent potliners. Landfill leachate data obtained from two hazardous waste landfill cells receiving approximately 40 percent untreated SPL shows cyanide concentrations of 11 and 14 mg/L, arsenic concentrations of 0.56 and 0.11 mg/L, and fluoride concentrations of 2.3 and 0.001 mg/L respectively. (Staff Communication; November 20, 1996, fax of analytical data reports for landfill cells L12 and L13, Chemical Waste Management of the Northwest, Inc., Arlington, Oregon). Toxic constituents in the untreated Oregon Landfill data are significantly lower than observed in the leachate from the treated waste in the Gum Springs landfill. The Agency notes that some dilution and neutralization probably occurs from leachate produced by other wastes in the Oregon landfill, so that a direct comparison of the two different leachate results is only partially appropriate. However, the Agency believes the comparison is still relevant in that K088 is presently being disposed in the Oregon landfill, and this same K088 stream would be diverted to the Reynolds facility if the Agency did not take action today. The data available indicate that a more concentrated and toxic leachate would result from the Reynolds facility.

The Agency believes that the increased mobility of cyanide, fluoride, and arsenic are due to the highly alkaline conditions that exist at Reynolds' Gum Springs monofill. In the case of cyanide, for example, alkali-metallic cyanide complexes are soluble,[9] and even insoluble iron cyanides can be solubilized under highly alkaline conditions.[10] While the total cyanide concentration in the treated waste has been greatly reduced by Reynolds' treatment process, cyanide remaining in the residue would be environmentally mobile and in fact does appear in high concentrations in the alkaline leachate from the Gum Springs landfill. As a result, almost all remaining cyanide is detected in the Gum Springs leachate, where at a more neutral pH, only soluble free cyanide

[9] Standard Methods for the Examination of Water and Wastewater, 16th Edition, APHA, AWWA, & WPCF, 1985, page 327.

[10] Id., page 330.

would be measured. In the case of the Oregon landfill, the leachate is of more neutral pH (i.e., pH 6.5 to pH 7.5) and only a small fraction of the constituents of concern are soluble even though the total concentration of toxics in the potliner being disposed is much higher. The Agency does not have information detailing the sources or properties of other hazardous wastes being co-disposed at the Oregon site, but again notes that their presence did not result in a more toxic leachate. EPA surmises that the co-disposed wastes provided some neutralization of the alkaline spent potliner. The extreme alkaline pH conditions that exist in the Gum Springs monofill were not anticipated by the Agency, and are not analogous to the test conditions (i.e. the TCLP) used to verify treatability and compliance with the delisting provisions.

III. EPA's Decision with Respect to Extending the National Capacity Variance

The root requirement of the land disposal restriction program is that treatment of hazardous wastes is to ''substantially diminish the toxicity of the waste or substantially reduce the likelihood of migration of hazardous constituents from the waste so that short-term and long-term threats to human health and the environment are minimized.'' RCRA section 3004(m)(1). To date, in the absence of a reliable means of quantifying when threats are minimized, EPA has implemented this requirement by requiring treatment to reflect the performance of Best Demonstrated Available Treatment technologies, in order to assure substantial reductions of a waste's toxicity and mobility before land disposal. See, e.g., 56 FR 6641 (Feb. 26, 1990).

There are certainly legitimate questions as to the degree of risk reduction through treatment needed to satisfy this minimize threat standard, and EPA has stated repeatedly that the statute does not require elimination of all threats or optimized treatment of each hazardous constituent in order to satisfy the requirement. See, e.g., *id.* at n. 1; 56 FR 12355, March 25, 1991. However, under the circumstances present here, EPA finds that the effectiveness of the Reynolds process, as operated, to minimize short-term or long-term threats sufficiently to satisfy the core statutory requirement must be seriously questioned. For instance, the levels of cyanide and arsenic (and also the less-toxic fluoride) in the leachate from the treated potliners is not significantly superior to that found when untreated potliners are landfilled, as explained above.

The statute further provides in section 3004(h)(2) that EPA shall establish the effective date of a land disposal prohibition on the earliest date on which ''adequate alternative treatment, recovery or disposal capacity *which protects human health and the environment* will be available''. (Emphasis added.) See also sections 3004 (d)(1), (e)(1) and (g)(5), which require that land disposal of hazardous wastes ultimately be protective if land disposal is not to be prohibited. See 60 FR at 14473 (March 2, 1995); 56 FR at 41168 (Aug. 19, 1991); *Natural Resources Defense Council* v. *EPA,* 907 F.2d 1146, 1171–72 (D.C. Cir. 1990) (dissenting opinion). EPA cannot but take notice of two facts relevant here to whether Reynolds'' process, as operated, provides treatment capacity which is protective of human health and the environment. First, because EPA has delisted the residues (see n.1 above and section V.A. below), Reynolds now disposes much of the treatment residue in a subtitle D unit. Although this unit appears to have adequate leachate collection and monitoring to prevent any immediate harm at the site, the monofill still lacks the safeguards subtitle C landfills have—such as double liners, financial responsibility, and more extensive monitoring and leachate collection. Second, Reynolds is placing some of the treatment residues as fill material in an unmonitored, unsupervised setting and no regulatory Agency has directly evaluated the potential for harm this type of disposal could be posing. While this use or disposal practice is presently legal under federal law, since the material is delisted, the Agency cannot say with any certainty (see RCRA sections (d)(1), (e)(1) and (g)(5)) that this practice protects human health and the environment. RCRA section 3004 (h)(2).[11]

EPA believes that treatment normally is adequate to be considered to be both minimizing threats to human health and the environment and to be protective of human health and the environment where there is substantial destruction of environmentally available toxics and/or substantial reduction of the mobility of toxic residuals. See 125 Cong. Rec. at S 9178 (statement of Sen. Chaffee introducing the provision which became RCRA section 3004(m) indicating that the land disposal restriction treatment standards are not to be technology forcing.) In almost all cases, simply meeting the treatment standards for the waste achieves this result. But where treatment is not operating so as to reduce environmental availability of key hazardous constituents appreciably more than disposal of untreated spent potliners, and where total and leachable arsenic may actually be increased by the treatment process, the Agency must question the adequacy of the treatment. Further, where disposal in subtitle C units may be safer than disposal of the residues in subtitle D landfills or in uncontrolled units, the Agency must seriously question the environmental consequences of expanded treatment operations at Gum Spring should the national capacity variance not be extended. The corrosivity and mobility of toxic constituents in the Gum Springs leachate, and the concentration of hazardous constituents in the leachate and runoff from the fill area, compels the Agency to find that the treatment process, as it is presently performing and as it includes disposal in non-subtitle C units, is not satisfying the requirement that threats posed by land disposal of the wastes be minimized and that the available treatment capacity be protective of human health and the environment.

In making this finding, EPA stresses that it is specific to this set of facts. The Agency does not mean to revisit the question of whether LDR standards should be technology-based or risk-based.[12] Nor should this action be read as automatically invoking risk-based levels to supplant technology-based treatment standards, or to vitiate a treatment standard whenever treatment performance turns out in practice to be less than predicted by analytic protocols such as the TCLP. Nor is land disposal

[11] As described in the text above, leachate and runoff levels of hazardous constituents from the fill area are presently significantly lower than from the landfill, although the levels are still of potential environmental concern (particularly given the unsecured disposal setting) and are higher than the K088 wastewater treatment standards. The lower levels undoubtedly result from the buffering effect of the acid mining material at the site. However, this buffering may not be permanent. In addition, it is important to evaluate total concentrations of hazardous constituents in the fill material because of the different types of exposure pathways (for example, air-borne particulate) that can result when wastes are placed in this type of uncontrolled setting. See generally 60 FR at 11732 (March 2, 1995) (proposal to prohibit use of hazardous waste as fill material). Reevaluation of this use will be one of the first matters EPA focuses on as it reexamines the decision to delist the K088 treatment residue. See section V.A. in the text.

[12] As EPA has stated many times, the Agency's ultimate preference is to develop risk-based levels that reflect levels at which threats to human health and the environment are minimized, with the reasonable degree of certainty noted by the statute (RCRA section 3004(d)(1)). See, e.g. 56 Fed. Reg. at 6641; See also 60 FR 66344, December 21, 1995, the so-called ''HWIR'' proposal. The risk-based levels would then cap technology-based standards.

typically to be taken into account in establishing an LDR treatment standard. *American Petroleum Inst.* v. *EPA,* 906 F. 2d 729, 734–37 (D.C. Cir. 1990). In fact, technology-based standards remain the best presently-available means of reducing threats posed by land disposal of hazardous wastes. Our finding here is a narrow response to particular facts: there has been on-going, consistent failure (in certain key aspects) of a treatment technology, and the failure is of a magnitude that, under the circumstances, disposal of untreated wastes in Subtitle C landfills is preferable to treatment of the wastes by this process followed by land disposal in non-subtitle C disposal units. Under these unusual circumstances, threats have not been adequately minimized and ultimate protectiveness has not yet been achieved.

A consequence of this finding is that the capacity for treatment that is protective is inadequate for spent potliners at this time. Since the Reynolds process provides virtually all available capacity, and EPA is finding that the process as it is presently performing does not protect human health and the environment (see RCRA section 3004 (h) (2)), the remaining treatment capacity is far below that needed to accommodate the volume of potliners being generated. Therefore, an extension of the existing national capacity variance is required.

IV. For How Long Should the National Capacity Variance Be Extended?

EPA continues to believe that Reynolds' process is inherently sound, and should be able to treat potliners in a manner that minimizes the threats their land disposal can pose. The process has been demonstrated to effectively destroy significant portions of the cyanide and PAHs present, and the stabilization technology has generally been effective in reducing soluble fluorides.[13] In fact, the high degree of leaching presently occurring may be due to the high pH of each of the materials being combined in the treatment process (i.e., spent potliner, limestone, and brown sand). Spent potliner alone has been found to raise the pH of deionized water to 11.2 to 12.0.[14] Brown sand is an alkaline mud produced from the extraction of alumina from bauxite ore with sodium hydroxide, and contains significant concentrations of highly caustic sodium hydroxide residuals. The high alkalinity of brown sand together with SPL and limestone provides no neutralization of the inherent alkalinity; in confirmation, the pH of deionized water leach solutions of the Reynolds' treatment residue has been found to range from 11.9 to 12.2.[15] This is a problem that may be rectified soon by using a different type of sand and keeping the pH of the treated solids within a particular range.

EPA is also aware of Reynolds' substantial investment of capital and expertise into developing this treatment process. The company also has complied with all applicable regulations in developing, implementing, and operating its process, seeking and obtaining RCRA permits for its process, and obtaining a delisting for the treatment residue. The company has also been complying with the terms of the delisting, which only require evaluation of newly-generated treatment residues for leachable cyanide, fluoride, PAHs, and TCLP metals. The Agency does not intend to take precipitous action that irrevocably undermines use of this still-promising treatment technology, or that discourages needed development of and investment in other treatment technologies (for potliners or for other hazardous wastes).

It is EPA's present judgment that the immediate problems with Reynolds' process could be resolved relatively quickly, possibly (as noted above) by substitution of different sand and other means of pH control. Brown sand functions only as a flux in the process to avoid the formation of lava like blockages in the kiln. Other high silica materials should perform equivalently as a flux, but should not contain or result in a highly alkaline treatment residue that promotes the mobility of hazardous constituents of concern. Process modifications and test trials of a sand substitute by Reynolds are planned or are underway. The Agency projects that six months may be required to complete these tests and data evaluation, and is, therefore extending the period of the national capacity variance until July 8, 1997. In the event that replacing the brown sand does not lower the pH, or that the lower pH does not eliminate the problems of the generation of a corrosive leachate high in hazardous constituents, EPA will evaluate other technical options to provide for treatment of K088 that adequately minimizes threats posed by land disposal and proves ultimately to be protective. The Agency may extend the capacity variance for up to an additional nine (9) months, should process modifications be determined to have not resulted in adequate treatment. The Agency will make available to the public for comment any data or additional information it receives in response to this capacity extension.

V. Other Issues

A. Delisting

As noted above, EPA has delisted the residues from Reynolds' treatment process, relying in significant part on use of the TCLP as a predictor of actual environmental performance. (56 FR 67197, December 30, 1991.) These predictions have proven incorrect, at least in the short-term. EPA also did not anticipate, or directly evaluate the use of the treatment residue as fill or road construction material when it granted the delisting.

Authority to evaluate delistings is presently delegated to EPA Regional offices and to authorized States. EPA's Region 6 is presently evaluating the terms of the existing delisting and plans regulatory action regarding the delisting during the spring of 1997.

EPA notes that a determination that the Reynolds process (or any other treatment process) is treating sufficiently to be considered to minimize threats to human health and the environment does not necessarily mean that the residues from the treatment process would have to remain delisted. See, e.g. the text of RCRA section 3004(m)(2) which speaks directly of treatment residues which have been treated to minimize threats then being disposed in subtitle C disposal units. Thus, should EPA find that the Reynolds process is performing sufficiently well to satisfy land disposal restriction requirements, i.e. that the potliners have been treated sufficiently to allow their land disposal, the finding would not necessarily require retention of the current delisting. Conversely, and for the same reasons, a potential finding that the treatment residues should be relisted as hazardous wastes would not preclude a finding that the treatment is nevertheless sufficient to satisfy the requirement that substantial reductions in toxicity and mobility sufficient to minimize threats occur so that land disposal of the treatment residue is permissible.

[13] EPA notes, however, that it may have to ultimately revise the treatment standard for fluoride, which is based on the performance of Reynolds' process. EPA will be seeking more information to more fully characterize the performance of the treatment process for fluoride during the extended national capacity variance period.

[14] Attachments to December 9, 1996 letter from Pat Grover of Reynolds Metal Company to Michael Shapiro, Director, Office of Solid Waste. Results cited are from the analysis of 100 grams of solid material leached with 2–Liters of deionized water (a 1:20 ratio).

[15] Id.

B. Competing Treatment Technologies as BDAT

As discussed above, treatment technologies other than Reynolds' exist which could satisfy the existing treatment standards. Other technologies are being developed, and some of these recover resources from the potliner (as well as destroying hazardous constituents). See ''Final BDAT Background Document for Spent Potliners from Primary Aluminum Reduction—K088'', dated February 1995.

EPA is presently being urged to designate these recovery technologies as exclusive BDAT. See Supplemental Submission in Support of Amendment of Land Disposal Restrictions Phase III—Spent Potliners. Although EPA is still studying these submissions, the Agency notes that it does not regard its proper role as picking winners and losers among different treatment technologies, so long as the treatment technologies are achieving substantial reductions in toxicity and mobility of hazardous constituents sufficient to find that threats are being adequately minimized. (See, for example, 57 FR 37198 (August 18, 1992), where EPA chose to base treatment standards on performance of a technology which substantially reduces concentrations of hazardous constituents but does not perform as well as certain other available treatment technologies). Further, the Agency has established the Universal Treatment Standards (268.40) and has indicated a preference to use numerical limits whenever possible, to allow any legitimate treatment process to meet the standards.

EPA notes, in addition, that the Reynolds process is presently the only treatment process offering any appreciable treatment capacity for K088. Reynolds also took the initiative and developed and marketed this technology in advance of the land disposal prohibition for spent potliners. Given these facts, plus the technology's ability to achieve substantial reductions in the waste's toxicity through destruction of hazardous constituents, EPA does not initially believe it should disallow the process as a valid treatment technology (assuming the present operational problems are resolved). EPA notes moreover that as a legal matter, the LDR treatment standards are *not* intended to be technology-forcing (see 125 Cong. Rec. S 9178 (July 25, 1984) (statement of Sen. Chaffee)), but *are* intended to force utilization of existing treatment capacity where that capacity can significantly reduce wastes' toxicity and mobility. S. Rep. No. 284, 98th Cong. 1st sess. at 19. Thus, as a matter of both policy and law, the Agency is disposed to retaining treatment standards for spent potliners that are achievable by a number of treatment technologies, and to try and hasten the use of currently existing technologies provided their performance and operation adequately minimize threats posed by land disposal of the potliners. [16]

Thus, the Agency's initial inclination is not to amend the current treatment standard for spent potliners to establish any particular technology as BDAT.

VI. Disposal of Potliners During National Capacity Variance Period

Section 3004(h)(4) states that during periods of national capacity variances (and case-by-case extensions), hazardous wastes subject to those extensions that are disposed in landfills (and surface impoundments) may only be so disposed if the landfill (or impoundment) is in compliance with the minimum technology requirements of section 3004(o). EPA has interpreted this language as requiring the individual unit receiving the waste to be in compliance with those so-called minimum technology standards, an interpretation sustained in *Mobil Oil* v. *EPA,* 871 F.2d 149 (D.C. Cir. 1989). In addition, EPA has indicated that this requirement only applies to wastes that are still hazardous when disposed. 55 Fed. Reg. at 22659–60 (June 1, 1990).

Putting this together, this means that during the extended period of the national capacity extension, generators other than Reynolds will dispose of K088 wastes in landfill units that satisfy the minimum technology requirements of section 3004(o). Reynolds' treatment residue is not subject to these requirements because it has been delisted, and so is not a hazardous waste. Should there be action reclassifying that treatment residue as a hazardous waste and should the national capacity extension still be in effect, then such residues would also be required to be disposed in landfill units satisfying minimum technology requirements (assuming that landfill disposal is utilized).

VII. Regulatory Requirements

A. Regulatory Impact Analysis Pursuant to Executive Order 12866

Executive Order No. 12866 requires agencies to determine whether a regulatory action is ''significant.'' The Order defines a ''significant'' regulatory action as one that ''is likely to result in a rule that may: (1) Have an annual effect on the economy of $100 million or more or adversely affect, in a material way, the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities; (2) create serious inconsistency or otherwise interfere with an action taken or planned by another agency; (3) materially alter the budgetary impact of entitlements, grants, user fees, or loan programs or the rights and obligations of recipients; or (4) raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in the Executive Order.''

The Agency and OMB consider today's final rule to be nonsignificant as defined by the Executive Order and therefore not subject to the requirement that a regulatory impact analysis has to be prepared. Today's rule delays for six months the imposition of treatment standards for spent aluminum potliners that were estimated previously by EPA to cost between $11.9 million and $47.3 million (61 FR 15566 and 15591, April 8, 1996). Thus, today's rule results in net savings over this period of time and prevents any potential hardship that would otherwise result from the lack of available thermal treatment capacity for spent aluminum potliner.

B. Unfunded Mandates Reform Act

Under Section 202 of the Unfunded Mandates Reform Act of 1995, signed into law on March 22, 1995, EPA must prepare a statement to accompany any rule where the estimated costs to State, local, or tribal governments in the aggregate, or to the private sector, will be $100 million or more in any one year. Under Section 205, EPA must select the most cost-effective and least burdensome alternative that achieves the objective of the rule and is consistent with the statutory requirements. Section 203 requires EPA to establish a plan for informing and advising any small governments that may be significantly impacted by the rule.

EPA has presented an analysis of the costs of implementing the prior LDR Phase III rule (61 FR 15566, April 8, 1996) and has determined that this rule does not include a Federal mandate that may result in estimated costs of $100 million or more to either State, local, or tribal governments in the aggregate. As stated above, the private sector is not expected to incur costs exceeding $100

[16] The Senate Report also states that ''[i]t is not intended, that a generating industry, for example, could be allowed to continue to have its wastes disposed of in an otherwise prohibited manner solely by binding itself to using a facility which has not been constructed.'' S. Rep. No. 284, 98th Cong. 2d sess. at 19.

million per year due to the delayed implementation of the land disposal restrictions for K088 wastes. EPA has fulfilled the requirement for analysis under the Unfunded Mandates Reform Act.

C. Submission to Congress and the General Accounting Office

Under 5 U.S.C. 801(a)(1)(A) as added by the Small Business Regulatory Enforcement Fairness Act of 1996, EPA submitted a report containing this rule and other required information to the U.S. Senate, the U.S. House of Representatives and the Comptroller General of the General Accounting Office prior to publication of the rule in today's Federal Register. This rule is not a ''major rule'' as defined by 5 U.S.C. 804(2).

VIII. Immediate Effective Date

EPA has determined to make today's action effective immediately. The Agency believes that there is good cause to do so, within the meaning of 5 U.S.C. section 553(b)(B). The current regulatory prohibition is scheduled to take effect on January 8, 1997. Should the Agency fail to act before that time, EPA believes that actions will occur which are both contrary to the objectives of the Land Disposal Restriction statutory provisions, and also environmentally worse than disposal of untreated hazardous waste in subtitle C units. Specifically, if the prohibition takes effect, virtually the entire national volume of potliners will be sent for treatment and disposal to the Reynolds facility. This is because, as set out in this Notice, the Reynolds process is presently operating poorly and because the treatment residues from that process are disposed in units other than subtitle C units. The result is treatment that does not minimize threats and disposal which could be less protective than disposal of untreated wastes in subtitle C units.

Good cause to forego notice-and-comment procedures exists where use of those procedures is contrary to the public interest. 5 U.S.C. section 553(b)(B). EPA believes it would be contrary to the public interest to force treatment of many thousands of tons of hazardous waste which could result in net environmental detriment, as set out in the preceding paragraph. For essentially the same reasons, EPA finds that use of notice-and-comment procedures would be impractical (again within the meaning of 5 U.S.C. section 553(b)(B)).

Finally, EPA notes that it has endeavored to provide actual notice and opportunity for comment on this action. EPA has held a number of meetings with both Reynolds and affected primary aluminum generators (noted in the record for this action), solicited and accepted written submissions from these entities (again part of the administrative record), and made each sides' submissions available to the other for response. The Agency has also had contacts (albeit more limited) with representatives of the hazardous waste treatment industry and the environmental community. Notice and opportunity for comment of course satisfies all procedural requirements of the Administrative Procedure Act (as to parties receiving such notice). 5 U.S.C. section 553(b).

For all of these reasons, EPA finds that this rule may be made effective immediately. In addition, because there is good cause to forego notice-and-comment procedures, the rule may take effect upon promulgation without prior submission of the rule to the Congress. 5 U.S.C. section 808. EPA will thereafter submit the rule to Congress, as required by 5 U.S.C. section 801(a).

List of Subjects in 40 CFR Part 268

Environmental protection, Hazardous waste, Reporting and recordkeeping requirements.

Dated: January 8, 1997.

Carol M. Browner,

Administrator.

For the reasons set out in the preamble, title 40, chapter I of the Code of Federal Regulations is amended as follows:

PART 268—LAND DISPOSAL RESTRICTIONS

1. The authority citation for part 268 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6921, and 6924.

2. Section 268.39 is amended by revising paragraph (c) to read as follows:

§ 268.39 Waste specific prohibitions—spent aluminum potliners; reactive; and carbamate wastes.

* * * * *

(c) On July 8, 1997, the wastes specified in 40 CFR 261.32 as EPA Hazardous Waste number K088 are prohibited from land disposal. In addition, soil and debris contaminated with these wastes are prohibited from land disposal on July 8, 1997.

Land Disposal Restrictions—Phase IV: Treatment Standards for Wood Preserving Wastes, Paperwork Reduction and Streamlining, Exemptions From RCRA for Certain Processed Materials; and Miscellaneous Hazardous Waste Provisions

AGENCY: Environmental Protection Agency (EPA, the Agency).

ACTION: Final rule.

SUMMARY: The Agency is finalizing treatment standards for hazardous wastes generated from wood preserving operations, and is making a conforming amendment to the standard for wastes from production of chlorinated aliphatics which carry the F024 hazardous waste code. These treatment standards will minimize threats to human health and the environment posed by these wastes. In addition, this final rule revises the land disposal restrictions (LDR) program to significantly reduce paperwork requirements by 1.6 million hours. This rule also finalizes both the decision to employ polymerization as an alternative method of treatment for certain ignitable wastes as well as the decision not to ban certain wastes from biological treatment because there is no need to classify these wastes as ''nonamenable.'' It also clarifies an exception from LDR requirements for de minimis amounts of characteristic wastewaters. Finally, this rule excludes processed circuit boards and scrap metal from RCRA regulation which is intended to promote the goal of safe recycling.

EFFECTIVE DATE: This final rule is effective on August 11, 1997 except §§ 148.18(b) and 268.30(b), which are effective on May 12, 1999.

ADDRESSES: The public docket for this rulemaking is available for public inspection at EPA's RCRA Docket, located at Crystal Gateway, First Floor, 1235 Jefferson Davis Highway, Arlington, Virginia. The regulatory docket for this final rule contains a number of background materials. To obtain a list of these items, contact the RCRA Docket at 703–603–9230 and request the list of references in EPA Docket #F–97–PH4F–FFFFF.

FOR FURTHER INFORMATION CONTACT: The RCRA Hotline between 9:00 a.m.–6:00 p.m. EST, toll-free, at 800–424–9346; (703) 412–9810 from Government phones or if in the Washington, DC local calling area; or 800–553–7672 for the hearing impaired. For more detailed information on specific aspects of the rulemaking, contact the Waste Treatment Branch (5302W), Office of Solid Waste (OSW), U.S. Environmental Protection Agency, 401 M Street SW., Washington, DC 20460; phone (703) 308–8434. For technical information on the treatment standards for wood preserving wastes, ask for Nick Vizzone; for information on paperwork reduction and clean-up of Part 268, call Rhonda Minnick at (703) 308–8771 or Nick Vizzone at (703) 308–8460. Contact Kristina Meson at (703) 308–8488 for information on the exclusions for scrap metal and shredded circuit boards. Call Pan Lee at (703) 308–8478 for information on the capacity analyses. For questions on the regulatory impact analyses, contact Paul Borst at (703) 308–0481. For other questions, call Sue Slotnick at (703) 308–8434.

SUPPLEMENTARY INFORMATION:

Availability of Rule on Internet

This rule is available on the Internet. Please follow these instructions to access the rule electronically: From the World Wide Web (WWW), type http://www.epa.gov/rules and regulations. In addition, several technical background documents contained in the docket supporting this rule will be available on the Internet at http://www.epa.gov/offices and regions/oswer.

Table of Contents

I. Background

In the 1984 Hazardous and Solid Waste Amendments (HSWA) of the Resource Conservation and Recovery Act (RCRA), Congress specified that land disposal of hazardous waste is prohibited unless the waste meets treatment standards established by EPA. HSWA requires that treatment standards must substantially diminish the toxicity or mobility of hazardous waste, so that short and long term threats to human health and the environment are minimized. The treatment standards are part of the Land Disposal Restrictions Program.

Today's final rule is one part of the collection of land disposal restrictions (LDR) rules known as ''Phase IV.'' They are the latest in a series of LDR rules that establish treatment standards for newly listed and identified wastes, and that resolve other hazardous waste matters.

EPA proposed the Phase IV rule in two proposed rules (60 FR 43654, August 22, 1995; and 61 FR 2338, January 25, 1996), and subsequently issued a Notice of Data Availability on Phase IV issues (61 FR 21418, May 10, 1996). The attached rule finalizes portions of those earlier proposals. Other proposed revisions are in a second supplemental proposed rule elsewhere in this **Federal Register**.

EPA estimates that the directly measurable benefits associated with the land disposal restrictions treatment standards in this rule are limited relative to the costs that may be incurred. Therefore, the relative priority of addressing these risks could be questioned. However, we do not believe, for this specific action, that a simple cost effectiveness measure alone provides a sufficient basis for decision-making. As discussed below, the preference for permanent treatment of hazardous wastes is part of the basic policy structure which Congress enacted when it amended RCRA in 1984, and reflects concern over the technological uncertainties regarding risks and long term protectiveness of land disposal and the intent to assure that waste management practices are protective for future generations.

The whole premise of the LDR legislation is that risks posed by land disposal of hazardous wastes are inherently uncertain to evaluate and that land-based units are incapable of long term containment. Land disposal units (such as landfills, surface impoundments, and waste piles) are engineered units that can and have failed in the past with significant consequences to human health and the environment. For this reason, Congress required that hazardous wastes be pretreated before disposal by ''treatment [which] should be the best that has been demonstrated to be achievable.'' Congressional Record of July 25, 1984 (S9178). The technology-based approach of the land disposal restrictions provides a measure of insurance against the potential for failure in these land based units.

Given these facts, and evident Congressional intent, EPA continues to believe that the LDR prohibitions and treatment standards are justified in many instances. EPA sets treatment standards that reduce toxicity and mobility of hazardous constituents (or require recycling), and EPA also requires that the treated wastes be placed in reasonably secure land disposal units. However, EPA does believe that, in some situations, the current LDR rules may not provide the optimum regulatory approach. In those situations, EPA will look to other mechanisms to address those relatively low risk scenarios.

II. Potentially Regulated Entities

Entities potentially regulated by this final rule vary according to the section of the rule. The following table breaks down the categories industries that may be regulated according to each major section. The table is not intended to be exhaustive, but rather to provide a guide for readers regarding entities likely to be regulated by this action. This table lists the types of entities that EPA is now aware could potentially be regulated by this action. Other types of entities not listed in the table could also be regulated.

TABLE OF ENTITIES—POTENTIALLY AFFECTED BY THE PHASE IV FINAL RULE

Section of the rule	Category	Examples of entities potentially affected
Addition to 40 CFR §268.40—Treatment standards for wood preserving wastes.	Wood Preserving Hazardous Waste Generators.	Any person that generates over 100kg of F032, F034, or F035.
	Hazardous Waste Treatment Facilities ..	Facilities that treat F032, F034, or F035.
Modifications to 40 CFR §268.7—Waste Analysis and Recordkeeping.	Hazardous Waste Generators	Any person who generates over 100kg of prohibited hazardous waste, or over 1 kg of acute hazardous waste in a calendar month.
	Hazardous Waste Treatment Facilities ..	Facilities permitted under 40 CFR Part 270 for incinerators, surface impoundments, and/or land treatment facilities.
	Hazardous Waste Disposal Facilities	Facilities permitted under 40 CFR Part 270 for landfills, and/or injection wells.
Addition of §§261.4(a)(12) and 261.4(a)(13)—Exclusion from the definition of solid waste for excluded scrap metal and shredded circuit boards.	Scrap Metal and/or Circuit Board Generators.	Persons who generate scrap metal, as defined under 40 CFR §261.1(c)(6) (e.g., Die Casters, Metal Stampers, Machining Parts).
	Scrap Metal Salvage and Storage Yards.	Facilities that store scrap metal, but do not generate or recycle.

TABLE OF ENTITIES—POTENTIALLY AFFECTED BY THE PHASE IV FINAL RULE—Continued

Section of the rule	Category	Examples of entities potentially affected
Point of generation; Decision not to ban nonamenable wastes.	Scrap Metal Recyclers	Facilities that process scrap metal as defined in 40 CFR § 261.1(c)(10).
	Circuit Board Shredders	Facilities that shred circuit boards.
	Hazardous Waste Generators	Any person who generates over 100kg of prohibited hazardous waste, or over 1 kg of acute hazardous waste in a calendar month.
	Hazardous Waste Treatment Facilities	Facilities that perform biological treatment in surface impoundments.

III. New Land Disposal Restrictions Treatment Standards for Wastes From Wood Preserving (Waste Codes F032, F034, and F035) and Revised Treatment Standard for Chlorinated Aliphatics Waste (F024)

A. Summary

EPA is promulgating UTS limits as the treatment standards for the hazardous constituents in wood preserving wastes F032, F034, and F035, as proposed. (See 60 FR 43654, August 24, 1995; 60 FR 546451, October 25, 1995; and 61 FR 21417, May 10, 1996.) In addition, EPA is establishing a compliance alternative for dioxin and furan (D/F) constituents in nonwastewater and wastewater forms of F032, namely allowing use of a method of treatment—combustion—for these constituents. Thus, if this method of treatment is utilized, combustion residues would not have to be analyzed for D/F constituents. The alternative is only available for F032 residues from units subject to the standards in Part 264 subpart O or Part 266 subpart H, or from interim status incinerators which have made a specific demonstration that they operate in a manner equivalent to a Part 264 or Part 266 combustion unit. EPA also is amending the treatment standard previously established for F024 wastes. EPA is adopting the alternative compliance standard for F032 as the standard for F024. The practical effect of this change will be to limit somewhat the type of facilities that can combust F024.

B. Determination of BDAT

1. General

EPA has determined that combustion (CMBST) represents BDAT for organics in nonwastewater forms of F032 and F034 (i.e., the treatment standards are based on the performance of combustion technology). For organics in wastewater forms of F032 and F034, EPA has determined that a single treatment technology or a normal wastewater treatment train can meet the treatment standards promulgated today. As explained in the *Final Best Demonstrated Available Technology Background Document for Wood Preserving Wastes—F032, F034, and F035* (Wood Preserving Background Document for this rule), EPA has determined that wastewater treatment technologies such as biological treatment, steam stripping, carbon adsorption, or combinations of these technologies can treat organics regulated in F032 and F034 to the concentration levels promulgated today. These wastewater treatment technologies are available to, or in use at, existing wood preserving facilities.

For metals in nonwastewater forms of F032, F034, and F035, EPA has determined that the promulgated treatment standards can be based on (slag) vitrification for arsenic and on stabilization for chromium (total). The treatment standard for arsenic also can be achieved using stabilization treatment (see the Wood Preserving Background Document). For wastewater forms of F032, F034, and F035, EPA has determined that treatment levels can be achieved by lime addition followed by sedimentation and filtration for arsenic, and by chemical precipitation followed by sedimentation for chromium. (Of course, since no method of treatment is required to be used under the promulgated treatment standards, any type of treatment other than impermissible dilution may be used to achieve these concentration levels.)

2. F032 Wastewaters

Some commenters felt that the limits proposed for D/F in F032 wastewaters, namely the existing UTS limits, were not achievable. Commenters felt that EPA's own wastewater characterization data showed that the D/F concentrations in untreated F032 wastewaters were orders of magnitude higher than the untreated concentrations in the wastewater samples used in establishing the UTS limits. They also emphasized that biological treatment normally removes D/F constituents in the order of 78% of influent pollutants and thus, may yield an effluent with higher concentrations than those proposed by EPA.

EPA has examined the available data on the characterization of F032, prevailing management practices for wastewaters as difficult to treat as F032, and for wastewaters managed by biological treatment systems. EPA acknowledges that the concentrations of D/F in F032 wastewaters, as generated, are much higher than those treated by the biological treatment system supporting the existing UTS limits for D/F. However, based on the available data on wastewater treatment practices at wood preserving facilities, EPA believes that prevailing wastewater treatment practices can be optimized or upgraded to meet the D/F limits promulgated for F032 wastewaters. As explained in the BDAT Background Document, pretreatment steps can be, and are, used to reduce influent concentrations to biotreatment units to levels comparable to those on which the treatment standards are based, and EPA believes the same level of performance is achievable for wood preservers. (See the wood preserving background document and the BDAT response to comments document for additional discussion on EPA's rationale and data review.)

Another commenter asked EPA to withdraw its proposal for the regulation of D/F constituents in F032 wastewaters. The commenter believes that the regulation of PCP and polynuclear aromatic hydrocarbons (PAH) can ensure the reduction of D/F in F032 wastewaters. The commenter also submitted data with regard to concentrations of D/F, PCP, and PAH analytes in two effluent F032 wastewaters treated by activated carbon adsorption. These data appear to support the commenter's statement that monitoring of PCP and PAHs may serve as a surrogate candidate for the reduction of D/F levels in these particular effluent wastewaters. However, EPA lacks data to determine if the alternative surrogate constituents

proposed for regulation can also serve as surrogates for monitoring the treatment of D/F in wastewater treatment effluents resulting from other treatment technology trains that may achieve the proposed UTS, and has therefore chosen not to adopt this suggestion.

3. F034 Wastes
